
Quantification

Blood **GC** ECD. Limit of detection, 5 µg/L [Redalieu *et al.* 1978]. ECD and FID [Lindström *et al.* 1975].
Plasma **GC** See Blood [Redalieu *et al.* 1978]. Limit of detection, 10 µg/L, see Blood [Lindström *et al.* 1975].
HPLC [Medvedovici *et al.* 2000]. Limit of detection, 10 µg/L [de Vries, Voss 1993]. [Kuo *et al.* 1990]. UV detection. Limit of detection, 10 µg/L for hydrochlorothiazide and chlorothiazide [Barbhaiya *et al.* 1981].
Serum **HPLC** Electrochemical detection. Limit of detection, <5 µg/L [Richter *et al.* 1996].
Urine **GC** See Blood [Lindström *et al.* 1975].
GC-MS Hydrochlorothiazide and other diuretics [Carreras *et al.* 1994].
HPLC UV detection. Limit of detection, 1 mg/L [Farthing *et al.* 1998]. See Plasma. Limit of detection, 200 µg/L [de Vries, Voss 1993]. See Plasma. Limit of detection, 2 mg/L [Barbhaiya *et al.* 1981].
Disposition in the Body Rapidly but incompletely absorbed after oral administration. >95% of an IV dose is excreted unchanged in the urine. About 65% of an oral dose is excreted in the urine unchanged in 24 h. It crosses the placenta and is distributed into breast milk.
Therapeutic Concentration
Peak plasma concentrations of 0.18–0.43 mg/L (mean 0.26) were attained in 2– 4 h, following a single oral dose of 50 mg given to 8 subjects [Beermann, Groschinsky–Grind 1977].
Steady-state plasma concentrations of 0.05–0.16 mg/L (mean 0.1) were achieved after daily oral doses of 75 mg to 8 subjects. [Beermann, Groschinsky-Grind 1978].
Bioavailability About 65–70%.
Half-life Plasma half-life, 5–15 h.
Volume of Distribution About 0.8 L/kg.
Distribution in Blood Plasma : whole blood ratio, 0.41.
Protein Binding About 60%.
Note For a review of the pharmacokinetics of diuretics, see Beermann and Groschinsky-Grind [1980].
Dose 25 to 200 mg daily.

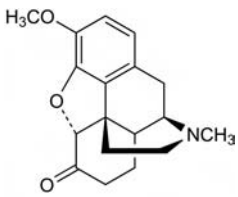
Hydrocodone

Antitussive, Narcotic Analgesic
$C_{18}H_{21}NO_3$ = 299.4
CAS—125-29-1

IUPAC Name 4,5-Epoxy-3-methoxy-17-methylmorphinan-6-one
Synonym Dihydrocodeinone



Chemical Properties Mp 198°. Insoluble in water; soluble in ethanol and dilute acids. pK_a 8.3 (20°). Log *P* (octanol/water), 2.2.

Hydrocodone Hydrochloride

$C_{18}H_{21}NO_3$, HCl,$2^1/_2H_2O$ = 380.9
CAS—25968-91-6 (anhydrous)
Synonym Dihydrocodeinone hydrochloride
Proprietary Name *Dicodid* (injection)
Chemical Properties A white crystalline powder. Soluble 1 in 2 of water; soluble in ethanol.

Hydrocodone Phosphate

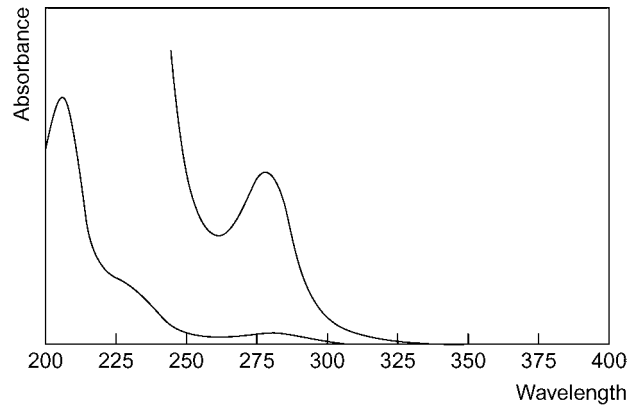
$C_{18}H_{21}NO_3$, $1^1/_2H_3PO_4$ = 446.4
CAS—34366-67-1
Chemical Properties A white or yellowish-white crystalline powder. Soluble in water; practically insoluble in ethanol, chloroform, and ether.

Hydrocodone Tartrate

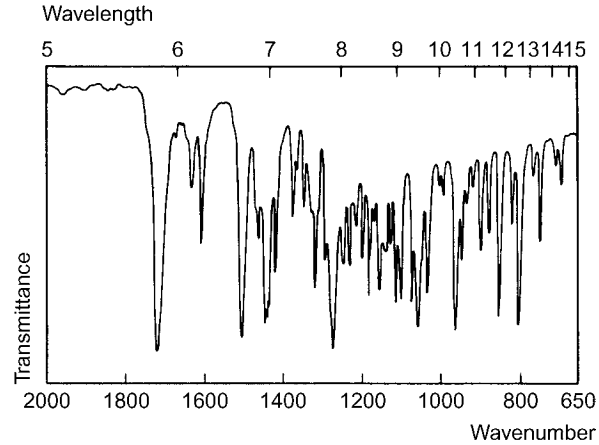
$C_{18}H_{21}NO_3$, $C_4H_6O_6$,$2^1/_2H_2O$ = 494.5
CAS—143-71-5 (anhydrous); 34195-34-1 (hemipentahydrate)
Synonyms Dihydrocodeinone acid tartrate; hydrocodone acid tartrate; hydrocodone bitartrate; hydrocone bitartrate.
Proprietary Names *Biocodone*; *Dicodid* (tablets); *Hycodan*; *Robidone*. It is an ingredient of many preparations [Sweetman *et al.* 2007].
Chemical Properties White crystals or crystalline powder. Mp 118° to 128°. Soluble 1 in 16 of water and 1 in 150 of ethanol; practically insoluble in chloroform and ether.

Colour Test Marquis test—yellow→brown→violet.
Thin-layer Chromatography System TA—R_f 0.25; system TB—R_f 0.04; system TC—R_f 0.20; system TE—R_f 0.33; system TL—R_f 0.04; system TAE—R_f 0.11; system TAF—R_f 0.13 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; Marquis test, violet).
Gas Chromatography System GA—hydrocodoneRI 2440, M (dihydromorphine) RI 2400, M (nor-)-AC RI 2760, M (nor-dihydro-)-AC RI 2700; system GB—hydrocodoneRI 2580, M (-TMS) RI 2674, M (nor-) RI 2599; system GC—RI 3028; system GF—RI 2930.
High Performance Liquid Chromatography System HA—*k* 7.1 (tailing peak); system HC—*k* 2.17; system HX—RI 286; system HY—RI 231; system HAX—RT 6.9 min; system HAY—RT 3.7 min.

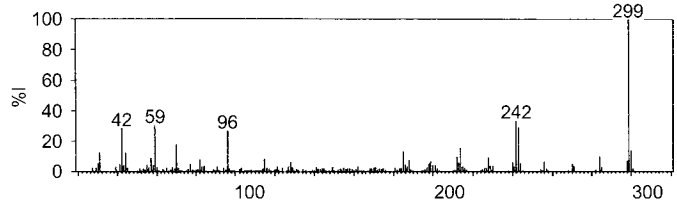
Ultraviolet Spectrum Aqueous acid—280 nm (A^1_1 = 41a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1720, 1270, 1500, 959, 1055, 800 cm^{-1}(KBr disk).



Mass Spectrum Principal ions at m/z 299, 242, 59, 243, 42, 96, 70, 214.



Quantification

Blood **GC** Column: 3% OV-17 on 100/120 mesh Chromosorb W HP (1.2 m × 3 mm i.d.) or 2% FFAP on 100/120 mesh Chromosorb W (0.6 m × 3 mm i.d.). Temperature: 240° or 220°, respectively. AFID. Limit of detection, 100 µg/L [Cimbura, Koves 1981].

GC-MS [Goldberger *et al.* 2010]. Hydrocodone and hydromorphone [Balikova *et al.* 2000].

LC-MS [Dahn *et al.* 2010]. Column: Nova-Pak CN HP (100 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate buffer (pH 3.0), flow rate 0.525 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 2 µg/L, limit of detection, 1 µg/L [Coles *et al.* 2007].

Plasma **LC-MS** See Blood [Dahn *et al.* 2010]. Column: $C_{18.}$ Mobile phase: acetonitrile : water (78 : 22, 0.1% acetic acid). ESI. Limit of detection, 0.1 µg/L [Zhang *et al.* 2009]. See Blood [Coles *et al.* 2007].

Note For a radioimmunoassay, see Honigberg, Stewart [1980].

Serum **GC** ECD. Limit of detection, 1 ng/mL [Barnhart, Caldwell 1977].

LC-MS See Blood [Dahn *et al.* 2010]. See Blood [Coles *et al.* 2007].

Urine **GC-MS** See Blood [Balikova *et al.* 2000; Goldberger *et al.* 2010]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 290° at 10°/min for 0.5 min. EI ionisation. Retention time: 291 s. Limit of quantification, 25 µg/L [Meatherall 1999]. Column: DB-1 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 150° for 1.5 min to 250° at 20°/min. MSD. Retention time: 7.46 min. Limit of quantification, 75 µg/L [Broussard *et al.* 1997]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (1.52 m × 2 mm i.d.). EI ionisation at 80 eV. Carrier gas: CH_4. Temperature: 210°. Limit of detection, 10 µg/L [Cone, Darwin 1978].

LC-MS See Blood [Coles *et al.* 2007; Dahn *et al.* 2010].

Oral Fluid **GC-MS** Column: DB-5 5% phenyl 95% methyl silicone (25 m × 0.2 mm i.d., 0.33 mm). Temperature programme: 150° for 1 min to 245° at 20°/min for

8 min to 290° at 50°/min. MSD in EI ionisation mode. Limit of quantification, 10 g/L, limit of detection, 3 µg/L [Jones *et al.* 2002].

***Hair* GC-MS** See Oral Fluid. Limit of quantification, 0.06 ng/mg, limit of detection, 0.06 ng/mg [Jones *et al.* 2002].

Disposition in the Body Hydrocodone is absorbed after oral administration. It is metabolised by demethylation and reduction of the 6-keto group. Approximately 26% of a dose is excreted in the urine in 72 h, with 12% of the dose as unchanged drug, 5% as norhydrocodone, 4% as conjugated hydromorphone, 3% as 6-hydrocodol and 0.1% as conjugated 6-hydromorphol. Hydrocodol and hydromorphol exist as stereoisomers. The unconjugated metabolites are thought to be active. Hydrocodone is a metabolite of codeine.

Therapeutic Concentration

After a single oral dose of 10 mg of hydrocodone tartrate to 5 subjects, peak serum concentrations of 0.018–0.032 mg/L (mean 0.023) were attained in 1.5 h [Barnhart, Caldwell 1977].

Toxicity The estimated lethal dose is 200 mg. Fatalities have occurred at blood concentrations >0.1 mg/L.

In 2 deaths caused by the ingestion of hydrocodone and phenyltoloxamine, the following postmortem concentrations were reported for the 2 cases, respectively: hydrocodone 0.3 mg/L in blood (both cases); hydrocodone 14.3 mg/L and none in bile, hydromorphone 98 and 48 mg/L in bile; in the first case, phenyltoloxamine was present in bile at a concentration of 0.4 mg/L [Park *et al.* 1982].

Half-life Plasma half-life, ~4 h.

Dose Usually 5 to 10 mg hydrocodone tartrate by mouth every 4 to 6 h.

Hydrocortisone

Corticosteroid

$C_{21}H_{30}O_5$ = 362.5

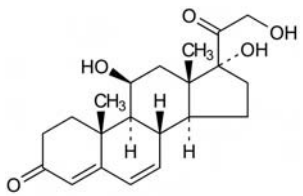
CAS—50-23-7

IUPAC Name (8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-Dihydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-2,6,7,8,9,11,12,14,15, 16-decahydro-1*H*-cyclopenta[a]phenanthren-3-one

Synonyms Compound F; cortisol; 17-hydroxycorticosterone; (11β)-11,17,21-trihydroxypregn-4-ene-3,20-dione.

Note Cortisol is also used as a proprietary name for cortisone acetate.

Proprietary Names Hydrocortisone and its esters are ingredients of many proprietary preparations—see Sweetman [2009].



Chemical Properties A white crystalline powder. Mp about 214°, with decomposition. A solution in dioxan is dextrorotatory. Practically insoluble in water and ether; soluble 1 in 40 of ethanol; slightly soluble in chloroform; very soluble in dioxan. Hydrocortisone sodium succinate, pK_a 5.1. Log *P* (octanol/water), 1.6.

Hydrocortisone Acetate

$C_{23}H_{32}O_6$ = 404.5

CAS—50-03-3

Synonym Hydrocortisone 21-acetate

Chemical Properties A white crystalline powder. Mp about 220°, with decomposition. Practically insoluble in water and ether; soluble 1 in 230 of ethanol; slightly soluble in chloroform; soluble in dioxane.

Hydrocortisone Butyrate

$C_{25}H_{36}O_6$ = 432.6

CAS—13609-67-1

Synonym Hydrocortisone 17-butyrate

Hydrocortisone Cipionate

$C_{29}H_{42}O_6$ = 486.6

CAS—508-99-6

Synonyms Hydrocortisone cypionate; hydrocortisone cyclopentylpropionate.

Chemical Properties A white crystalline powder. Practically insoluble in water; soluble in ethanol; very soluble in chloroform; slightly soluble in ether.

Hydrocortisone Hydrogen Succinate

$C_{25}H_{34}O_8$ = 462.5

CAS—2203-97-6

Synonyms Cortisol hemisuccinate; hydrocortisone hemisuccinate.

Chemical Properties A white crystalline powder. Mp 170° to 173° or 210° to 214°. Practically insoluble in water; soluble 1 in 40 of ethanol and 1 in 7 of dehydrated alcohol.

Hydrocortisone Sodium Phosphate

$C_{21}H_{29}Na_2O_8P$ = 486.4

CAS—6000-74-4

Chemical Properties A white or light yellow hygroscopic powder. Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Hydrocortisone Sodium Succinate

$C_{25}H_{35}NaO_8$ = 484.5

CAS—125-04-2

Synonym Hydrocortisone 21-sodium succinate

Chemical Properties A white, hygroscopic, crystalline powder or amorphous solid. Mp 169.0° to 171.2°. Soluble 1 in 3 of water and 1 in 34 of ethanol; practically insoluble in chloroform and ether. It is unstable in aqueous solution.

Hydrocortisone Valerate

$C_{26}H_{38}O_6$ = 446.6

CAS—57524-89-7

Synonym Hydrocortisone 17-valerate

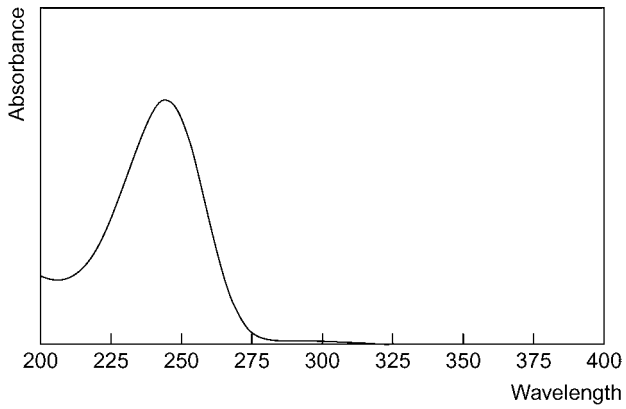
Colour Tests Antimony pentachloride—orange; naphthol–sulfuric acid—yellow-brown/yellow-brown; sulfuric acid—green, orange dichroism (green fluorescence under ultraviolet light).

Thin-layer Chromatography Hydrocortisone: system TA—R_f 0.96; system TB—R_f 0.00; system TE—R_f 0.45; system TF—R_f 0.28; system TP—R_f 0.27; system TQ—R_f 0.02; system TR—R_f 0.08; system TS—R_f 0.00; system TAE—R_f 0.86; system TAJ—R_f 0.36; system TAK—R_f 0.05; system TAL—R_f 0.74; system TAM—R_f 0.58. Hydrocortisone acetate: system TP—R_f 0.51; system TQ—R_f 0.11; system TR—R_f 0.38; system TS—R_f 0.00. Hydrocortisone hydrogen succinate: system TP—R_f 0.08; system TQ—R_f 0.00; system TR—R_f 0.00; system TS—R_f 0.00. Hydrocortisone sodium phosphate: system TP—R_f 0.00; system TQ—R_f 0.00; system TR—R_f 0.00; system TS—R_f 0.00 (DPST solution).

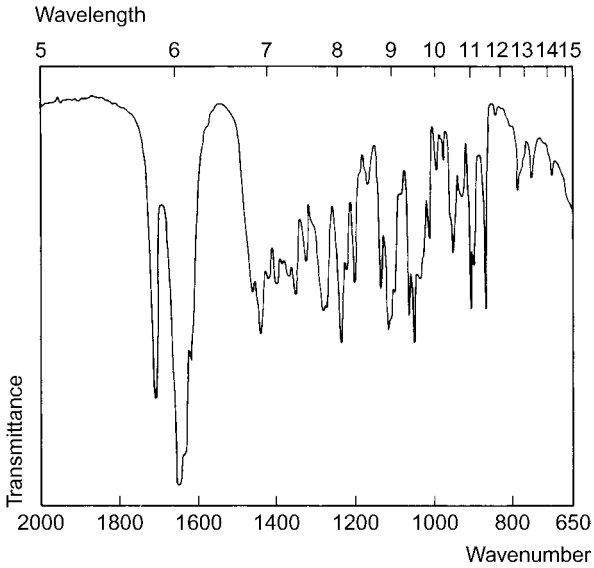
Gas Chromatography System GA—RI 2740.

High Performance Liquid Chromatography System HT—*k* 5.8; system HX—RI 403; system HY—RI 349; system HAA—retention time 17.7 min.

Ultraviolet Spectrum Ethanol—240 nm (A^1_1=435a).



Infrared Spectrum Principal peaks at wavenumbers 1640, 1702, 1610, 1232, 1042, 1115 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** Fluorescence. Hydrocortisone and other glucocorticoids. Limit of detection, 0.1 µg/L for hydrocortisone [Shibata *et al.* 1998]. UV detection. Hydrocortisone, prednisone and prednisolone. Limit of detection, <5 µg/L [Jusko *et al.* 1994]. UV detection. Limit of detection, 300 ng/L [Hariharan *et al.* 1992]. UV detection. Hydrocortisone and hydrocortisone succinate. Limits of detection, 0.2 mg/L for hydrocortisone, and 0.5 mg/L for hydrocortisone succinate [Iwasaki 1987]. UV detection. Limit of detection, 5 µg/L [Toothaker *et al.* 1982].

Urine **HPLC** See Plasma [Shibata *et al.* 1998].

Disposition in the Body Hydrocortisone (cortisol) is the main glucocorticoid secreted by the adrenal cortex. It is administered parenterally as the sodium phosphate or sodium succinate ester in emergencies. Hydrocortisone is readily absorbed after oral administration and through the skin; hydrocortisone acetate is less well absorbed. It is metabolised in the liver and other tissues by reduction, hydroxylation, side-chain cleavage and conjugation with glucuronic acid. About 90% of a dose is excreted in the urine in 24 h; <1% is excreted unchanged, 40% is the 5α- and 5β-forms of tetrahydrocortisol and the 5β-form of tetrahydrocortisone, 17% is a mixture of the 5α- and 5β- and 20α- and 20β-cortols and cortolones, and 6% is 11-hydroxy- and 11-keto-etiocholanolone; most of the metabolites are excreted as glucuronide conjugates; at plasma concentrations of >0.2 mg/L, the amount of unchanged hydrocortisone excreted in the urine is increased.

Blood Concentration Endogenous hydrocortisone exhibits a diurnal variation in plasma concentrations; in the morning, concentrations are in the approximate range 0.08 to 0.20 mg/L and, in the evening, in the range 0.04 to 0.10 mg/L.

Following a single intravenous injection of 40 mg to 6 subjects, a mean plasma concentration of 1.85 mg/L was reported at 10 min [Toothaker, Welling 1982].

Half-life Plasma half-life, about 1.5 h.

Volume of Distribution About 0.3 L/kg.

Protein Binding More than 90%.

Dose 10 to 30 mg daily, by mouth. In the treatment of certain medical emergencies, the equivalent of 100 to 500 mg of hydrocortisone by IV injection, 3 or 4 times daily.

Hydroflumethiazide

Diuretic

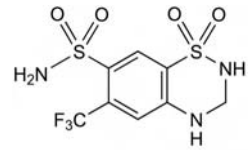
$C_8H_8F_3N_3O_4S_2$ = 331.3

CAS—135-09-1

IUPAC Name 3,4-Dihydro-6-(trifluoromethyl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide

Synonym Trifluoromethylhydrothiazide

Proprietary Names *Diucardin*; *Elodrine*; *Finuret*; *Hydol*; *Hydrenox*; *Leodrine*; *Rodiuran*; *Rontyl*; *Saluron*; *Sisuril*. It is an ingredient of *Aldactide*, *Protensin-M*, *Rautrax*, *Salutensin* and *Spio-Co*.



Chemical Properties White or cream-coloured glistening crystals or crystalline powder. Mp 272° to 273°. Soluble 1 in 3000 of water, 1 in about 50 of ethanol and 1 in 4 of acetone; practically insoluble in chloroform and ether. pK_a 8.5, 10.0 (20°). Log *P* (octanol/water), 0.4.

Colour Tests Chromotropic acid—violet, after dilution; Koppanyi–Zwikker test—violet; Liebermann's reagent—blue-green.

Thin-layer Chromatography System TA—R_f 0.86; system TD—R_f 0.07; system TE—R_f 0.36; system TF—R_f 0.47; system TAD—R_f 0.13; system TAE—R_f 0.87; system TAJ—R_f 0.09; system TAK—R_f 0.00; system TAL—R_f 0.43 (location under ultraviolet light, violet fluorescence; acidified potassium permanganate solution, faint reaction).

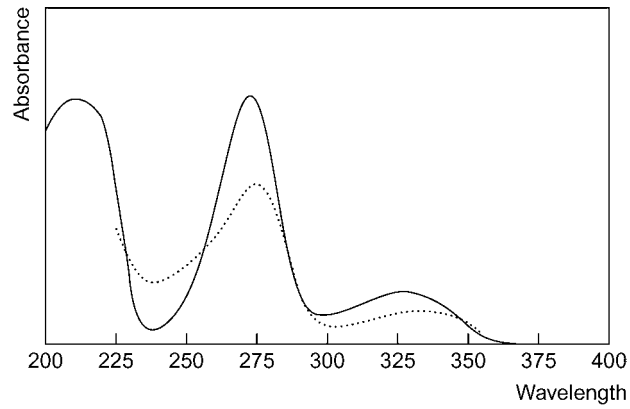
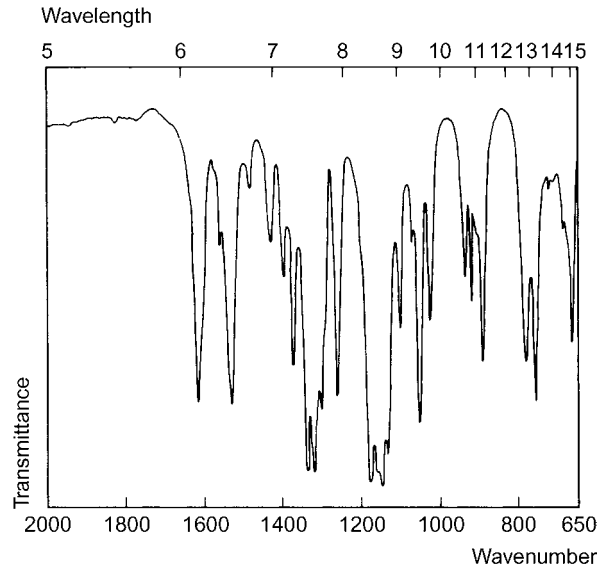
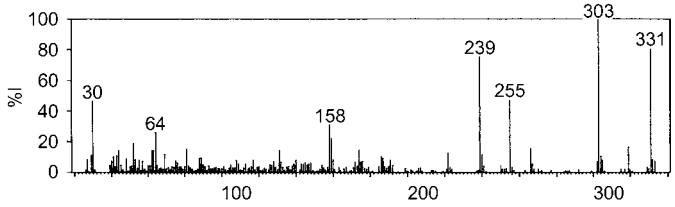
Ultraviolet Spectrum Aqueous acid—273 (A_1^1=578a), 325 nm; aqueous alkali—274, 333 nm.



Infrared Spectrum Principal peaks at wavenumbers 1151, 1180, 1125, 1052, 1300, 1525 (KBr disk).



Mass Spectrum Principal ions at *m/z* 303, 331, 239, 255, 30, 158, 64, 159.



Quantification

Plasma **Spectrofluorimetry** Limit of detection, 10 µg/L in plasma [Brørs *et al.* 1977].

TLC Limit of detection, 10 µg/L [Garceau *et al.* 1974].

Urine **Spectrofluorimetry** Limit of detection, 100 µg/L, see Plasma [Brørs *et al.* 1977].

TLC Limit of detection, 500 µg/L, see Plasma [Garceau *et al.* 1974].

Disposition in the Body Incompletely but fairly rapidly absorbed after oral administration. During daily dosing, 50 to 70% of a dose is excreted in the 24-h urine as unchanged drug and about 2% as 2,4-disulfamyl-5-trifluoromethylaniline (DTA).

Therapeutic Concentration

Following single oral doses of 100 mg to 12 subjects, peak plasma concentrations of 0.17 to 0.6 mg/L (mean 0.4) were attained in 2 to 4 h [Yakatan *et al.* 1977].

Half-life Derived from urinary excretion data, 5 to 18 h (dose-dependent).

Distribution in Blood Plasma : whole blood ratio, about 0.7.

Protein Binding About 75%.

Dose 25 to 200 mg daily.

Hydrogen Cyanide

Rodenticide, Insect Fumigant

HCN = 27.0

CAS—74-90-8

Synonyms CHN; hydrocyanic acid; prussic acid.

Chemical Properties Colourless gas or liquid with a characteristic odour. Burns in air with a blue flame. Flammable. Intensely poisonous even when mixed with air. Mp −13.4°. Bp 25.6°. Miscible in water and alcohol, slightly soluble in ether. Aqueous solutions of alkalis decompose it to alkali cyanide and alkali bromide. pK_a 9.2 [USEPA 1999]. Log *P* (octanol/water) −0.25 [Hansch *et al.* 1995].

Capillary Electrophoresis Capillary: Fused silica (50 cm × 75 µm i.d.). Buffer: 10 mmol/L borate buffer (pH 9.5). Fluorescence detection (λ= 388 nm). Limit of detection, 9.3 µg/L [Copper, Collins 2004].

Quantification

Blood **GC** Column: CP Sil 8B methylsilicone (50 m × 0.23 mm i.d., 1.2 µm). Carrier gas: He, 2 mL/min. Temperature: 60°. ECD. Limit of quantification, 100 µg/L, limit of detection, 5 µg/L [Odoul *et al.* 1994]. Column: Halcomid-M-18 (3 m × 3 mm i.d.). ECD. Limit of detection, ≈50 µg/L [Shiono *et al.* 1991]. Column: 7% Halcomid-M-18 (3 m × 3 mm i.d.). Carrier gas: N_2, 30 mL/min. ECD. Limit of detection, 50 µg/L [Maseda *et al.* 1989].

GC-MS Column: 7% Halcomid-M-18 (9ft × $^1/_4$ in i.d.). Carrier gas: He, 30 mL/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5 µmol/L [Thomson, Anderson 1980].

Other **GC** Cyanogenic Plants. Column: 100% methylsilicone capillary (15 m × 0.32 mm i.d., 12 µm). Carrier gas: N_2. Temperature: 60°. ECD. Limit of detection, 69 µg/L [Curtis *et al.* 2002].

Disposition in the Body

Toxicity

A 32-year-old woman was admitted to hospital with a lack of co-ordination and fixed, dilated pupils. Her Glasgow Coma Score was fluctuating between 6 and 11. She was hypothermic and tachycardic, but was breathing spontaneously. She had documented breast cancer with liver metastases. Conventional treatment having failed, she took only 'vitamin supplements' bought via the Internet. Over the course of the next 6 h, she required mechanical ventilation and increasing doses of inotropes. Diabetes insipidus developed. Upon inspection of her medications, a bottle labelled 'vitamin B17' was discovered. While not a vitamin, it contains amygdalin, a drug linked to cyanide toxicity. A blood sample showed levels of thiocyanate of 445 µg/L. The patient made a full recovery over the next 8 h [O'Brien *et al.* 2005].

The concentrations (µg/mL) of cyanide in the hearts of 18 people who died in house fires were reported as shown in the following table. The left ventricular concentration was twice the right ventricular concentration in half of the victims.

Victim number	*Left ventricle*	*Right ventricle*
1	2.23	1.07
2	0.49	0.20
3	1.69	0.91
4	1.32	1.24
5	0.66	0.64
6	1.83	0.54
7	2.70	1.96
8	18.12	9.44
9	1.05	0.12
10	3.46	1.50
11	2.42	1.14
12	6.98	4.18
13	0.87	0.46
14	4.36	2.47
15	3.98	1.65
16	2.07	0.11
17	0.11	0.09
18	0.82	0.54

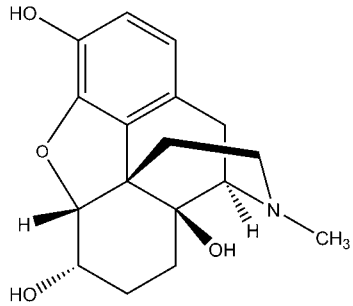
Hydromorphinol

Narcotic Analgesic

$C_{17}H_{21}NO_4$ = 303.4

Synonym 4,5-Epoxy-3,6,14-trihydroxy-*N*-methyl-morphinan

Proprietary Name *Numorphan Oral*



Chemical Properties A creamy-white crystalline powder. Insoluble in water. Hydromorphinol is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve the yield.

Colour Tests Ammonium molybdate test—purple→blue→yellow (limit of detection, 0.1 µg); ammonium vanadate test—grey (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—purple (limit of detection, 0.1 µg); Vitali's test—yellow/yellow/orange.

Thin-layer Chromatography System T1—R_f 0.48 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum 0.1 N sulphuric acid—284 nm (E1%, 1 cm 54) and an inflexion at about 278 nm.

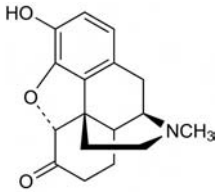
Infrared Spectrum Principal peaks at wavenumbers 1086, 1111, 1318, 1327 cm^{-1} (KBr disk).

Dose Usually 15 mg.

Hydromorphone

Narcotic Analgesic
$C_{17}H_{19}NO_3 = 285.3$
CAS—466-99-9

Synonyms Dihydromorphinone; dimorphone; 4,5-epoxy-3-hydroxy-17-methylmorphinan-6-one.

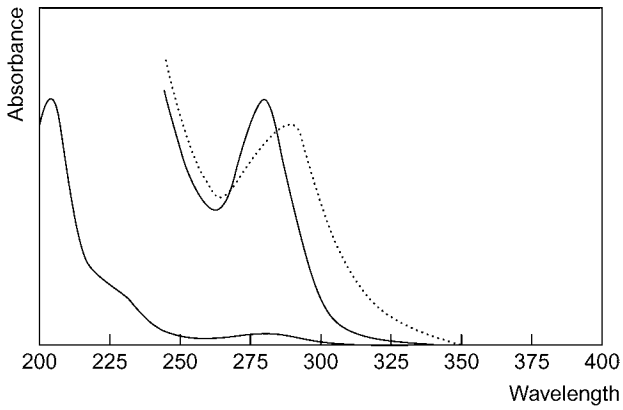


Chemical Properties Crystals. A fine, white, crystalline powder. Mp 266° to 267° (crystals from ethanol). Slightly soluble in water; freely soluble in ethanol; very soluble in chloroform. pK_a 8.2 (20°). Log *P* (heptane/pH 7.4), −4.0. Extraction yield (chlorobutane), 0.1 [Demme *et al.* 2005].

Hydromorphone Hydrochloride

$C_{17}H_{19}NO_3$, HCl = 321.8
CAS—71-68-1
Synonym Dihydromorphinone hydrochloride
Proprietary Names *Dilaudid*; *Hydal*; *Hydromorph*; *Opidol*; *Palladon(e)*; *Sophidone*.
Chemical Properties A white crystalline powder that is affected by light. Mp 305° to 315°, with decomposition. Soluble 1 in 3 of water and 1 in 100 of ethanol (90%); practically insoluble in chloroform and ether.

Colour Test Mandelin's test—violet→orange; Marquis test—yellow→red→violet.
Thin-layer Chromatography System TA—R_f 0.23; system TB—R_f 0.03; system TC—R_f 0.09; system TE—R_f 0.18; system TL—R_f 0.02; system TAE—R_f 0.12; system TAF—R_f 0.14 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—violet).
Gas Chromatography System GA—hydromorphone RI 2445, hydromorphone-AC RI 2595, hydromorphone-enol-AC_2 RI 2625, hydromorphone-PFP RI 2250, hydromorphone-enol-PFP_2 RI 2320, hydromorphone-enol-TFA_2 RI 2230, M (dihydromorphine) RI 2451; system GB—hydromorphone RI 2598, hydromorphone-TMS RI 2621, hydromorphone-enol-TMS_2 RI 2595, hydromorphone oxime-TMS_2 RI 2678.
High Performance Liquid Chromatography System HA—*k* 7.9 (tailing peak); system HX—RI 240; system HY—RI 187; system HAX—RT 5.8 min; system HAY—RT 3.4 min.
Ultraviolet Spectrum Aqueous acid—280 nm ($A_1^1 = 50a$); aqueous alkali—290 nm.



Infrared Spectrum Principal peaks at wavenumbers 1727, 1247, 1279, 1034, 757, 1500 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 285, 96, 229, 228, 70, 214, 115, 200.
Quantification
Blood **GC** Column: 3% OV-17 on 100/120 mesh Chromosorb W HP (1.2 m × 3 mm i.d.) or 2% FFAP (0.6 m × 3 mm i.d.). Carrier gas: N_2, 20 mL/min. Temperature: 240° and 220°, respectively. AFID. Limit of detection, 100 µg/L [Cimbura, Koves 1981].

GC-MS [Balikova *et al.* 2000]. Column: 3% OV-101 100/120 mesh (0.9 m × 2 mm i.d.). Carrier gas: He, 35 mL/min. Temperature programme: 205° for 1 min to 240° at 12°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 2.4 min Limit of detection, 80 µg/L [Saady *et al.* 1982].

HPLC Column: Supelcosil LC-18-DB (5 µm). Mobile phase: 0.1 mol/L sodium dihydrogen phosphate : methanol (67.5 : 32.5, pH 7.3), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 4.4 min. Limit of detection, 62 µg/L [Sawyer *et al.* 1988].

LC-MS Column: Waters HSS T3 (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: 1% formic acid in water : 1% formic acid in acetonitrile (97 : 3 for 0.1 min to 80 : 20 at 2.5 min to 1 : 99 at 2.55 min for 0.45 min to 97 : 3 at 3.01), flow rate 0.6 mL/min. ESI, positive ion mode. Limit of quantification, 10 µg/L [Dahn *et al.* 2010]. Column: Phenomenex Synergi reversed-phase. Mobile phase: 10 mmol/L ammonium formate : acetonitrile. Limit of quantitiation, 0.5–4.09 µg/L, limit of detection, 0.16–1.2 µg/L [Al Asmari, Anderson 2007].
Plasma **HPLC** Column: Spherisorb C_8 (100 × 3.2 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L disodium hydrogen phosphate (1.5 : 8.5) with 3 mmol/L orthophosphoric acid, flow rate 0.8 mL/min. Electrochemical detection. Retention time: 8.0 min. Limit of detection, 2.5 µg/L [Bouquillon *et al.* 1992].
LC-MS See Blood [Dahn *et al.* 2010].
Note For a radioimmunoassay for hydromorphone and morphine, see Lee *et al.* [1991] or Honigberg, Stewart [1980].
Serum **GC-MS** See Blood [Saady *et al.* 1982].
LC-MS See Blood [Dahn *et al.* 2010].
Urine **GC** FID [Cone *et al.* 1977].
GC-MS See Blood [Balikova *et al.* 2000]. Hydromorphone and other opioids, see Broussard *et al.* [1997].
HPLC See Blood [Sawyer *et al.* 1988].
LC-MS See Blood [Dahn *et al.* 2010].
Oral Fluid **GC-MS** See Hair. Limit of quantification, 2 ng/mg, limit of detection, 3 ng/mg [Jones *et al.* 2002].
Tissue Homogenates **GC-MS** See Blood [Saady *et al.* 1982].
Vitreous Humour **HPLC** See Blood [Sawyer *et al.* 1988].
Hair **GC-MS** Column: DB-5 5% phenyl 95% methyl silicone (25 m × 0.2 mm i.d., 0.33 mm). Carrier gas: 1.5 mL/min. Temperature programme: 150° for 1.0 min to 245° at 20°/min for 8 min to 290° at 50°/min. Limit of quantification, 0.15 ng/mg, limit of detection, 0.01 ng/mg [Jones *et al.* 2002].
Postmortem Tissues **HPLC** See Blood [Sawyer *et al.* 1988].
Disposition in the Body Hydromorphone is rapidly but incompletely absorbed after oral administration. Approximately 6% of a dose is excreted in the urine in 24 h as free hydromorphone, with ~30% as conjugated hydromorphone and only traces of the active 6α- and 6β-hydroxy metabolites. It crosses the placenta. Hydromorphone is a metabolite of hydrocodone.
Therapeutic Concentration

Following a single oral dose of 8, 16 or 32 mg hydromorphone as a sustained-release formulation or 8 mg as an immediate-release formulation to 12 subjects, the plasma concentration peaked later after the sustained-release oral preparation (9–13.5 h versus 0.8–1.0 h for the 8 mg dose). Peak plasma concentrations were 0.00474 ± 0.00176 mg/L for the 8 mg immediate-release formulation, 0.00077 ± 0.00033 mg/L for the 8 mg sustained-release formulation, 0.00145 ± 0.00043 mg/L for the 16 mg sustained-release formulation and 0.00241 ± 0.00085 mg/L for the 32 mg sustained-release formulation [Angst *et al.* 2001].

In 43 patients with chronic severe pain receiving hydromorphone therapy, 7 achieved good pain control with doses of 24–96 mg daily (median, 48) and had serum levels of ≥0.004 mg/L [Reidenberg *et al.* 1988].

Following a single oral dose of 4 mg to 6 subjects, peak plasma concentrations of 0.018–0.027 mg/L (mean, 0.022) were attained in ~1 h [Vallner *et al.* 1981].

Toxicity The estimated minimum lethal dose is 200 mg. Plasma concentrations >0.1 mg/L may be toxic.

In a fatality attributed to hydromorphone overdose, the following tissue concentrations were reported: blood 1.2 mg/L, brain a trace, kidney 1.2 µg/g, liver 0.4 µg/g and urine 1.1 mg/L; diazepam was also detected [Baselt 1978].

The following postmortem tissue concentrations were reported in a fatality caused by an injected overdose of hydromorphone: blood 0.17 mg/L, bile 8.6 mg/L, kidney 0.13 µg/g and liver 0.07 µg/g [Walls 1976].

Half-life Plasma half-life, ~2.5 h.
Bioavailability Approximately 50% but there is considerable intersubject variation.
Volume of Distribution ~3 L/kg.
Protein Binding ~7%.
Dose Hydromorphone hydrochloride 1.3 to 4 mg orally every 4 to 6 h.

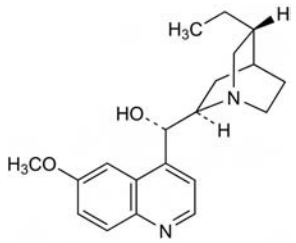
Hydroquinidine

Antiarrhythmic
$C_{20}H_{26}N_2O_2$ = 326.4
CAS—1435-55-8

IUPAC Name (*S*)-[(2*R*, 5R)-5-Ethyl-1-azabicyclo[2.2.2]octan-2-yl]-(6-methoxyquinolin-4-yl) methanol
Synonyms Dihydrochinidin; (9*S*)-10,11-dihydro-6′-methoxycinchonan-9-ol; dihydroquinidine; hydroconchinine.

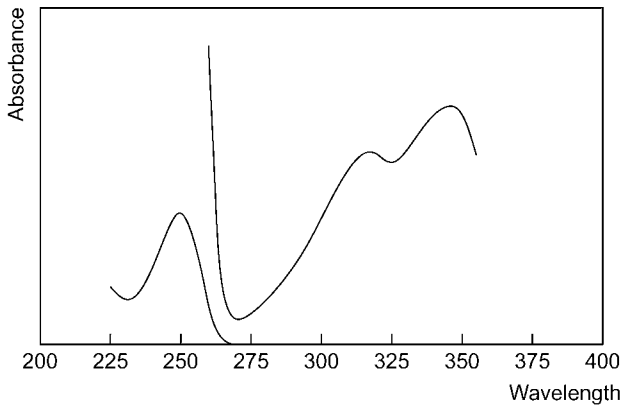


Chemical Properties An alkaloid present in the bark of species of *Cinchona* (Rubiaceae). Crystals. Mp about 169°. Slightly soluble in water and ether; readily soluble in hot alcohol. Log *P* (octanol/water), 3.4.

Hydroquinidine Hydrochloride

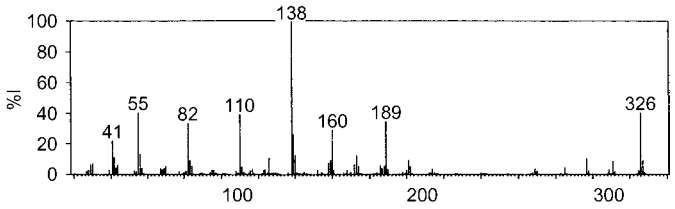
$C_{20}H_{26}N_2O_2$, HCl = 362.9
CAS—1476-98-8
Proprietary Names *Lentoquine*; *Serecor.*
Chemical Properties Colourless crystals. Mp 273° to 274°. Freely soluble in chloroform and methanol; less readily soluble in water and ethanol.

Colour Tests Sulfuric acid—yellow (fluoresces under ultraviolet light); thalleioquin test—green.
Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.03; system TC—R_f 0.08; system TE—R_f 0.43; system TL—R_f 0.05; system TAE—R_f 0.20; system TAF—R_f 0.70 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2810.
Ultraviolet Spectrum Aqueous acid—250 (A^1_1=1240b), 316, 345 nm (A^1_1=180b).



Infrared Spectrum Principal peaks at wavenumbers 1509, 1261, 1620, 1234, 854, 1030 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 138, 326, 55, 110, 189, 82, 160, 139.



Quantification

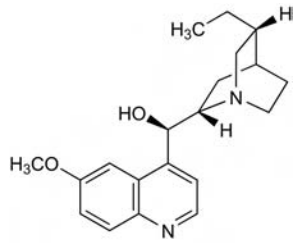
Plasma **HPLC** Fluorescence detection. Hydroquinidine, quinidine, hydroxyquinidine, and quinidine *N*-oxide. Limit of detection, <10 nmol/L [Nielsen *et al.* 1994].
Serum **HPLC** Limit of detection, 0.2 mg/L [Camsonne *et al.* 1984].
Urine **HPLC** Limit of detection, <25 nmol/L (urine), see Plasma [Nielsen *et al.* 1994].
Dose Usually 450 to 600 mg of hydroquinidine hydrochloride daily.

Camsonne R *et al.* (1984). A simple fluorescence high-performance liquid chromatographic assay for dihydroquinidine in serum. *Ther Drug Monit* 6: 471–473.
Nielsen F *et al.* (1994). Determination of quinidine, dihydroquinidine, (3S)-3-hydroxyquinidine and quinidine N-oxide in plasma and urine by high-performance liquid chromatography. *J Chromatogr B Biomed Appl* 660: 103–110.

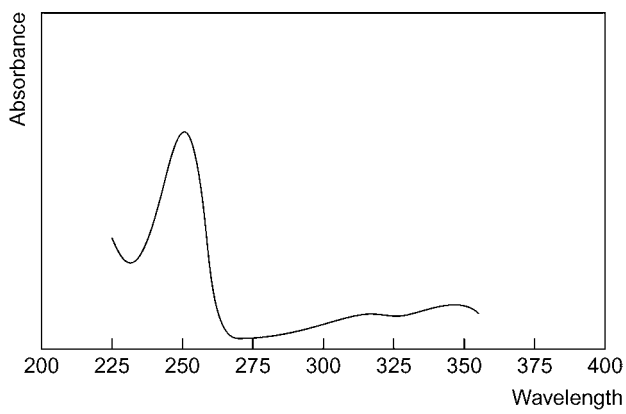
Hydroquinine

Alkaloid
$C_{20}H_{26}N_2O_2$ = 326.4
CAS—522-66-7

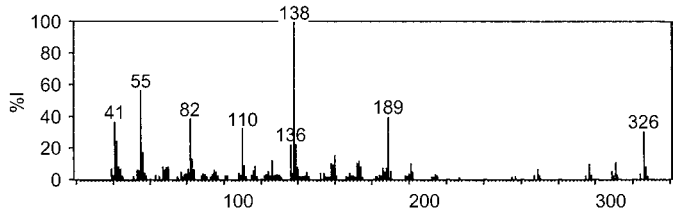
IUPAC Name (8α,9*R*)-10,11-Dihydro-6′-methoxycinchonan-9-ol
Synonym Dihydroquinine



Chemical Properties An alkaloid present in the bark of species of *Cinchona* (Rubiaceae). Crystals. Mp 172°. Almost insoluble in water; freely soluble in acetone, ethanol, chloroform, ether, and petroleum ether. pK_a, 5.33. Log *P* (octanol/water), 3.4.
Colour Tests Sulfuric acid—yellow (fluoresces under ultraviolet light); thalleioquin test—green
Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.02; system TC—R_f 0.07; system TE—R_f 0.40; system TL—R_f 0.03; system TAE—R_f 0.21; system TAF—R_f 0.69 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1450.
High Performance Liquid Chromatography System HZ—retention time 2.8 min.
Ultraviolet Spectrum Aqueous acid—250 (A^1_1=915b), 316, 345 nm (A^1_1=167b).



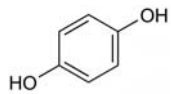
Infrared Spectrum Principal peaks at wavenumbers 1240, 1225, 1507, 1623, 1026, 1132 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 138, 55, 189, 82, 41, 110, 326, 42.



Hydroquinone

Depigmenting Agent, Antioxidant
$C_6H_6O_2$ = 110.1
CAS—123-31-9

IUPAC Name 1,4-Benzenediol
Synonyms Hydroquinol; quinol.
Proprietary Names *African Gold*; *Aida*; *Banishing Cream*; *Claripel*; *Discromil*; *Eldopaque*; *Eldoquin*; *Epocler*; *Esoteric*; *Hidroquin*; *Jouvence*; *Lustra*; *Melanex*; *Melanox*; *Melpaque HP*; *Melquin HP*; *Nadinola*; *Neostrata AHA*; *Porcelana*; *Solaquin*; *Tecquinol*.



Chemical Properties Fine white crystals, or white crystalline powder, which darken on exposure to light and air. Mp 170° to 171°. Soluble 1 in 14 of water, 1 in 4 of ethanol, 1 in 51 of chloroform and 1 in 16 of ether; slightly soluble in benzene. pK_a 10.9 (25°). Log *P* (octanol/pH 7.4), 0.6.
Colour Tests Ammoniacal silver nitrate—grey-yellow/brown; Benedict's reagent—red; ferric chloride—green
Gas Chromatography System GA—hydroquinone RI 1240; M (2-OH-) RI 1460; hydroquinone-AC_2 RI 1395.
Ultraviolet Spectrum Ethanol—295 nm (A^1_1=282b).
Infrared Spectrum Principal peaks at wavenumbers 1210, 1192, 1520, 760, 1240, 813 cm^{-1} (KBr disk).
Quantification
Urine **GC-MS** [Saito *et al.* 1994].
HPLC Electrochemical detection [Wittig *et al.* 2001]. Fluorescence detection. Hydroquinone, catechol and phenol [Lee *et al.* 1993].
Kidney **GC-MS** See Urine [Saito *et al.* 1994].
Liver **GC-MS** See Urine [Saito *et al.* 1994].
Disposition in the Body
Toxicity
In a fatality involving the ingestion of photographic developer solution containing hydroquinone, tissue concentrations were: urine 3.4 mg/L, liver 0.5 µg/g, kidney 0.2 µg/g [Saito *et al.* 1994].
Use As a 2 to 5% ointment for depigmentation of the skin.

Lee BL *et al.* (1993). Simultaneous determination of hydroquinone, catechol and phenol in urine using high-performance liquid chromatography with fluorimetric detection. *J Chromatogr* 619: 259–266.

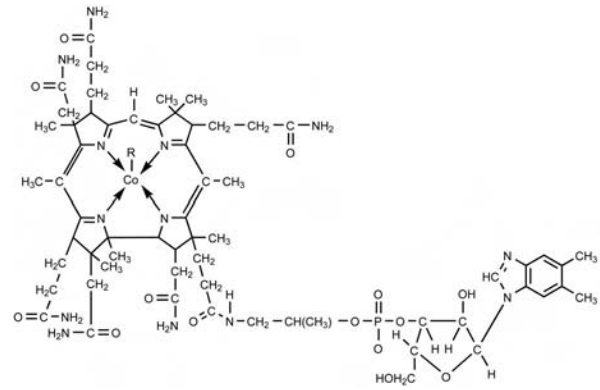
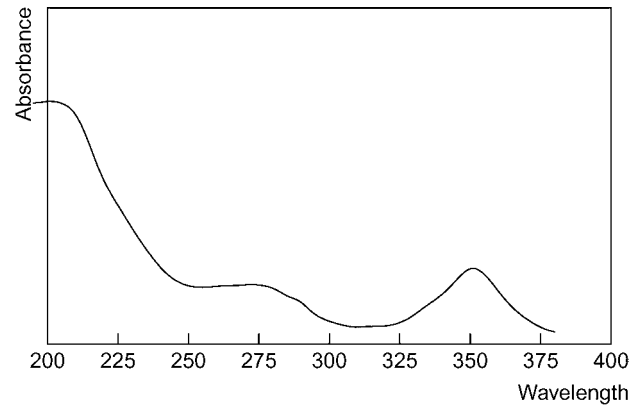
Hydroxocobalamin

Haemopoietic Vitamin
$C_{62}H_{89}CoN_{13}O_{15}P$ = 1346.4
CAS—13422-51-0

IUPAC Name Cobalt(2+); [(2*R*,3*S*,4*R*,5*S*)-5-(5, 6-dimethylbenzimidazol-1-yl)-4-hydroxy-2-(hydroxymethyl)oxolan-3-yl] [(2*R*)-1-[3-[(2*R*,3*R*,4*Z*,7*S*,9*Z*,12*S*,13*S*,14*Z*,17*S*,18*S*,19*R*)-2,13,18-tris(2-amino-2-oxoethyl)-7,12,17-tris(3-amino-3-oxopropyl)-3,5,8,8,13,15,18,19-octamethyl-2,7,12,17-tetrahydro-1*H*-corrin-21-id-3-yl] propanoylamino]propan-2-yl] phosphate; hydrate
Synonyms Coα-[α-(5,6-Dimethylbenzimidazol-1-yl)]-Coβ-hydroxocobamide; vitamin B_{12a}; vitamin B_{12b}.
Proprietary Names *Alpha Cobione*; *Alpha Redisol*; *Alpha-Ruvite*; *Axlon*; *Cobalin-H*; *Codroxomin*; *Droxomin*; *Duradoc*; *Duralta-12*; *Hydroxo B_{12}*; *Neo-Betalin 12*; *Neo-Cytamen*; *Novobedouze*; *Redisol H*; *Rubesol-LA*; *Sytobex-H*.



Chemical Properties Hydroxocobalamin occurs either as aquocobalamin chloride [α-(5,6-dimethylbenzimidazol-1-yl)aquocobamide chloride], $C_{62}H_{90}ClCoN_{13}O_{15}P$, or as aquocobalamin sulfate, $C_{124}H_{180}Co_2N_{26}O_{34}P_2S$. Dark red crystals or crystalline powder. Soluble 1 in 50 of water and 1 in 100 of ethanol; practically insoluble in acetone, benzene, chloroform, ether, and petroleum ether.
Note In acid solutions, hydroxocobalamin takes up a hydrogen ion which converts the hydroxyl group to a co-ordinated water molecule, and in this form it is known as aquocobalamin, which is basic and forms salts with acids. In solution, aquocobalamin exists in equilibrium with hydroxocobalamin and, since it is more stable in acid solution, it usually occurs commercially in the form of aquocobalamin [Smith *et al.* 1962].
Ultraviolet Spectrum Acetic acid—274, 351 nm.



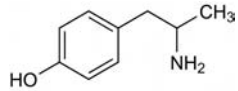
Quantification
Plasma **HPLC** UV detection. Hydroxocobalamin and cyanocobalamin [Astier, Baud 1995].
Dose Initially 0.25 to 1 mg, by IM injection, daily or on alternate days.

Astier A, Baud FJ (1995). Simultaneous determination of hydroxocobalamin and its cyanide complex cyanocobalamin in human plasma by high-performance liquid chromatography. Application to pharmacokinetic studies after high-dose hydroxocobalamin as an antidote for severe cyanide poisoning. *J Chromatogr B Biomed Appl* 667: 129–135.
Smith EL *et al.* (1962). *Analyst* 87: 183–186.

Hydroxyamfetamine

Sympathomimetic
$C_9H_{13}NO$ = 151.2
CAS—103-86-6; 1518-86-1 (±)

IUPAC Name 4-(2-Aminopropyl)phenol
Synonyms Oxamfetamine; oxamphetamine; PHA.

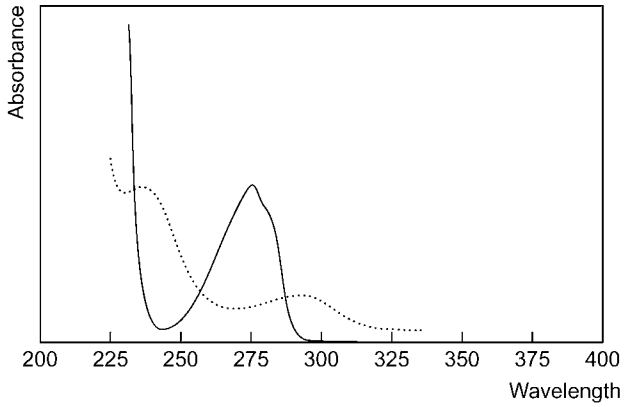


Chemical Properties Crystals. Mp 125° to 126°. Soluble in water, ethanol, chloroform and ethyl acetate. pK_a 9.3 (25°). Log *P* (octanol/water), 1.3.

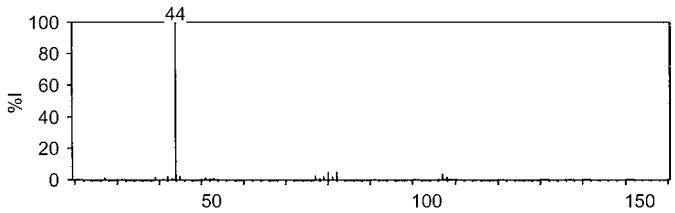
Hydroxyamfetamine Hydrobromide

$C_9H_{13}NO$, HBr = 232.1
CAS—306-21-8; 140-36-3 (±)
Proprietary Name *Paredrine*
Chemical Properties A white crystalline powder. Mp 189° to 192°. Soluble 1 in 1 of water and 1 in 2.5 of ethanol; freely soluble in acetone; slightly soluble in chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.35; system TB—R_f 0.02; system TC—R_f 0.02; system TL—R_f 0.11 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—hydroxyamfetamineRI 1480, M (methoxyamfetamine) RI 1465, M (-AC) RI 1890, M (-AC_2) RI 1900.
High Performance Liquid Chromatography System HB—*k* 2.24; system HC—*k* 1.11; system HY—RI 166.
Ultraviolet Spectrum Aqueous acid—275 nm ($A_1^1 = 103a$); aqueous alkali—238 ($A_1^1 = 672b$), 294 nm.



Infrared Spectrum Principal peaks at wavenumbers 1259, 1517, 1599, 1102, 813, 1111 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 44, 82, 80, 107, 77, 108, 81, 79.



Quantification

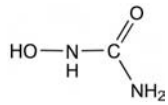
Plasma **GC-MS** Column: HP-5MS capillary (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° to 250° at 10°/min to 310° at 30°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 5 µg/L [Peters *et al.* 2003].
Urine **HPLC**Column: Spherisorb C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : ammonium acetate buffer with 0.1% TEA (pH 3.9, 23 : 77 for 19 min to 35 : 65 for 16 min), flow rate 0.7 mL/min for 8 min to 1.2 mL/min at 9 min for 10 min to 1.4 mL/min at 21 min for 14 min. UV detection (λ= 210 nm). Limit of detection, 5.3 ng [Soares *et al.* 2004]. Column: Cosmosil 5C18 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L potassium dihydrogen phosphate with dipotassium hydrogen phosphate (pH 6.0) : acetonitrile : tetrahydrofuran : EDTA (x : 2 : 0.2 : 0.005), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, ~50 pg [Shimosato *et al.* 1986a; Shimosato *et al.* 1986b].
Body Fluids **GC-MS** Column: 5% OV-17 on Chromosorb W HP 80/100 mesh (2 m × 3 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 190° to 220° at 7°/min. Limit of detection, 0.05 µg [Hara *et al.* 1988].
Disposition in the Body Readily absorbed after oral administration. Approximately 90% of a dose is excreted in the urine in 24 h as free and conjugated hydroxyamfetamine, with ~4% of the dose as free and conjugated 4′-hydroxynorephedrine.
Toxicity The estimated minimum lethal dose, intranasally, in children up to 2 years of age is 200 mg, and in adults ~2 g.
Dose Hydroxyamfetamine hydrobromide has been given in doses of 60 to 240 mg daily.

Hara K *et al.* (1988). Simultaneous quantitative analysis of methamphetamine and 4-hydroxymethamphetamine in body fluids by gas chromatography/mass spectrometry. *Z Rechtsmed* 100: 231–236.
Peters FT *et al.* (2003). Screening for and validated quantification of amphetamines and of amphetamine- and piperazine-derived designer drugs in human blood plasma by gas chromatography/mass spectrometry. *J Mass Spectrom* 38: 659–676.
Shimosato K *et al.* (1986a). Rapid determination of *p*-hydroxylated methamphetamine metabolites by column liquid chromatography–electrochemistry. *J Chromatogr* 377: 279–286.
Shimosato K *et al.* (1986b). Urinary excretion of *p*-hydroxylated methamphetamine metabolites in man. I. A method for determination by high-performance liquid chromatography–electrochemistry. *Arch Toxicol* 59: 135–140.
Soares ME *et al.* (2004). Simultaneous determination of amphetamine derivatives in human urine after SPE extraction and HPLC-UV analysis. *Biomed Chromatogr* 18: 125–131.

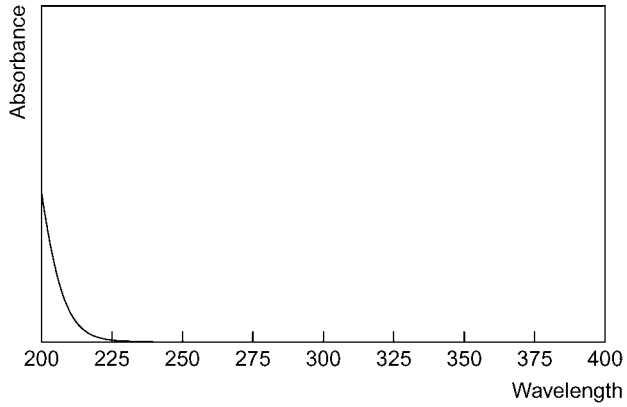
Hydroxycarbamide

Antineoplastic
$CH_4N_2O_2 = 76.1$
CAS—127-07-1

Synonym Hydroxyurea
Proprietary Names *Droxia*; *Hydrea*; *Litalir*; *Mylocel*; *Onco-Carbide*; *Oxeron*; *Syrea*.



Chemical Properties A white crystalline powder. Hygroscopic and decomposes in the presence of moisture. Mp 133°, with decomposition. Freely soluble in water and hot ethanol; slightly soluble in ethanol. Log *P* (octanol/water), −1.8.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1639, 1592, 1111, 1492, 812, 758 cm^{-1} (KBr disk).

Quantification

Plasma **HPLC** UV detection [Iyamu *et al.* 1998]. Electrochemical detection. Limit of detection, 0.02 mmol/L [Havard *et al.* 1992].
Serum **HPLC** UV–Vis detection [Manouilov *et al.* 1998].

Disposition in the Body

Therapeutic Concentration

In 30 subjects, the maximum tolerated dose of intravenous hydroxycarbamide given as a 24-h continuous infusion was 13.52 g/m^2 following a bolus of 1.69 g/m^2 and for a 48-h infusion the maximum tolerated dose was 17.576 g/m^2 following a bolus of 2.197 g/m^2; mean plasma steady-state concentrations were 146.8 mg/L and 108.8 mg/L, respectively [Smith *et al.* 1993].

Note For a review of the pharmacokinetics and pharmacodynamics of hydroxycarbamide, see Gwilt and Tracewell [1998].
Dose 20 to 30 mg/kg daily or 80 mg/kg every third day, orally.

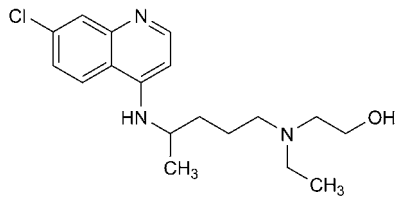
Hydroxychloroquine

Antimalarial
$C_{18}H_{26}ClN_3O = 335.9$
CAS—118-42-3

IUPAC Name 2-[[4-[(7-Chloro-4-quinolinyl)amino]pentyl]ethylamino]ethanol
Synonym Oxichlorochin

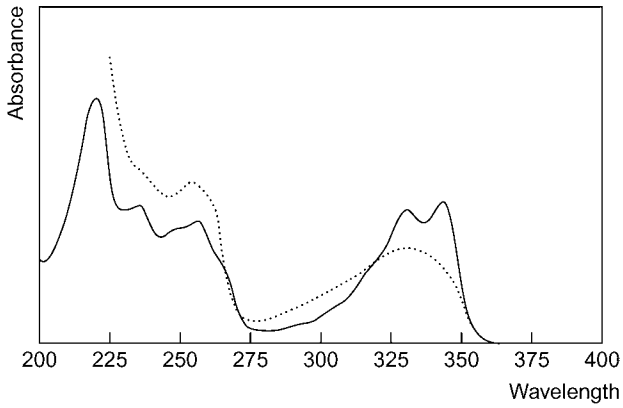


Chemical Properties Crystals. Mp 89° to 91°.

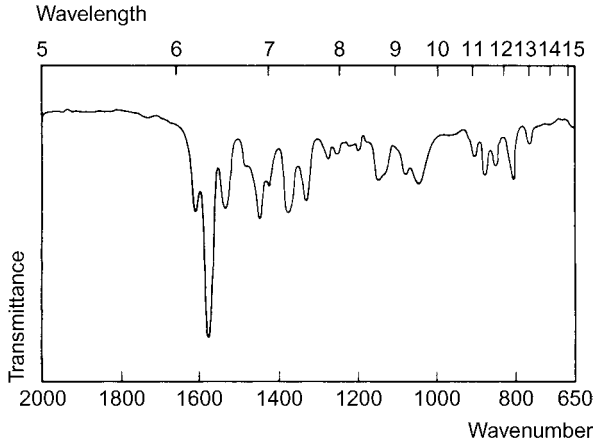
Hydroxychloroquine Sulfate

$C_{18}H_{26}ClN_3O$, H_2SO_4 = 433.0
CAS—747-36-4
Proprietary Names *Ercoquin*; *Plaquenil*; *Quensyl*.
Chemical Properties White crystalline powder. There are 2 forms: one melting at about 198° and the other at about 240°. Soluble 1 in 5 of water; practically insoluble in ethanol, chloroform and ether. Log *P* (octanol/water), 3.0.

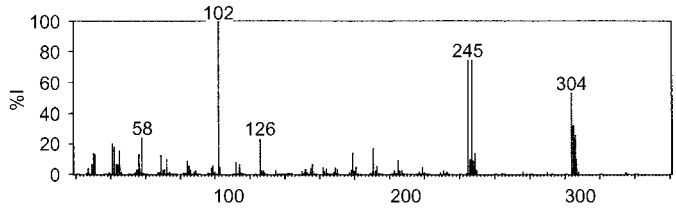
Thin-layer Chromatography System TA—R_f 0.45; system TAE—R_f 0.07; system TL—R_f 0.03; system TB—R_f 0.02; system TC—R_f 0.02; system TE—R_f 0.37 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2872.
High Performance Liquid Chromatography System HX—RI 280; system HZ—RT 1.9 min.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1 = 560a), 256, 329, 343 nm; aqueous alkali—253, 330 nm.



Infrared Spectrum Principal peaks at wavenumbers 1579, 1608, 1530, 1050, 1150, 810 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 102, 245, 247, 304, 305, 306, 58, 126.



Quantification

Blood **HPLC** Column: PRP-1 polystyrene divinyllbenzene (150 × 4.1 mm i.d., 2 µm). Mobile phase: methanol : water (80 : 20) with 100 mmol/L triethylamine (pH 11), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 337 nm, λ_{em} = 370 nm). Limit of detection, 1 µg/L [Tett *et al.* 1985]. Column: Radial-PAK silica (100 × 8 mm, 5 µm). Fluorescence detection. Limit of detection, 10 µg/mL for hydroxychloroquine [Williams *et al.* 1988]. Hydroxychloroquine enantiomers, UV detection [Brocks *et al.* 1992]. Column: Spherisorb S5SCX sulfophenylpropyl-modified silica (150 × 5 mm i.d., 5 µm). Mobile phase: 4.705 g ammonium perchlorate in 500 mL methanol : water (98.5 : 1.5), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 215 nm). Hydroxychloroquine, chloroquine, quinine and desethylchloroquine, limit of detection <5 ng/mL [Croes *et al.* 1994].

Plasma **HPLC** See Blood [Tett *et al.* 1985]; see Blood [Brocks *et al.* 1992].
Serum **HPLC** See Blood [Brocks *et al.* 1992]; [Croes *et al.* 1994]; Column: Nova-Pak C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: 58 mmol/L monobasic sodium phosphate buffer with 6 mmol/L heptanesulfonic acid sodium salt (pH 3.1) with hydroxychloroquine, chloroquine and corticosteroids, DAD [Volin 1995].
Urine **HPLC** See Blood [Williams *et al.* 1988]. Column: Partisil 5 C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate (pH 3.5) : methanol : ethanol : tetraethylammonium (78 : 22 : 1 : 0008), flow rate 0.75 to 8 mL/min. Limit of detection, 12.5 µg/L [Brocks *et al.* 1992]. Column: Ultremex Cyano. Mobile phase: 0.03 mol/L sodium phosphate buffer (pH 7.0) : ethanol : acetonitrile (79 : 20 : 1) containing 0.05 mol/L *N,N*-DMOA phosphate, flow rate 0.7 mL/min. Limit of quantification, 5 µg/L for hydroxychloroquine enantiomers and metabolites [Fieger *et al.* 1993].
Note For an UV spectrophotometric method for the detection of hydroxychloroquine in blood and urine, see [Dalley and Hainsworth 1965]. For a spectrofluorimetric method for the detection of hydroxychloroquine in plasma, see McChesney *et al.* [1962].
Disposition in the Body Rapidly and almost completely absorbed after oral administration. It is metabolised by de-ethylation. About 6% of a single dose is excreted in the urine over 10 days and about 25% of a dose is eliminated in the faeces in 3 days as unchanged drug plus the de-ethylated metabolites. During daily therapy, <13% of a dose is excreted in the 24 h urine with 8% of the dose as unchanged drug, 2% as desethylchloroquine, 2% as desethylhydroxychloroquine, and 0.5% as didesethylchloroquine.

Therapeutic Concentration

After an oral dose of hydroxychloroquine sulfate equivalent to 310 mg of the base to 6 subjects, peak plasma concentrations of 0.003 to 0.20 mg/L (mean 0.08) were attained in 3 h. Following oral administration of hydroxychloroquine diphosphate equivalent to 1264 mg of the base to 3 subjects, peak plasma concentrations of 0.29 to 1.0 mg/L (mean 0.64) were attained in 3 h and therapeutic concentrations greater than 0.01 mg/L were maintained for 240 h [McChesney *et al.* 1962].

In 23 subjects receiving 200 or 400 mg hydroxychloroquine sulfate orally daily, mean steady-state hydroxychloroquine concentrations at 6 months were 450.6 and 870.3 µg/L, respectively [Tett *et al.* 2000].

Toxicity

In a fatality due to the ingestion of at least 12 g, the following postmortem tissue concentrations were reported: blood 48 mg/L, heart blood 61 mg/L, liver 71 µg/g, urine 970 mg/L [Dalley, Hainsworth 1965].

Postmortem tissue concentrations in a $2^1/_2$-year-old boy who died after ingesting an estimated 1800 mg of hydroxychloroquine were as follows: blood 104 mg/L, stomach 1.2 mg (total), small intestine 75 mg (total), liver 500 µg/g [Kemmenoe 1990].

An 18-year-old female who survived after ingesting 20 g of hydroxychloroquine had a plasma concentration of 9.87 mg/L 2 h after ingestion [Jordan *et al.* 1999].

Half-life Plasma half-life, about 3 days.
Dose For an acute attack of malaria, 2 g of hydroxychloroquine sulfate given over three days (1.2 g on the first day). In rheumatoid arthritis, initially 400 to 800 mg daily.

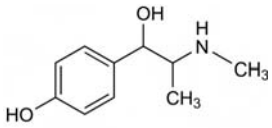
Hydroxyephedrine

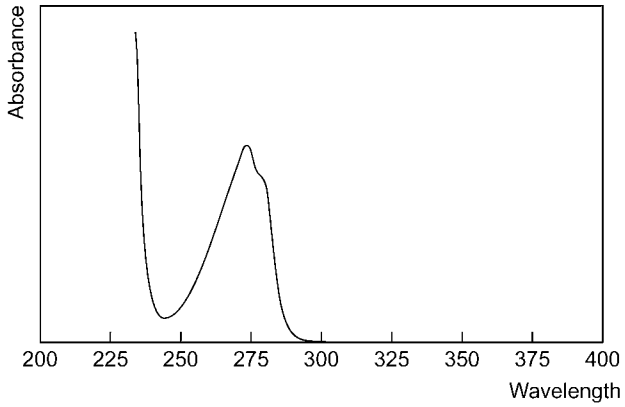
Sympathomimetic
$C_{10}H_{15}NO_2$ = 181.2
CAS—365-26-4
IUPAC Name 4-Hydroxy-α-[1-(methylamino)ethyl]benzenemethanol
Synonyms *p*-Hydroxyephedrine; methylsynephrine; oxyephedrine.



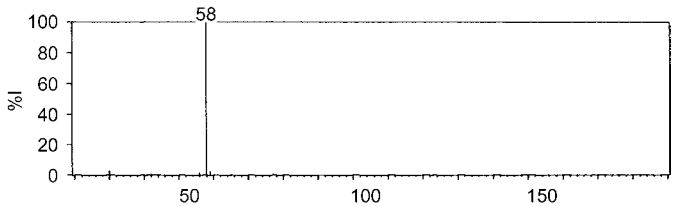
Chemical Properties A crystalline powder. Mp 152° to 154°. Sparingly soluble in water, ethanol and ether; readily soluble in dilute acids and sodium hydroxide solution. Log *P* (octanol/water), 0.2.

Hydroxyephedrine Hydrochloride
$C_{10}H_{15}NO_2$, HCl = 217.7
CAS—942-51-8
Proprietary Name *Carnigen*
Chemical Properties A crystalline powder. Mp 209° to 211°. Soluble 1 in 3 of water, 1 in 5 of glycerol and 1 in 10 of ethanol; sparingly soluble in acetone.

Colour Tests Liebermann's reagent—black; Mandelin's test—green; Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.35, streaking (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1682.
High Performance Liquid Chromatography System HB—*k* 0.73.
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1=75b); aqueous alkali—242 (A_1^1=760b), 290 nm (A_1^1=131b).



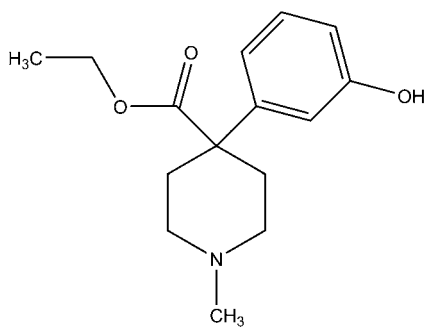
Infrared Spectrum Principal peaks at wavenumbers 980, 1238, 835, 1157, 1129, 792 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 30, 59, 56, 77.



Dose Hydroxyephedrine hydrochloride has been given in doses of 10 mg daily.

Hydroxypethidine

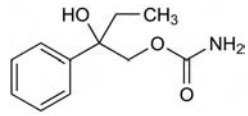
Narcotic
$C_{15}H_{21}NO_3$ = 263.3
IUPAC Name Ethyl 4-(3-hydroxyphenyl)-1-methylpiperidine-4-carboxylate
Synonyms 446; 10446; Hoechst 10446; oxypetidin; Win 771.



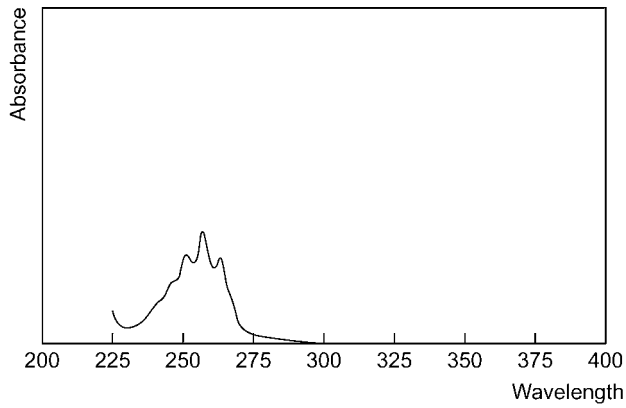
Chemical Properties Hydoxypethidine is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve the yield.
Colour Tests Ammonium molybdate test—bright blue, fading (limit of detection, 0.25 µg); ammonium vanadate test—dark green (limit of detection, 0.5 µg); sulfuric acid-formaldehyde test—dull orange (limit of detection, 0.1 µg); Vitali's test—yellow (limit of detection, 0.25 µg).
Thin-layer Chromatography System T1—R_f 0.47 (location reagent potassium permanganate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.75 (relative to diphenhydramine); system G4—retention time 0.56 (relative to codeine).

Hydroxyphenamate

Tranquilliser
$C_{11}H_{15}NO_3$ = 209.2
CAS—50-19-1
IUPAC Name 2-Phenyl-1,2-butanediol 1-carbamate
Synonym Oxyfenamate
Proprietary Name *Listica*



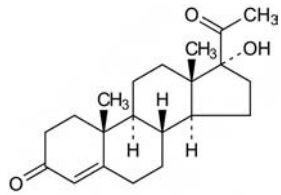
Chemical Properties A white crystalline powder. Mp 55° to 56.5°. Soluble 1 in 40 of water; soluble in ethanol and chloroform. Log *P* (octanol/water), 1.1.
Thin-layer Chromatography System TA—R_f 0.74 (van Urk reagent, positive).
Gas Chromatography System GA—RI 1724.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=9.0a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1715, 1072, 700, 1603, 1110, 760 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 135, 57, 91, 77, 43, 119, 105, 180.
Dose Hydroxyphenamate has been given in doses of 600 mg daily.

Hydroxyprogesterone

Progestational Steroid
$C_{21}H_{30}O_3$ = 330.5
CAS—68-96-2
IUPAC Name 17-Hydroxypregn-4-ene-3,20-dione

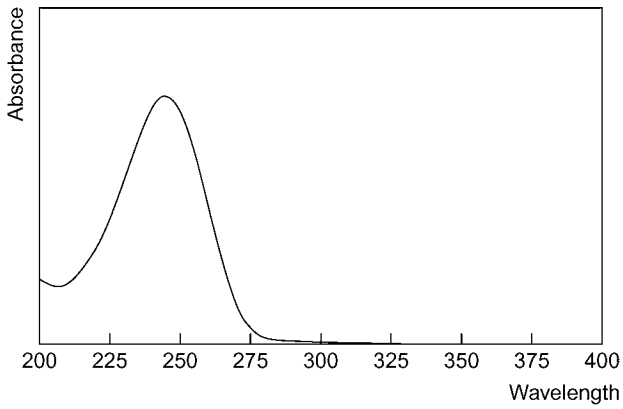


Chemical Properties A crystalline powder. Mp 222° to 223° with rapid heating; with slow heating it undergoes molecular rearrangement accompanied by partial resolidification and melts at 276°. Log *P* (octanol/water), 3.2.

Hydroxyprogesterone Caproate
$C_{27}H_{40}O_4$ = 428.6
CAS—630-56-8
Synonyms 17 AHPC; hydroxyprogesterone hexanoate.

Proprietary Names *Caposten*; *Delalutin*; *Hylutin*; *Hyprogest*; *Hyproval PA*; *Lentogest*; *Primolut Depot*; *Proluton Depot*; *Relutin*.
Chemical Properties A white or creamy-white crystalline powder. Mp 120° to 124°. Practically insoluble in water; soluble 1 in 10 of ethanol, 1 in 0.4 of chloroform, and 1 in 10 of ether.

Colour Tests Antimony pentachloride—orange; naphthol-sulfuric acid—orange-red/blue, violet dichroism; sulfuric acid—yellow (green fluorescence under ultraviolet light).
Thin-layer Chromatography Hydroxyprogesterone: system TB—R_f 0.38; system TE—R_f 0.85; system TF—R_f 0.63; system TAE—R_f 0.86. Hydroxyprogesterone caproate: system TP—R_f 0.81; system TQ—R_f 0.55; system TR—R_f 0.99; system TS—R_f 0.90 (*p*-toluenesulfonic acid solution, positive.)
High Performance Liquid Chromatography Hydroxyprogesterone: system HX—RI 1054.
Ultraviolet Spectrum Hydroxyprogesterone caproate: dehydrated alcohol—240 nm (A^1_1=395a).

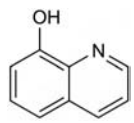


Infrared Spectrum Principal peaks at wavenumbers 1728, 1670, 1177, 1188, 1716, 1224 cm^{-1} (hydroxyprogesterone caproate, KBr disk).
Quantification
Blood **GC–MS** Limit of detection, 20 µg/L [Lai *et al.* 2002].
Plasma **GC–MS** For method for quantification of hydroxyprogesterone, 4-androstenedione, and testosterone, see Wudy *et al.* [1995]. Limit of detection, <1 pg [Shimizu 1988].
Dose Usually 250 to 500 mg of hydroxyprogesterone caproate weekly, by IM injection.

Lai CC *et al.* (2002). Rapid screening assay of congenital adrenal hyperplasia by measuring 17 alpha-hydroxyprogesterone with high-performance liquid chromatography/electrospray ionization tandem mass spectrometry from dried blood spots. *J Clin Lab Anal* 16: 20–25.
Shimizu K *et al.* (1988). Determination of 17-hydroxyprogesterone in plasma by gas chromatography-mass spectrometry with high-resolution selected-ion monitoring. *J Chromatogr* 432: 21–28.
Wudy SA *et al.* (1995). 17 alpha-hydroxyprogesterone, 4-androstenedione, and testosterone profiled by routine stable isotope dilution/gas chromatography-mass spectrometry in plasma of children. *Pediatr Res* 38: 76–80.

Hydroxyquinoline

Antibacterial, Antifungal
C_9H_7NO = 145.2
CAS—148-24-3
IUPAC Name 8-Quinolinol
Synonyms Oxine; oxyquinoline; 8-quinolinol.

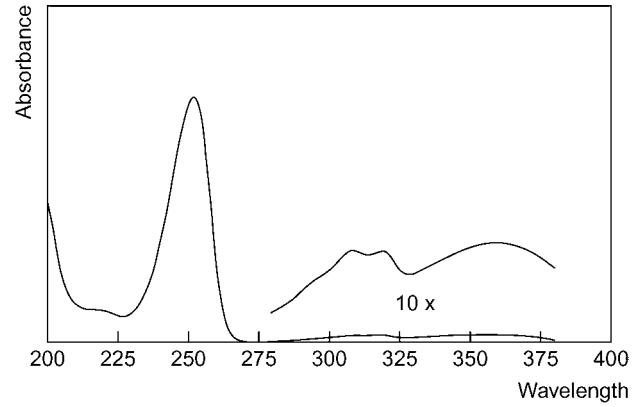


Chemical Properties A white or faintly yellow crystalline powder. Mp 76°. Soluble 1 in 1500 of water; freely soluble in ethanol, acetone, benzene, aqueous mineral acids and chloroform; almost insoluble in ether. pK_a 5.0, 9.9 (20°). Log *P* (octanol/water), 2.0.

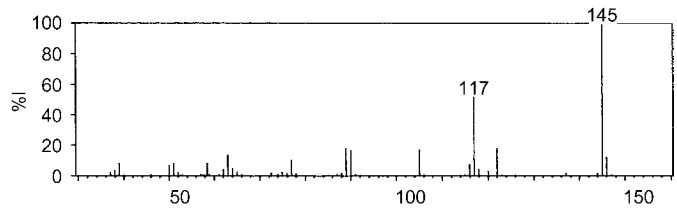
Hydroxyquinoline Sulfate
$(C_9H_7NO)_2, H_2SO_4$ = 388.4
CAS—134-31-6
Synonyms Chinosol; chinosolum; oxyquinol; oxyquinoline sulfate.
Proprietary Name *Sérorhinol*
Chemical Properties A light-yellow powder. Mp 175° to 178°. Soluble 1 in 1 of water, 1 in 100 of ethanol and 1 in 100 of glycerol; practically insoluble in chloroform and ether.

Potassium Hydroxyquinoline Sulfate
Synonyms Oxyquinol potassium; potassium oxyquinoline sulfate.
Proprietary Names It is an ingredient of *Auralgicin*, *Quinocaort*, *Quinoderm*, *Quinoped* and *Valderma*.
Chemical Properties An equimolecular mixture of potassium sulfate and 8-quinolinol sulfate, containing the equivalent of 50% of 8-quinolinol. A pale-yellow microcrystalline powder. Mp 172° to 184°. Soluble 1 in 2 of water; partly soluble in ethanol; practically insoluble in ether.

Colour Test Ferric chloride—green.
Thin-layer Chromatography System TA—R_f 0.32, streaking (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—251 (A^1_1=3930a), 308 (A^1_1=105a), 318, 356 nm.



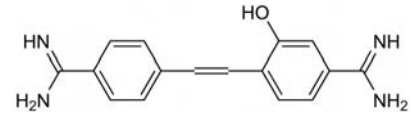
Infrared Spectrum Principal peaks at wavenumbers 1509, 779, 709, 1282, 1219, 1190 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 145, 117, 122, 89, 105, 90, 63, 146.



Use Potassium hydroxyquinoline sulfate is used topically in concentrations of 0.05 to 0.5%.

Hydroxystilbamidine

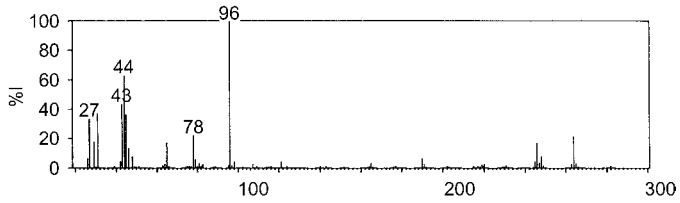
Antifungal, Antiprotozoal
$C_{16}H_{16}N_4O$ = 280.3
CAS—495-99-8
IUPAC Name 4-[2-[4-(Aminoiminomethyl)phenyl]ethenyl]-3-hydroxybenzene carboximidamide
Synonym Oxistilbamidine



Chemical Properties Yellow crystals. Mp 235°. Log *P* (octanol/water), 1.6.

Hydroxystilbamidine Isetionate
$C_{16}H_{16}N_4O, 2C_2H_6O_4S$ = 532.6
CAS—533-22-2
Chemical Properties A fine, yellow, crystalline powder, which decomposes on exposure to light. Mp 286°. Freely soluble in water; slightly soluble in ethanol; practically insoluble in ether.

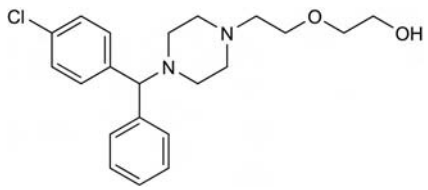
Colour Tests Folin–Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—blue-green.
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—344 nm (A^1_1=1093a); aqueous alkali—310 nm (A^1_1=811b).
Infrared Spectrum Principal peaks at wavenumbers 1196, 1028, 1667, 1597, 742, 1053 cm^{-1} (hydroxystilbamidine isetionate, KBr disk).
Mass Spectrum Principal ions at *m/z* 96, 44, 43, 31, 45, 27, 78, 264.



Dose 225 or 250 mg of hydroxystilbamidine isetionate daily or on alternate days, by IV infusion.

Hydroxyzine

Antihistamine, Tranquilliser
$C_{21}H_{27}ClN_2O_2$ = 374.9
CAS—68-88-2
IUPAC Name 2-[2-[4-[(4-Chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy] ethanol



Chemical Properties pK_a 2.1, 7.1. Log *P* (octanol/water), 2.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

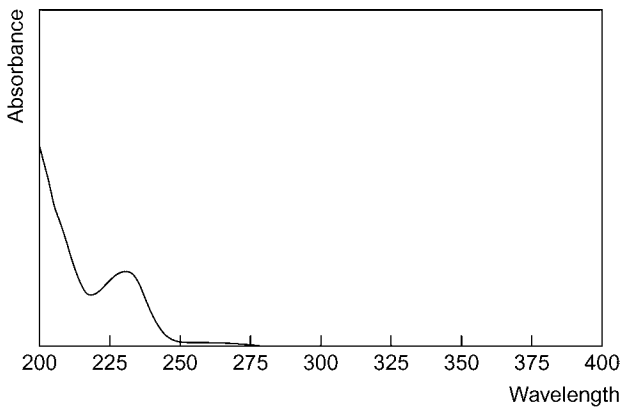
Hydroxyzine Embonate

$C_{21}H_{27}ClN_2O_2$, $C_{23}H_{16}O_6$ = 763.3
CAS—10246-75-0
Synonym Hydroxyzine pamoate
Proprietary Names *Equipose*; *Masmoran*; *Paxistil*; *Vistaril* (capsules and oral suspension).
Chemical Properties A pale-yellow powder. Practically insoluble in water, chloroform, ether, and methanol; soluble 1 in 700 of ethanol and 1 in 10 of dimethylformamide.

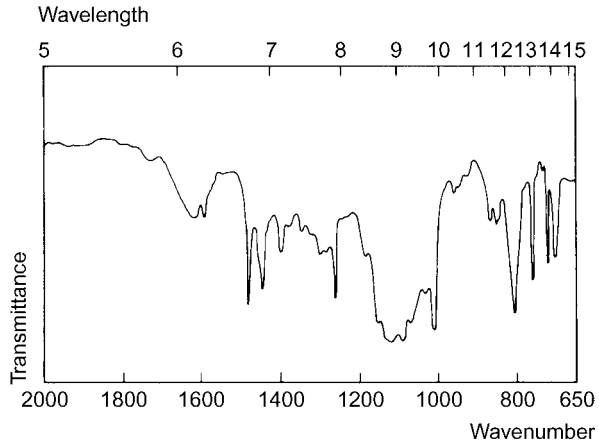
Hydroxyzine Hydrochloride

$C_{21}H_{27}ClN_2O_2$, 2HCl = 447.8
CAS—2192-20-3
Proprietary Names *Alamon*; *Atarax*; *Atazina*; *Aterax*; *Durrax*; *Orgatrax*; *Quiess*; *Sedaril*; *Vistaril* (injection).
Chemical Properties A white crystalline powder. Mp 193°. Soluble 1 in 1 of water, 1 in 4.5 of ethanol, and 1 in 13 of chloroform; practically insoluble in ether.

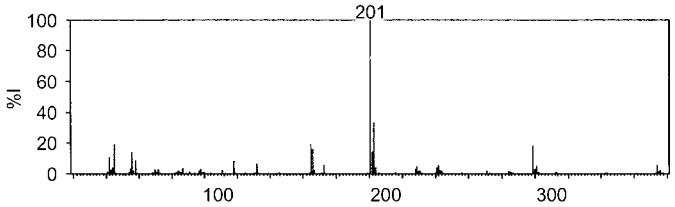
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.10; system TC—R_f 0.54; system TE—R_f 0.54; system TL—R_f 0.19; system TAE—R_f 0.57; system TAF—R_f 0.65; system TAJ—R_f 0.26; system TAK—R_f 0.00; system TAL—R_f 0.34 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, green).
Gas Chromatography System GA—hydroxyzine RI 2880; M (4-chlorobenzophenone) RI 1850; M (4-chloromethylbiphenyl) RI 1600; M (OH-chlorobenzophenone) RI 2300; M (desalkyl-) RI 2520; system GB—hydroxyzine RI 3000; M (norchlorcyclizine) RI 2355; M (4-chlorobenzophenone) RI 1862; M (4-chloromethylbiphenyl) RI 1688; M (OH-chlorobenzophenone) RI 2230.
High Performance Liquid Chromatography System HA—*k* 1.4; system HX—RI 437; system HY—RI 326; system HZ—retention time 5.7 min; system HAA—retention time 15.3 min; system HAX—retention time 11.4 min; system HAY—retention time 6.3 min.
Ultraviolet Spectrum Aqueous acid—232 (A_1^1=416a), 258, 263, 270 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1082, 1130, 1005, 1149, 1063, 800 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 201, 203, 165, 45, 299, 166, 202, 56.



Quantification

Plasma **GC** NPD. Limit of detection, 0.8 µg/L [Kintz *et al.* 1990].
GC–MS Limit of detection, 2 µg/L [Fouda *et al.* 1979].
Biological Fluids **GC** NPD. For method of quantification see Kintz *et al.* [1990].

Disposition in the Body

Therapeutic Concentration

Following a single oral dose of 100 mg of the hydrochloride given to 4 subjects, peak plasma concentrations of 74 to 89 µg/L (mean, 83) were attained in 2 to 4 h [Fouda *et al.* 1979].

Toxicity

A plasma concentration of 102.7 mg/L was reported 8.5 h after the ingestion of about 500 mg of hydroxyzine by a 13-month-old child; the child recovered within 72 h [Magera 1981].

In a fatality due to hydroxyzine, the following postmortem tissue concentrations were reported: blood 39 mg/L, brain 163 µg/g, bile 122 mg/L, liver 414 µg/g, urine 19 mg/L [Johnson 1982].

In a fatal self-poisoning attributed to hydroxyzine, postmortem tissue concentrations were: blood 4.18 mg/L, urine 1.43 mg/L, bile 23.24 mg/L, stomach content 78.23 mg/L [Kintz *et al.* 1990].

Half-life Plasma half-life, about 3 h.
Dose 75 to 400 mg of hydroxyzine hydrochloride daily.

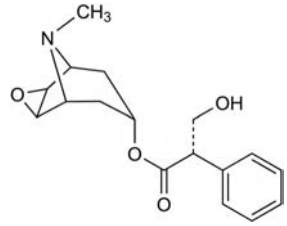
Hyoscine

Anticholinergic
$C_{17}H_{21}NO_4$ = 303.4
CAS—51-34-3
IUPAC Name (1α,2β,4β,5α,7β)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl-(α-*S*)-α-(hydroxymethyl)benzene acetate
Synonym Scopolamine
Proprietary Names *Scopoderm*; *Transcop*; *Transderm Scop*.

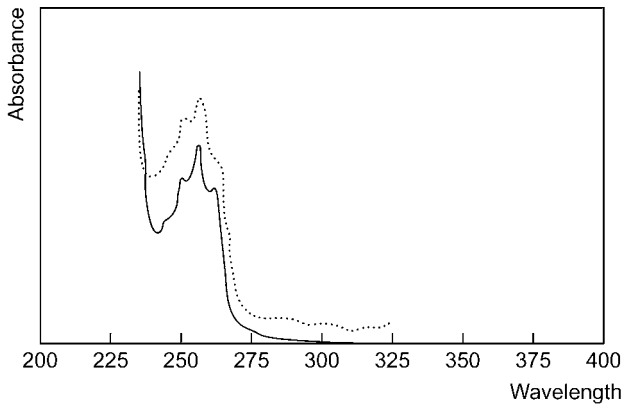


Chemical Properties Crystals. An alkaloid found in various solanaceous plants, particularly species of *Datura*, *Scopolia* and *Duboisia*. A viscous liquid which forms a crystalline monohydrate with a Mp 59°. Soluble 1 in 9.5 of water at 15°, freely soluble in hot water; freely soluble in ethanol, chloroform, acetone and ether; sparingly soluble in benzene and petroleum ether. pK_a 7.6 (23°). Log *P* (octanol/pH 7.4), 1.2.

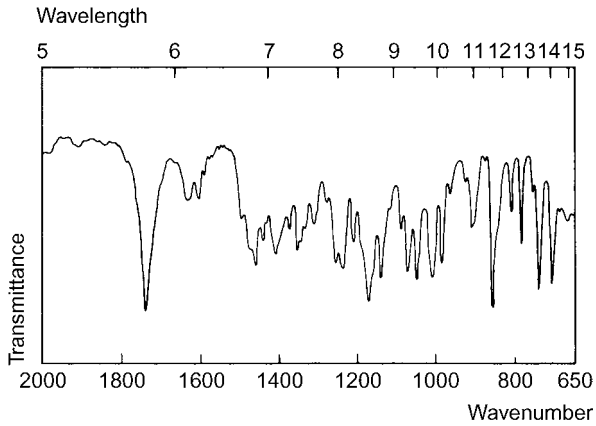
Hyoscine Hydrobromide

$C_{17}H_{21}NO_4$, $HBr,3H_2O$ = 438.3
CAS—114-49-8 (anhydrous); 6533-68-2 (trihydrate)
Synonyms Scopolamine bromhydrate; scopolamine hydrobromide.
Proprietary Names *Joy-Rides*; *Kwells*; *Scopace*; *Travacalm HO*; *Travel Calm*; *Vorigeno*.
Chemical Properties Colourless transparent crystals or white crystalline powder; slightly efflorescent in dry air. Mp 195°. Soluble 1 in 1.5 of water and 1 in 20 of ethanol; practically insoluble in chloroform and ether.

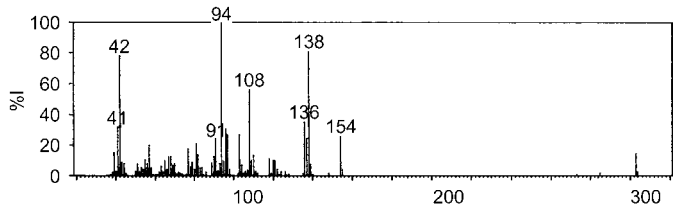
Colour Test Liebermann's reagent—red-orange.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.06; system TC—R_f 0.37; system TE—R_f 0.48; system TL—R_f 0.18; system TAE—R_f 0.49; system TAF—R_f 0.47; system TAJ—R_f 0.61; system TAK—R_f 0.49; system TAL—R_f 0.93 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; Marquis test, pink).
Gas Chromatography System GA—hyoscine RI 2300, M (hydrate) RI 2230, M (art desacyl-) RI 1210; system GB—hyoscine RI 2427, M (hydrate) RI 2255; system GF—RI 2885.
High Performance Liquid Chromatography System HA—*k* 1.1; system HX—RI 270; system HY—RI 253; system HAA—RT 7.4 min; system HAX—RT 7.0 min; system HAY—RT 3.7 min.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1 = 6.3a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1730, 853, 1166, 736, 705, 1047 cm^{-1} (hyoscine hydrobromide, KBr disk).



Mass Spectrum Principal ions at *m/z* 94, 138, 42, 108, 136, 41, 96, 97.



Quantification

Plasma **GC-MS** Column: 3% OV-17 on Gas Chrom Q 100/120 (1.8 m × 2 mm i.d.). Carrier gas: 30 mL/min. Temperature: 95°. Limit of detection, 50 ng/L [Bayne *et al.* 1975].
Serum **GC-MS** Column: Durabond 5 fused silica capillary (15 m × 0.25 mm i.d., 0.1 μm). Carrier gas: H_2. Temperature: 290°. Limit of detection, 50 ng/L [Oertel *et al.* 1996].
Note For an immunoassay see Hagemann *et al.* [1992].
Urine **HPLC** Column: Spherisorb S5W (250 × 4.6 mm i.d.). Mobile phase: methanol : acetonitrile : 0.1 moL/L ammonium nitrate buffer (pH 9.3, 20 : 70 : 10), flow rate 0.8 mL/min. Electrochemical detection. Limit of detection, 5 ng [Whelpton *et al.* 1992].
GC-MS See Plasma [Bayne *et al.* 1975].
Disposition in the Body Hyoscine is readily absorbed after oral administration of the hydrobromide and extensively metabolised. Approximately 5% of an oral dose is excreted in the urine as unchanged drug. Hyoscine is well absorbed following application to the skin. It crosses the blood–brain barrier and may cross the placenta.
Therapeutic Concentration

Administration of hyoscine hydrobromide nasally at a dose of 0.2 mg/0.05 mL or 0.4 mg/0.10 mL in formulations of varying pH to 18 subjects produced average peak plasma concentrations of 0.262, 0.419 and 0.488 μg/L after the 0.2–mg dose at pH 4, 7 and 9, respectively, and 0.503, 0.933 and 1.308 μg/L after the 0.4–mg dose at the same pH values. At both doses, the average time to reach peak plasma concentration decreased linearly with a decrease in formulation pH (e.g. at the 0.4–mg dose, the time to peak concentration was 26.7, 15.0 and 8.8 min at pH 4, 7 and 9, respectively) [Ahmed *et al.* 2000].

Following administration of a single dose of 0.4 mg hyoscine bromide by the intranasal or oral route in 12 subjects (at least 2 weeks separated the doses), peak plasma concentrations of 0.00168 and 0.000164 mg/L, respectively, were attained within 1 h of dosing (0.37 h after intranasal dose and 0.78 h after oral dose) [Putcha *et al.* 1996].

A peak plasma concentration of 0.55 ± 0.06 mg/L was attained within 15 min in all but 2 of 8 subjects given 0.25% hyoscine eye drops unilaterally [Lahdes *et al.* 1990].

Following a single oral dose equivalent to 415 μg hyoscine to 10 subjects, a mean peak plasma concentration of 0.3 μg/L was attained in 0.5–1 h, decreasing to 50% of the peak concentration in 2– h [Muir, Metcalfe 1983].

Toxicity The lethal dose in children may be as low as 10 mg but fatalities after hyoscine poisoning are rare.
Protein Binding Binding occurs.
Dose Hyoscine hydrobromide, 0.9 mg orally over 24 h; 1 mg hyoscine over 72 h transdermally.

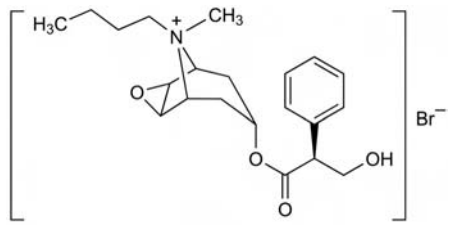
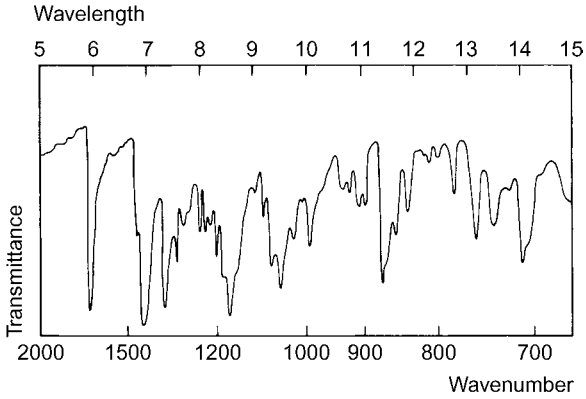
Hyoscine Butylbromide

Anticholinergic
$C_{21}H_{30}BrNO_4$ = 440.4
CAS—149-64-4
IUPAC Name [7(*S*)-(1α,2β,4β,5α,7β)]-9-Butyl-7-(3-hydroxy-1-oxo-2-phenylpropoxy)-9-methyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane bromide
Synonyms Butylscopolamonii bromidum; hyoscine-*N*-butyl bromide; scopolamine butylbromide.
Proprietary Name *Buscopan*



Chemical Properties A white crystalline powder. Mp 140° to 144°. Soluble 1 in 1 of water, 1 in 50 of ethanol and 1 in 5 of chloroform; practically insoluble in ether. Log *P* (octanol/water), −1.1.
Colour Tests Aromaticity (method 2)—colourless/yellow; Liebermann's reagent—orange.
Thin-layer Chromatography System TA—R_f 0.08 (acidified iodoplatinate solution, positive).

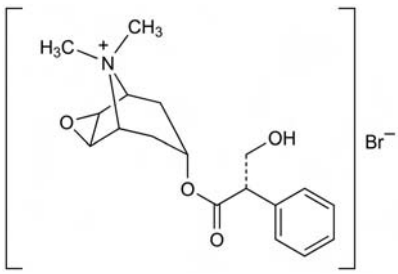
High Performance Liquid Chromatography System HY—RI 294.
Ultraviolet Spectrum Aqueous acid—252 (A^1_1=3.7a), 258 (A^1_1=4.6a), 264 nm (A^1_1=3.6a).
Infrared Spectrum Principal peaks at wavenumbers 1175, 1721, 1052, 874, 1072, 709 cm^{-1} (Nujol mull).



Disposition in the Body Poorly absorbed after oral administration. About 90% of an oral dose is eliminated in the faeces and <10% is excreted in the urine. After IV administration, about 40% of a dose is excreted in the urine.
Half-life Plasma half-life, about 8 h.
Protein Binding About 10%.
Dose 20 mg given parenterally, repeated if necessary; 80 mg daily, orally.

Hyoscine Methobromide

Anticholinergic
$C_{18}H_{24}BrNO_4$ = 398.3
CAS—155-41-9
IUPAC Name (1α,2β,4β,5α,7β)-7-[(2*S*)-3-Hydroxy-1-oxo-2-phenylpropoxy]-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane bromide
Synonyms Epoxymethamine bromide; hyoscine methylbromide; methoscopolamine bromide; scopolamine methylbromide.
Proprietary Names *Holopon*; *Pamine*.



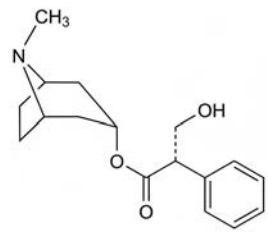
Chemical Properties White crystals or crystalline powder. Mp about 225°, with decomposition. Soluble 1 in 3 of water, 1 in 100 of ethanol and 1 in 40 of methanol; practically insoluble in chloroform. Log *P* (octanol/water), −2.6.
Colour Test Aromaticity (method 2)—colourless/yellow.
Ultraviolet Spectrum Aqueous acid—253 (A^1_1=3.7b), 258 (A^1_1=4.4a), 264 nm (A^1_1=3.4b).
Infrared Spectrum Principal peaks at wavenumbers 1718, 1180, 1174, 1042, 923, 858 cm^{-1} (KBr disk).
Dose 10 to 12.5 mg daily.

Hyoscine Methonitrate

Anticholinergic
$C_{18}H_{24}N_2O_7$ = 380.4
CAS—6106-46-3
IUPAC Name (1α,2β,4β,5α,7β-7-[(2*S*)-3-Hydroxy-1-oxo-2-phenylpropoxyl]-9,9-dimethyl-3-oxo-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane nitrate
Synonyms Hyoscine methylnitrate; methscopolamine nitrate; methylhyoscini nitras; methylscopolamini nitras; scopolamine methylnitrate.
Proprietary Name *Skopyl*
Chemical Properties Colourless hygroscopic crystals or a white crystalline powder. Mp 194° to 199°. Soluble 1 in 1.5 of water and 1 in 40 of ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), 0.4.
Colour Tests Aromaticity (method 2)—colourless/violet (transient); Liebermann's reagent—orange.
Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—251 (A^1_1=4.3a), 257 (A^1_1=5.1a), 263 nm (A^1_1=3.8a).
Infrared Spectrum Principal peaks at wavenumbers 1735, 1175, 1185, 1317, 860, 923 cm^{-1} (KBr disk).
Dose Up to 12 mg daily.

Hyoscyamine

Anticholinergic
$C_{17}H_{23}NO_3$ = 289.4
CAS—101-31-5
IUPAC Name 8-Methyl-8-azabicyclo[3.2.1]oct-3-yl [3(*S*)-*endo*]-α-(hydroxymethyl)-benzeneacetate
Synonym L-Hyoscyamine
Proprietary Name *Cystospaz*



Chemical Properties An alkaloid obtained from various solanaceous plants, *Hyoscyamus muticus* and *Duboisia myoporoides* being the best sources. It is the levo-isomer of atropine. A white crystalline powder. Mp 106° to 109°. Soluble 1 in 280 of water, 1 in 1 of chloroform, 1 in 69 of ether, 1 in 150 of benzene; freely soluble in ethanol and dilute acids. pK_a 9.7 (21°). Log *P* (octanol/water), 1.9.

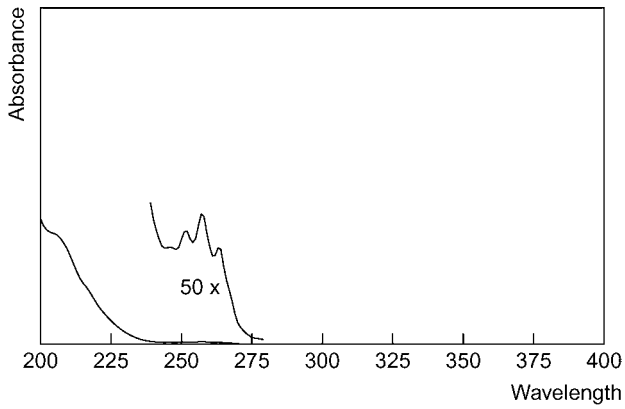
Hyoscyamine Hydrobromide

$C_{17}H_{23}NO_3$, HBr = 370.3
CAS—306-03-6
Synonym Hyoscyamine bromhydrate
Chemical Properties White prismatic crystals or crystalline powder. Mp 152°. Very soluble in water; soluble 1 in 3 of ethanol and 1 in 1.2 of chloroform; very slightly soluble in ether.

Hyoscyamine Sulfate

$(C_{17}H_{23}NO_3)_2$, H_2SO_4, $2H_2O$ = 712.9
CAS—620-61-1 (anhydrous); 6835-16-1 (dihydrate)
Proprietary Names *Anaspaz*; *Cystospaz-M*; *Egacen(e)*; *Egazil*; *Levsin*; *Levsinex*; *Peptard*.
Chemical Properties Colourless needles or a white deliquescent crystalline powder. Mp about 203°, with decomposition. Soluble 1 in 0.5 of water and 1 in 5 of ethanol; sparingly soluble in dehydrated alcohol; very slightly soluble in chloroform and ether.

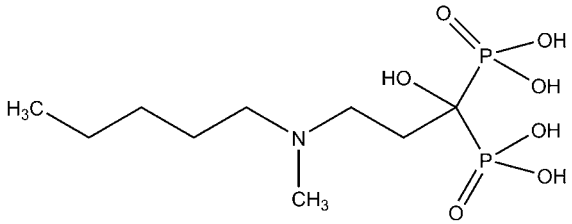
Colour Test Liebermann's reagent—red-orange.
Thin-layer Chromatography System TA—R_f 0.18; system TE—R_f 0.26; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.34 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2190; system GB—RI 2293.
High Performance Liquid Chromatography System HA—*k* 3.7 (tailing peak); system HAA—retention time 9.7 min.
Ultraviolet Spectrum Aqueous acid—252 (A^1_1=6.2a), 258 (A^1_1=8.2a), 264 nm (A^1_1=6.2a).



Infrared Spectrum Principal peaks at wavenumbers 1738, 1160, 1025, 1145, 1225, 1050 cm^{-1} (hyoscyamine hydrobromide, KBr disk).
Quantification See under Atropine.
Dose 0.6 to 1.2 mg daily.

Ibandronic Acid

Aminobiphosphonate, Bone Resorption Inhibitor
$C_9H_{23}NO_7P_2 = 319.2$
CAS—114084-78-5
IUPAC Name [1-Hydroxy-3-(methyl-pentylamino)-1-phosphonopropyl]phosphonic acid
Synonyms BM-21.0955; [1-hydroxy-3-(methylpentylamino)propylidene] biphosphonic acid.



Ibandronate Sodium

$C_9H_{22}NNaO_7P_2, H_2O = 359.2$
CAS—138926-19-9
Proprietary Names *Bandrobon*; *Bondronat*; *Boniva*; *Bonviva*; *Elasterin*; *Femorel*; *Idena*; *Modifical.*
Chemical Properties White to off-white powder. Freely soluble in water, practically insoluble in organic solvents [Hoffmann-La Roche 2006]. pK_{a1} 2.0, pK_{a2} 6.3, pK_{a3} 10.5 [Barrett *et al.* 2004]. Log *P* (octanol/water), −1.04 [Wishart 2006].

Capillary Electrophoresis Column: uncoated fused silica capillary (total/effective length: 50/40, 50 µm i.d.). Buffer: 10 mmol/L potassium chromate : tetradecyltrimethylammonium bromide : water (pH 10.0; 10 : 4 : 6). UV detection (λ = 254 nm). Retention time: ibandronate 2.8 min, phosphyte 3.1 min, phosphate 3.2 min. Limit of quantification not reported [Rodriguez *et al.* 2007].
Quantification
Plasma **GC-MS** Column: DB-WAX fused silica (10 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.5 mL/min. Temperature programme: 80° for 1 min to 220° at 40° for 1 min. CI, SIM acquisition mode. Retention time: 2.2 min (*N*-pentyl, *N*-methyl-β-alanine methyl ester derivative). Limit of quantification, 1 µg/L [Endele *et al.* 2005].
Urine **GC-MS** See Plasma. Limit of quantification, 2 µg/L [Endele *et al.* 2005].
Bone **GC-MS** See Plasma. Limit of quantification, 20 ng/kg [Endele *et al.* 2005].
Disposition in the Body Like other bisphosphonates, ibandronate is poorly absorbed after oral doses. Absorption is decreased by food, especially by products containing calcium or other polyvalent cations, so it is usually administered with a 1 h post-dose fast. Absorption is thought to occur in the upper gastrointestinal tract, with peak plasma concentrations reached within 1 h, declining rapidly (down to 10% of peak plasma concentrations within 3 to 8 h) as ibandronate binds to bone (40 to 50% of a dose, with <2% retained in soft tissue) or is excreted unchanged in urine. Subsequent falls in plasma levels are much slower as ibandronate is redistributed back into the blood from bone and cleared through the kidneys. Elimination is dependent on the rate of bone turnover. Bisphosphonates do not appear to be metabolised, and the unabsorbed fraction of ibandronate is excreted unchanged in urine. Biliary excretion of the drug is virtually zero. It is removed by dialysis.
Therapeutic Concentration

A group of 40 Caucasian patients with varying degrees of renal impairment were administered a 6 mg IV dose of ibandronate over 30 min. Peak plasma concentrations were reported as follows:

Renal function	C_{max} *(µg/L)*	*Time (min)*
Normal	327	37.5
Mild impairment	352	32.2
Moderate impairment	332	31.5
Severe impairment	310	31.7

[Bergner *et al.* 2007].

Toxicity Ibandronate does not inhibit or interact with CYP450 enzymes; it therefore has little potential for drug-drug interactions.
Bioavailability Less than 1%. Compared with administration in the fasted state, bioavailability is reduced by ~90% when taken with a standard breakfast, by ~30% when taken 30 min before a meal, and by 75% when administered 2 h after a meal.
Half-life In healthy post-menopausal women, 10 to 23 h; also reported as 10 to 72 h.
Volume of Distribution In the range 90 to 175 L.
Clearance Total, 98 to 130 mL/min; renal, 60 mL/min (dependent on renal function and directly related to creatinine clearance).
Distribution in Blood Blood : plasma ratio, ≈0.7.
Protein Binding Approximately 87%; also reported as 90.9 to 99.5%. Binding to erythrocytes and platelets is very low.

Dose Ibandronate sodium is given by IV infusion or orally, the dose being expressed in terms of ibandronic acid: ibandronate sodium 1.13 mg is equivalent to ≈1 mg ibandronic acid. For hypercalcaemia of malignancy, a single IV dose of the equivalent of 2 to 4 mg ibandronic acid is given, up to a maximum of 6 mg. For the prevention of skeletal events in patients with breast cancer and bone metastases, the equivalent of 6 mg ibandronic acid is given IV. The dose is repeated every 3 to 4 weeks. Alternatively, ibandronic acid 50 mg daily may be given by mouth.

For the prevention and treatment of postmenopausal osteoporosis, ibandronate is given orally in a usual dose equivalent to 150 mg of ibandronic acid once monthly on the same date each month; alternatively, 2.5 mg daily by mouth may be given. Alternatively, treatment may be given IV, in a dose equivalent to 3 mg of ibandronic acid once every 3 months.

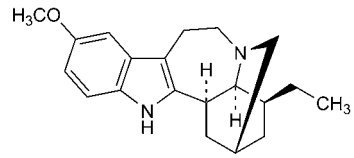
Ibogaine

Alkaloid
$C_{20}H_{26}N_2O = 310.4$
CAS—83-74-9
Synonym 12-Methoxyibogamine



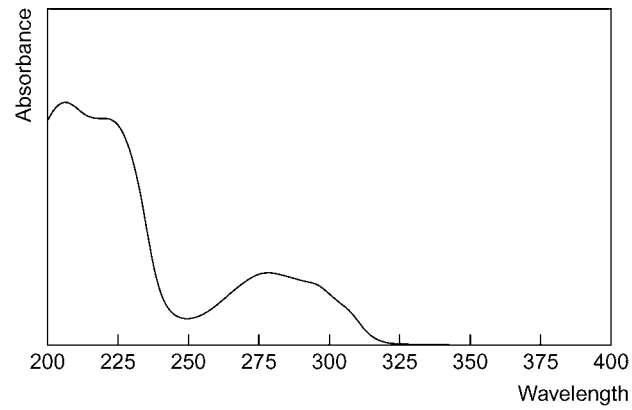
Chemical Properties Alkaloid obtained from *Tabernanthe iboga* (Apocynaceae). Crystals. Mp 152° to 153°. Practically insoluble in water; soluble in acetone, benzene, ethanol, chloroform and ether. Ibogaine was stable in plasma stored at –20° [Alburges *et al.* 1995]. Stock solutions can be stored for up to 7 months at 10° [Gallagher *et al.* 1995]. Freezing and thawing had no effect when plasma samples were taken and stored at –20° [Hearn *et al.* 1995].

Ibogaine Hydrochloride

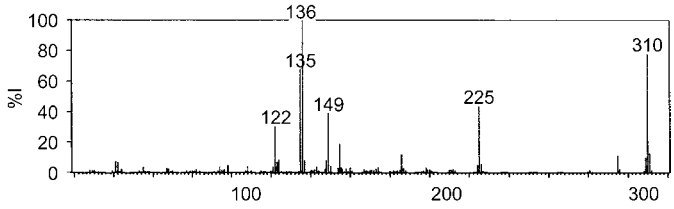
$C_{20}H_{26}N_2O, HCl = 346.9$
CAS—5934-55-4
Chemical Properties Crystals. Mp 299° to 300°, with decomposition. Soluble in water, ethanol and methanol; slightly soluble in acetone and chloroform; practically insoluble in ether. Log *P* (octanol/water), 3.6.

Colour Tests Liebermann's reagent—black; Mandelin's test—grey→violet; Marquis test—grey→orange.

Thin-layer Chromatography System TA—R_f 0.65; system TAE—R_f 0.39; system TAF—R_f 0.72; system TL—R_f 0.62; system TB—R_f 0.28; system TC—R_f 0.50; system TE—R_f 0.86 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2872.
High Performance Liquid Chromatography System HA—*k* 2.1; system HY—RI 321.
Ultraviolet Spectrum Aqueous acid—278 nm ($A^1_1 = 212c$).



Infrared Spectrum Principal peaks at wavenumbers 1490, 1210, 1140, 810, 1020, 835 (Ibogaine hydrochloride) (KBr disk).
Mass Spectrum Principal ions at *m/z* 136, 310, 135, 225, 149, 122, 155, 311.



Quantification

Plasma **GC-MS** Column: DB-1 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 125° for 0.5 min to 250° at 40°/min for 1 min to 300° at 10°/min for 3 min. SIM acquisition mode. Retention time: 10 min. Limit of detection, 3 µg/L [Ley *et al.* 1996]. Column: DB-1 dimethylpolysiloxane fused silica capillary (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: H_2, 80 cm/s. Temperature programme: 160° for 1.5 min to 310° at 20°/min for 1 min. PICI. Limit of detection, 10 µg/L for ibogaine and 12-hydroxyibogamine [Alburges *et al.* 1995]. Column: DB-5 phenylmethylsilicone FSOT (15 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 1 mL/min. Temperature programme: 50° for 1 min to 230° at 25°/min for 30 s to 300° at 5°/min for 5 min. Limit of detection, 5 µg/mL for ibogaine and 12-hydroxyibogamine. Column: DB-5 phenylmethylsilicone FSOT (15 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 1 mL/min. Temperature programme: 50° for 1 min to 230° at 25°/min, after 30 s to 230° at 5°/min for 7 min. Limit of detection, 5 µg/L [Hearn *et al.* 1995].

Urine **GC** Column: 1% SE-30 Chromosorb W 80/100 mesh (1.8 × 0.3 m i.d.). Carrier gas: N_2. Temperature programme: 180 to 225°. AFID. Limit of detection, 1 µg [Cartoni, Giarusso 1972].

GC-MS Column: DB-5MS (30 m × 0.25 mm i.d., 0.1 µm). Temperature: 90° to 250° at 70°/min. EI ionisation at -70 eV. Multiple ion monitoring. Retention time: 9.9 min. Limit of detection, 20 µg/mL [Gallagher *et al.* 1995]. See Plasma [Hearn *et al.* 1995].

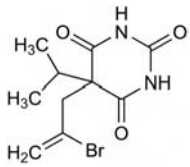
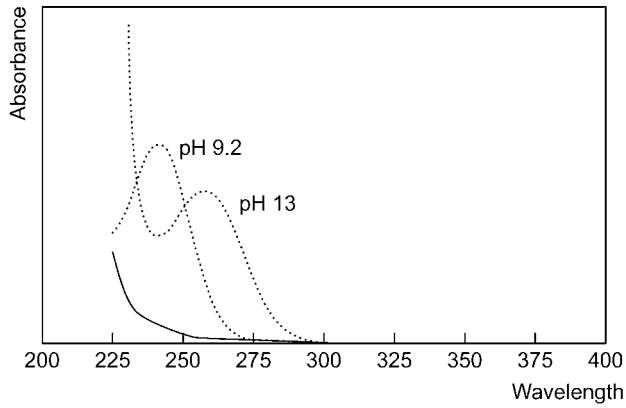
Ibomal

Hypnotic, Barbiturate
$C_{10}H_{13}BrN_2O_3$ = 289.1
CAS—545-93-7

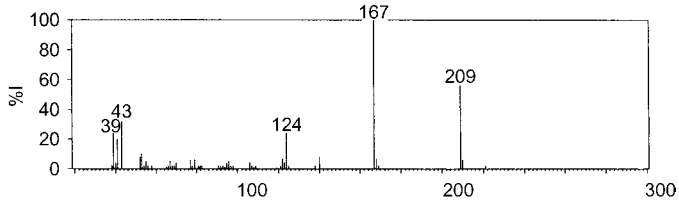
IUPAC Name 5-(2-Bromo-2-propenyl)-5-(1-methylethyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione
Synonyms Bromoaprobarbitone; isopropyl-bromallyl-barbitursäure; propallylonal.
Proprietary Name *Noctal*



Chemical Properties A white crystalline powder. Mp 177° to 179°. Slightly soluble in water; freely soluble in acetone, ethanol and glacial acetic acid; sparingly soluble in benzene, chloroform and ether. pK_a 7.7 (20°). Log *P* (octanol/water), 1.5.
Colour Test Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TD—R_f 0.50; system TE—R_f 0.32; system TF—R_f 0.66; system TH—R_f 0.61; system TAD—R_f 0.56; system TAE—R_f 0.91.
Gas Chromatography System GA—ibomal RI 1880, M (desbromo-OH-) RI 1770; ibomal-Me_2 RI 1745; M (desbromo-oxo-)-Me_2 RI 1720; M (desbromo-OH-)-Me_2 RI 1730. Also metabolised to aprobarbital RI 1618.
High Performance Liquid Chromatography System HG—*k* 4.01; system HH—*k* 2.58; system HX—RI 379; system HY—RI 352.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—240 nm (A_1^1=307a); 1 mol/L sodium hydroxide (pH 13)—257 nm (A_1^1=240b).



Infrared Spectrum Principal peaks at wavenumbers 1700, 1722, 1210, 1300, 830, 1622 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 167, 209, 43, 124, 39, 41, 53, 140.

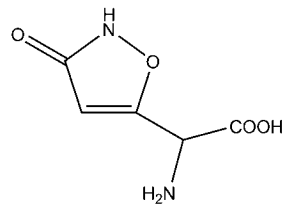


Disposition in the Body Metabolised by side-chain oxidation to 5-(2-acetonyl)-5-isopropylbarbituric acid. About 6 to 16% of a dose is slowly excreted in the urine as the metabolite with about 1 to 3% as unchanged drug; the metabolite is still detectable in urine 9 days after a single dose.
Therapeutic Concentration In plasma, usually 0.3 to 10 mg/L.
Toxicity Blood concentrations greater than about 10 mg/L may be toxic or lethal.
Protein Binding About 34%.
Dose 100 to 400 mg, as a hypnotic.

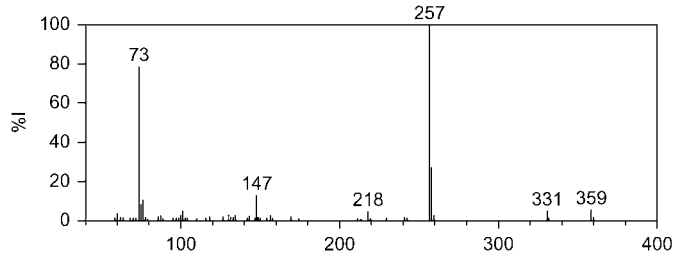
Ibotenic Acid

Isoxazole, Neurotoxin
$C_5H_6N_2O_4$ = 158.1
CAS—2552-55-8

IUPAC Name 2-Amino-2-(3-oxo-1,2-oxazol-5-yl) acetic acid
Synonyms α-Amino-2,3-dihydro-3-oxo-5-isoxazoleacetic acid; α-amino-3-hydroxy-5-isoxazoleacetic acid; amino-(3-hydroxy-5-isoxazolyl)acetic acid.



Chemical Properties Crystals. Mp 151° to 152°. Readily soluble in water. Log *P* (octanol/water), −1.073 [ACD 2007]. Fly-killing and narcosis-potentiating amino acid structurally similar to kainic acid [q.v.] extracted from poisonous mushroom species [O'Neil *et al.* 2006].
Mass Spectrum Principal ions at *m/z* 257, 73, 147, 359, 331, 218(*tri*-TMS derivative) [Tsujikawa *et al.* 2006].



Quantification

Other **GC-MS** Dried Mushrooms. Column: DB-5 MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 53.0 mL/min. Temperature programme: 100° for

1 min to 300° at 15°/min. EIionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 µg/L [Tsujikawa *et al.* 2006].

LC-MS Dried Mushrooms. Column: Symmetry C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (70 : 30 for 1 min to 10 : 90 at 25 min for 5 min to 70 : 30 at 31 min for 15 min), flow rate 0.2 mL/min. DAD (λ = 256 nm). Limit of quantification, 25.9 µg/L; limit of detection, 7.8 µg/L [Tsujikawa *et al.* 2007].

Note For a GLC-mass spectral analysis of fungal metabolites, see Repke *et al.* [1978].

Disposition in the Body After ingestion, ibotenic acid hydrolysed to muscimol in the low pH of the gastric fluid; muscimol proceeds to the brain or is eliminated via the systemic circulation [Michelot, Melendez-Howell 2003]. Both ibotenic acid and muscimol are found in urine 1 h after consumption [Satora *et al.* 2006].

Toxicity The LD_{50} in mice is 15 mg/kg (IV) and 38 mg/kg (oral); in rats it is 42 mg/kg (IV) and 129 mg/kg (oral) [O'Neil *et al.* 2006]. For an overview of the features of various types of mushroom poisoning, see DiPalma [1981].

A 47-year-old mother and 27-year-old daughter ingested 5 fried mushroom caps thinking that they were parasol mushrooms *Macrolepiota procera*. Approximately 2 h later, the women suffered from nausea, stomach ache, and diarrhoea and had vomited several times. After several days in hospital, both patients were discharged [Satora *et al.* 2006].

A 48-year-old man consumed a plate of what he thought were *A. caesarea* mushrooms. Half an hour later he became nauseous, vomited and fell asleep. His wife found him 3 h later comatose and having a seizure-like episode. Examination of the mushrooms he had picked revealed *A. muscaria* among them. Ten hours after ingestion he awoke and was completely oriented. Eight hours later, however, his condition deteriorated and he became confused and uncooperative. He developed visual and auditory hallucinations as well as paranoia. He refused treatment and was diagnosed with paranoid psychosis. He was transferred to a psychiatric hospital 3 days later. On the fifth day he started to drink and take tablets and on the sixth day all symptoms of psychosis disappeared and he was discharged [Brvar *et al.* 2006].

Note For a study investigating the ibotenic acid-muscimol content of various *Amanita* species from several continents, see Chilton and Ott [1976].

Dose Used as a neurobiological tool.

Ibuprofen

Analgesic, COX Inhibitor, NSAID

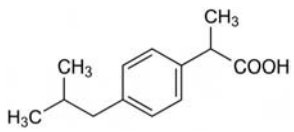
$C_{13}H_{18}O_2$ = 206.3

CAS—15687-27-1

IUPAC Name 2-[4-(2-Methylpropyl)phenyl]propanoic acid

Synonyms Ibuprofenum; RD-13621; U-18573.

Proprietary Names *Advil*; *Apsifen*; *Arthrofen*; *Brufen*; *Cuprofen*; *Ebufac*; *Fenbid*; *Galprofen*; *Genpril*; *Haltran*; *Ibrufhalal*; *Ibu*; *Ibufac*; *Ibufem*; *Ibugel*; *Ibular*; *Ibuleve*; *Ibumousse*; *Ibuspray*; *Inoven*; *Isisfen*; *Junifen*; *Librofem*; *Lidifen*; *Manorfen*; *Menadol*; *Migrafen*; *Motrin*; *Novaprin*; *Nuprin*; *Nurofen*; *Obifen*; *Orbifen*; *Pacifene*; *PhorPain*; *Proflex*; *Relcofen*; *Rimafen*; *Saleto-200*; *Seclodin*; *Uniprofen*. Ibuprofen is an ingredient of many proprietary preparations [Sweetman 2007].



Chemical Properties A white powder or crystals. Mp 75° to 77°. Practically insoluble in water; soluble 1 in 1.5 of ethanol, 1 in 1 of chloroform and 1 in 2 of ether. pK_{a1} 4.4, pK_{a2} 5.2. Log *P* (octanol/water), 4.0. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Colour Tests Liebermann's reagent—brown-orange; Marquis test—brown (→orange at 100°).

Thin-layer Chromatography System TD—R_f 0.46; system TE—R_f 0.06; system TF—R_f 0.57; system TG—R_f 0.18; system TAD—R_f 0.54; system TAE—R_f 0.75; system TAJ—R_f 0.59; system TAK—R_f 0.76; system TAL—R_f 0.93.

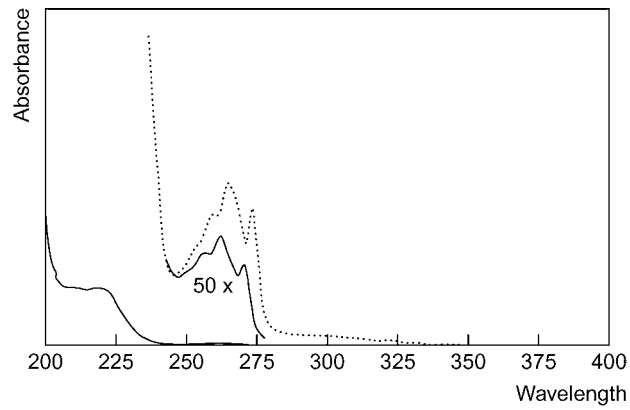
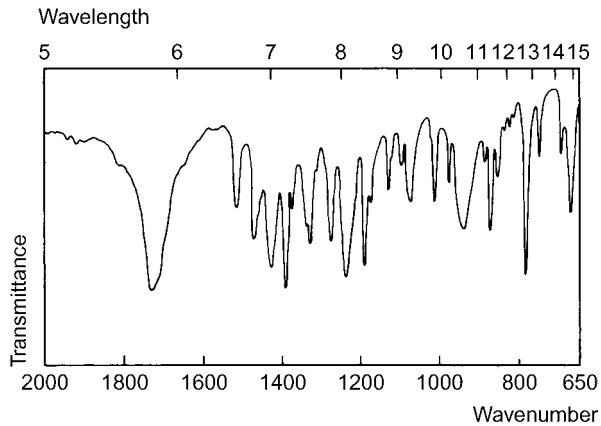
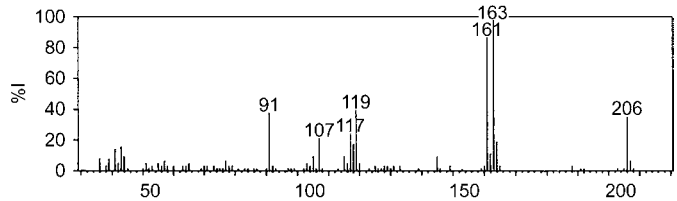
Ultraviolet Spectrum Aqueous alkali—265 (A_1^{1} = 18.5a), 273 nm.



Infrared Spectrum Principal peaks at wavenumbers 1721, 1232, 779, 1185, 1273, 870 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 163, 161, 119, 91, 206, 117, 107, 164.



Quantification

Blood **GC-MS** Quantification of ibuprofen [Huber, Garg 2010]. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (2.0 m × 4 mm i.d.). Carrier gas: N_2, 70 mL/min. Temperature: 275°. ECD. Limit of detection, ~20 pg [Montagna, Groppi 1980].

Plasma **HPLC** Column: Waters Symmetry C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (pH 2.6, 60 : 40), flow rate 2 mL/min. UV detection (λ = 220 nm). Limit of quantification, 1.56 mg/L [Farrar *et al.* 2002]. Column: Waters Symmetry C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : acetic acid : triethylamine (pH 5.0, 60 : 40 : 0.1 : 0.02 to 100 : 0 : 0: at 20 min for 5 min), flow rate 1.6 mL/min. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 320 nm). Limit of quantification, 0.1 mg/L [Canaparo *et al.* 2000]. UV detection (λ = 254 nm). Limit of detection, 50 ng [Save *et al.* 1997]. Column: C_{18} (33 × 4.6 mm i.d., 3 µm). Mobile phase: concentrated phosphoric acid : water : acetonitrile (4 : 600 : 400), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Retention time: 3.9 min. Limit of detection, 25 mg/L [Rifai *et al.* 1996]. Column: C_{18} Econosil ODS (250 × 10 mm i.d., 10 µm). Mobile phase: methanol : 10 mmol/L acetic acid (pH 3.0, 65 : 35), flow rate 3.5 mL/min, UV detection (λ = 225 or 214 nm). Retention time: 24.8 min. Limit of detection, 0.5 mg/L [Castillo, Smith 1993]. C_{18}

reversed phase (100 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid : triethylamine (60 : 40 : 0.1 : 0.02), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 320 nm) [Lemko *et al.* 1993] Spherisorb ODS (125 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (pH 3.3, 65 : 35), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Retention time: 8 min. Limit of detection, 5 mg/L [Blagbrough *et al.* 1992]. Column: C_{18} reversed phase. Mobile phase: acetonitrile : phosphoric acid (pH 2.2, 1 : 1). UV detection (λ = 220 nm). Limit of detection, 25 µg/L [Rustum 1991].

GC-MS Column: DB-1 (15 m × 0.22 mm i.d.). Temperature programme: 100° to 280° at 12°/min. Retention time: 17 min. Limit of detection, 5 mg/L [Way *et al.* 1997]. Column: 3% phenylmethylsiloxane on Chromosorb WHP 100/120 mesh (2.0 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 320°. CI at 100 eV, SIM acquisition mode. Retention time: 2.15 min for (*S*)-(+)-ibuprofen and 2.55 min for (*R*)-(−)-ibuprofen. Limit of detection, 5 µg/L [Zhao *et al.* 1994]. Column: cross-linked methyl silicone HP-1 (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 55 cm/s. Temperature programme: 60° to 200° at 30°/min to 240° at 8°/min to 290° at 30°/min. EI ionisation, SIM acquisition mode. Retention time: 8.86 min for (*S*)-ibuprofen and 8.96 min for (*R*)-ibuprofen. Limit of quantification, 3 µg/L, limit of detection, <1 µg/L [Jack *et al.* 1992].

Serum **HPLC** Column: YMC ODS (70 × 4.6 mm i.d., 5 µm) or TSK ODS 80 TM (150 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 3.5) : acetonitrile (60 : 40), containing 5 mmol/L tetra-*n*-butylammonium bromide or 20 mmol/L phosphate buffer (pH 7.0) : acetonitrile (70 : 30) containing 5 mmol/L tetra-*n*-butylammonium bromide or 20 mmol/L phosphate buffer (pH 7.0) : acetonitrile (70 : 30), flow rate 1.0 mL/min. UV detection (λ = 221 nm). Limit of detection, 0.5 µg/L [Yamashita *et al.* 1991].

GC Column: 10% 3-cyanopropyl silicone on 100/120 mesh Gas Chrom Q (1.83 m × 3 mm i.d.). Carrier gas: CH_4 : Ar (5 : 95), 10 mL/min. Temperature: 190°. ECD. Retention time: 9.1 min. Limit of detection, 100 µg/L [Kaiser, Martin 1978]. Column: 5% FFAP on Gas Chrom W (HP) 80/100 mesh (1.83 m × 2 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 220°. FID. Retention time: 4.3 min. Limit of detection, 500 µg/L [Hoffman 1977].

Urine **HPLC** Column: Inertsil ODS-2 (150 × 4.6 mm, i.d., 5 µm). Mobile phase: 50 mmol/L phosphate buffer (58 : 42, pH 5.0), flow rate 0.9 mL/min. Limit of detection, 50 µg/L [Hirai *et al.* 1997]. Column: Polygosi 60-5 (120 × 4.6 mm, i.d., 5 µm). Mobile phase: acetonitrile : 0.2 mol/L potassium phosphate (pH 7.4) : water (18 : 15 : 67), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Limit of quantification, 4–23.3 mg/L, limit of detection, 1–12 mg/L for phase I and II metabolites [Kepp *et al.* 1997]. Column: Partisil silica column (250 × 4.6 mm i.d., 5 µm). Mobile phase: hexane : ethanol (98.2 : 1.8) containing 0.05% trifluroacetic acid, flow rate 2 mL/min. UV detection (λ = 220 nm). Limit of quantification, 10 mg/L [Tan *et al.* 1997].

GC-MS See Blood [Montagna, Groppi 1980].

Biological Fluids, Plasma and Urine **HPLC** Column: C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : acetic acid : TEA (46.5 : 53.5 : 0.1 : 0.03), flow rate 1.6 mL/min. UV detection (λ = 225 nm). Retention time: 17.7 min for (*S*)-ibuprofen and 15.7 min for (*R*)-ibuprofen. Limit of detection, 0.25 mg/L [Wright *et al.* 1992]. Column: Partisil 10 ODS-3 (250 × 4.5 mm i.d.). Mobile phase: acetonitrile-water (28 : 72) : acetonitrile-0.05 mol/L monobasic potassium phosphate (50 : 50), flow rate 2.0 mL/min. UV detection (λ = 220 nm). Limit of detection, 1 mg/L for ibuprofen in plasma, 5 mg/L for ibuprofen or the hydroxy or carboxy metabolites in urine [Lockwood, Wagner 1982].

GC-MS Column: 3% OV-17 on Chromosorb W AW DMCS 120/140 mesh (0.91 m × 2 mm i.d.). Carrier gas: CH_4, 20 mL/min. Temperature programme: 150°. CI at 110 eV. Limit of detection, 50 pg [Whitlam, Vine 1980].

Synovial Fluid **GC-MS** See Plasma [Jack *et al.* 1992].

HPLC See Plasma [Blagbrough *et al.* 1992].

Disposition in the Body Ibuprofen is readily and almost completely absorbed after oral administration. >60% of a dose is excreted in the urine in 24 h, including ~9% of the dose as the 2-hydroxy metabolite, 2-[4-(2-hydroxy-2-methylpropyl) phenyl]propionic acid; ~17% as the conjugated hydroxy metabolite; ~16% as the 2-carboxy metabolite, 2-[4-(carboxypropyl)phenyl]propionic acid; and ~19% as the conjugated carboxy metabolite (both metabolites are inactive); <10% of a dose is excreted unchanged. The remainder of the dose is probably eliminated in the faeces after excretion in the bile; excretion is virtually complete within 24 h. It is found in breast milk in very low concentrations. Ibuprofen's disposition is stereoselective and there is some metabolic conversion of the inactive (*R*)-(−)-enantiomer to the active (*S*)-(+)-form (dexibuprofen).

Therapeutic Concentration In plasma, usually in the range 20–30 mg/L.

In 98 patients receiving high doses of ibuprofen (20–30 mg/kg IV as a single dose), peak plasma concentrations of 21–150 mg/L (mean, 83) were attained in 1–3 h (mean, 1.77) [Murry *et al.* 1999].

Ibuprofen lysine (10 mg/kg) given as an IV bolus within the first 3 h after birth to 21 premature neonates produced an ibuprofen plasma concentration of 180.6 mg/L (±11.1) after 1 h. In 5 of the neonates, maintenance doses of 5 mg/kg once daily on days 2 and 3 resulted in mean plasma concentrations of 116.6 mg/L (±54.5) and 113.6 mg/L (±58.2), respectively [Aranda *et al.* 1997].

Percutaneous application of ibuprofen 500 mg (10 g of a 5% gel under occlusion for 2 h, on the back 20 × 20 cm) produced a peak plasma concentration of 7.1 mg/L (±4.4) at 2.4 h (±0.8) in 18 subjects. In the same subjects, a single oral dose of 400 mg produced a peak plasma concentration of 36.7 mg/L (±7.5) at 1.1 h (±0.8) [Kleinbloesem *et al.* 1995].

After a single oral dose of 200 mg to 2 subjects, peak plasma concentrations of 18 and 24 mg/L ibuprofen were attained in 1.5 h; peak plasma concentrations of 0.6 and 1 mg/L for the hydroxy metabolite and 1.7 and 2.1 mg/L for the carboxy metabolite were attained in 3 h; plasma concentrations after oral doses of 200 mg three times daily for 14 days were of the same order [Mills *et al.* 1973].

Toxicity

A 26-year-old male with a history of ibuprofen overdose was found dead after having recently been issued with a prescription for ibuprofen. The following postmortem tissue concentrations were reported: heart blood 518.0 mg/L, femoral blood 348.3 mg/L, liver 942 µg/g, brain 283.9 µg/g, gastric contents 131 mg total [Kunsman, Rohrig 1993].

In 2 overdoses caused by ibuprofen, plasma concentrations of 400 and 711 mg/L were reported ~1.5 h after ingestion. In the first case, the estimated dose was 14–16 g; both subjects recovered [Court *et al.* 1981].

In an attempted suicide involving the ingestion of 12 g ibuprofen, an initial serum concentration of 840 mg/L was reported; this declined to 220 mg/L at 3 h; chlorpheniramine (chlorphenamine) was also detected in the urine. The subject was comatose but recovered within 24 h [Hunt, Leigh 1980].

Half-life Plasma half-life, ~2 h.

Volume of Distribution ~0.1 L/kg.

Protein Binding ~99%.

Note For a review of the clinical pharmacokinetics of ibuprofen, see Davies [1998].

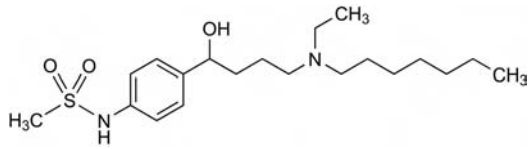
Ibutilide

Antiarrhythmic
$C_{20}H_{36}N_2O_3S = 384.6$
CAS—122647-31-8

IUPAC Name *N*-[4-[4-(Ethylheptylamino)-1-hydroxybutyl]phenyl]methanesulfonamide



Chemical Properties pK_a 10.5 (pH <6); 8.36 (pH >6).

Ibutilide Fumarate

$(C_{20}H_{36}N_2O_3S)_2, C_4H_4O_4 = 885.2$
CAS—122647-32-9
Synonym U-70226E
Proprietary Name *Corvert*
Chemical Properties A white to off-white powder. Mp 117° to 119°. Soluble (>100 g/L) in solutions at pH 7 or less.

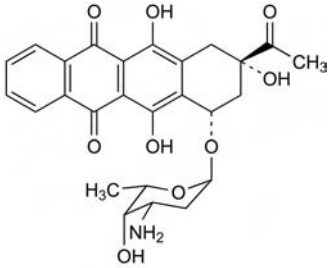
Ultraviolet Spectrum Aqueous acid (ethanol)—228 , 267 nm.
Quantification
Plasma **HPLC** Fluorescence detection (λ_{ex}=224 nm, λ_{em}=340 nm). Limit of detection, <0.018 µg/L [Hsu, Walters 1995].
Disposition in the Body After IV administration, ibutilide is widely distributed in the body and extensively metabolised in the liver, to produce eight metabolites, by *O*-oxidation followed by sequential β-oxidation of the heptyl side chain. Approximately 82% of a dose may be excreted in urine with 7% as the unchanged drug, and up to 19% in excreted in faeces.
Therapeutic Concentration The peak serum concentration, after a 0.01 mg/kg infusion, is ~10 µg/L. Ibutilide has a low therapeutic dosage of 0.01 to 0.03 mg/kg, with peak plasma concentrations not reaching >20 µg/L.
Toxicity Acute toxicity can cause potentially fatal arrhythmias, also tachycardia, hypotension, congestive heart failure, myocardial depression, third degree atrioventricular (AV) block and renal failure. Poisonous by the IV route. Moderately toxic by ingestion.
Half-life 2 to 12 h, with an average of 6 h.
Volume of Distribution 9 to 13 L/kg.
Clearance Plasma clearance, 29 mL/min/kg.
Protein Binding Approximately 40%.
Dose In patients with a body weight >60 kg, a 1 mg dose of ibutilide fumarate is suggested. For those weighing <60 kg, 0.01 mg/kg body weight is administered. Usual dose between 0.01 and 0.10 mg/kg body weight.

Hsu CL, Walters RR (1995). Assay of the enantiomers of ibutilide and artilide using solid-phase extraction, derivatization, and achiral-chiral column-switching high-performance liquid chromatography. *J Chromatogr B Biomed Appl* 667(1): 115–128.

Idarubicin

Antineoplastic
$C_{26}H_{27}NO_9 = 497.5$
CAS—58957-92-9

IUPAC Name (7*S*,9*S*)-9-Acetyl-7-[(3-amino-2,3,6-trideoxy-α-L-*lyxo*-hexopyranosyl)-oxy]-7,8,9,10-tetrahydro-6,9,11-trihydroxy-5,12-naphthacenedione
Synonyms 4-Demethoxydaunomycin; 4-DMDR; IMI 30; NSC-256439.



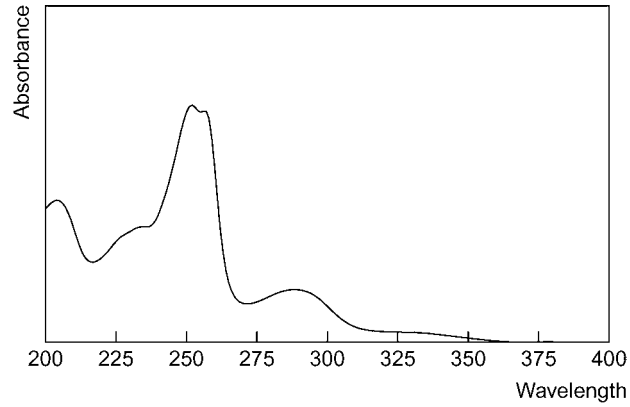
Chemical Properties Log *P* (octanol/water), 2.10.

Idarubicin Hydrochloride

$C_{26}H_{27}NO_9$, HCl = 534.0
CAS—57852-57-0
Proprietary Names *Idamycin*; *Zavedos*.
Chemical Properties An orange crystalline powder. Mp 183° to 185°, also reported as Mp 172° to 174°.

Thin-layer Chromatography System TE—R_f 0.06; system TF—R_f 0.00.
High Performance Liquid Chromatography System HX—RI 410.

Ultraviolet Spectrum Principal peaks at 253, 289 nm.



Quantification
Plasma **HPLC** Column: LC-CN5 Supelcosil (250 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L monobasic sodium phosphate : acetonitrile (65:35), (pH 4.0), flow rate 1 mL/min. Fluorescence detection (λ_{ex}=480 nm, λ_{em}=560 nm). Retention time: idarubicin, 11.3 min; idarubicinol, 8.0 min. Limit of detection and quantification, 0.4 µg/L [Fogli *et al.* 1999].
Serum **LC-MS** Limit of quantification, 5 µg/L [Lachatre *et al.* 2000].
Disposition in the Body After IV administration, idarubicin is rapidly distributed into body tissues and extensively tissue bound. After oral administration, idarubicin is rapidly absorbed. It is mostly metabolised in the liver, by aldoketoreductase, which reduces the ketone function at the C_{13} position to idarubicinol (1,3-dihydroidarubicin), the principal metabolite. The unchanged drug and metabolite are excreted mainly in bile but also in urine. Oral bioavailability is between 24 and 39% after oral administration.
Therapeutic Concentration
Thirteen male and 7 female patients with advanced malignant disease, for example, non-Hodgkins lymphoma, aged between 22 and 76 years, were administered 15 mg/m^2 over 1 min (IV). 11 patients were also administered 40 and 50 mg/m^2 oral doses of idarubicin. Peak plasma levels of idarubicin and idarubicinol ranged between 7.4 and 89.4 nmol/L and reached 1.5 to 8 h after administration [Gillies *et al.* 1987].
Toxicity Acute/high doses of idarubicin (>600 mg/m^2) can lead to myocardial toxicity, with potentially fatal congestive heart failure (CHF), life-threatening arrhythmias and serious gastrointestinal events, for example, bleeding and prefarations.
Half-life 12 to 35 h (idarubicin); 50 to 70 h (idarubicinol).
Volume of Distribution Steady state, 1500 L/m^2.
Clearance Plasma clearance, 60 L/h/m^2.
Protein Binding Idarubicin is 97% bound to plasma proteins and idarubicinol, 94%.
Dose In adults: dose ranges from 8 to 12 mg/m^2/daily for 3 to 5 days (IV) and 15 to 45 mg/m^2/daily, alone or in combination, in a single dose or for 3 days (orally).
In children: 10 mg/m^2/daily for 3 days (IV). Maximum cumulative dose for all indications is 400 mg/m^2. Dose reduced if patient has impaired hepatic or renal function.

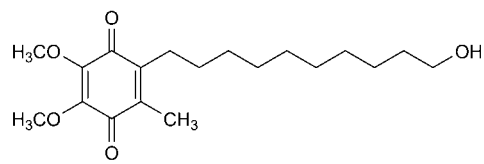
Idebenone

Nootropic
$C_{19}H_{30}O_5 = 338.4$
CAS—58186-27-9

IUPAC Name 2-(10-Hydroxydecyl)-5,6-dimethoxy-3-methylcyclohexa-2,5-diene-1,4-dione
Synonyms CV-2619; 2-(10-hydroxydecyl)-5,6-dimethoxy-3methyl-2,5-cyclohexadiene-1,4-dione; ide,6-(10-hydroxydecyl)-2,3-dimethoxy-5-methyl-*p*-benzoquinone.
Proprietary Names *Avan*; *Daruma*; *Mneisis*.



Chemical Properties Orange needles from ligroin. Mp 46° to 50°. Also reported to be crystals from hexane and ethylacetate. Mp 52° to 53°. Soluble in organic solvents; practically insoluble in water.
High Performance Liquid Chromatography Column: μBondapak C_{18}. Mobile phase: isopropanol : dioxane : water (15 : 15 : 70) containing 0.05% acetic acid. UV detection (λ = 280 nm). Retention time: 6.85 min [Barkworth *et al.* 1985].
Quantification
***Plasma* LC-MS** Column: Supelco C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (80 : 20), 1 mL/min. APCI, SIM acquisition mode. Limit of quantification, 20 μg/L [Hu *et al.* 2000].
***Serum* HPLC** Column: Nucleosil C_{18} (25 × 0.4 cm i.d., 5 μm). Mobile phase: methanol : water containing 20 mmol/L 95% lithium perchlorate, flow rate 1.2 mL/min. ECD. Limit of detection, 500 pmol/L [Artuch *et al.* 2002].
Disposition in the Body Idebenone is metabolised by oxidation followed by β-oxidation, reduction and subsequent conjugation (sulfation and glucuronidation). Two of the main metabolites are QS-4 and QS-6. It is widely distributed in tissues and is excreted as the metabolites in urine and faeces. The ratio of idebenone: QS-4 : QS-6 in urine is 2 : 89 : 9.
Therapeutic Concentration
A peak plasma concentration of 316 ± 85 μg/L was achieved within 96 ± 34 min of the administration of an oral dose of 30 mg to 10 volunteers [Hu *et al.* 2000].
Ten healthy males aged between 21 and 30 years were administered a single oral dose of 100 mg idebenone on days 1 and 35; in between doses of 300 mg daily were received. Peak serum concentrations of 0.65 and 0.85 mg/L were reached on days 1 and 35 within 4 to 5 h, respectively for the parent drug. Peak concentrations for the 2 metabolites, QS-4 and QS-6 were 0.35 and 0.40 mg/L (days 1 and 35) and 0.035 and 0.045 mg/L, respectively, which were reached within 3 h for both metabolites [Barkworth *et al.* 1985].
Half-life 18 h.
Protein Binding ≈90%.
Dose 90 mg daily.

Artuch R *et al.* (2002). Monitoring of idebenone treatment in patients with Friedreich's ataxia by high-pressure liquid chromatography with electrochemical detection. *J Neurosci Methods* 115: 63–66.

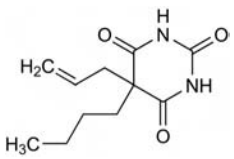
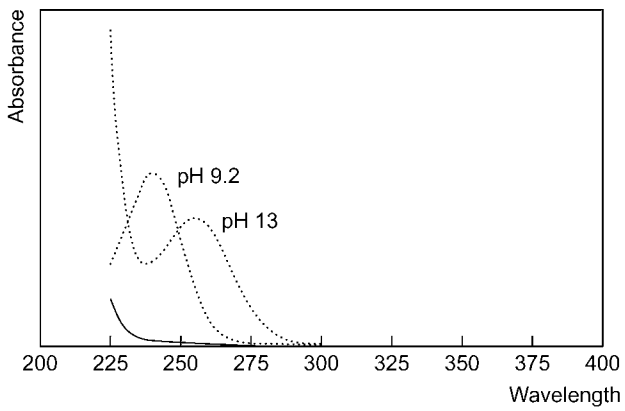
Idobutal

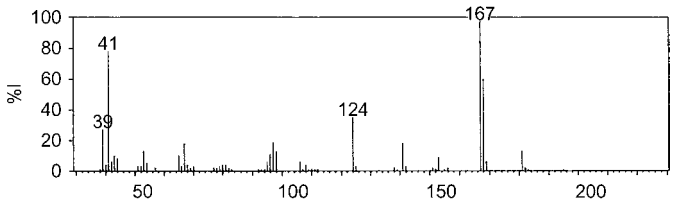
Hypnotic, Barbiturate
$C_{11}H_{16}N_2O_3$ = 224.3
CAS—3146-66-5
IUPAC Name 5-Butyl-5-prop-2-enyl-2,4,6(1H,3H,5H)-pyrimidinetrione
Synonym *n*-Butylallylbarbituric acid



Chemical Properties Crystals. Mp 128°. Slightly soluble in water; freely soluble in ethanol and ether. Log *P* (octanol/water), 2.3.
Thin-layer Chromatography System TD—R_f 0.55; system TE—R_f 0.41; system TF—R_f 0.69; system TH—R_f 0.71; system TAD—R_f 0.59.
Gas Chromatography System GA—idobutal RI 1700; idobutal-Me_2 RI 1610.
High Performance Liquid Chromatography System HG—*k* 8.12; system HH—*k* 4.77; system HY—RI 357.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A^1_1=434b); 1 mol/L sodium hydroxide (pH 13)—254 nm (A^1_1=328b).

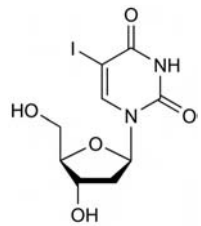


Infrared Spectrum Principal peaks at wavenumbers 1696, 1728, 1755, 835, 1290, 1207 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 167, 41, 168, 124, 39, 97, 141, 67.

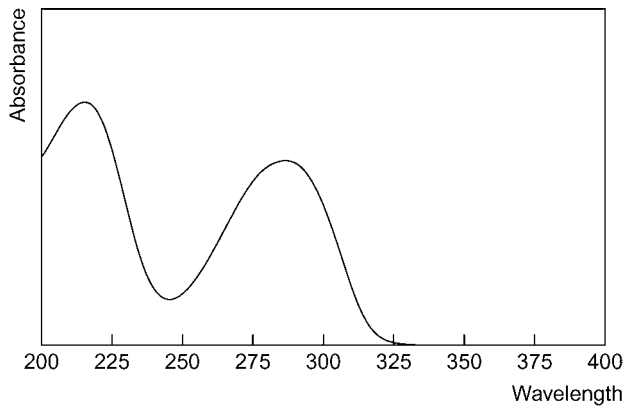


Idoxuridine

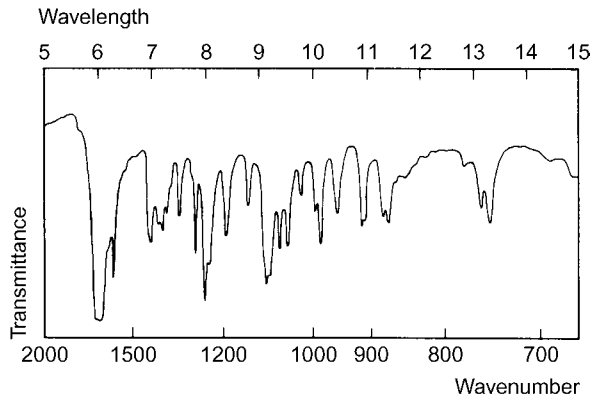
Antiviral
$C_9H_{11}IN_2O_5$ = 354.1
CAS—54-42-2
IUPAC Name 2′-Deoxy-5-iodouridine
Synonyms IDU; 5 IDUR.
Proprietary Names *Herpid*; *Herpidu*; *Herplex*; *Iderpes*; *Idina*; *Idoxene*; *Iducher*; *Idulea*; *Iduridin*; *Idustatin*; *Iduviran*; *Kerecid*; *Ophthalmadine*; *Stoxil*; *Virexen*; *Virudox*; *Virunguent*; *Zostrum*. It is an ingredient of *Herpesine*, *Iducol* and *Virasolve*.



Chemical Properties Colourless crystals or a white crystalline powder. It decomposes on heating with the liberation of iodine vapour. Soluble 1 in 500 of water, 1 in 400 of ethanol and 1 in 230 of methanol; practically insoluble in chloroform and ether. pK_a 8.3. Log *P* (octanol/water), −1.0.
Colour Test Iodine test—positive.
Ultraviolet Spectrum Aqueous acid—288 nm (A^1_1=220a); aqueous alkali—279 nm (A^1_1=162a).



Infrared Spectrum Principal peaks at wavenumbers 1667, 1259, 1096, 1605, 1289, 1070 cm^{-1} (KBr disk).



Quantification

Serum **HPLC** UV detection. For method of quantification for idoxuridine and its metabolite 5-iodouracil, see Belotto *et al.* [1991].

Use Solutions of idoxuridine in dimethyl sulfoxide are used topically in concentrations of 5 to 40%.

Belotto N *et al.* (1991). Determination of 2′-deoxy-5-iodouridine and its metabolite 5-iodouracil by high-performance liquid chromatography with ultraviolet absorbance detection in human serum. *J Chromatogr* 572: 327–332.

Ilodecakin

Antiinflammatory

CAS—149824-15-7

Synonyms Sch-52000; recombinant human interleukin-10.

Dose It is under investigation for its antiinflammatory properties in several diseases including psoriasis, inflammatory bowel disease and hepatitis C. It is postulated that interleukin-10 has immunostimulant as well as immunosuppressive properties.

Imidacloprid

Insecticide

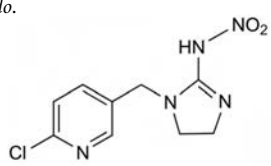
$C_9H_{10}ClN_5O_2$ = 255.7

CAS—138261-41-3; 105827-78-9

IUPAC Name 1-[(6-Chloro-3-pyridinyl)methyl]-4,5-dihydro-*N*-nitro-1*H*-imidazol-2-amine

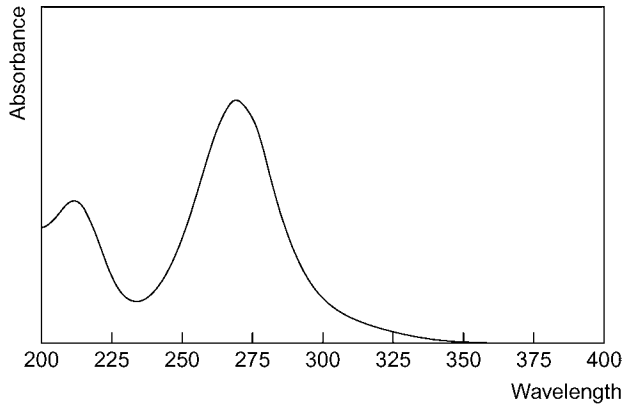
Synonym BAY-NTN 33893

Proprietary Names *Admire*; *Confidor*; *Gaucho*; *Imazethepyr*; *Marathon*; *Merit*; *Premier*; *Premise*; *Provado*.



Chemical Properties A colourless crystalline solid. Mp 136° to 144°. It is soluble in water (0.51 to 0.61 g/L), dichloromethane (50 to 100 g/L at 20°), isopropanol (1 to 2 g/L at 20°), toluene (0.5 to 1 g/L at 20°) and *n*-hexane (<0.1 g/L at 20°). Log *P* (octanol/water), 0.57 (22°).

Ultraviolet Spectrum Principal peaks at 220, 270 nm.



Disposition in the Body Imidacloprid is quickly and almost completely absorbed after ingestion and degraded to 6-chloronicotinic acid, which may be conjugated with glycine and then eliminated or reduced to guanidine. Of an administered dose, 70 to 80% may be excreted in urine, with 20 to 30% in faeces.

Imidapril

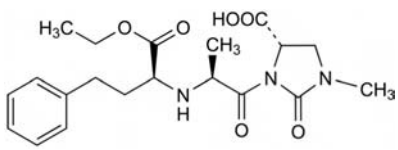
Antihypertensive

$C_{20}H_{27}N_3O_6$ = 405.4

CAS—89371-37-9

IUPAC Name (*4S*)-3-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]-1-methyl-2-oxo-4-imidazolidinecarboxylic acid

Proprietary Names *Novarok*; *Tanatril*.



Chemical Properties Colourless crystals (from ethyl acetate and *n*-hexane). Mp 139° to 140°.

Imidaprilat

$C_{18}H_{23}N_3O_6$ = 377.4

CAS—89371-44-8

Chemical Properties Crystals. Mp 239° to 241°.

Imidapril Monohydrochloride

$C_{20}H_{27}N_3O_6$, HCl = 441.9

CAS—89396-94-1

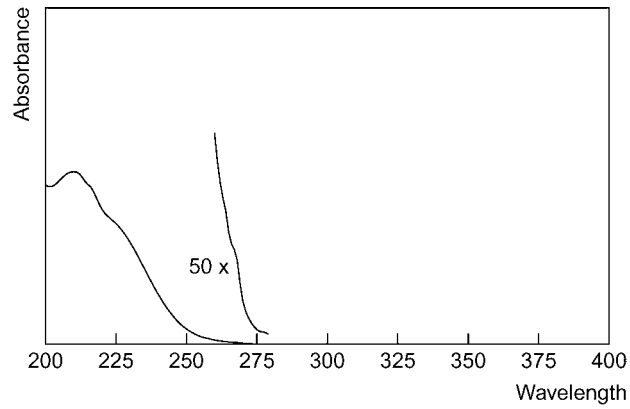
Synonym TA-6366

Proprietary Names *Novaloc*; *Tanatril*.

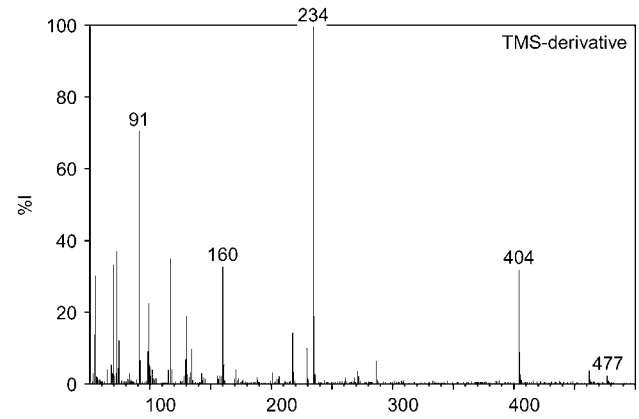
Chemical Properties Colourless crystals. Mp 214° to 216° (dec).

High Performance Liquid Chromatography Column: Symmetry C_{18}(100 × 2.1 mm i.d., 3.5 µm). Temperature: 40°. Mobile phase: acetonitrile : 0.05% formic acid (1:3), flow rate 0.2 mL/min. MS–MS detection (ESI, *m/z*: 406→234 for imidapril and 378→206 for imidaprilat). Retention time: imidapril, 3.06 min, imidaprilat, 4.39 min [Mabuchi *et al.* 1999].

Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 234, 91, 74, 107, 70, 160, 55, 404 (TMS derivative).



Quantification

Plasma **GC–MS** Limit of detection, 1 µg/L for the metabolites [Matsuoka *et al.* 1992].

HPLC Limit of determination, 0.2 µg/L for imidapril and 0.5 µg/L for imidaprilat [Horimoto *et al.* 1993]. Limit of detection, 0.2 µg/L and 10 µg/L, for imidapril and its active metabolite, imidaprilat, respectively [Tagawa *et al.* 1993].

Urine **GC–MS** Limit of detection, 5 µg/L for the metabolites [Matsuoka *et al.* 1992].

HPLC See Plasma [Tagawa *et al.* 1993].

Disposition in the Body Imidapril is rapidly absorbed and extensively metabolised in the liver, by de-esterification, to its pharmacologically active diacid metabolite, imidaprilat and a number of minor metabolites. Peak concentrations of the drug are seen after 2 h and the active metabolite, 7 to 8 h after administration. It is excreted in urine mainly as the metabolites.

Therapeutic Concentration

Ten hypertensive patients without renal or hepatic disease or diabetes, aged 37 to 72 years, 3 males and 7 females, were administered a 10 mg single dose of imidapril and 10 mg daily for 4 weeks in a multiple dose study. Peak concentrations of 39.3 µg/L imidapril and 15.7 µg/L imidaprilat were observed 1 to 2 h and 5 to 10 h, respectively, after administration. In the multiple dosing study, levels reached 34.7 and 20.4 µg/L for the parent drug and its metabolite, respectively in 1 to 2 h and 3 to 6 h [Harder *et al.* 1998].

Eight patients with normal liver function, with a mean age of 42 years, and 8 patients with liver dysfunction, mean age 55 years, were administered a 10 mg dose once daily for 7 days. The mean peak plasma concentration of imidapril was 33.9 μg/L, observed 1.1 to 2.5 h after administration, for the healthy individuals and 38.0 μg/L after 1.5 to 3.0 h for those with liver dysfunction. Mean concentrations for the metabolite, imidaprilat, were 12.0 μg/L and 5.2 μg/L, respectively for the two groups of patients observed after 6.0 to 8.1 h, and 4.2 to 12.1 h [Hoogkamer *et al.* 1997].

Group 1: 8 volunteers with normal renal function, mean age 53 years. Group 2: 8 patients with moderate renal failure, mean age 58 years. Group 3: 8 patients with severe renal failure. All groups were administered 10 mg once daily for 7 days. The mean peak plasma concentrations of imidapril were 25.9, 37.8 and 75.8 μg/L, for the three groups, observed 1.0 to 3.5 h after administration. Mean concentrations for the metabolite, imidaprilat, were 8.6, 17.1 and 51.7 μg/L for groups 1, 2 and 3, respectively. These concentrations were seen 3.0 to 12.4 h after administration [Hoogkamer *et al.* 1998].

Bioavailability About 20%.
Half-life 2 h (imidapril); 8 h (imidaprilat).
Protein Binding 85%.
Dose 5 to 10 mg daily, as the hydrochloride.

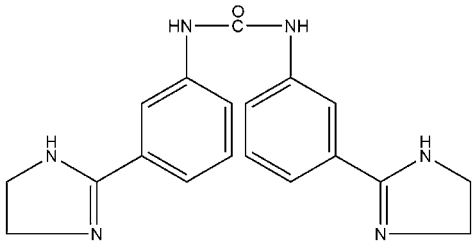
Imidocarb

Antiprotozoal (Veterinary)
$C_{19}H_{20}N_{60}$ = 348.4
CAS—27885-92-3

IUPAC Name 1,3-Bis[3-(4,5-dihydro-1*H*-imidazol-2-yl)phenyl]urea
Synonym 3,3′-Di(2-imidazolin-2-yl)carbanilide



Chemical Properties White crystalline powder, Mp 370°, with decomposition. Soluble in dilute acetic acid.

Imidocarb Dihydrochloride

Synonym 4A65
Chemical Properties Imidocarb is extracted by ether from aqueous alkaline solutions.

Colour Test Vitali's test—pale yellow/orange (limit of detection, 1.0 μg).
Thin-layer Chromatography System T1—R_f 0.03 (location reagent acidified iodoplatinate spray, strong reaction).
Gas Chromatography System G2/225—no peak within 30 min; system G4/225—no peak within 30 min.
High Performance Liquid Chromatography Column: C_{18} RP, ABZ+ Plus (150 × 4.6mm, 5 μm). Mobile phase: acetonitrile : 0.005 mol/L 1-pentansulfonic acid sodium salt in water containing 0.1% triethylamine with glacial acetic acid (pH 3.2, 10 : 90 for 2 min to 20 : 80 at 8 min for 4 min to 10 : 90 at 12 min for 3 min), flow rate 1 mL/min. UV detection (λ= 250 nm). Retention time: 9.18 ± 0.10 min. Limit of detection, 0.025 mg/L. [Lai *et al.* 2002].

Column: C_{18} RP, XBridge™ (150 × 4.6 mm, 5 μm). Mobile phase: 0.1% trifluoroacetic acid in water : acetonitrile (89 : 11), flow rate 1.0 mL/min. UV detection. Retention time: 10.0 min. Limit of quantification, 0.01 mg/L, limit of detection, 0.005 mg/L [Su *et al.* 2007].

Column: C_{18} (100 × 4.6 mm, 50 μm). Mobile phase: 0.01 mol/L sodium acetate with 0.001 mol/L sodium trifluoroacetate (pH 7)-acetonitrile (85 : 15) : 0.01 mol/L sodium acetate with 0.01 mol/L trifluoroacetic acid and 0.01 mol/L tetramethylammonium chloride (pH 2)-acetonitrile (90 : 10, 85 : 15 for 5 min to 90 : 10 at 5 min for 15 min, flow rate 1.0 mL/min. UV detection (λ= 260 nm) [Tarbin, Shearer 1992].

Disposition in the Body
Intramuscularly injected imidocarb was administered to 7 sheep (4.5 mg/kg), the peak plasma concentration after 4 h was 7.9 mg/L, rapidly decreasing to 4.6 mg/L in the next 2 h. Trace amounts of imidocarb were still present 4 weeks after administration. Twenty-four hours after IM administration the highest concentrations of imidocarb were found in the kidney, liver and brain. Within 24 h 11–17% was excreted in the urine. High concentrations were also found in bile and in the milk from lactating ewes. [Aliu *et al.* 1977].
Toxicity LD_{50} (SC) in mice 107 mg/kg and in rats 150 mg/kg.
Dose 3 mg/kg body weight in cattle (red water disease) [Tarbin, Shearer 1992].

Aliu YO *et al.* (1977). Absorption, distribution, and excretion of imidocarb dipropionate in sheep. *Am J Vet Res* 38: 2001–2007.

Lai O *et al.* (2002). Depletion and bioavailability of imidocarb residues in sheep and goat tissues. *Vet Hum Toxicol* 44: 79–83.

Su D *et al.* (2007). Pharmacokinetics and bioavailability of imidocarb dipropionate in swine. *J Vet Pharmacol Ther* 30: 366–370.

Tarbin JA, Shearer G (1992). High-performance liquid chromatographic determination of imidocarb in cattle kidney with cation-exchange clean-up. *J Chromatogr* 577: 376–381.

Iminodimethylphenylthiazolidine

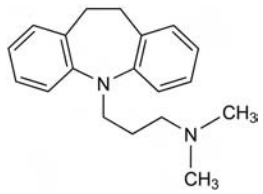
Sympathomimetic
$C_{11}H_{14}N_2S$ = 206.3

Synonym (—)-2-Imino-3,4-dimethyl-5-phenylthiazolidine
Chemical Properties Insoluble in water; soluble in chloroform.
Colour Test Ammonium vanadate test—(green) orange (limit of detection, 0.1 μg).
Thin-layer Chromatography System T1—R_f 0.48 (location reagent acidified iodoplatinate spray, positive reaction).

Imipramine

Antidepressant
$C_{19}H_{24}N_2$ = 280.4
CAS—50-49-7

IUPAC Name 10,11-Dihydro-*N*,*N*-dimethyl-5*H*-dibenz[*b*,*f*]azepine-5-propanamine
Synonyms 5-(3-Dimethylaminopropyl)-10,11-dihydro-5*H*-dibenz[*b*,*f*]azepine; *N*-(γ-dimethylaminopropyl)iminodibenzyl; imizin; G-22355.
Proprietary Name *Topramine*



Chemical Properties pK_a 9.53 (24°) [Esrafili *et al.* 2007]. Log *P* (octanol/water), 4.47 [Esrafili *et al.* 2007], (octanol/water pH 7.4), 2.5. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Imipramine Embonate

$(C_{19}H_{24}N_2)2$, $C_{23}H_{16}O_6$ = 949.2
CAS—10075-24-8
Synonym Imipramine pamoate
Proprietary Name *Tofranil-PM*
Chemical Properties A yellow powder. Practically insoluble in water; soluble in ethanol, chloroform and ether.

Imipramine Hydrochloride

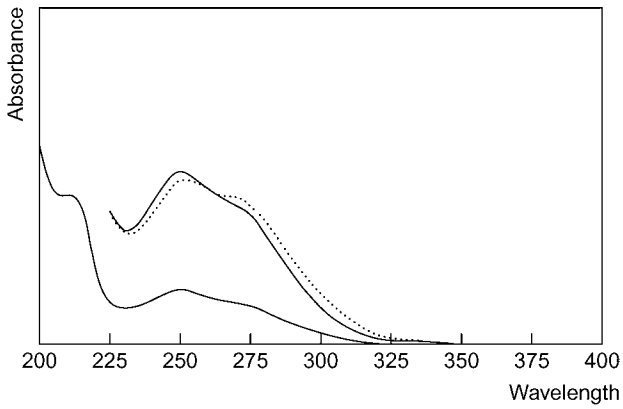
$C_{19}H_{24}N_2$, HCl = 316.9
CAS—113-52-0
Synonym Imizine
Proprietary Names *Antidep*; *Berkomine*; *Celamine*; *Ethipramine*; *Imavate*; *Impril*; *Iramil*; *Janimine*; *Medipramine*; *Melipramine*; *Mipralin*; *Novo-Pramine*; *Presamine*; *Primonil*; *Pryleugan*; *Sermonil*; *Talpramin*; *Tofranil*.
Chemical Proprieties A white or slightly yellow crystalline powder. Mp 174° to 175° (crystals from acetone). Soluble 1 in 2 of water, 1 in 1.5 of ethanol and 1 in 1.5 of chloroform; sparingly soluble in acetone; practically insoluble in ether.

Colour Test Forrest reagent—blue; FPN reagent—blue; Liebermann's reagent—blue; Mandelin's test—blue (add water).
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.48; system TC—R_f 0.23; system TE—R_f 0.67; system TL—R_f 0.13; system TAE—R_f 0.21; system TAF—R_f 0.47; system TAJ—R_f 0.07; system TAK—R_f 0.02; system TAL—R_f 0.52 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; FPN reagent, blue; Marquis test, blue).

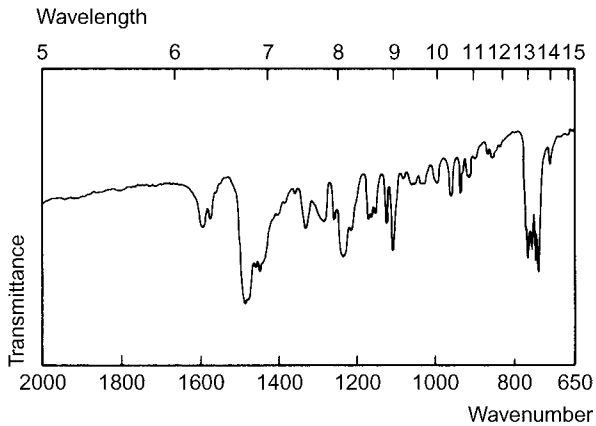
Gas Chromatography System GA—imipramine RI 2230, desipramine RI 2235, M (OH-) RI 2565, M (OH-methoxy-ring) RI 2390, M (OH-ring) RI 2240, M (di-OH-ring) RI 2600, M (ring) RI 1930, M (OH-)-AC RI 2610, M (OH-methoxy-ring)-AC RI 2370, M (OH-ring)-AC RI 2535, M (bis-nor-)-AC RI 2640, M (OH-)-Me RI 2480; system GB—imipramine RI 2314, M (2-OH-) RI 2636, M (10-OH-) RI 2494, M (di-OH-) RI 2962, M (OH-methoxy-) RI 2715; system GF—RI 2540; system GM—RRT 0.784 (relative to iprindole); system GS—RT 17.1 min.

High Performance Liquid Chromatography System HA—imipramine *k* 4.2, desipramine *k* 2.1, 2-hydroxydesipramine *k* 1.2, 2-hydroxyimipramine *k* 3.1; system HF—imipramine *k* 4.17, desipramine *k* 3.60; system HX—RI 437; system HY—RI 335; system HZ—RT 6.7 min; system HAA—RT 15.1 min; system HAM—RT 9.0 min; system HAV—*k* 6.4; system HAX—RT 14.7 min; system HAY—RT 6.8 min; system HAZ—imipramine *k* 1.62, M (10-OH-) *k* 0.39, M (2-OH-) *k* 0.39, M (*N*-oxide) *k* 1.85.

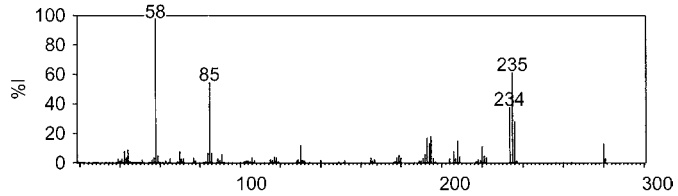
Ultraviolet Spectrum Aqueous acid—251 nm ($A_1^1 = 298a$); aqueous alkali—252 nm (see below).



Infrared Spectrum Principal peaks at wavenumbers 740, 747, 765, 1230, 1110, 756 cm^{-1} (imipramine hydrochloride, KBr disk, see below).



Mass Spectrum Principal ions at *m/z* 58, 235, 85, 234, 236, 195, 193, 208; desipramine 235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxyimipramine 58, 251, 250, 211, 85, 42, 209, 296; 2-hydroxydesipramine 44, 209, 211, 250, 210, 224, 42, 251.



Quantification

Blood **GC-MS** Column: Chem Elut and Bond Elut Certify. Limit of quantification, 128–504 µg/L and 70–330 µg/L, respectively; limit of detection, 39–153 µg/L and 21–100 µg/L, respectively [Martinez *et al.* 2002].

LC-MS Column: XTerra RP-18. Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2). MRM acquisition mode. Limit of quantification, 2 µg/L [Titier *et al.* 2007].

Plasma **GC** Limit of quantification, 25 µg/L [Way *et al.* 1998]. Column: DB-17 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: N_2 0.7 mL/min. Temperature programme: 260° for 1 min. NPD. Limit of quantification, 90 µg/L [Ulrich, Martens 1997].

GC-MS EI ionisation, SIM acquisition mode, positive ion mode. Limit of quantification, 2–5 µg/L, limit of detection, 0.5–2 µg/L [Lee *et al.* 2008]. MSD, 234 *m/z* [Pommier *et al.* 1997]. Column: 3% OV-17 on 80/100 mesh Chromosorb WHP or 1.5% Poly*S*-179 on 80/100 mesh Chromosorb W AW DMCS (1.5 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 230° to 250°. EI ionisation at 37 eV. Retention time: 2.4–2.7 min. Limit of detection, 0.2 µg/L [Alkalay *et al.* 1979].

HPLC Column: A Kromasil C_8 (250 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L ammonium acetate : acetonitrile (45 : 55), flow rate 1.5 mL/min [Samanidou *et al.* 2007]. Column: Zorbax Extend-C_{18} (100 × 2.1 mm i.d., 3.5 µm i.d.). Mobile phase: 0.02 mol/L acetic acid (pH 4.0) : methanol (54 : 46), flow rate 0.25 mL/min. UV detection (λ = 215 nm). Limit of detection, 0.5–0.7 µg/L [Esrafili *et al.* 2007]. Column: Nucleosil 100 C_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : phosphate buffer (pH 3.0, 60 : 40), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 3.6 min. Limit of quantification, 2 µg/L, limit of detection, 1.0 µg/L [Chmielewska *et al.* 2006], Column: C_{18}. Mobile phase: methanol : acetate buffer (70 : 30). UV detection (λ = 215 nm). Limit of detection, 2 µg/L [Bakkali *et al.* 1999]. Mobile phase: acetonitrile : 0.1 mol/L dipotassium hydrogen phosphate (pH 6.0, 30 : 70) flow rate 2 mL/min. Limit of quantification, 3 µg/L [Chen *et al.* 1997]. Column: Eicompak C_{18} reversed phase (250 × 4.6 mm i.d., 7 µm). Mobile phase: 0.05 mol/L potassium monophosphate buffer (pH 4.0) : acetonitrile : methanol (670 : 330 : 5) with 2.5 mmol/L sodium 1-octane sulfonate, flow rate 1.3 mL/min. Electrochemical detection. Retention time: 24.5 min. Limit of quantification, 0.5 µg/L [Koyama *et al.* 1993]. See also Foglia *et al.* [1991], Kabra *et al.* [1981], Nielsen, Brosen [1993] and Suckow, Cooper [1981].

LC-MS Column: Inertsil C_8. Mobile phase: methanol : 10 µmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. Limit of detection, 30 and 630 µg/L [Shinozuka *et al.* 2006].

Serum **GC-MS** See Plasma [Alkalay *et al.* 1979].

HPLC See Plasma [Kabra *et al.* 1981].

Urine **HPLC** See Plasma [Chen *et al.* 1997; Esrafili *et al.* 2007; Koyama *et al.* 1993; Nielsen, Brosen 1993].

Disposition in the Body Imipramine is readily absorbed after oral administration and widely distributed throughout the tissues; bioavailability is ~50%, but there is considerable intersubject variation. Imipramine undergoes considerable first-pass metabolism, mainly by demethylation to the primary active metabolite desipramine. Other major metabolic reactions include hydroxylation at the 2- or 10-positions followed by conjugation. Both pathways are genetically determined. 2-Hydroxyimipramine and 2-hydroxydesipramine appear to be active. A large number of metabolites have been identified in the urine and <10% of a dose is excreted unchanged. A total of ~40% of a dose is excreted in the urine in 24 h and ~70% in 72 h. Of the urinary material, up to 40% consists of free and conjugated 2-hydroxydesipramine, up to ~25% is free and conjugated 2-hydroxyimipramine, and ~15% is free and conjugated 2-hydroxyiminodibenzyl; small amounts of didesmethylimipramine, free iminodibenzyl and 10-hydroxydesipramine are also found. The excretion of unchanged drug and unconjugated metabolites is pH dependent and is increased in acid urine. Approximately 20% of a dose is eliminated in the faeces. Imipramine and desipramine cross the blood–brain barrier and placenta. They are excreted in breast milk in concentrations similar to those found in plasma.

Therapeutic Concentration Plasma concentrations vary considerably between individual subjects; therapeutic effect has been correlated with plasma concentrations of imipramine plus desipramine greater than 0.1 mg/L.

Following a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.010–0.083 mg/L (mean 0.03) imipramine and 0.004–0.014 mg/L (mean 0.008) desipramine were attained in ~3.4 h and 4.8 h, respectively [Sistovaris *et al.* 1983].

After daily oral doses of 50 to 300 mg (mean 100) to 24 subjects, the following steady-state plasma concentrations were reported: imipramine 0.01–0.11 mg/L (mean 0.05), desipramine 0.02–0.33 mg/L (mean 0.09), 2-hydroxyimipramine 0–0.02 mg/L (mean 0.01), 2-hydroxydesipramine 0–0.06 mg/L (mean 0.03) and didesmethylimipramine 0–0.04 mg/L (mean 0.007) [Gram *et al.* 1983].

Toxicity In adults the estimated minimum lethal dose is 1 g, although fatalities have occurred with less and patients have survived the ingestion of as much as 5 g. In children, as little as 350 mg may be fatal. Blood concentrations greater than 0.5 mg/L (imipramine plus desipramine) may cause toxic effects and imipramine concentrations of 0.8–13 mg/L (mean 4.5) have been associated with fatalities.

In 5 deaths attributed to overdosage with imipramine, the following postmortem concentrations were found: blood 0.3–4.1 mg/L (mean 2.7), bile 19.2–71.7 mg/L (mean 46, 4 cases), liver blood 0.2–9.6 mg/L (mean 4.6), urine 0.8–12.7 mg/L (mean 5.3, 3 cases) [Robinson, Holder 1979].

A 49-year-old female was found dead after having ingested 33 tablets, equivalent to 925 mg imipramine; blood and tissue concentrations were as follows: blood 14 mg/L, bile 88 mg/L, brain 25 µg/g, liver 75 µg/g [Singh *et al.* 1978].

In 2 deaths caused by imipramine overdose, the following postmortem tissue concentrations were reported:

	Imipramine	*Desipramine*
Blood (mg/L)	10, 3	3, trace
Kidney (µg/g)	9, —	6, -
Liver (µg/g)	16, 46	10, 13
Urine (mg/L)	-, 64	-, 13

[Hodda 1974]

In a death involving the ingestion of imipramine, paracetamol and ethanol, the following concentrations of imipramine, desipramine, 2-hydroxyimipramine and paracetamol, respectively, were reported: blood 9.0, 1.1, 3.9 and 11 mg/L; urine 92, 14, 42, – mg/L. Ethanol concentration in the blood and urine was <100 mg/L and 1050 mg/L, respectively [Fraser *et al.* 1987].

In 2 unrelated cases, a 7-year-old boy and a 21-year-old woman died suddenly while receiving chronic imipramine therapy; the evidence indicated that neither had ingested an acute overdose. The following postmortem tissue concentrations were reported for imipramine and desipramine, respectively, in the boy: left femoral blood 0.5 and 6.7 mg/L, right femoral blood 1.2 and 9.9 mg/L, aorta blood 1.0 and 8.7 mg/L, liver 68 and 400 µg/g. In the female, the imipramine and desipramine concentrations, respectively, were 0.6 and 3.74 mg/L in the femoral blood and 37 and 261 µg/g in the liver [Swanson *et al.* 1997]

Half-life Plasma half-life, imipramine 8–20 h, increased in children, elderly subjects and after overdose; desipramine 10–35 h.

Volume of Distribution 10–20 L/kg.

Clearance Plasma clearance, ~15 mL/min/kg, decreased in elderly subjects.

Distribution in Blood Plasma : whole blood ratio, 0.98.

Protein Binding 85–95%.

Note For a review of the pharmacokinetics of tricyclic antidepressants see Molnar, Gupta [1980].

Dose In the treatment of depression, 25 to 200 mg imipramine hydrochloride daily; up to 300 mg daily has been given.

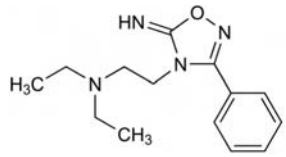
Imolamine

Antianginal Vasodilator

$C_{14}H_{20}N_4O$ = 260.3

CAS—318-23-0

IUPAC Name 4-[2-(Diethylamino)ethyl]-5-imino-3-phenyl-Δ^2-1,2,4-oxadiazoline



Chemical Properties Log *P* (octanol/water), 3.6.

Imolamine Hydrochloride

$C_{14}H_{20}N_4O$, HCl = 296.8

CAS—15823-89-9

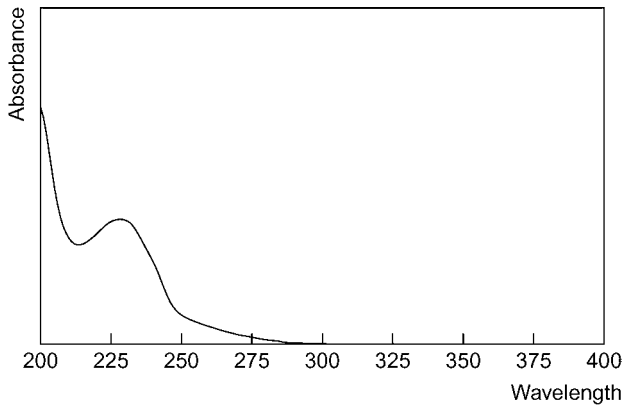
Proprietary Name *Irrigor*

Chemical Properties A white powder. Mp 154° to 155°. Soluble 1 in 1 of water and 1 in 500 of ethanol; slightly soluble in chloroform.

Thin-layer Chromatography System TA—R_f 0.56 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2177.

Ultraviolet Spectrum Principal peak at 230 nm.



Infrared Spectrum Principal peaks at wavenumbers 1638, 698, 752, 1610, 1500, 1070 cm^{-1} (KBr disk).

Dose Imolamine hydrochloride has been given in doses of 30 to 90 mg daily.

Indapamide

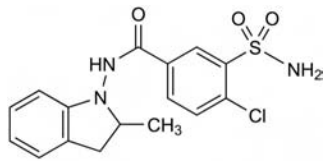
Diuretic

$C_{16}H_{16}ClN_3O_3S$ = 365.8

CAS—26807-65-8

IUPAC Name 3-(Aminosulfonyl)-4-chloro-*N*-(2,3-dihydro-2-methyl-1*H*-indol-1-yl)-benzamide

Proprietary Names *Agelan*; *Clonilix*; *Dapamax*; *Dapa-Tabs*; *Daptril*; *Extur*; *Fludapamide*; *Fludex*; *Inamide*; *Indaflex*; *Indamol*; *Indanorm*; *Indolin*; *Lozol*; *Napamide*; *Naplin*; *Natramid*; *Natrilix*; *Nindaxa*; *Opumide*; *Pressural*; *Tandix*; *Tertensif*.



Chemical Properties Log *P* (octanol/water), 2.7.

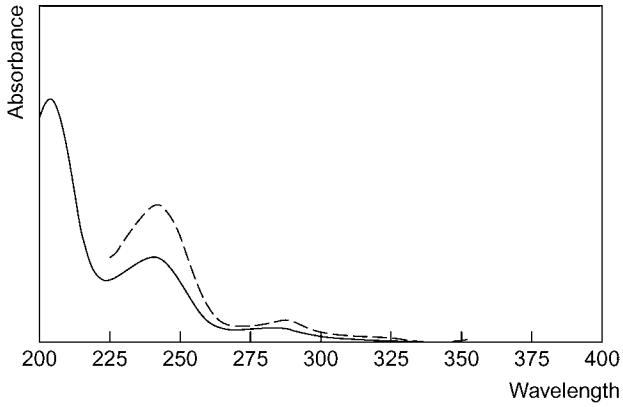
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—violet-red; Mandelin's test—red; Marquis test—orange→violet; mercurous nitrate—black; sulfuric acid—pink (slow).

Thin-layer Chromatography System TD—R_f 0.38; system TE—R_f 0.66; system TF—R_f 0.61; system TAD—R_f 0.46; system TAE—R_f 0.89; system TAJ—R_f 0.56; system TAK—R_f 0.22; system TAL—R_f 0.92.

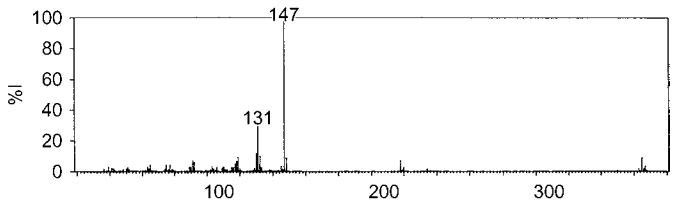
Gas Chromatography System GA—indapamide-Me_3 RI 3035; system GX—indapamide-Me_3 retention time 9.0 min.

High Performance Liquid Chromatography System HA—*k* 0.1.

Ultraviolet Spectrum Ethanol—242 (A^{1}_{1}=627b), 288 nm.



Mass Spectrum Principal ions at *m/z* 147, 131, 130, 132, 119, 148, 365, 218.



Quantification
Blood **HPLC** UV detection. For method of quantification, see Miller *et al.* [1993]. UV detection. Limit of detection, 50 µg/L [Choi *et al.* 1982].
Plasma **HPLC** UV detection. Limit of detection, 25 µg/L [Choi *et al.* 1982].
Urine **HPLC** Amperometric detection. Limit of detection, <1 µg/L [Legorburu *et al.* 1999]. UV detection. Limit of detection, 25 µg/L for indapamide and 4-chloro-3-sulfamoylbenzoic acid [Pietta *et al.* 1982]. See Blood [Choi *et al.* 1982].
Disposition in the Body Rapidly absorbed after oral administration. It is extensively metabolised and about 60% of a dose is slowly excreted in the urine over a period of 8 days with <5% as unchanged drug. About 20% of a dose is slowly eliminated in the faeces.
Therapeutic Concentration
Following a single oral dose of 5 mg to 22 subjects, a mean peak plasma concentration of 0.26 mg/L was attained in about 2 to 3 h [Grebow *et al.* 1982].
Following daily oral doses of 2.5 mg to 6 subjects, steady-state plasma concentrations of 0.02 to 0.05 mg/L (mean 0.03) were attained in 3 days [Campbell *et al.* 1977].
In 12 subjects, a single oral dose of indapamide as a 2.5 mg immediate-release preparation or as a 1.5 mg sustained-release formulation produced a dose-normalised mean peak plasma concentration of 39.3 µg/L at 0.8 h and 17.6 µg/L at 12.3 h, respectively [Schiavi *et al.* 2000].
Half-life Plasma half-life, about 15 h.
Protein Binding About 80%.
Note For a review of indapamide, see Chaffman *et al.* [1984].
Dose 2.5 to 5 mg daily.

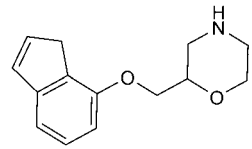
Indeloxazine

Nootropic
$C_{14}H_{17}NO_2$ = 231.3
CAS—60929-23-9
IUPAC Name (±)-2-[(Inden-7-yl-oxy)methyl]morpholine
Synonym Indeloxacine



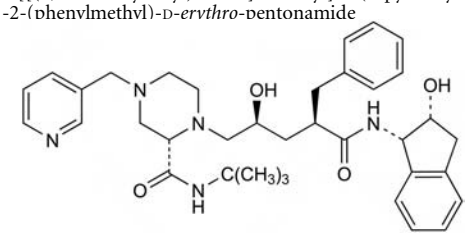
Indeloxazine Hydrochloride
$C_{14}H_{17}NO_2$, HCl = 267.8
CAS—65043-22-3
Synonyms CI-874; YM-08054-1.
Proprietary Names *Elen*; *Noin*.

Chemical Properties (±)-Form: pale-yellow needles from methanol, Mp 169° to 170°. Also reported as colourless acicular crystals from acetone, Mp 155° to 156°. (+)-Form: crystals from ethanol, Mp 112° to 113°. (−)-Form: crystals form isopropanol, Mp 142° to 142.5°.
Mass Spectrum Principal ions at *m/z* 100, 56, 231, 132, 103, 115, 57, 70.
Quantification
Plasma **GC-MS** Column: 3% OV-1 on Chromosorb W 80/100 mesh (50 cm × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 210°. Limit of detection, 2 µg/L [Kamimura *et al.* 1985].
HPLC Column: LiChrosorb SI-60 (15 cm × 4 mm i.d., 5 µm). Mobile phase: *n*-heptane : ethyl acetate (20 : 3), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 350 nm, λ_{em} = 505 nm). Retention time: 3.4 min. Limit of detection 5 µg/L [Kamimura *et al.* 1985].
Disposition in the Body Indeloxazine is metabolised in the liver by glucuronidation and metabolites include *trans*-4-(2-morpholinylmethoxy)-1,2-indenediol and *trans*-6-[[(1,2-dihydroxy-4-indanyl)oxy]methyl]-3-morpholine.
Toxicity Poison by SC and IV routes. Moderately toxic by ingestion.

Kamimura H *et al.* (1985). Determination of indeloxazine in plasma by liquid chromatography and gas chromatography-mass spectrometry. *J Pharm Sci* 74: 559–561.

Indinavir

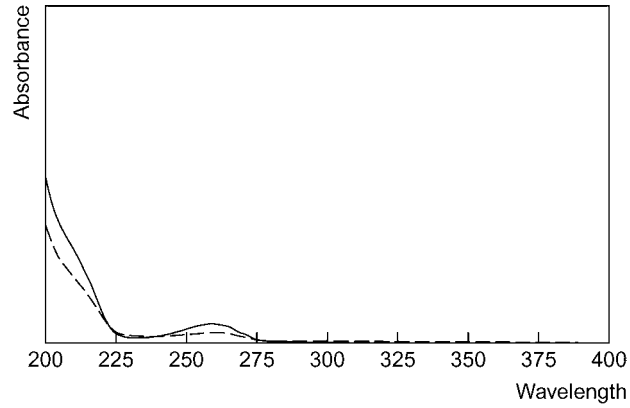
Protease Inhibitor, Antiviral
$C_{36}H_{47}N_5O_4$ = 613.8
CAS—150378-17-9
IUPAC Name 2,3,5-Trideoxy-*N*-[(1*S*,2*R*)-2,3-dihydro-2-hydroxy-1*H*-inden-1-yl]-5-[(2*S*)-2-[[(1,1-dimethylethyl)amino]carbonyl]-4-(3-pyridinylmethyl)-1-piperazinyl]-2-(phenylmethyl)-D-*erythro*-pentonamide



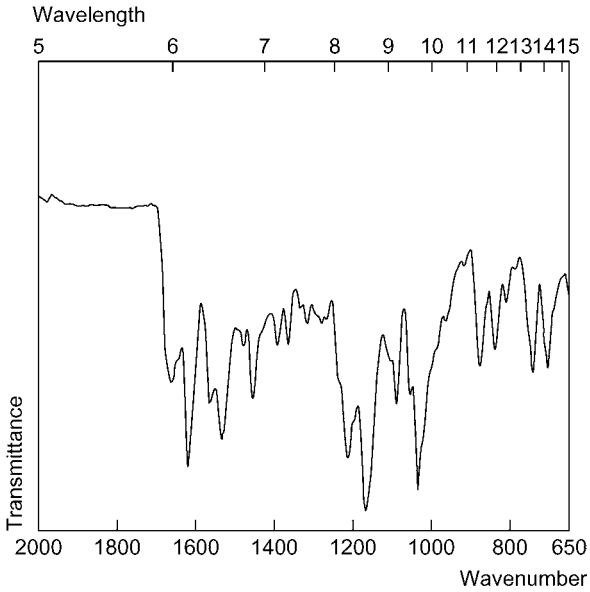
Chemical Properties Crystalline two anhydrous forms, Mp 153° to 154° (first anhydrous form), 167.5° to 168° (second anhydrous form). It is soluble in water: 0.015 g/L (unbuffered) and > 1.5 g/L (pH 4).

Indinavir Sulfate
$C_{36}H_{47}N_5O_4$, H_2SO_4 = 711.9
CAS—157810-81-6
Synonyms L-735524; MK-639; MK-0639.
Proprietary Name *Crixivan*
Chemical Properties Crystals from absolute ethanol. Mp 150° to 153° (softens at 135°).

High Performance Liquid Chromatography System HAB—retention time 4.2 min; system HAC—*k* 2.0.
Ultraviolet Spectrum Aqueous acid—210 (major band), 259 nm (minor).



Infrared Spectrum Principal peaks at wavenumbers 3295, 1619, 1535, 1215, 1169, 1035 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 596, 513, 465, 364, 338.

Quantification

***Plasma* HPLC** UV detection (λ=261 nm). Limit of quantification, 0.05 mg/L [Aymard *et al.* 2000]. UV detection (λ=210 nm). Limit of quantification, 0.005 mg/L [Woolf *et al.* 1995].

***Serum* HPLC** UV detection (λ=250 nm). Limit of detection, 0.21 mg/L [Simon *et al.* 2001].

***Urine* HPLC** See Plasma [Woolf *et al.* 1995].

Disposition in the Body Indinavir is rapidly absorbed after oral administration and peak plasma concentrations are reached within 0.8 h. Absorption is reduced when administration occurs with a high fat meal. The drug is metabolised by oxidation by the CYP3A4 isoenzyme in the liver and also glucuronidation, *para*-hydroxylation, 3′-hydroxylation and *N*-depyridomethylation. Seven metabolites have been isolated and identified; minor product identified as a 2′,3′-*trans*-dihydroxyindan analogue. <20% of the absorbed dose is excreted in urine, with about half being the unchanged drug. The rest is excreted in faeces.

Therapeutic Concentration

Twelve HIV-positive male patients, aged 40 to 49 years, were fasted overnight and administered indinavir as three dosing regimens. Group 1: 800 mg indinavir twice daily and 100 mg ritonavir twice daily. Group 2: 1200 mg indinavir twice daily. Group 3: 1200 mg indinavir twice daily and 100 mg ritonavir twice daily. The peak plasma indinavir concentration for group 1 was 8.7 mg/L (range, 7.5 to 10.0 mg/L); group 2, 13.8 (range, 9.5 to 18.0) mg/L; group 3, 15.4 mg/L. These levels were observed at 2.3 (0.5 to 4.0), 1.0 (0.5 to 1.5) and 1.0 to 1.5 h for the three groups, respectively [van Heeswijk *et al.* 1999].

Eleven children, aged between 9.0 and 13.6 years (mean, 11.0 years), infected with HIV-1 and previously treated with a nucleoside analogue reverse transcriptase inihibitor (zidovudine alone or in combination with dideoxyinosine) were included in the study. Indinavir was administered at 500 mg/m^2 every 8 h in combination with lamivudine and stavudine. The mean maximum plasma level observed was 12.3 mg/L (range 3.2 to 28.8 mg/L) at 1.9 h (1.0 to 4.0 h). The mean minimum level was 0.14 (0.05 to 0.13) mg/L [Gatti *et al.* 2000].

Toxicity

In a study of 11 children undergoing treatment with 500 mg/m^2 indinavir every 8 h (with stavudine or lamivudine), toxicity was observed as renal side effects ranging from mild to severe. This included kidney stones, renal cholic and acute renal failure (serum creatinine level greater than 5 mg/L above the base-line) [Gatti *et al.* 2000].

Bioavailability 65%.

Half-life 1.8 h; 0.77 h (children).

Volume of Distribution 195 L.

Clearance Apparent, 110 L/h.

Protein Binding 61%.

Dose A dose of 800 mg daily is administered as the sulfate. The dose is reduced to 600 mg in those with mild to moderate hepatic impairment.

Indometacin

Analgesic

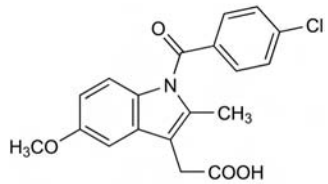
$C_{19}H_{16}ClNO_4$ = 357.8

CAS—53-86-1

IUPAC Name 2-[1-(4-Chlorobenzoyl)-5-methoxy-2-methylindol-3-yl]acetic acid

Synonym 1-(4-Chlorobenzoyl)-5-methoxy-2-methyl-1*H*-indole-3-acetic acid, indomethacin

Proprietary Names *Amuno*; *Artracin*; *Confortid*; *Flexin Continus*; *Imbrilon*; *Indochron*; *Indocid*; *Indocin*; *Indoflex*; *Indolar*; *Indomax*; *Indotard*; *Maximet SR*; *Mobilan*; *Pardelprin*; *Rheumacin*; *Rimacid*; *Slo-Indo.*



Chemical Properties A white to yellow-tan, crystalline powder. Mp about 155° to 162°. It exhibits polymorphism. Practically insoluble in water; soluble 1 in 50 of ethanol, 1 in 30 of chloroform and 1 in about 40 of ether; soluble in acetone. pK_a 4.5. Log *P* (octanol/pH 7.4), −1.0. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Colour Tests Liebermann's reagent—black; Mandelin's test—grey; Marquis test—orange; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.94; system TD—R_f 0.16; system TE—R_f 0.05; system TF—R_f 0.13; system TG—R_f 0.20; system TAD—R_f 0.38; system TAE—R_f 0.83; system TAF—R_f 0.63; system TAJ—R_f 0.46; system TAK—R_f 0.90; system TAL—R_f 0.90 (chromic acid solution, grey-brown; acidified potassium permanganate solution, positive).

Radioimmunoassay See Plasma [Hare *et al.* 1977].

Synovial fluid **GC-MS** See Plasma [Dawson *et al.* 1990].

Disposition in the Body Readily and almost completely absorbed after oral administration. Indometacin is subject to considerable enterohepatic circulation. Metabolic reactions include *O*-demethylation, *N*-deacetylation and glucuronic acid conjugation, the major metabolites being desmethylindometacin (DMI), deschlorobenzoylindometacin (DBI), and desmethyldeschlorobenzoylindometacin (DMBI) and their glucuronides. These substances, together with unchanged indometacin and its glucuronide, are excreted in the urine (up to about 60% of the dose in 48 h) and the faeces (up to about 30% of the dose in 96 h) in variable amounts. Expressed as a percentage of the dose, the average amounts excreted in the urine in 48 h are: unchanged indometacin 5 to 20% (dependent on urinary pH), indometacin glucuronide 6 to 26%, DMI and its glucuronide 8 to 23%, DBI and its glucuronide 4 to 20%, DMBI and its glucuronide <3%; in the faeces the major metabolites found are DMBI (up to about 16%) and DMI (up to about 12%), with only small amounts of unchanged indometacin and DBI.

Therapeutic Concentration In plasma, usually in the range 0.5–3 mg/L.

After a single oral dose of 50 mg given to 20 subjects, peak plasma concentrations of 1.0–3.0 mg/L (mean 1.9) were attained in 1–4 [Kwan *et al.* 1976].

Steady-state plasma concentrations of 0.31–0.63 mg/L (mean 0.49) were attained in about 6 days after oral doses of 25 mg three times a day to 5 subjects [Alván *et al.* 1975].

Toxicity Toxic effects may be produced by plasma concentrations >5 mg/L.

Half-life Plasma half-life, 3–15 h.

Volume of Distribution About 1 L/kg.

Clearance Plasma clearance, 1–2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.9.

Protein Binding 90–99%.

Note For a review of the pharmacokinetics of indometacin, see Helleberg [1981].

Indoprofen

Analgesic

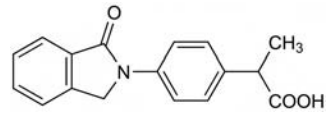
$C_{17}H_{15}NO_3 = 281.3$

CAS—31842-01-0

IUPAC Name 2-[4-(3-Oxo-1*H*-isoindol-2-yl)phenyl]propanoic acid

Synonyms 4-(1,3-Dihydro-1-oxo-2*H*-isoindol-2-yl)-α-methylbenzeneacetic acid; isindone.

Proprietary Names *Bor-Ind*; *Flosin*; *Flosint*; *Isindone*; *Praxis*; *Reumofene*.



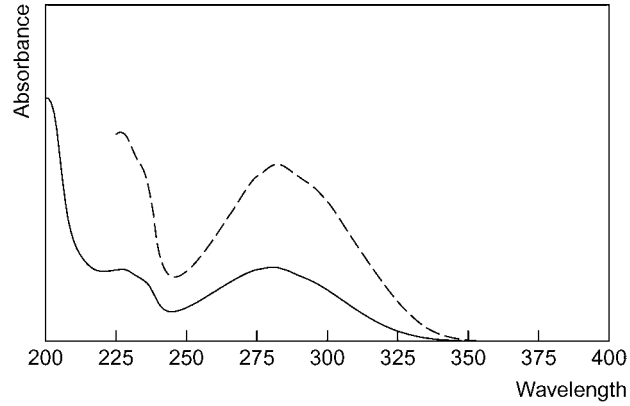
Chemical Properties A white crystalline powder. Mp 212°. Practically insoluble in water; very slightly soluble in chloroform; freely soluble in dimethylformamide; slightly soluble in methanol; sparingly soluble in 0.1 mol/L sodium hydroxide. pK_a 5.8. Log *P* (octanol/water), 2.8.

Thin-layer Chromatography System TG—R_f 0.08 (Ludy Tenger reagent, brown-black).

Gas Chromatography System GA— RI 2708 indoprofen-Me; system GD—RRT 2.27 methyl derivative and RRT 2.07 methyl derivative (relative to n-$C_{16}H_{34}$).

High Performance Liquid Chromatography System HD—*k* 1.2; system HV—RRT 0.52 (relative to meclofenamic acid); system HY—RI 406.

Ultraviolet Spectrum Methanol—282 nm (A^1_1=505a).



Infrared Spectrum Principal peaks at wavenumbers 1680, 1510, 730, 1300, 1220, 1605 cm^{-1} (KBr disk).

Quantification

Plasma **GC** FID. Limit of detection, 400 µg/L [Smith *et al.* 1977].

HPLC For method for quantification of indoprofen enantiomers, see Bjorkman [1985]. UV detection. Limit of detection, 500 µg/L [Lanbeck *et al.* 1980].

Urine **HPLC** See Plasma [Lanbeck *et al.* 1980].

Disposition in the Body Rapidly and almost completely absorbed after oral administration. About 80 to 90% of a dose is excreted in the urine in 24 h as the glucuronide conjugate together with small amounts of unchanged drug and metabolites.

Therapeutic Concentration

After a single oral dose of 100 mg given to 4 subjects, peak plasma concentrations of 6.9 to 14.3 mg/L were attained in 1 to 1.5 h; following a single oral dose of 200 mg, peak plasma concentrations of 14.2 to 26.1 mg/L were reported at 0.5 to 2 h [Tamassia *et al.* 1976].

Toxicity Indoprofen was suspended from use in the United Kingdom in December 1983 because of reports of side-effects and fatalities.

Half-life Plasma half-life, about 2 h.

Volume of Distribution About 0.1 L/kg.

Clearance Plasma clearance, about 0.7 mL/min/kg.

Protein Binding About 99%.
Dose Indoprofen has been given in doses of 200 to 800 mg daily.

Bjorkman S (1985). Determination of the enantiomers of indoprofen in blood plasma by high-performance liquid chromatography after rapid derivatization by means of ethyl chloroformate. *J Chromatogr* 339: 339–346.

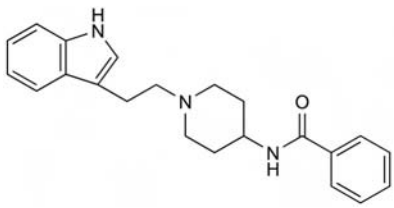
Antihypertensive
$C_{22}H_{25}N_3O = 347.5$
CAS—26844-12-2
IUPAC Name *N*-[1-[2-(1*H*-Indol-3-yl)ethyl]-4-piperidinyl]benzamide

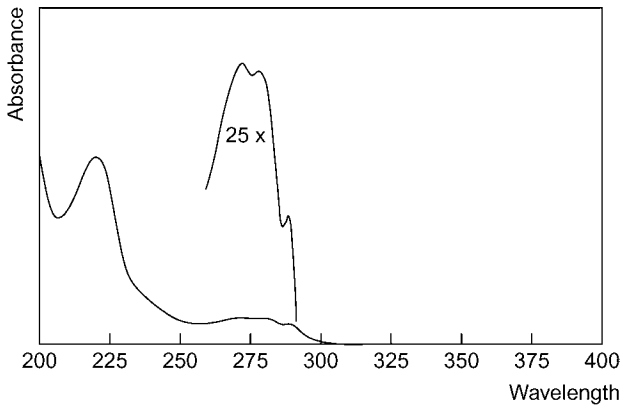


Chemical Properties pK_a 7.7. Log *P* (octanol/water), 3.6.

Indoramin Hydrochloride

$C_{22}H_{25}N_3O$, HCl = 383.9
CAS—33124-53-7 (xHCl)
Proprietary Names *Baratol*; *Doralese*; *Orfidora*; *Vidora*; *Wypresin*.
Chemical Properties Crystals. Mp 230° to 232°. Slightly soluble in water and chloroform; sparingly soluble in ethanol; soluble in methanol.

Thin-layer Chromatography System TA—R_f 0.84; system TE—R_f 0.74; system TAJ—R_f 0.13; system TAK—R_f 0.10; system TAL—R_f 0.77.
High Performance Liquid Chromatography System HAA—retention time 12.5 min.
Ultraviolet Spectrum Ethanol—273 (A^1_1=187b), 279 (A^1_1=190b), 289 nm (A^1_1=159b).



Infrared Spectrum Two major polymorphic forms exist. Principal peaks at wavenumbers 1640, 1535, 1316, 745, 1575, 715 cm^{-1} (indoramin hydrochloride form I (Nujol mull)); 1620, 1630, 1540, 1560, 740, 1317 cm^{-1} (indoramin hydrochloride form II (Nujol mull)).
Quantification
Plasma **HPLC** Electrochemical detection. Limit of detection, 0.5 µg/L [Leelavathi *et al.* 1986]. Fluorescence detection. Limit of detection, 1 µg/L [Swaisland 1981].
Disposition in the Body Readily absorbed after oral administration, but undergoes extensive first-pass metabolism to active metabolites. About 35% of a dose is excreted in the urine in 5 days, mainly as metabolites; <10% of a dose is excreted in the urine as unchanged drug; about 47% of a dose is eliminated in the faeces, mainly as metabolites; 6-hydroxyindoramin has been identified as a major metabolite. Other metabolites include acid-labile conjugates of indoramin and 6-hydroxyindoramin.
Therapeutic Concentration
Following a single oral dose of 50 mg to 6 middle-aged female subjects, peak plasma concentrations of 4 to 90 µg/L (mean, 20) were attained in about 3 h. After the same dose given to 5 elderly female subjects, peak plasma concentrations of 11 to 90 µg/L (mean 40) were attained after about 4 h [Norbury *et al.* 1984].

Following daily oral doses of 150 mg given to 5 subjects, steady-state plasma concentrations of 0.08 to 0.22 mg/L (mean, 0.13) were reported [Draffan *et al.* 1976].
Toxicity
In a fatality attributed to indoramin overdose, an antemortem plasma concentration of 6.4 mg/L was reported together with an alcohol concentration of 2.25 g/L [Hunter 1982].
Half-life Plasma half-life, 2 to 8 h (mean, 5), increased in elderly subjects.
Volume of Distribution About 7 L/kg.
Clearance Plasma clearance, about 20 mL/min/kg.
Protein Binding About 70 to 90% (concentration-dependent).
Dose The equivalent of 50 to 200 mg of indoramin daily.

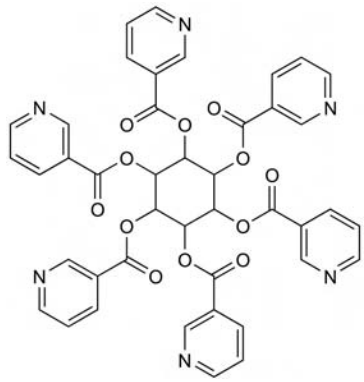
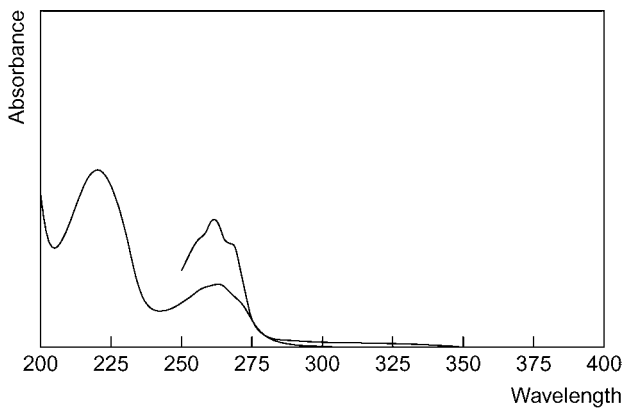
Inositol Nicotinate

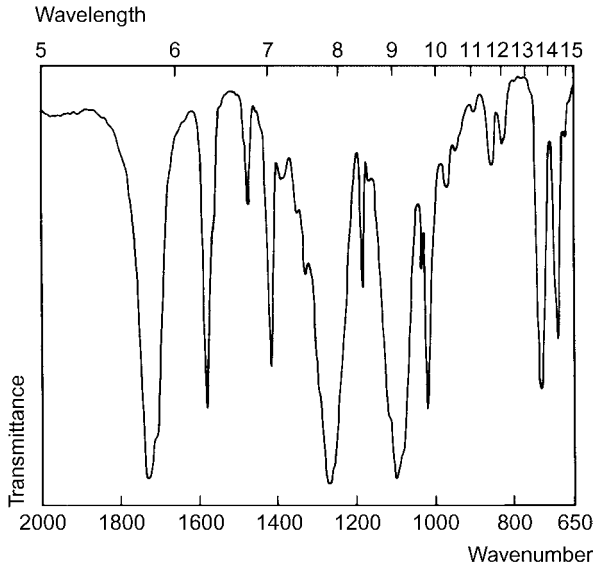
Vasodilator
$C_{42}H_{30}N_6O_{12} = 810.7$
CAS—6556-11-2
IUPAC Name [2,3,4,5,6-Pentakis(pyridine-3-carbonyloxy)cyclohexyl] pyridine-3-carboxylate
Synonyms Hexanicotinoyl inositol; *myo*-inositol hexa-3-pyridinecarboxylate; inositol niacinate.
Proprietary Names *Dilcit*; *Dilexpal*; *Hamovannad*; *Hexanicit*; *Hexogen*; *Hexopal*; *Linodil*; *Mesonex*; *Mesotal*; *Nicolip*; *Palohex*; *Vasodil*.



Chemical Properties A white crystalline powder. Mp 254.3° to 254.9°. Practically insoluble in water and most organic solvents; soluble 1 in 100 of chloroform; soluble in dilute acids. Log *P* (octanol/water), 1.6.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.01; system TC—R_f 0.43; system TL—R_f 0.16 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—261 nm (A^1_1=352b).



Infrared Spectrum Principal peaks at wavenumbers 1272, 1734, 1102, 1593, 1025, 718 cm^{-1} (KBr disk).



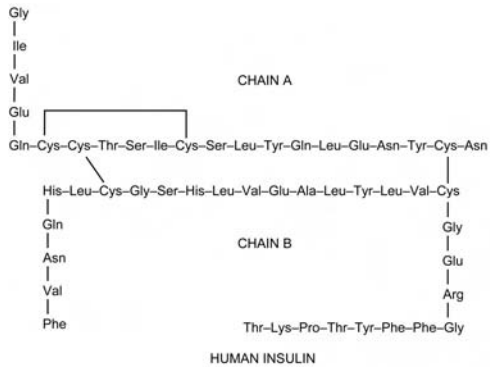
Dose 1.5 to 4 g daily.

I

Insulin

Antidiabetic

CAS—9004-10-8; 11061-68-0 (human)

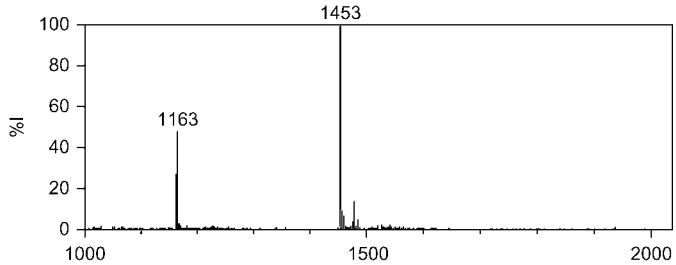


Chemical Properties Insulin is an amphoteric pancreatic protein that is extracted from beef or pork pancreas and purified by crystallisation. Insulin that is structurally identical with human insulin may be produced by chemical manipulation of animal insulin or by recombinant DNA technology.

A white crystalline powder. Slightly soluble in water; practically insoluble in ethanol, chloroform and ether; soluble in dilute solutions of mineral acids and, with degradation, in solutions of alkali hydroxides.

Ultraviolet Spectrum Aqueous acid—276 nm ($A_1^1 = 10.3$a).

Mass Spectrum



Quantification

***Plasma* HPLC** Column: RP-C_{18}. Mobile phase: 0.2 mol/L sodium sulfate anhydrous (pH 2.3) : acetonitrile (74 : 26), flow rate 1.2 mL/min. UV detection (λ= 214 nm). Limit of detection, 50 IU/L [Khaksa *et al.* 1998].

***Serum* LC-MS** Column: XBridge C_{18} (10 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile-water (10 : 90) : acetonitrile-water (70 : 30, 10 : 90 to 40 : 60 in 3 min to 70 : 30 in 0.1 min for 3 min to 10 : 90 for 5 min), flow rate 0.25 mL/min. ESI, positive ion mode, CID. Limit of quantification, 8.6 pmol/L, limit of detection, 1.5 fmol [Van Uytfanghe *et al.* 2007].

***Other* HPLC** Innovative Formulations. Column: Reversed phase C_8. Mobile phase: 40 µmol/L sodium sulfate solution (pH 3.7) : acetonitrile (24 : 76,), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 276 nm, λ_{em}= 306 nm). Limit of quantification, 100 µg/L, limit of detection, 30 µg/L [Mercolini *et al.* 2008].

Note For enzyme immunoassay for the quantification of insulin see Yoshioka *et al.* [1979]. For radioimmunoassay for the quantification of insulin see Dickson *et al.* [1977] and Gennaro, Van Norman [1975].

Disposition in the Body Insulin is an endogenous hormone secreted by the β-cells of the islets of Langerhans of the pancreas; it consists of 2 linked polypeptide chains. It is ineffective after oral administration, owing to rapid inactivation by proteolytic enzymes, but is well absorbed after SC or IM injection. The rate of absorption from different sites depends on local blood flow, absorption from the abdomen being faster than that from the arm, and that from the arm faster than from either the thigh or buttock. Exercise may increase absorption. It circulates in the blood as a polymer with a molecular weight of 17 000–43 000 and is rapidly taken up by the tissues. Approximately 50% of endogenous insulin in the portal vein is metabolised in a single passage through the liver. It is reduced to 2 separate chains by glutathione insulin transhydrogenase. The intact molecule or reduced chains may be metabolised by insulin-specific protease to peptides and amino acids. Insulin is filtered at the glomeruli but is reabsorbed and metabolised in the renal tubules, and only small amounts are excreted unchanged in the urine. It is also excreted in the bile.

Therapeutic Concentration In normal subjects, endogenous blood insulin concentrations vary throughout the day. The fasting or basal concentration in the plasma is usually in the range 5–40 mU/L (mean 17), with 50–100 mU/L in the portal vein. During absorption of food the peripheral blood concentration may increase by 10–15 times.

Serum insulin concentrations were measured in 21 diabetics; the daily dose varied from 3–80 units (mean 36) and the treatment period from 1 month to 35 years. The concentration of free insulin in the serum was in the range 10–440 mU/L (mean 47) and total insulin (free and antibody bound) varied from 67–17 020 mU/L (mean 2676) [Gennaro, Van Norman 1975].

After SC administration of 0.4 units/kg neutral protamine insulin or neutral protamine lispro insulin to 8 subjects, plasma concentrations of 1.86 µg/L (± 0.47) and 2.02 µg/L (± 0.69) were attained in 394 min (± 166) and 371 min (± 185), respectively [Rave *et al.* 1999] as reported by Roach, Woodworth [2002].

In 10 patients receiving two 240–unit doses of inhaled regular insulin via an inhaler and two 24–unit doses of SC regular insulin on 4 separate study days, a mean peak concentration of 96 mU/L occurred 76 min after the inhaled dose and 47 mU/L at 193 min after the SC dose [Perera *et al.* 2002].

Toxicity

In a 49-year-old diabetic man who intentionally injected himself IV with 150–250 units of NPH insulin (beef-pork species), a total insulin level of 1389 mU/L was reported, with a free insulin level of 378 mU/L; these levels declined to 1105 and 123 mU/L, respectively, after 18 h [Hsi, Werner 1987].

In 12 deaths caused by insulin injection, the following postmortem tissue concentrations were reported 1 day to 6 weeks after death: blood 1–155 mU/L (mean 49), CSF 62–64 mU/L (mean 63). In 1 case, selected as an example, in which a 43-year-old male was discovered next to empty insulin vials (1200 units in total), postmortem insulin levels were heart blood 155 mU/L and femoral vein blood 78 mU/L [Kernbach-Wighton, Puschel 1998].

A 51-year-old non-diabetic woman who was found dead next to 2 empty insulin syringes (300 units of intermediate type human insulin) and 1 empty ampoule of 10 mg diazepam. Analysis of heart blood revealed an insulin concentration of 382 mU/L, a diazepam concentration of 210 µg/L and a C-peptide concentration of 0.58 µg/L [Logemann *et al.* 1993].

The body of a 68-year-old non-diabetic physician was discovered next to 3 used insulin syringes; a suicide note was found. At postmortem, the concentration of insulin was 1848.8 mU/L in serum and 0.4 mU/L in aqueous humour; C-peptide (0.5 mU/L), metoprolol (0.4 mg/L) and alcohol (1.22 g/L) were also present in the blood [Junge *et al.* 2000].

Half-life Plasma half-life, ~5–6 min in normal subjects but may be longer in diabetics who develop anti-insulin antibodies.

Protein Binding Approximately 5% in normal subjects, but in diabetics the binding capacity may be extremely high owing to formation of insulin-binding antibodies.

Note For a review of the biochemistry and forensic aspects of insulin, see Fletcher [1983].

Dose Usually 10 to 80 units daily, SC; a dose of more than 80 units would be unusual and may indicate insulin resistance.

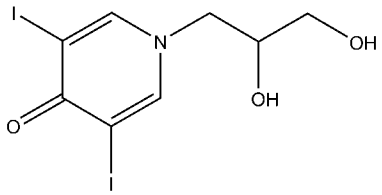
Iopydol

Radio-opaque Substance
$C_8H_9I_2NO_3 = 421.0$

IUPAC Name 1-(2,3-Dihydroxypropyl)-3,5-diiodopyridin-4-one
Synonyms 1-(2,3-Dihydroxypropyl)-1,4-dihydo-3,5-di-iodo-4-oxopyridine; NPP.
Proprietary Name It is an ingredient of *Hytrast*, together with iopydone.

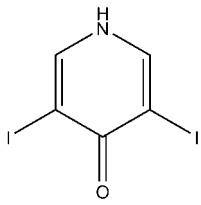


Chemical Properties A white crystalline powder. Mp 183° to 190°. Soluble 1 in 500 of water; soluble in methanol and pyridine.
Disposition in the Body After the bronchial administration in dogs of 20 mL of *Hytrast*, 60% was recovered in the faeces and 0.5% in the urine in 24 h. In cats given 15 mL of *Hytrast* orally, 0.06 g of iodine was detected in the urine in 24 h. This was equivalent to 1.3% of the ingested dose. A crystalline precipitate of iopydol was detected in the urine.
Toxicity An oral dose of 80 mL/kg of *Hytrast* proved to be non-toxic to mice.
Dose Iopydol is an X-ray contrast medium used in conjunction with iopydone as the proprietary preparation, *Hytrast*, for examination of the bronchial tract. *Hytrast* is a mixture of 46% iopydol and 30.5% iopydone in aqueous suspension; it is given by cannula or catheter into the lungs. Maximum dose: 25 mL.

Iopydone

Radio-opaque Substance
$C_5H_3I_2NO = 346.9$
CAS—5579-93-1

IUPAC Name 3,5-Diiodo-1*H*-pyridin-4-one
Synonym DJP
Proprietary Name Combined with iopydol, it is an ingredient of *Hytrast*.



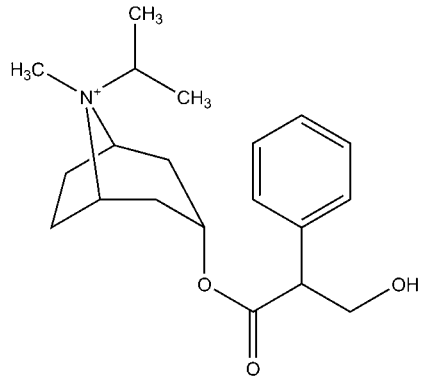
Chemical Properties A white crystalline powder. Mp 318° to326° with decomposition. Insoluble in water; soluble in aqueous alkaline solutions and methanol.
Thin-layer Chromatography System T1—R_f 0.87 (location reagent potassium permanganate spray, positive reaction).
Disposition in the Body After the bronchial administration of 20 mL of *Hytrast* to dogs, 60% was recovered in the faeces and 0.5% in the urine in 24 h. In cats given 15 mL of *Hytrast* orally, 0.06 g of iodine was detected in the urine after 24 h. This was equivalent to 1.3% of the ingested dose. A crystalline precipitate of iopydol was detected in the urine.
Toxicity An oral dose of 80 mL/kg of *Hytrast* proved non-toxic to mice, although a group of rats (264–295 g) receiving 1.5 mL *Hytrast* all died and 50% of a group receiving 0.75 mL *Hytrast* also died [Ginai *et al.* 1986].
Dose Iopydone is an X-ray contrast medium used in conjunction with iopydol in the proprietary preparation, *Hytrast*, for examination of the bronchial tract. *Hytrast* is a mixture of 46% iopydol and 30.5% iopydone in aqueous suspension, and is given by cannula or catheter into the lungs. The maximum dose is 25 mL.

Ginai AZ *et al.* (1986). Intraperitoneal toxicity of *Hytrast*: an experimental study. *Br J Radiol* 59: 1079–1082.

Ipratropium

Antiarrhythmic, Antimuscarinic, Bronchodilator, Quaternary Ammonium
$C_{20}H_{30}NO_3 = 332.5$
CAS—60205-81-4

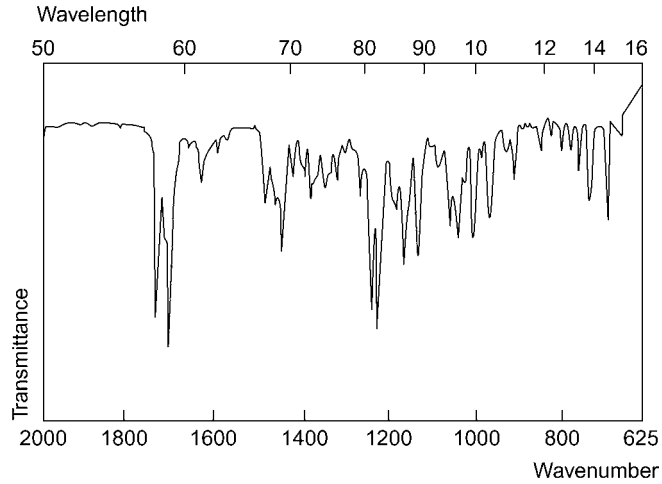
IUPAC Name [(1*R*,5*R*)-8-Methyl-8-propan-2-yl-8-azoniabicyclo[3.2.1]octan-3-yl] 3-hydroxy-2-phenylpropanoate
Synonym (1*R*,3*R*,5*S*,8*R*)-8-Isopropyl-3-[(±)-tropoyloxy]tropanium
Chemical Properties Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].



Ipratropium Bromide

$C_{20}H_{30}BrNO_3, H_2O = 430.4$
CAS—22254-24-6 (anhydrous ipratropium bromide); 66985-17-9 (ipratropium bromide monohydrate)
IUPAC Name [(1*S*,5*R*)-8-Methyl-8-propan-2-yl-8-azoniabicyclo[3.2.1]octan-3-yl] 3-hydroxy-2-phenylpropanoate bromide hydrate
Synonyms 3α-Hydroxy-8-isopropyl-1α*H*,5α*H*-tropanium bromide (±)-tropate; (3-endo,8-syn)-3(3-hydroxy-1-oxo-2-phenylproxy)-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane bromide; 8-isopropylnoratropine methobromide; *N*-isopropylnoratropinium bromomethylate; Sch-1000; Sch-1000-Br-monohydrate.
Proprietary Names *Aerotrop*; *Alvent*; *Apo-Ipravent*; *Apoven*; *Atem*; *Atronase*; *Atrovent*; *Cyclovent*; *Iprabron*; *Ipranase*; *Ipraneo*; *Ipratrin*; *Ipravent*; *Ipraxa*; *Ipvent*; *Itrop*; *Novo-Ipramide*; *Respontin*; *Rhinovent*; *Rinovagos*; *Rinatec*; *Ritanec*. It is also an ingredient in several preparations: see Sweetman [2009] for further details.
Chemical Properties White, crystalline substance with a bitter taste. Mp 230° to 232°. Freely soluble in water and lower alcohols; insoluble in ether, chloroform, or fluorocarbons [Deckers 1975]. Log *P* (octanol/buffer pH 7.4) −1.42 [Wood *et al.* 1995].

Infrared Spectrum [Deckers 1975].



Quantification
Blood **LC-MS** Column: C_{18} (100 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : 15 mmol/L heptafluorobutyric acid : 20 mmol/L ammonium formate buffer (pH 3.3; 5 : 95 to 90 : 10 over 18 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 13.6 min. Limit of quantification, 19.5 µg/L, limit of detection, 5.9 µg/L [Ariffin, Anderson 2006].
Disposition in the Body Ipratropium bromide has poor systemic absorption after oral and inhaled administration. The absolute amount of ipratropium bromide in the blood after oral administration is ~0.5% of the administered dose.

Blood concentrations after inhalation of the drug are ~1000 times lower than concentrations achieved after oral administration of an equibronchodilatory dose. Approximately 90% of the inhaled drug remains in the upper airways and the mouth. The drug diffuses rapidly into tissues after IV or IM administration. It is partially metabolised to 8 metabolites, which have little anticholinergic activity. The main metabolites are tropic acid (formed by enzymatic hydrolysis of the ester) and *N*-isopropylmethylnortropanium. After inhalation, the parent drug and metabolites are eliminated in the urine and faeces, with ~3.2% recovered in the urine and 69% recovered in faeces after 6 days. Renal excretion occurs at ~6 times the glomerular filtration rate. It does not cross the blood–brain barrier and it is not known whether placental transfer or excretion to human milk occurs.

Therapeutic Concentration

Ten patients with severe vasomotor rhinitis and 10 healthy volunteers were administered 20 µg/dose ipratropium intranasally. All participants were administered doses 3 times into each nostril at time 0 and thereafter: 2 series of 3 doses into each nostril were repeated twice at 15 min intervals. The total amount of ipratropium bromide administered was 360 µg in 30 min. Mean peak plasma concentrations in the patient group and in the healthy volunteers group were 380 and 245 ng/L, respectively, reached after 39.5 and 34.5 min, respectively. All concentrations were measured by radioimmunoassay [Kaila *et al.* 1990].

Seven healthy volunteers were administered a single 30 mg oral dose of ipratropium bromide. The mean peak plasma concentration was 25 µg/L, reached at 3 h. Plasma concentrations remained above 20 µg/L for a further 3 h before declining gradually over the next 6 h. In another group of 7 healthy volunteers administered an IV dose of 1 mg ipratropium bromide, the mean plasma concentration 1 h after the end of infusion was 12 µg/L, and after 5 h, 3.3 µg/L. Following inhalation of a very high dose (555 µg) by 5 healthy volunteers, ipratropium appeared in plasma within 2 min. At 3 h post-dose, the plasma concentration was 0.06 µg/L, representing 0.03% of the inhaled dose. All concentrations were measured by RIA [Adlung *et al.* 1976].

Bioavailability Approximately 3.3% (range 0.9 to 6.1%) [Ensing *et al.* 1989].

Half-life Approximately 3.5 h.

Clearance 2325 mL/min [Ensing *et al.* 1989].

Protein Binding Minimal, ~0 to 9% *in vitro*.

Dose Usual UK dosage by inhalation from a metred-dose aerosol is 20 or 40 µg three or four times daily. In children aged 6 to 12 years, the usual dosage is 20 or 40 µg three times daily, and below 6 years the usual dosage is 20 µg three times daily. Dry powder inhalation capsules are also available for use in adults, the usual dosage being 40 µg three or four times daily. Ipratropium bromide may also be given by inhalation as a nebulised solution in doses of 250 to 500 µg up to four times daily. In children aged 6 to 12 years, the usual dose by nebuliser is 250 µg, which may be repeated up to a total daily dose of 1 mg. In the management of acute asthma in children under 6 years old, doses of 125 to 250 µg may be repeated at intervals of at least 6 h, up to a total daily dose of 1 mg.

Ipratropium bromide, given intranasally, is also used in the management of rhinorrhoea associated with rhinitis. A dose of 42 µg is given into each nostril by metred-dose nasal spray two or three times daily.

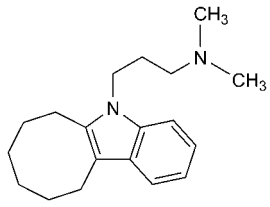
Ipridole

Antidepressant

$C_{19}H_{28}N_2$ = 284.4CAS—5560-72-5

IUPAC Name 3-(6,7,8,9,10,11-hexahydrocycloocta[*b*]indol-5-yl)-*N*,*N*-dimethylpropan-1-amine

Synonyms 6,7,8,9,10,11-Hexahydro-*N*,*N*-dimethyl-5*H*-cyclo-oct[*b*]indole-5-propanamine; pramindole.



Chemical Properties pK_a 8.2. Log *P* (octanol/water), 5.74 [Meylan, Howard 1995].

Ipridole Hydrochloride

$C_{19}H_{28}N_2$, HCl = 320.9

CAS—20432-64-8

Proprietary Names *Galatur*; *Prondol*.

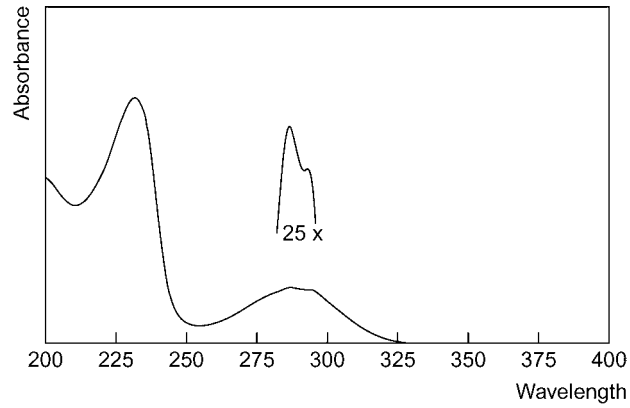
Chemical Properties White powder. Mp about 144°. Soluble in water, ethanol and chloroform.

Thin-layer Chromatography System TA—R_f 0.47; system TL—R_f 0.16; system TB—R_f 0.49; system TC—R_f 0.34 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2335; system GB—RI 2437; system GM—RRT 1.000 (relative to ipridole).

High Performance Liquid Chromatography System HA—*k* 4.1; system HF—*k* 10.83.

Ultraviolet Spectrum Aqueous acid—287 (A^1_1 = 248a), 293 nm; aqueous alkali—302 nm.



Infrared Spectrum Principal peaks at wavenumbers 738, 1650, 1612, 1145, 1173, 1040 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 170, 284, 213, 145, 212, 159, 144.

Quantification

Plasma GC Column: Apiezon L plus 10% KOH Anakrom ABS 100/200 mesh (1.91 m × 2 mm i.d.). Carrier gas: N_2, 29 mL/min. Temperature: 285°. AFID, Retention time: 8.4 min. Limit of detection, 5 µg/L.[Caillé *et al.* 1982].

Disposition in the Body Well absorbed after oral administration. It is slowly excreted in the urine, about 50% of a dose being eliminated in 3 days, and it is still detectable one week after administration; only about 5% of a dose is excreted in the urine as unchanged drug.

Therapeutic Concentration

After a single oral dose of 60 mg given to 5 subjects, peak plasma concentrations of 0.05 to 0.09 mg/L (mean 0.07) were attained in 2 to 4 h. Following oral administration of 30 mg three times daily to 4 subjects, plasma concentrations of 0.03 to 0.08 mg/L (mean 0.06) were reported 10 h after the final daily dose on day 21 [Caillé *et al.* 1982].

Half-life Plasma half-life, ≈35 to 70 h (mean 52).

Dose The equivalent of 45 to 180 mg of iprindole daily.

Caillé G *et al.* (1982). Quantitation of iprindole in plasma by GLC. *Biopharm Drug Dispos* 3: 11–17.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Iproniazid

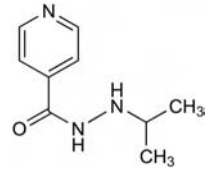
Antidepressant

$C_9H_{13}N_3O$ = 179.2

CAS—54-92-2

IUPAC Name *N*′-Propan-2-ylpyridine-4-carbohydrazide

Synonym 4-Pyridinecarboxylic acid 2-(1-methylethyl)hydrazide



Chemical Properties Crystals. Mp 113°. Freely soluble in water and ethanol. Log *P* (chloroform/pH 7.4), 0.

Iproniazid Phosphate

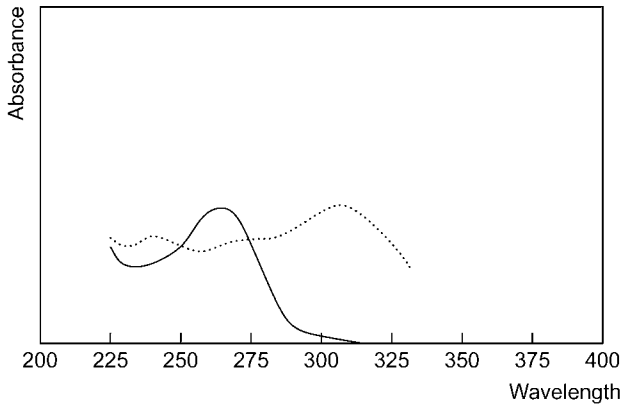
$C_9H_{13}N_3O$, H_3PO_4 = 277.2

CAS—305-33-9

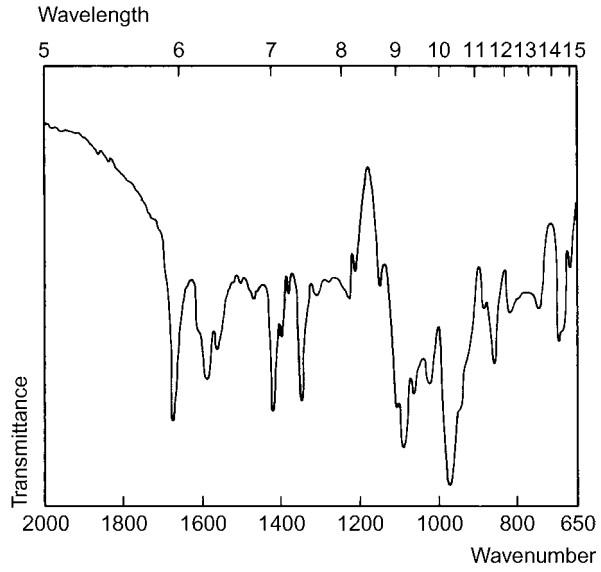
Proprietary Name *Marsilid*

Chemical Properties A white crystalline powder. Mp 175° to 184°. Soluble 1 in 5 of water and 1 in 90 of ethanol; practically insoluble in chloroform and ether.

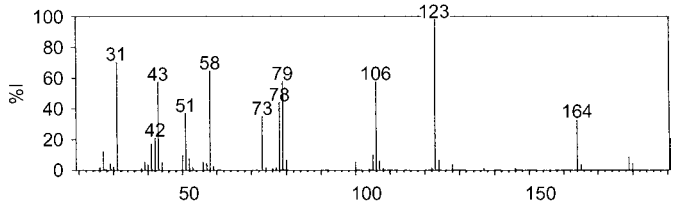
Colour Tests Cyanogen bromide—orange-pink; Nessler's reagent—black.
Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.01; system TC—R_f 0.23; system TE—R_f 0.41; system TL—R_f 0.17; system TAE—R_f 0.70; system TAF—R_f 0.69 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1593; system GB—RI 1609.
High Performance Liquid Chromatography System HX—RI 249.
Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1=235c); aqueous alkali—242, 307 nm.



Infrared Spectrum Principal peaks at wavenumbers 975, 1090, 1672, 1110, 1065, 1025 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 123, 31, 58, 106, 79, 43, 78, 51; isonicotinic acid 123, 51, 78, 106, 50, 52, 105, 39.

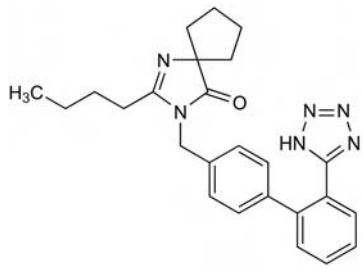


Quantification
Urine **GC** FID. For method for quantification, see de Sagher *et al.* [1976].
Disposition in the Body Readily absorbed after oral administration. It is excreted in the urine mainly as metabolites, principally isonicotinic acid, with up to 15% as unchanged drug.
Half-life Plasma half-life, about 10 h.
Dose The equivalent of 25 to 150 mg of iproniazid daily.

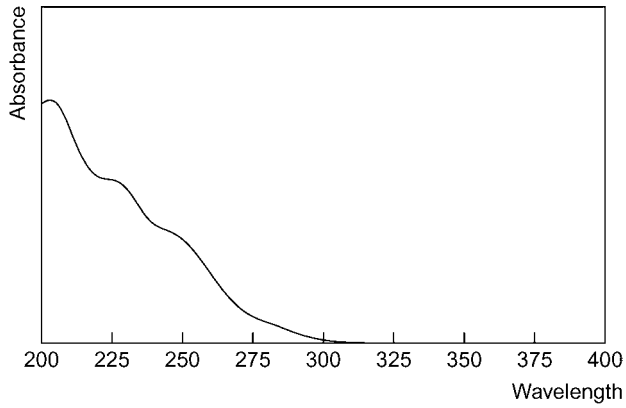
de Sagher RM *et al.* (1976). Identification and quantitative GLC determination of iproniazid in human urine. *J Pharm Sci* 65: 878–882.

Irbesartan

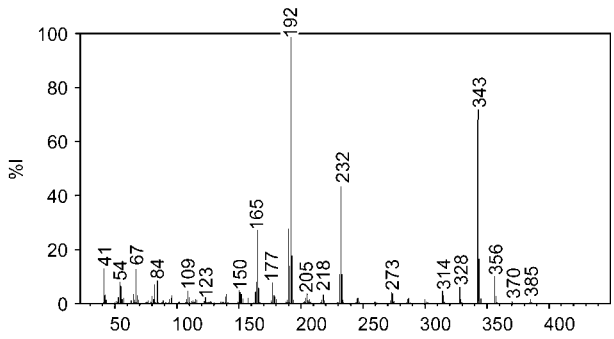
Angiotensin II Receptor Antagonist
$C_{25}H_{28}N_6O$ = 428.5
CAS—138402-11-6
IUPAC Name 2-Butyl-3-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-1,3-diazaspiro[4.4]non-1-en-4-one
Synonyms BMS-186295; SR-47436.
Proprietary Names *Aprovel*, *Avapro*.



Chemical Properties White to off-white crystals (from ethanol, 96%). Mp 180° to 181°. It is slightly soluble in alcohol and methylene chloride. It is practically insoluble in water. pK_a 4.5. Log *P* (octanol/water), 10.1.
Ultraviolet Spectrum Aqueous acid (0.2 mol/L HCl)—224, 246 nm.



Mass Spectrum Principal ions at *m/z* 192, 343, 342, 232, 190, 165, 193, 67.



Quantification
Plasma **HPLC** Fluorescence detection (λ_{ex}=250 nm, λ_{em}=371 nm). Limit of quantification, 1.0 µg/L [Chang *et al.* 1997].
Urine **HPLC** See Plasma [Chang *et al.* 1997].
Disposition in the Body Irbesartan is almost completely absorbed after administration and steady state concentrations are reached within 3 to 4 days. No significant accumulation has been observed. Eight metabolites have been identified and are formed by glucuronidation or oxidation, primarily by the cytochrome P450 CYP2C9. Excretion is mainly through faeces with <2% of an administered dose recovered unchanged in urine.
Therapeutic Concentration
Twelve healthy male volunteers were administered a single oral dose of 50 mg. Peak plasma concentrations of 0.942 mg/L were reached within ≈3 h [Chang *et al.* 1997].
Forty-eight healthy men, aged between 18 and 45 years, were administered a single oral dose of 150, 300, 600 or 900 mg irbesartan (9 in each group and 12 received placebo). Peak plasma concentrations after single doses were 1.9, 2.9, 4.9 and 5.3 mg/L, respectively, which were reached within 1.5 to 2 h. Peak concentrations were very similar after multiple dosing [Marino *et al.* 1998].
Bioavailability 60 to 80%.

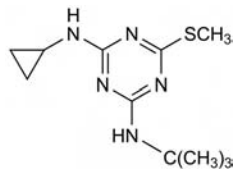
Half-life 11 to 15 h.
Volume of Distribution 53 to 93 L.
Clearance Plasma, 0.07 L/h/kg (healthy) and 0.12 L/h/kg (hepatic cirrhosis).
Protein Binding 90%.
Dose 150 mg once daily which may be increased to 300 mg if necessary. In the elderly or those undergoing haemodialysis, the dose may be reduced to 75 mg.

Chang SY *et al.* (1997). High-performance liquid chromatographic assay for the quantitation of irbesartan (SR 47436/BMS-186295) in human plasma and urine. *J Chromatogr B Biomed Sci Appl* 702: 149–155.
Marino MR *et al.* (1998). Pharmacokinetics and pharmacodynamics of irbesartan in healthy subjects. *J Clin Pharmacol* 38: 246–255.

Irgarol

Insecticide
$C_{11}H_{19}N_5S = 253.4$
CAS—28159-98-0

IUPAC Name 2-*N*-tert-Butyl-4-N-cyclopropyl-6-methylsulfanyl-1,3,5-triazine-2, 4-diamine
Synonym *N*-Cyclopropyl-*N*′-(1,1-dimethylethyl)-6-(methylthio)-1,3,5-triazine-2,4-diamine
Proprietary Names *Irgarol 1051*; *Irgarol 1071*.

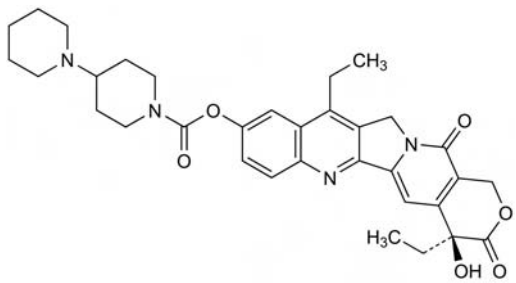


Chemical Properties Crystals. Mp 128° to 133°. It is practically insoluble in water. Log *P* (octanol/water), 3.95.

Irinotecan

Antineoplastic
$C_{33}H_{38}N_4O_6 = 586.7$
CAS—97682-44-5

Synonyms [1,4′-Bipiperidine]-1′-carboxylic acid (4*S*)-4,11-diethyl-3,4,12,14-tetrahydro-4-hydroxy-3,14-dioxo-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinolin-9-yl ester; CPT-11.



Chemical Properties Pale-yellow powder. Mp 222° to 223°.

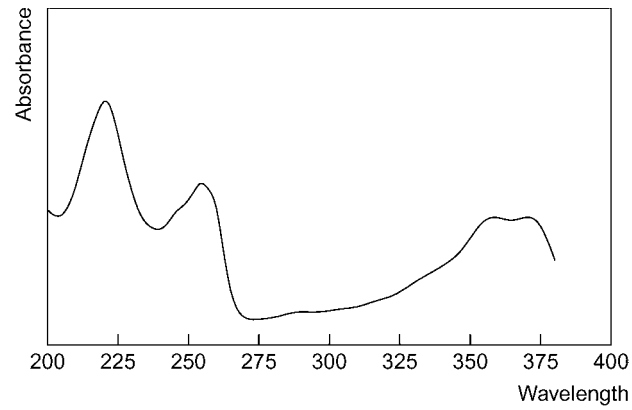
Irinotecan Hydrochloride
$C_{33}H_{39}ClN_4O_6 = 623.2$
CAS—100286-90-6

Irinotecan Hydrochloride Trihydrate
$C_{33}H_{38}N_4P_6$, HCl, $3H_2O = 677.2$
CAS—136572-09-3
Synonyms DQ-2805; U-101440E.
Proprietary Names *Campto*; *Camptosar*; *Topotectin*.
Chemical Properties A pale-yellow to yellow crystalline powder. Mp 256.5°. It is soluble in water and glacial acetic acid; partially soluble in chloroform; slightly soluble in methanol.

High Performance Liquid Chromatography Columns: TSK gel ODS-80Ts (150 × 4.6 mm i.d., 5 µm). Temperature: 30°. Mobile phase: acetonitrile : 50 mmol/L sodium hydrogen phosphate (28:72) containing sodium 1-heptanesulfonate, (pH 3.0), flow rate, 1 mL/min. IS: camptothecin. Fluorescence detection (λ_{ex}=380 nm, λ_{em}=556 nm). Retention time: irinotecan, 5.4 min; IS, 8.8 min [Sumiyoshi *et al.* 1995].

Column: C_{18} Nova-Pak (100 × 5 mm, 4 µm). Mobile phase: acetonitrile : 75 mmol/L ammonium acetate (pH 6.4) (22:78) containing 5 mmo/L tetrabutylammonium phosphate. Fluorescence detection (λ_{ex}=355 nm, λ_{em}=515 nm). Retention time: irinotecan (carboxylate form), 4.2 min; (lactone form), 8.2 min [Rivory, Robert 1994].

Ultraviolet Spectrum Aqueous acid—221, 254, 359, 372 nm.



Quantification
Plasma **HPLC** Columns: C_{18} Zorbax SB (150 × 4.6 mm, 3.5 µm). Mobile phase: acetonitrile : 100 mmol/L ammonium acetate (pH 6.4) : triethylamine (15.6:80:0.1) containing 5 mmol/L tetrabutylammonium phosphate, flow rate, 1.5 mL/min. Fluorescence detection (λ_{ex}=375 nm, λ_{em}=460 nm). Retention time: irinotecan (carboxylate form), 5.7 min; (lactone form), 11.2 min. Limit of quantification,1.0 µg/L for irinotecan, 0.5 µg/L for the metabolite, SN-38 [Herben *et al.* 1998].
Urine **HPLC**Columns: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Temperature: 50°. Mobile phase: (A) methanol : 100 mmol/L ammonium acetate containing 10 mmol/L tetrabutylammonium sulfate (35:65), (pH 5.5); (B) (30:70), (pH 5.3), flow rate, 1 mL/min. Fluorescence detection (λ_{ex}=355 nm, λ_{em}=515 nm). Retention time: 8.3 min (A); 16.1 min (B) [de Bruijn *et al.* 1997]; [Sparreboom *et al.* 1998]. Limit of quantification, 100 µg/L [Sparreboom *et al.* 1998].
Faeces **HPLC** See Urine [Sparreboom *et al.* 1998].
Disposition in the Body After IV administration, irinotecan is metabolised, by carboxyesterase, in the liver to the active metabolite 7-ethyl-10-hydroxycamptothecin, SN-38 and carboxylic acid. SN-38 then undergoes conjugation, by UDP-glucuronyltransferase, to SN-38 glucuronide. Another metabolite 7-ethyl-10-[4-*N*-(5-aminopentanoic acid)-1-piperidino]-carbonyloxycamphothecin (APC) is produced by oxidative attack at the piperidine group. About 20% of the dose is excreted in urine within 24 h, <1% as SN-38 and ≈3 to 6% as SN-38 glucuronide. Further excretion is via bile.
Therapeutic Concentration
In phase I clinical studies, three patients were administered a dose of 100 mg/m^2, over 30 min, and peak plasma concentrations reached ≈2800 µg/L by the end of infusion. Peak concentrations of the metabolite, SN-38, reached 35.5 ± 10.9 µg/L [Barilero *et al.* 1992].
Toxicity Diarrhoea if prolonged and over 24 h can be life threatening.
Half-life 6 to 12 h; 10 to 20 h for the metabolite SN-38.
Volume of Distribution About 157 L/m^2.
Clearance Body clearance, 15 L/m^2/h.
Protein Binding Irinotecan is ~65% (range between 30 and 68%) bound, SN-38 metabolite 95%.
Dose The usual dosage range is 40 mg/m^2 body surface to 250 mg/m^2 administered three times a week, once a week to once every 3 weeks. One suggested regimen is 125 mg/m^2 infused over 90 min, once a week for 4 weeks, followed by 2-week rest period. Dose is modified according to toxicity. The maximum dose is 750 mg/m^2/day.

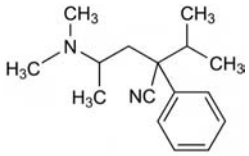
Isoaminile

Cough Suppressant
$C_{16}H_{24}N_2 = 244.4$
CAS—77-51-0

IUPAC Name 4-(Dimethylamino)-2-phenyl-2-propan-2-ylpentanenitrile
Synonym α-[2-(Dimethylamino)propyl]-α-(1-methylethyl)benzeneacetonitrile

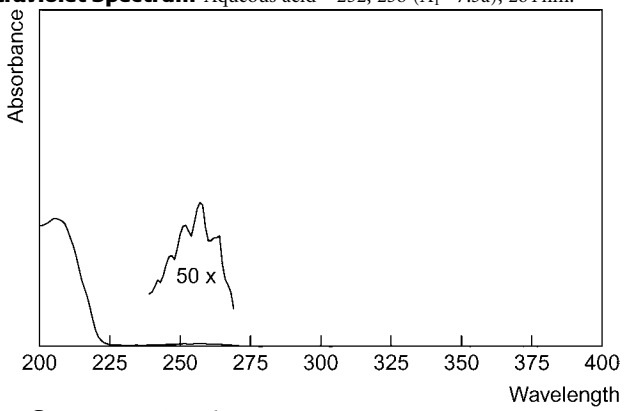


Chemical Properties A liquid. Log *P* (octanol/water), 3.5.

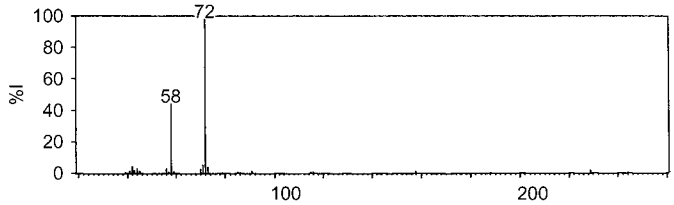
Isoaminile Citrate

$C_{16}H_{24}N_2$, $C_6H_8O_7$ = 436.5
CAS—28416-66-2
Proprietary Names *Dimyril*; *Perocan* (citrate or cyclamate).
Chemical Properties Crystals. Mp 63° to 64°. Soluble in water.

Colour Tests Liebermann's reagent—red-orange; sodium picrate (Steyn test)—orange.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.58; system TC—R_f 0.54; system TE—R_f 0.81; system TL—R_f 0.55; system TAE—R_f 0.45.
Gas Chromatography System GA—RI 1830.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=7.3a), 264 nm.



Mass Spectrum Principal ions at *m/z* 72, 58, 71, 42, 73, 70, 56, 44.

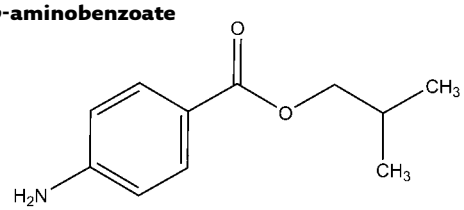


Dose 40 mg of isoaminile citrate 3 to 5 times daily.

Isobutyl Aminobenzoate

Anaesthetic (Local)
$C_{11}H_{15}NO_2$ = 193.2
IUPAC Name 2-Methylpropyl 4-aminobenzoate
Synonym Isobutylcaine
Proprietary Names *Cyclocaine*; *Cycloform*; *Cyclogesin*.

Isobutyl *p*-aminobenzoate

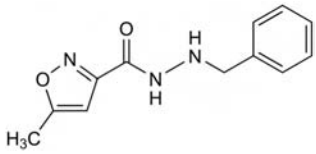


Chemical Properties White scales or a white crystalline powder. Mp 65°. Slightly soluble in water; soluble in ethanol and ether. Isobutyl aminobenzoate is extracted by organic solvents from aqueous alkaline solutions.
Colour Tests Diazotization test—red (limit of detection, 1.0 µg); *p*-dimethylaminobenzaldehyde test—bright yellow (limit of detection, 0.1 µg); Vitali's test—yellow-brown/bright yellow (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.77 (location reagents: diazotisation followed by alkaline betanaphthol spray, red; p-dimethylaminobenzaldehyde spray, positive reaction).
Ultraviolet Spectrum Ethanol—maxima at 223 nm (A_1^1 371) and 294 nm (A_1^1 1150).
Infrared Spectrum Principal peaks at wavenumbers A 1278, B 1172, C 1109 cm^{-1}; or A 1607, B 1683, C 1313 cm^{-1} (KBr disk).

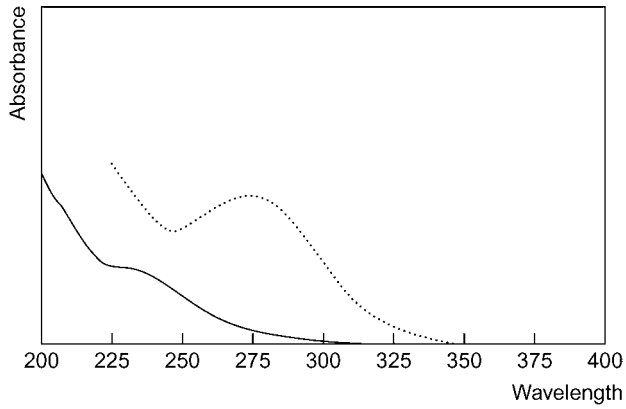
Isocarboxazid

Antidepressant
$C_{12}H_{13}N_3O_2$ = 231.3
CAS—59-63-2

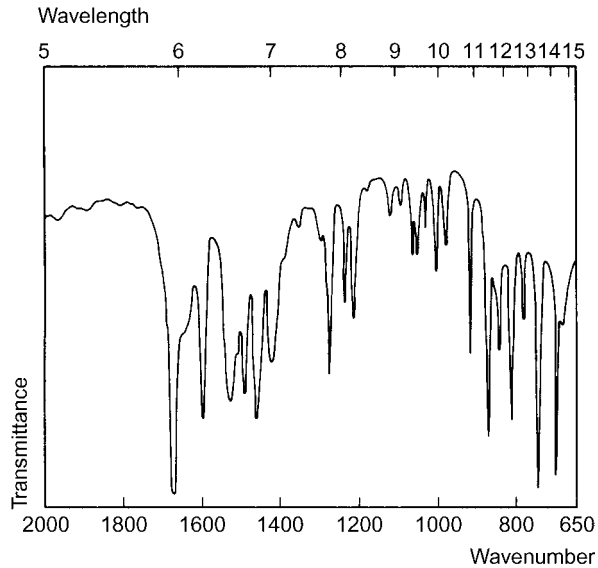
IUPAC Name *N′*-Benzyl-5-methyl-1,2-oxazole-3-carbohydrazide
Synonym 5-Methyl-3-isoxazolecarboxylic acid 2-benzylhydrazide
Proprietary Name *Marplan*



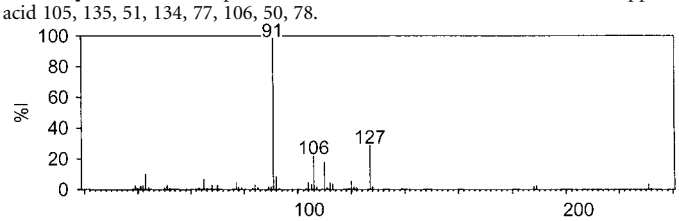
Chemical Properties A white or creamy-white crystalline powder. Mp 105° to 108°. Very sparingly soluble in hot water; soluble 1 in 150 of ethanol, 1 in 3 of chloroform, and 1 in 50 of ether. pK_a 10.4. Log *P* (octanol/pH 7.4), 1.5.
Colour Tests Liebermann's reagent—red-orange; Nessler's reagent—black
Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.20; system TC—R_f 0.74; system TE—R_f 0.75; system TL—R_f 0.61; system TAE—R_f 0.84; system TAF—R_f 0.86; system TAJ—R_f 0.67; system TAK—R_f 0.67; system TAL—R_f 0.92 (Dragendorff spray, positive; FPN reagent, pink-yellow; acidified iodoplatinate solution, positive; Marquis reagent, brown; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1949.
High Performance Liquid Chromatography System HX—RI 392; system HY—RI 353.
Ultraviolet Spectrum Aqueous alkali—274 nm (A_1^1=240b).



Infrared Spectrum Principal peaks at wavenumbers 1670, 750, 705, 870, 815, 1595 cm^{-1} (KBr disk).



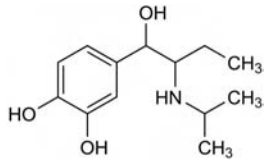
Mass Spectrum Principal ions at *m/z* 91, 127, 106, 110, 43, 92, 65, 120; hippuric acid 105, 135, 51, 134, 77, 106, 50, 78.



Disposition in the Body Rapidly absorbed after oral administration. Metabolised by oxidation to benzoic acid followed by glycine conjugation to form hippuric acid; an active metabolite, benzhydrazine, has been detected in animal studies, but its formation in humans has not been confirmed. About 60% of a dose is excreted in the urine in 24 h and about 70% in 8 days; 90% of the excreted material is hippuric acid and about 2% is unchanged drug.
Therapeutic Concentration Peak plasma concentrations are attained about 4 h after oral administration. Maximal therapeutic effects are attained within 5 to 10 days after beginning treatment.
Toxicity Toxic reactions from overdosage may occur in hours despite the long delay in onset of a therapeutic response. A fatality has been reported 24 h after ingestion of 400 mg.
Half-life Plasma half-life, about 36 h.
Dose 10 to 30 mg daily.

Isoetarine

Sympathomimetic
$C_{13}H_{21}NO_3 = 239.3$
CAS—530-08-5
IUPAC Name 4-[1-Hydroxy-2-[(1-methylethyl)amino]butyl]-1,2-benzenediol
Synonyms *N*-Isopropylethylnoradrenaline; isoetharine; Win-3046.
Proprietary Names *Dilabron*; *Neoisoprel*.

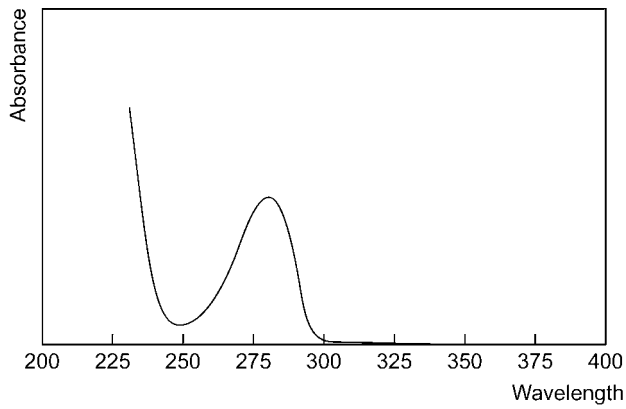


Chemical Properties Log *P* (octanol/water), 1.4.

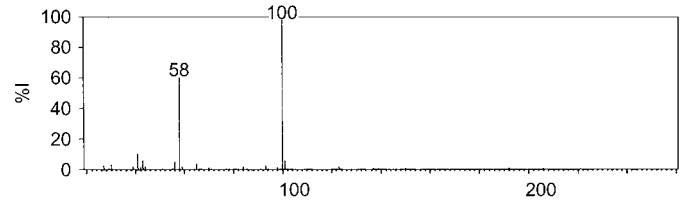
Isoetarine Hydrochloride
$C_{13}H_{21}NO_3$, HCl = 275.8
CAS—2576-92-3
Synonym Etyprenalinum hydrochloridum
Proprietary Names *Asthmalitan Depot*; *Beta-2*; *Bronkosol*; *Numotac*.
Chemical Properties A white crystalline solid. Mp 196° to 208°, with decomposition. Soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Isoetarine Mesilate
$C_{13}H_{21}NO_3$, $CH_4O_3S = 335.4$
CAS—7279-75-6
Synonym Isoetarine methanesulfonate
Proprietary Name *Bronkometer*
Chemical Properties White crystals. Mp 162° to 168°. Freely soluble in water; soluble in ethanol; practically insoluble in acetone and ether.

Colour Tests Ammoniacal silver nitrate—red/brown-orange; ferric chloride—green; Folin–Ciocalteu reagent—blue; Mandelin's test—brown; Marquis test—yellow→orange; methanolic potassium hydroxide—red→orange→yellow; Nessler's reagent—black; palladium chloride—orange→brown; potassium dichromate (method 1)—green→brown (30 s).
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.36; system TL—R_f 0.00; system TAE—R_f 0.73; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.26 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HX—RI 222.
Ultraviolet Spectrum Aqueous acid—278 nm (A^1_1=132a).



Infrared Spectrum Principal peaks at wavenumbers 1200, 1287, 1075, 1114, 1518, 1160 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 100, 58, 41, 101, 43, 56, 65, 30.

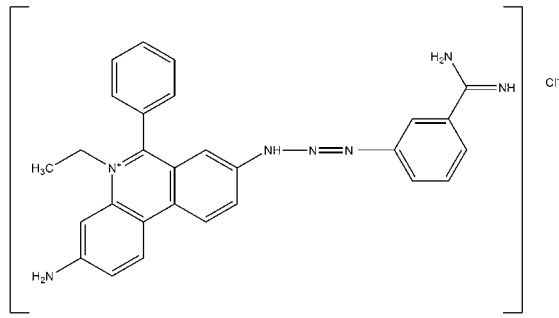


Quantification
Plasma **HPLC** Electrochemical detection. Limit of detection, 500 µg/L [Park *et al.* 1982].
Dose 30 to 80 mg of isoetarine hydrochloride daily.

Park GB *et al.* (1982). Determination of isoetharine in plasma by reversed-phase chromatography with amperometric detection. *J Pharm Sci* 71: 932–934.

Isometamidium

Trypanocide (Veterinary)
$C_{28}H_{26}ClN_7 = 496.0$
IUPAC Name 3-[2-(3-Amino-5-ethyl-6-phenylphenanthridin-5-ium-8-yl)iminohydrazinyl] benzenecarboximidamide
Synonym 8-(3-*m*-Amidinophenyl-2-triazeno)-3-amino-5-ethyl-6-phenylphenanthridinium chloride [Also contains 2 impurities, (A) 3,8-di(3-*m*-amidinophenyltriazeno)-5-ethyl-6-phenylphenanthridinium chloride and (B) 2-,4-,7-, or 9-(*m*-amidinophenyldiazo)-3,8-diamino-5-ethyl-6-phenylphenanthridinium chloride].

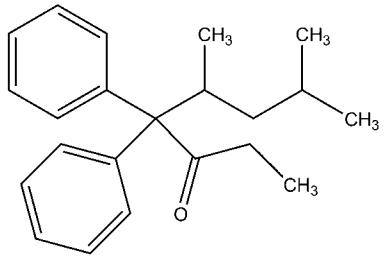


Isometamidium Hydrochloride
Synonyms B-4180A; M-4180A.
Proprietary Name *Samorin*
Chemical Properties Dark-red crystals. Mp 244° to 245°. Soluble in water and dilute acetic acid. Isometamidium is a quaternary ammonium compound, but can be extracted by ether from aqueous alkaline solutions.

Colour Tests Ammonium molybdate test—(dark brown) yellow-brown→purple (limit of detection, 0.1 µg); ammonium vanadate test—(dark brown) yellow-brown→grey-green, developing slowly (limit of detection, 0.1 µg); sulfuric acid test—(dark brown) yellow-brown→red-purple (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—(dark brown) orange→red-purple (limit of detection, 0.1 µg); Vitali's test—(dark brown) purple-brown/brown/brown (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.05, visible brown streak (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—no peaks within 30 min; system G4/225—no peaks within 30 min.
Ultraviolet Spectrum Methanol—284 (A^1_1 470) and 317 nm (A^1_1 510), minima at 262, 295 and 348 nm; 0.1 N hydrochloric acid—243 (A^1_1 550), 252 (A^1_1 520) and 280 nm (A^1_1 450), minima at 231, 248 and 270 nm.

Isomethadone

Narcotic
$C_{21}H_{27}NO = 309.5$
CAS—466-40-01
IUPAC Name 6-Dimethylamino-5-methyl-4,4-di(phenyl)hexan-3-one
Synonyms 6-Dimethylamino-4,4-diphenyl-5-methyl-3-hexanone; 1-dimethylamino-2-methyl-3,3-diphenyl-4-hexanone; 6-(dimethylamino)-5-methyl-4,4-diphenyl-3-hexanone; isoamidone.
Proprietary Name Combined with iopydol, it is an ingredient of *Hytrast*.



Chemical Properties Isomethadone occurs as an oil. Isomethadone is extracted by organic solvents from aqueous alkaline solutions.

Isomethadone (*dl*-Form)
CAS—116836-09-0
Chemical Properties Slightly yellow, very viscous liquid. Bp 215°.

Isomethadone Hydrobromide (*dl*-Form)
$C_{21}H_{27}NO$, HBr = 390.4
Chemical Properties Crystals from water. Mp 149° to 150°.

Isomethadone (*d*-Form)
CAS—26594-41-2
Chemical Properties Oil.

Isomethadone Hydrochloride (*d*-Form)
$C_{21}H_{27}NO$, HCl = 345.9
CAS—63814-06-2
Chemical Properties Mp 231° to 232°.

Isomethadone Hydrochloride Monohydrate (*d*-Form)
$C_{21}H_{27}NO$, HCl, H_2O = 363.9
Chemical Properties Mp 176° to 177°.

Isomethadone (*l*-Form)
CAS—561-10-4
Chemical Properties Oily liquid. Bp 162° to 165°.

Isomethadone Hydrobromide (*l*-Form)
Chemical Properties Crystals. Mp 217° to 218°.

Isomethadone Hydrochloride (*l*-Form)
CAS—7487-81-2
Chemical Properties Mp 231° to 233°. Soluble in water and alcohol. Solutions and tablets are stable.

Isomethadone Hydrochloride Monohydrate (*l*-Form)
Chemical Properties Mp 173° to 174°.

Colour Tests Ammonium vandate test—brown-purple→violet-blue (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.61 (location reagent acidified iodoplatinate spray, positive reaction).

Plates: Silica Gel G (20 × 20 cm, 0.25 mm). Solvent system A: chloroform : acetone : diethylamine (88 : 2 : 10). Solvent system B: benzene : methanol : diethylamine (75 : 15 : 10). Solvent system C: methanol : benzene : *n*-butanol : ammonia (0.88) : water (60 : 10 : 15 : 5 : 10). R_f values were reported as follows:

Solvent system	*Isomethadone*	*Isomethadone cyclic metabolite*	*Isomethadone N-oxide*
A	0.70	0.68	0.07
B	0.71	0.68	0.35
C	0.91	0.17	0.79

[a][Beckett *et al.* 1971].

Gas-Liquid Chromatography Column: Gas Chrom Q OV17 (A; 2 m × 1/4 in o.d.) or Chromosorb G (B; 1 m × 1/8 in o.d.). Carrier gas: N_2, 65 mL/min for column A, 36 mL/min for column B. Temperature programme: 195° for column A and 180° for column B. Retention times were reported as follows:

Column	*Unchanged drug*	*Cyclic metabolite*
A	12.2	10.4
B	11.4	9.2

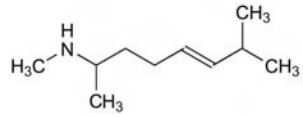
[a][Beckett *et al.* 1971].

Ultraviolet Spectrum Ethanol—259, 265, 298 nm.

Beckett AH *et al.* (1971). Identification and quantitative determination of some metabolites of methadone, isomethadone and normethadone. *J Pharm Pharmacol* 23: 347–352.

Isometheptene

Sympathomimetic
$C_9H_{19}N$ = 141.3
CAS—503-01-5
IUPAC Name *N*,6-Dimethyl-5-hepten-2-amine
Synonym Methyloctenylamine
Proprietary Names *Octin*; *Octon*; *Octanil*.

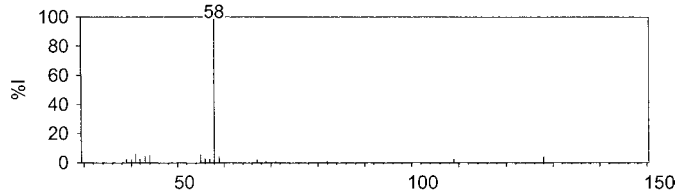


Chemical Properties A colourless or slightly yellow oily liquid. Bp 176° to 178°. Practically insoluble in water; freely soluble in acetone, ethanol, chloroform and ether. Log *P* (octanol/water), 3.0.

Isometheptene Hydrochloride
$C_9H_{19}N$, HCl = 177.7
CAS—6168-86-1
Proprietary Name *Octinum (injection)*
Chemical Properties An almost white, very hygroscopic, crystalline powder. Mp 68° to 69°. Soluble in water and ethanol.

Isometheptene Mucate
$(C_9H_{19}N)_2$, $C_6H_{10}O_8$ = 492.7
CAS—7492-31-1
Synonym Isometheptene galactarate
Proprietary Names *Octinum (tablets)*. It is an ingredient of *Midrid*.
Chemical Properties A white crystalline powder. Mp about 152°. Freely soluble in water; soluble in ethanol; almost insoluble in chloroform and ether.

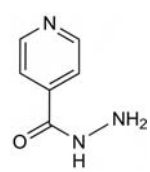
Colour Test Mandelin's test—brown.
Thin-layer Chromatography System TA—R_f 0.24; system TAJ—R_f 0.00; system TAK—R_f 0.04; system TAL—R_f 0.43 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1052; system GB—RI 994.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Mass Spectrum Principal ions at *m/z* 58, 55, 41, 44, 43, 128, 59, 56.



Dose Isometheptene mucate has been given in doses of up to 520 mg daily.

Isoniazid

Tuberculostatic
$C_6H_7N_3O$ = 137.1
CAS—54-85-3
IUPAC Name 4-Pyridinecarboxylic acid hydrazide
Synonyms FSR-3; INAH; INH; isonicotinic acid hydrazide; isonicotinoylhydrazine; isonicotinylhydrazide; isonicotinylhydrazine; RP-5015; Tubazid.
Proprietary Names *Cemidon*; *Isotamine*; *Isotinyl*; *Laniazid*; *Neoteben*; *Nicizina*; *Niconyl*; *Nicotibine*; *Nicozid*; *Nydrazid*; *Panazid*; *Rimifon*; *Tebesium*; *Teebaconin*; *Trisofort*; *Tubilysin*. It is an ingredient of *Mynah*, *Rifinah*, *Rimactazid*, *Rimafate* and *Rifater*.

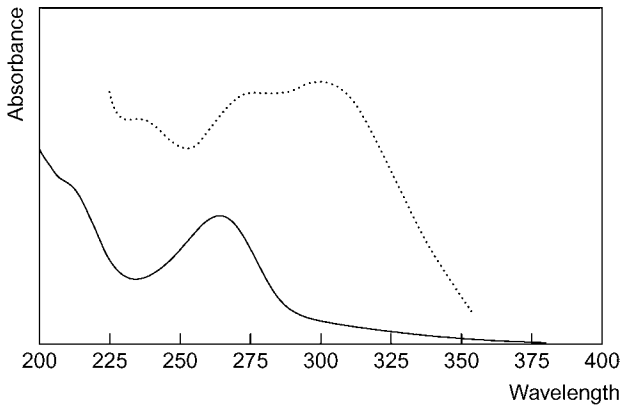


Chemical Properties Colourless crystals or white crystalline powder. Mp 170° to 174°. Soluble 1 in 8 of water, 1 in about 45 of ethanol and 1 in 1000 of chloroform; practically insoluble in benzene and ether. pK_a 1.8, 3.5, 10.8 (20°). Log *P* (octanol/pH 7.4), −1.1.

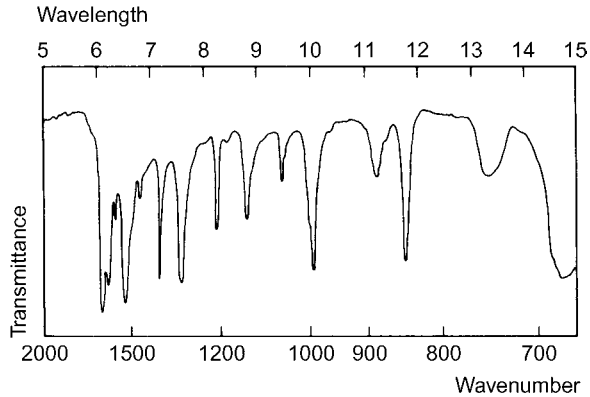
Isoniazid Aminosalicylate
$C_6H_7N_3O$, $C_7H_7NO_3$ = 290.3
CAS—2066-89-9

Synonyms GEWO-399; pasiniazid.
Proprietary Names *Dipasic*; *Paraniazide*.
Chemical Properties Yellow crystals. Mp 140° to 142°. Sparingly soluble in water.

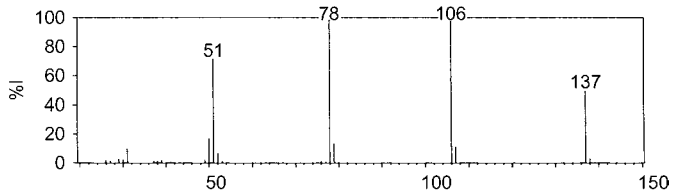
Colour Tests Cyanogen bromide—orange; Nessler's reagent—black.
Thin-layer Chromatography System TA—R_f 0.47; system TAD—R_f 0.18; system TAE—R_f 0.55; system TAF—R_f 0.49; system TL—R_f 0.20; system TB—R_f 0.01; system TC—R_f 0.11; system TE—R_f 0.29; system TAJ—R_f 0.09; system TAK—R_f 0.03; system TAL—R_f 0.47 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1670.
High Performance Liquid Chromatography System HY—RI 246; system HZ—retention time 1.6 min.
Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1=390a); aqueous alkali—298 nm.



Infrared Spectrum Principal peaks at wavenumbers 1653, 1541, 1621, 676, 992, 845 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 106, 78, 51, 137, 50, 79, 107, 31; isonicotinic acid 123, 51, 78, 106, 50, 52, 105, 39.



Quantification

Blood **HPLC** For method for quantification of isoniazid and other antitubercular drugs, see Khuhawar and Rind [2002].

Plasma **GC–MS** Limit of detection, 100 µg/L for isoniazid and acetylisoniazid, 50 µg/L for hydrazine metabolites [Lauterburg *et al.* 1981].

HPLC UV detection. For method for quantification of isoniazid and acetylisoniazid, see Moussa *et al.* [2002]. For method for quantification of isoniazid, rifampicin and pyrazinamide, see Smith *et al.* [1999]. Coulometric detection. For method, see Delahunty *et al.* [1998]. For method for quantification of isoniazid and other antitubercular drugs, see Walubo *et al.* [1994]. UV detection. Limit of detection, 100 µg/L for isoniazid and acetylisoniazid [Holdiness 1982].

Spectrofluorimetry For method for quantification of isoniazid and acetylisoniazid, see Olson *et al.* [1977].

Serum **HPLC** Limit of detection, <82 µg/L for isoniazid and other antitubercular drugs [Gennaro *et al.* 2001]. UV detection. For method, see Sadeg *et al.* [1996].

Urine **GC** AFID. Limit of detection, 2 mg/L for isoniazid and acetylisoniazid, 400 µg/L for hydrazine, monoacetylhydrazine and diacetylhydrazine [Timbrell *et al.* 1977].

HPLC Fluorimetric detection. Limit of detection, 0.2 mg/L [Kohno *et al.* 1991].

Biological Fluids **HPLC** UV detection. Isoniazid, acetylisoniazid, and hydrazine. Limit of detection, <1 mg/L for isoniazid [Seifart *et al.* 1995].

Bronchoalveolar Lavage **HPLC** See Plasma [Delahunty *et al.* 1998].

Alveolar Cells **HPLC** See Plasma [Delahunty *et al.* 1998].

Disposition in the Body Isoniazid is readily absorbed after oral administration. The main metabolic reaction is acetylation and the rate at which this occurs shows genetic variation, ≈40% of the population being rapid acetylators and the remainder slow acetylators. Other metabolic reactions which occur are hydrolysis, glycine conjugation, hydrazone formation and *N*-methylation. Metabolites include acetylisoniazid, isonicotinic acid, isonicotinylglycine and mono- and diacetylhydrazine. All the metabolites are inactive with the exception of monoacetylhydrazine, which is a reactive metabolite and is hepatotoxic. Up to about 70% of a dose is excreted in the urine in 24 h, most being excreted in the first 12 h. In slow acetylators, about 30% of the dose is excreted in the urine as unchanged drug, up to about 25% as acetylisoniazid, about 10% as isonicotinic acid and about 8% as diacetylhydrazine. In rapid acetylators, about 10% of a dose is excreted as unchanged drug, up to 45% as acetylisoniazid, about 20% as isonicotinic acid and about 25% as diacetylhydrazine. Small amounts of monoacetylhydrazine are also excreted in the urine. Less than 10% of a dose is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 3 to 10 mg/L.

Following a single oral dose of 300 mg to 6 fasting subjects classified as slow acetylators, mean peak serum concentrations of 7.2 mg/L of isoniazid and 1.7 mg/L of acetylisoniazid were attained in 0.6 and 3.7 h, respectively. Following a single oral dose of 300 mg given to 4 rapid acetylators, mean peak serum concentrations of 7.2 mg/L of isoniazid and 4.5 mg/L of acetylisoniazid were attained in 0.4 h and 2.6 h, respectively [Männistö *et al.* 1982].

In 94 subjects, aged 1 to 13 years, with tuberculosis given rifampicin and isoniazid at a dose of 12 and 10 mg/kg/day, respectively, for 10 to 12 days, mean serum-rifampicin concentrations of 3.38 to 3.88 mg/L were achieved in 2 h and mean serum-isoniazid concentrations of 4.38 to 8.17 mg/L were achieved in 1 h; concentrations of both drugs were still much above those required for therapeutic efficacy at 7 to 8 h [Seth *et al.* 1993].

Toxicity Serious toxic symptoms may occur with doses of 3 g or more. In children, toxic effects have occurred after ingestion of 0.9 g or more but a child has recovered after taking as much as 20 g. Toxic effects have been associated with plasma concentrations >20 mg/L.

A 16-year-old girl who had ingested an unknown quantity of isoniazid had a serum concentration of 127 mg/L on admission to hospital and died 7 h later. Two children aged $1^1/_2$ and $2^1/_2$ years had serum concentrations of 103 mg/L and 35 mg/L, respectively, on admission to hospital following ingestion of isoniazid and subsequently recovered [Miller *et al.* 1980].

In a fatality due to the ingestion of isoniazid, the tissue distribution was as follows: heart blood 43 mg/L, subclavian blood 94 mg/L, urine 470 mg/L, bile 900 mg/L, liver 650 µg/g, kidney 110 µg/g, stomach contents 4 mg [LoDico *et al.* 1992].

A 7-year-old boy who ingested 3 g (125 mg/kg) of isoniazid had blood levels of 250 mg/L ~6 h later (gastric content 450 mg/L and urine 760 mg/L); haemodialysis resulted in recovery [Orlowski *et al.* 1988].

Bioavailability About 80%.

Half-life Plasma half-life, about 1 h in rapid acetylators and 3 to 5 h in slow acetylators.

Volume of Distribution About 0.8 L/kg.

Clearance Plasma clearance, about 2.5 and about 7 mL/min/kg in slow and rapid acetylators, respectively.

Protein Binding Not significantly bound.

Note For a review of the pharmacokinetics of isoniazid, see Weber and Hein [1979]. For a review of isoniazid overdose, see Romero and Kuczler [1998].

Dose Usually 4 to 5 mg/kg daily, orally, to a maximum of 300 mg daily.

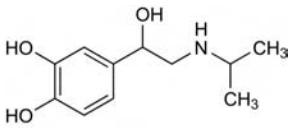
Isoprenaline

Sympathomimetic
$C_{11}H_{17}NO_3 = 211.3$
CAS—7683-59-2

IUPAC Name 4-[1-Hydroxy-2-[(1-methylethyl)amino]ethyl]-1,2-benzenediol
Synonyms A-21; isopropylarterenol; isopropylnoradrenaline; isoproterenol.
Proprietary Names *Aludrine*; *Asmalar*; *Bellasthman*; *Isoprel*; *Novodrin*; *Respifral*; *Saventrine*.



Chemical Properties Crystals. Mp 155°. pK_a 8.6, 10.1, 12.0 (20°). Log *P* (octanol/water), 0.2.

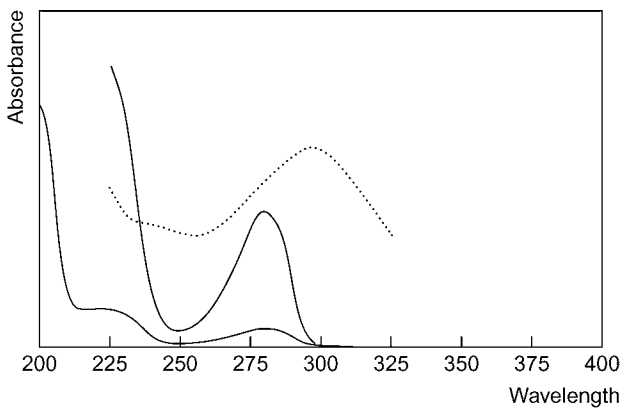
Isoprenaline Hydrochloride

$C_{11}H_{17}NO_3$, HCl = 247.7
CAS—51-30-9
Synonym Isoproterenol hydrochloride
Proprietary Names *Aerolone*; *Imuprel*; *Isuprel*; *Lenoprel*; *Proternol*; *Saventrine*.
Chemical Properties A white crystalline powder. Gradually darkens on exposure to air and light. Mp 165° to 170°, with decomposition. Soluble 1 in less than 1 of water and 1 in about 50 of ethanol; practically insoluble in chloroform and ether. Aqueous solutions become pink to brownish-pink on standing exposed to air, and almost immediately so when made alkaline.

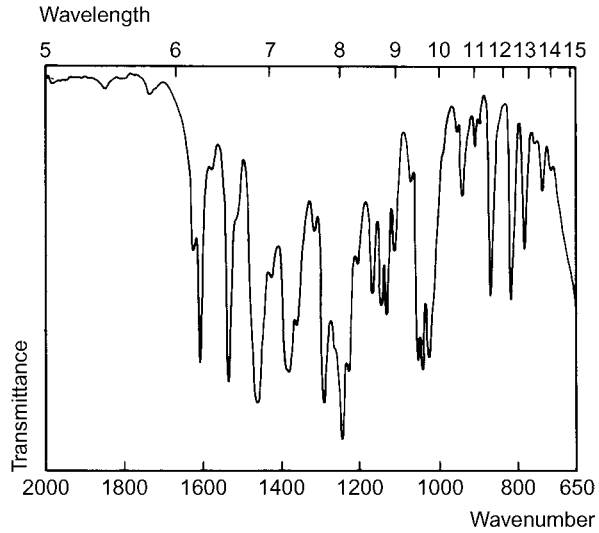
Isoprenaline Sulfate

$(C_{11}H_{17}NO_3)_2$, H_2SO_4, $2H_2O$ = 556.6
CAS—299-95-6 (anhydrous); 6700-39-6 (dihydrate)
Synonym Isoproterenol sulfate
Proprietary Names *Aleudrina*; *Ingelan*; *Kattwilon N*; *Medihaler Iso*; *Norisodrine*.
Chemical Properties A white crystalline powder. Gradually darkens on exposure to light and air. Mp about 128°, with decomposition. Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in benzene, chloroform and ether. Aqueous solutions become pink to brownish-pink on standing exposed to air, and almost immediately so when made alkaline.

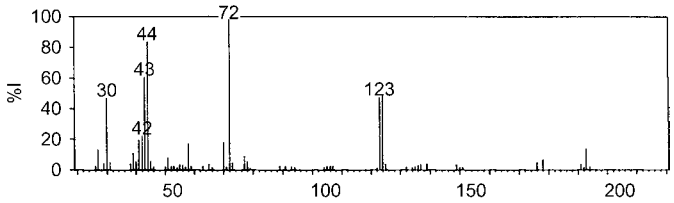
Colour Tests Ammoniacal silver nitrate—red→red-brown/brown; ferric chloride—green; Folin–Ciocalteu reagent—blue; Mandelin's test—brown; Marquis test—brown→violet; methanolic potassium hydroxide—orange→yellow; Nessler's reagent—black; potassium dichromate—green→brown (30 s).
Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.21; system TL—R_f 0.03; system TAE—R_f 0.14; system TAF—R_f 0.69 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1730.
High Performance Liquid Chromatography System HX—RI 79.
Ultraviolet Spectrum Aqueous acid—279 nm (A^1_1=134a); aqueous alkali—297 nm.



Infrared Spectrum Principal peaks at wavenumbers 1246, 1293, 1535, 1230, 1040, 1607 cm^{-1} (isoprenaline hydrochloride, KCl disk).



Mass Spectrum Principal ions at *m/z* 72, 44, 43, 124, 123, 30, 42, 41.



Quantification
***Plasma* HPLC** Electrochemical detection. Limit of detection, 1 µg/L [Causon *et al.* 1984]. Fluorescence detection. Limit of detection, 40 pg [Kishimoto *et al.* 1982].
***Urine* HPLC** See Plasma [Causon *et al.* 1984]. See Plasma [Kishimoto *et al.* 1982].
Disposition in the Body Isoprenaline is irregularly absorbed after oral or sublingual administration with extensive metabolism and conjugation occurring in the gut. Only about 10% of an inhaled dose reaches the lungs. It is rapidly metabolised by 3-*O*-methylation and sulfate conjugation; 3-*O*-methylisoprenaline exhibits weak activity. After IV administration, about 90% of a dose is excreted in the urine in 24 h, mostly as the conjugated 3-*O*-methyl metabolite, with up to about 15% of the dose as unchanged drug; after inhalation or oral administration, 68 to 94% of a dose is excreted as conjugated isoprenaline, with about 2 to 8% of a dose as the 3-*O*-methyl conjugate and <5% as unchanged drug or free 3-*O*-methylisoprenaline; small amounts of a dose are excreted in the bile, mainly as metabolites.
Therapeutic Concentration
After a dose of 500 µg administered by aerosol inhalation, plasma concentrations of about 0.0003 mg/L were attained in 5 min in 2 subjects [Blackwell *et al.* 1970].
After an oral dose of 0.2 mg/kg, plasma concentrations of about 0.5 mg/L of isoprenaline plus metabolites were attained within 90 min; in blood the major component was the sulfate ester together with small amounts of the methylated metabolite [Conolly *et al.* 1972].
Toxicity Estimated minimum lethal dose for children, applied to mucous membranes, 100 mg.
Half-life Plasma half-life, 3 to 7 h.
Volume of Distribution About 0.5 L/kg.
Protein Binding About 68%.
Dose 90 to 840 mg of isoprenaline hydrochloride daily, orally, as sustained-release tablets.

Blackwell EW *et al.* (1970). The fate of isoprenaline administered by pressurized aerosols. *Br J Pharmacol* 39: 194P–195P.

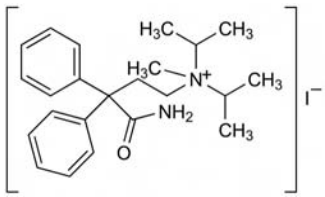
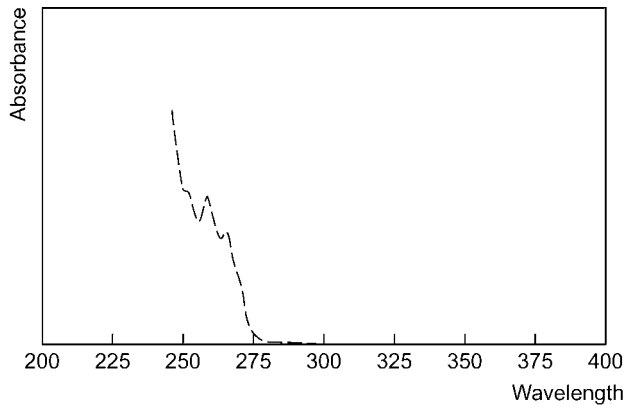
Isopropamide Iodide

Anticholinergic
$C_{23}H_{33}IN_2O = 480.4$
CAS—7492-32-2 (isopropamide); 71-81-8 (iodide)

IUPAC Name (4-Amino-4-oxo-3,3-diphenylbutyl)-methyl-di(propan-2-yl)azanium iodide
Synonym γ-(Aminocarbonyl)-*N*-methyl-*N*,*N*-bis(1-methylethyl)-γ-phenylbenzenepropanaminium iodide
Proprietary Names *Priamide*. It is an ingredient of *Combid*, *Ornade*, and *Stelabid*.



Chemical Properties A white to pale-yellow crystalline powder. Mp 198° to 201°, with decomposition. Soluble 1 in 50 of water, 1 in 10 of ethanol and 1 in 5 of chloroform; practically insoluble in ether. Log *P* (octanol/water), 1.2.
Colour Tests Aromaticity (method 2)—colourless/brown; Liebermann's reagent—grey.
Thin-layer Chromatography System TA—R_f 0.05; system TB—R_f 0.00; system TC—R_f 0.05; system TE—R_f 0.03; system TL—R_f 0.00; system TAE—R_f 0.03; system TAF—R_f 0.41; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.19 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2022 and RI 2670.
High Performance Liquid Chromatography System HA—*k* 2.4 (tailing peak); system HX—RI 379.
Ultraviolet Spectrum Methanol—259 (A^1_1=9.1a), 265 nm.

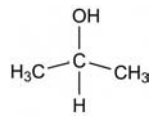


Infrared Spectrum Principal peaks at wavenumbers 1650, 1576, 705, 769, 757, 1500 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 114, 100, 44, 238, 115, 56, 72.
Dose The equivalent of 5 to 10 mg of isopropamide every 12 h.

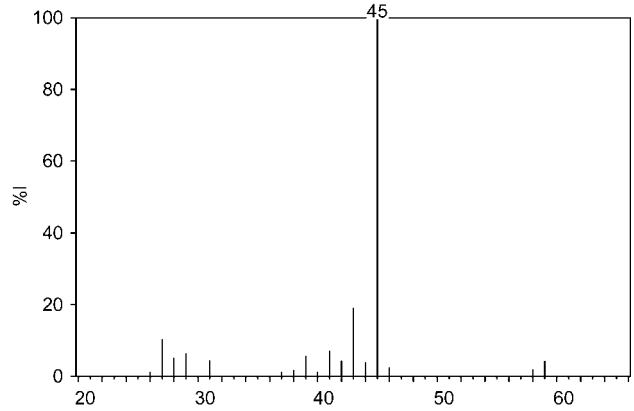
Isopropyl Alcohol

Solvent
C_3H_8O = 60.10
CAS—67-63-0

IUPAC Name 2-Propanol
Synonyms Alcohol isopropylicus; dimethyl carbinol; isopropanol; 2-propanol; secondary propyl alcohol.
Proprietary Names *Alcojel*; *Alcowipe*; *Alko Isol*; *Avitracid*; *Clearasil Daily Face*; *Duonale*; *Medi-Swab*; *Mundisept*; *Sterets*; *Steriwipe*.



Chemical Properties A clear, colourless, mobile, volatile, inflammable liquid. Macs per mL 0.784 to 0.786 g. Bp 81° to 83°. Refractive index, at 20°, 1.377 to 1.380. Miscible with water, ethanol, chloroform and ether. pK_a 17.1. Log *P* (octanol/water), 0.
Colour Test Potassium dichromate (method 2)—green.
Gas Chromatography System GA—RI 530; system GI—retention time 4.0 min.
Infrared Spectrum Principal peaks at wavenumbers 952, 1123, 1162, 819, 1111, 1298 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 45, 43, 27, 41, 39, 29, 59, 44; acetone 43, 58, 59, 27, 42, 26, 39, 29.



Quantification
Blood **GC** For method, see Daniel *et al.* [1981].
Serum **GC** Limits of detection, 10 mg/L to 25 mg/L, for isopropyl alcohol and other alcohols and glycols [Williams *et al.* 2000].
Disposition in the Body Isopropyl alcohol is readily absorbed after oral administration and slowly absorbed through intact skin. It is metabolised more slowly than ethanol; it is largely converted to acetone, which is slowly excreted from the lungs and in the urine; acetone may be further metabolised to acetate, formate and carbon dioxide; some unchanged isopropyl alcohol may be excreted in the urine together with its glucuronide conjugate, particularly after large doses.
Toxicity The estimated minimum lethal dose is 240 mL. Isopropyl alcohol is about twice as toxic as ethanol and the symptoms of intoxication are similar. Fatalities have been associated with blood concentrations >1000 mg/L. The maximum permissible atmospheric concentration is 400 ppm. A dose of 16 mL has been ingested daily for 3 days without discomfort, but marked depression has been observed following a dose of 23 mL. Recovery has followed treatment by haemodialysis in subjects with initial blood concentrations of up to 4400 mg/L of isopropyl alcohol.

In a review of 31 fatalities attributed solely to isopropyl alcohol poisoning, postmortem blood concentrations ranged from 100 to 2500 (mean, 1400) mg/L for isopropyl alcohol and 400 to 3000 (mean, 1700) mg/L for acetone [Alexander *et al.* 1982].

A woman who died about 3 h after ingesting isopropyl alcohol was reported to have the following postmortem tissue concentrations: isopropyl alcohol, blood 3300 mg/L, brain 1800 µg/g, urine 2000 mg/L; acetone, blood 1200 mg/L, brain 600 µg/g, urine 700 mg/L [Cravey 2000].

In 4 fatalities due to the ingestion of isopropyl alcohol, the following antemortem or postmortem tissue concentrations were reported: blood 200 to 2000 mg/L (mean 1300 mg/L, 4 cases), brain 1000 µg/g (1 case), liver 1000 µg/g (1 case), spleen 1300 µg/g (1 case), urine 1500 and 1800 mg/L (2 cases) [Adelson 1962].

Half-life Blood half-life, about 3 h in subjects with acute intoxication.

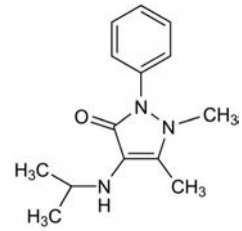
Isopropylaminophenazone

Analgesic (Veterinary)
$C_{14}H_{19}N_3O$ = 245.3
CAS—3615-24-5

IUPAC Name 1,5-Dimethyl-2-phenyl-4-(propan-2-ylamino)pyrazol-3-one
Synonyms 1,2-Dihydro-1,5-dimethyl-4-[(1-methylethyl)amino]-2-phenyl-3*H*-pyrazol-3-one; isopyrin; ramifenazone.
Note The name Isopyrin has also been applied to isoniazid.
Proprietary Names It is an ingredient of *Tomanol*.



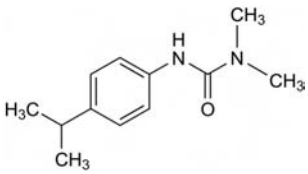
Chemical Properties Crystals. Mp 80°. Log *P* (octanol/water), 1.3.

Thin-layer Chromatography System TE—R_f 0.63; system TAE—R_f 0.78.
Gas Chromatography System GA—RI 2033.
Ultraviolet Spectrum Aqueous acid—260 nm (A_1^1=377b); aqueous alkali—271 nm (A_1^1=334b); methanol—243 (A_1^1=310b), 269 nm (A_1^1=381b).

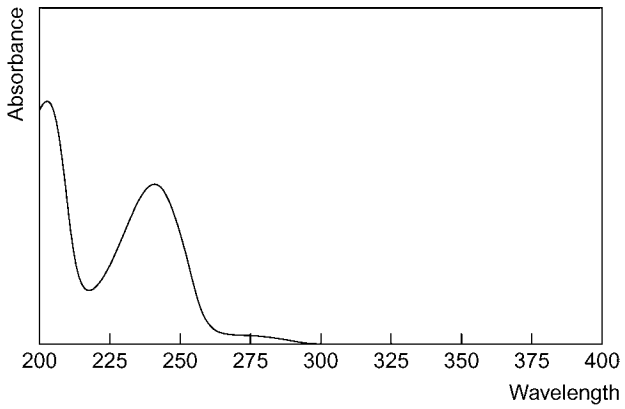
Isoproturon

Herbicide
$C_{12}H_{18}N_2O$ = 206.3
CAS—34123-59-6

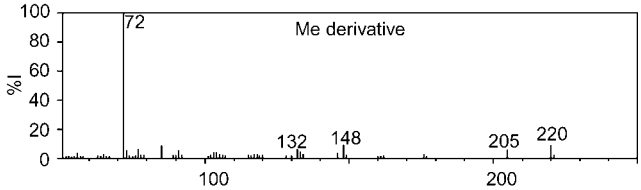
IUPAC Name *N*,*N*-dimethyl-*N*′-[4-(1-methylethyl)phenyl]urea
Synonyms CGA-18731; DPX 6774; HOE-16410; IP 50; IP Flo; IPU.
Proprietary Names *Alon*; *Arelon*; *Augur*; *Avanon*; *Belgran*; *Graminon*; *Hytane*; *Isotop*; *Nocilon*; *Protugan*; *Sabre*; *Swing*; *Tolkan*.



Chemical Properties A colourless to white crystalline solid. Mp 158°. Soluble in water (72 mg/L at 20°); readily soluble in common organic solvents, e.g. alcohol, ketones, esters, aromatic hydrocarbons, chlorinated hydrocarbons, methanol (56 g/L at 20°), dichloromethane (63 g/L at 20°), benzene (5 g/L at 20°) and hexane (0.1 g/L at 20°). Log *P* (octanol/water), 2.87.
Gas Chromatography System GA—isoproturon-Me RI 1685.
Ultraviolet Spectrum Principal peaks at 205, 240 nm.



Mass Spectrum Principal ions at *m/z* 72, 220, 148, 132, 205 (methyl derivative).

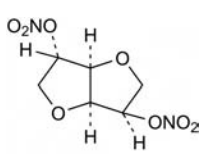


Disposition in the Body Isoproturon is excreted in urine with ≈50% of an administered dose being excreted within the first 8 h.

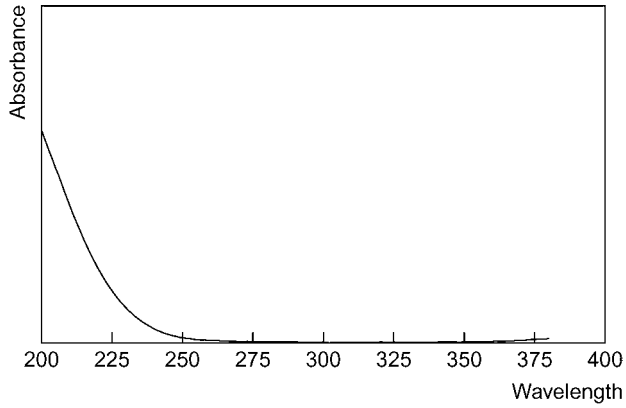
Isosorbide Dinitrate

Antianginal Vasodilator
$C_6H_8N_2O_8$ = 236.1
CAS—87-33-2

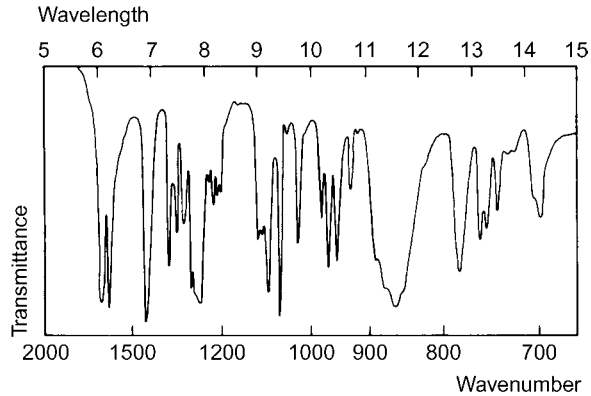
IUPAC Name [(3*S*,3a*S*,6*R*,6a*S*)-3-Nitrooxy-2,3,3*a*,5,6,6*a*-hexahydrofuro[3,2-*b*]furan-6-yl] nitrate
Synonyms ,4:3,6-Dianhydro-D-glucitol dinitrate; dinitrosorbide; sorbide nitrate.
Proprietary Names *Angitak*; *Cedocard*; *Corovliss*; *Dilatrate*; *Dinit*; *Disorlon*; *Imtack*; *Iso Mack*; *Isocard*; *Isodinit*; *Isoket*; *Isordil*; *Isotrate*; *Jeridin*; *Langoran*; *Nitrosid*; *Risordan*; *Soni-Slo*; *Sorbichew*; *Sorbid*; *Sorbidilat*; *Sorbitrate*; *Sorquad*; *Vascardin*; *Vasorbate*; *Vasotrate*.



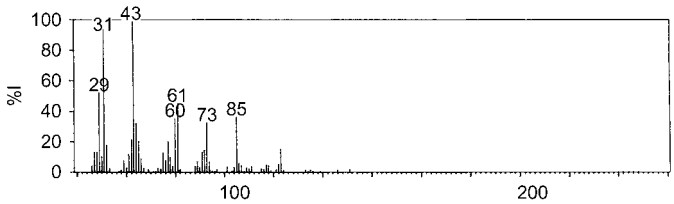
Chemical Properties A white crystalline powder. Mp 70°. Sparingly soluble in water; freely soluble in acetone, ethanol and chloroform; soluble in methanol. Log *P* (octanol/water), 1.3.
Caution Isosorbide dinitrate may explode if subjected to percussion or excessive heat.
High Performance Liquid Chromatography System HY—RI 396.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1062, 1618, 862, 1266, 1653, 1089 cm^{-1} (isosorbide (Nujol mull)).



Mass Spectrum Principal ions at *m/z* 43, 31, 29, 61, 60, 85, 73, 44.



Quantification

Plasma **GC** ECD. Limit of detection, 2.5 µg/L for isosorbide dinitrate and its metabolites [Pommier *et al.* 1996]. Isosorbide dinitrate, glyceryl trinitrate and their metabolites. Limit of detection, 20 µg/L for isosorbide dinitrate [Booth *et al.* 1990]. ECD. Limit of detection, 0.5 µg/L for isosorbide dinitrate, 2 µg/L for isosorbide 2-mononitrate and 10 µg/L for isosorbide 5-mononitrate [Santoni *et al.* 1984]. ECD. Limit of detection, 0.5 µg/L [Sioufi, Pommier 1982].

HPLC Limit of detection, 200 pg [Yu, Goff 1983].

Urine **GC** See Plasma [Sioufi, Pommier 1982].

Disposition in the Body Isosorbide dinitrate is readily absorbed after sublingual or oral administration. It is metabolised by enzymatic denitration followed by glucuronide conjugation. Isosorbide 2-mononitrate and isosorbide 5-mononitrate have some pharmacological activity. About 80% of a dose is excreted in the urine in 24 h, of which about 50% is isosorbide glucuronide, up to 15% is free and conjugated isosorbide 5-mononitrate, about 1% is free isosorbide 2-mononitrate, and <1% is unchanged drug.

Therapeutic Concentration Isosorbide 5-mononitrate accumulates in the plasma during chronic treatment.

Following a single oral dose of 20 mg of isosorbide dinitrate to 8 subjects, peak plasma concentrations of 0.02 to 0.09 (mean, 0.05) mg/L of isosorbide dinitrate, 0.02 to 0.06 (mean, 0.04) mg/L of isosorbide 2-mononitrate, and 0.10 to 0.22 (mean, 0.14) mg/L of isosorbide 5-mononitrate, were attained in 0.25, 0.7, and 1 h, respectively [Laufen *et al.* 1983].

After a single sublingual dose of 5 mg to 6 subjects, peak plasma concentrations of 0.007 to 0.015 (mean, 0.009) mg/L were attained in 10 to 15 min [Assinder *et al.* 1977].

I

Bioavailability About 60% after sublingual administration and about 20% orally, but there is considerable intersubject variation.
Half-life Plasma half-life, isosorbide dinitrate about 0.5 to 1.5 h, isosorbide 2-mononitrate about 2 h, isosorbide5-mononitrate 3 to 7 h. A longer terminal elimination half-life of about 8 h has been reported for isosorbide dinitrate.
Saliva Plasma : saliva ratio, about 1.5.
Protein Binding About 30%.
Note For a review of the pharmacokinetics of organic nitrates, see Bogaert [1983].
Dose 10 to 240 mg daily, orally.

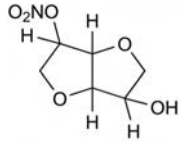
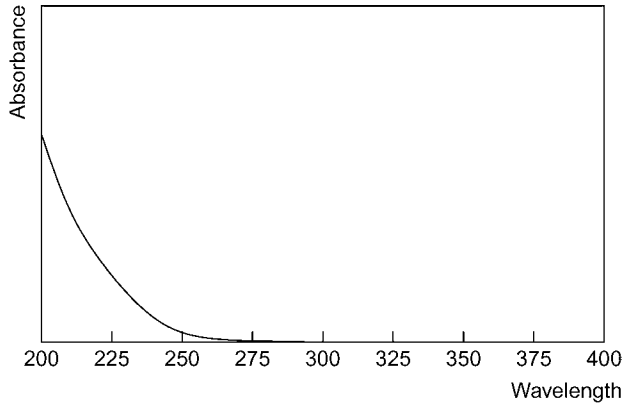
Isosorbide Mononitrate

Antianginal Vasodilator
$C_6H_9NO_6$ = 191.1
CAS—16051-77-7

IUPAC Name [(3*S*,3*aR*,6*R*,6*aS*)-3-Hydroxy-2,3,3*a*,5,6,6*a*-hexahydrofuro[3,2-*b*]furan-6-yl] nitrate
Synonyms 1,4:3,6-Dianhydro-D-glucitol 5-nitrate; isosorbide 5-mononitrate.
Proprietary Names *Angeze*; *Chemydur*; *Coleb*; *Conpin*; *Corangin*; *Duride*; *Dynamin*; *Elantan*; *Imdur*; *Imtrate*; *Isib*; *Ismo*; *Isodur*; *Isomonit*; *Isotard*; *Isotrate*; *MCR-50*; *Monicor*; *Modisal*; *Monit*; *Mono-Cedocard*; *Monoket*; *Monomax*; *Monosorb*; *Xismox*.



Chemical Properties Colourless prismatic crystals. Mp 89° to 91°. Soluble in water, ethanol, acetone and methanol; slightly soluble in chloroform and ether. Log *P* (octanol/water), −0.2.
Caution Isosorbide mononitrate may explode if subjected to percussion or excessive heat.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1280, 1650, 1635, 852, 1090, 968 cm^{-1} (KBr disk).
Quantification
Plasma **GC** ECD. Limit of detection, 2 µg/L [Yang *et al.* 1997]. ECD. Limit of detection, 1 µg/L [Straehl, Galeazzi 1984].
GC–MS For method, see Lauro-Marty *et al.* [1995].
Disposition in the Body Isosorbide mononitrate is rapidly and almost completely absorbed after oral or sublingual administration. It is metabolised by enzymatic denitration and by glucuronide conjugation. About 80% of a dose is excreted in the urine in 24 h.
Therapeutic Concentration Following a single oral dose of 20 mg given to 19 subjects, peak plasma concentrations of 0.34 to 0.68 (mean, 0.48) mg/L were attained in 1 h [Abshagen *et al.* 1981].

Toxicity
A 15-year-old girl survived after ingesting 1.6 g of isosorbide mononitrate and 20 mg of glyceryl trinitrate in a suicide attempt. Plasma levels of isosorbide mononitrate measured 4 and 6 h after gastric lavage (performed 2 h after ingestion) were 2.993 and 3.140 mg/L, respectively; glyceryl trinitrate was not detected [Sobrino *et al.* 1992].
Bioavailability Almost 100%.
Half-life Plasma half-life, 3 to 7 h.
Volume of Distribution About 0.6 L/kg.
Clearance Plasma clearance, about 1 to 2 mL/min/kg.
Saliva Plasma : saliva ratio, about 0.8.
Protein Binding <5%.
Dose 20 to 120 mg daily.

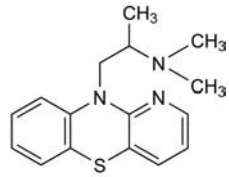
Isothipendyl

Antihistamine
$C_{16}H_{19}N_3S$ = 285.4
CAS—482-15-5

IUPAC Name *N*,*N*-Dimethyl-1-pyrido[3,2-*b*][1,4]benzothiazin-10-ylpropan-2-amine
Synonyms D-201; *N*,*N*,α-trimethyl-10*H*-pyrido[3,2-*b*][1,4]benzothiazine-10-ethanamine.

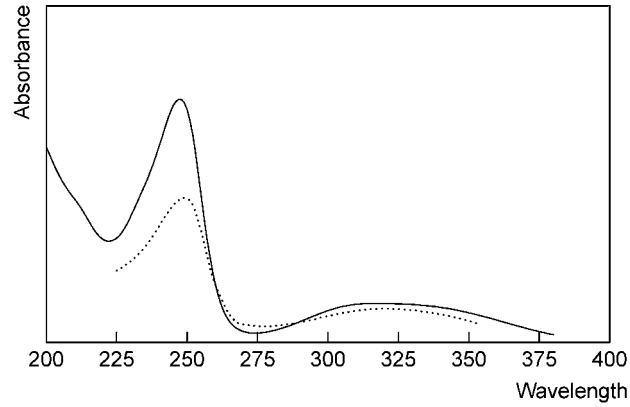


Chemical Properties Log *P* (octanol/water), 3.9.

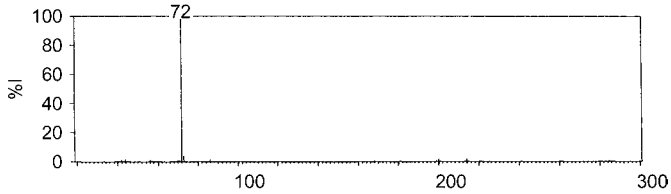
Isothipendyl Hydrochloride

$C_{16}H_{19}N_3S$, HCl = 321.9
CAS—1225-60-1
Proprietary Names *Andantol*; *Apaisyl*; *Calmogel*; *Istamyl*; *Nilergex*; *Sedermyl*; *Thiodantyl*.
Chemical Properties A fine white crystalline powder. Mp about 212°, with decomposition. Soluble 1 in 5 of water, 1 in 60 of ethanol and 1 in 10 of chloroform; practically insoluble in ether.

Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.41; system TC—R_f 0.30; system TE—R_f 0.64; system TL—R_f 0.14; system TAE—R_f 0.22; system TAF—R_f 0.35 (Dragendorff spray, positive; FPN reagent, yellow-pink; acidified iodoplatinate solution, positive; Marquis reagent, pink; ninhydrin spray, positive).
Gas Chromatography System GA—isothipendyl RI 2225, M (nor-) RI 2220, M (OH-) RI 2450, M (bis-nor-) RI 2230.
High Performance Liquid Chromatography System HA—*k* 3.8; system HX—RI 390; system HAA—retention time 13.5 min.
Ultraviolet Spectrum Aqueous acid—245 nm (A^{1}_{1}=860a); aqueous alkali—250 nm.



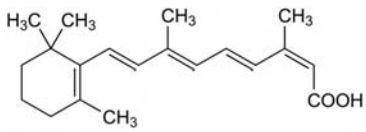
Infrared Spectrum Principal peaks at wavenumbers 1017, 1030, 1070, 987, 1090, 1080 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 72, 73, 214, 200, 44, 285, 86, 56.



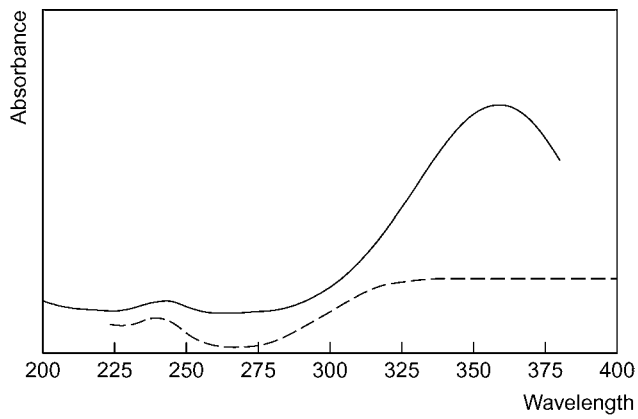
Dose 12 to 32 mg of isothipendyl hydrochloride daily.

Isotretinoin

Dermatological Agent
$C_{20}H_{28}O_2$ = 300.4
CAS—4759-48-2
IUPAC Name (2*Z*,4*E*,6*E*,8*E*)-3,7-Dimethyl-9-(2,6,6-trimethyl-1-cyclohexen-1-yl)nona-2,4,6,8-tetraenoic acid
Synonyms (13*Z*)-15-Apo-β-caroten-15-oic acid; 13-*cis*-retinoic acid; 13-RA; 2-*cis*-vitamin A acid; neovitamin A acid; Ro-4-3780.
Proprietary Names *Accure*; *Accutane*; *Isotrex*; *Isotrexin (multi-ingredient)*; *Roaccutan*; *Roaccutane*.



Chemical Properties Reddish-orange plates from isopropyl alcohol. Mp 174° to 175°. Practically insoluble in water; sparingly soluble to slightly soluble in alcohol; sparingly soluble in ether and isopropyl alcohol; soluble in chloroform and dichloromethane. Log *P* (octanol/water), 2.8; also reported as 6.0.
Thin-layer Chromatography System TF—R_f 0.45.
High Performance Liquid Chromatography System HX—RI 939.
Column: μC_{18} RP (300 × 4.6 mm). Mobile phase: methanol : water (80:20), flow rate 1.0 mL/min. IS: Ro-11-5036. UV detection (λ=350 nm). Retention time: isotretinoin, 6.3 min; IS, 5.6 min [Khan *et al.* 1996].
Ultraviolet Spectrum Aqueous acid—243, 359 nm.



Quantification

Plasma **HPLC** UV detection (λ=360 nm). Limit of quantification, 0.3 µg/L [Wyss, Bucheli 1997]. Column: RP C_{18} Nova-Pak (150 × 3.9 mm i.d.) and RP C_{18} Nova-Pak (75 × 3.9 mm). Temperature: 40°. Mobile phase: acetonitrile; 0.1 mol/L ammonium acetate, (pH 5). (80:20 for 10 min, increased to 90:10). Internal standard (IS): acitretin. MS detection, SIM mode (m/z 414). Retention time: isotretinoin, 25.5 min; IS, 16.2 min. Limit of detection, 25 pg [Lehman, Franz 1996]. MS detection. Limit of quantification, 0.3 µg/L [Ranalder *et al.* 1993].
Serum **HPLC** UV detection (λ=360 nm). Limit of quantification, 6.17 µg/L for isotretinoin and 3.48 µg/L for 4-oxo-isotretinoin, limit of detection, 1.85 µg/L for isotretinoin and 1.05 µg/L for 4-oxo-isotretinoin [Gundersen *et al.* 1997]. UV detection (λ=365 nm). Limit of detection, 12 µg/L [Gadde, Burton 1992].
Disposition in the Body Isotretinoin is rapidly absorbed after oral administration; the extent of which is increased in the presence of food. Bioavailability of the drug is low because first pass metabolism occurs in the liver and also metabolism occurs in the gut wall. The major metabolite identified in blood is 4-oxo-isotretinoin; tretinoin and 4-oxo-tretinoin can also be detected. Both the drug and metabolites undergo enterohepatic recycling. Equal amounts of the absorbed drug are excreted in faeces, mainly as the unchanged drug, and in urine, as the metabolites. Isotretinoin crosses the placenta.
Therapeutic Concentration
Thirty-eight patients with high-risk neuroblastoma, aged 2 to 12 years, were administered 100, 125, 160 or 200 mg/m^2 daily for 2 weeks, followed by a 2-week rest period. The peak concentrations were 4.9, 5.7, 7.2 and 8.9 µg/L for the 4 doses observed at 3.7, 3.8, 4.1 and 4.0 h, respectively. The minimum concentrations observed at 2.8, 4.2, 4.1 and 3.9 µg/L for the 100, 125, 160 and 200 mg doses [Khan *et al.* 1996].
Toxicity Overdosing with isotretinoin has been associated with vomiting, facial flushing, abdominal pain, headache, dizziness and problems with muscle co-ordination/regularity.
A 29-year-old male ingested 900 mg isotretinoin (equivalent to 12.5 mg (/kg/day); 30 times the prescribed dose) and 1 day later he complained of a mild headache which was easily controlled with aspirin. Five days after the overdose he was admitted to hospital with a persistent headache and eczema. The serum isotretinoin concentrations were 12, 5, 3 and <2 µg/L at 4, 5, 6 and 11 days after ingestion, respectively. The corresponding 4-oxo-isotretinoin concentrations were 562, 290, 114 and 22 µg/L, respectively [Aubin *et al.* 1995].
Half-life 10 to 20 h.
Clearance Total body, mean 5.64 L/m^2/h (children aged 2 to 12 years old).
Volume of Distribution Apparent, 29.45 L/m^2.
Protein Binding 99.9%.
Dose The initial dose is 0.5 to 1.0 mg/kg daily with a maximum dose up to 2.0 mg/kg daily for 15 to 20 weeks. The dose may be adjusted according to the response of the disease and any clinical toxic effects observed.

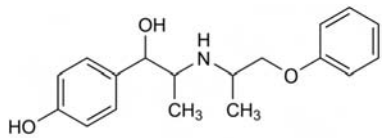
Isoxsuprine

Vasodilator
$C_{18}H_{23}NO_3$ = 301.4
CAS—395-28-8
IUPAC Name 4–Hydroxy-α-[1-[(1-methyl-2-phenoxyethyl)amino]ethyl]benzenemethanol



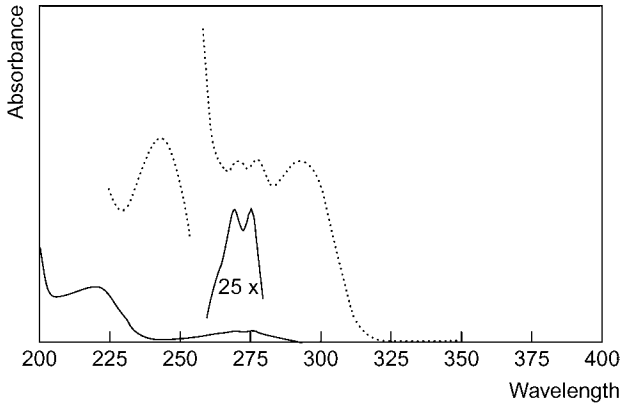
Chemical Properties Crystals. Mp 102.5° to 103.5°. pK_a 8.0, 9.8. Log *P* (octanol/water), 2.4.

Isoxsuprine Hydrochloride

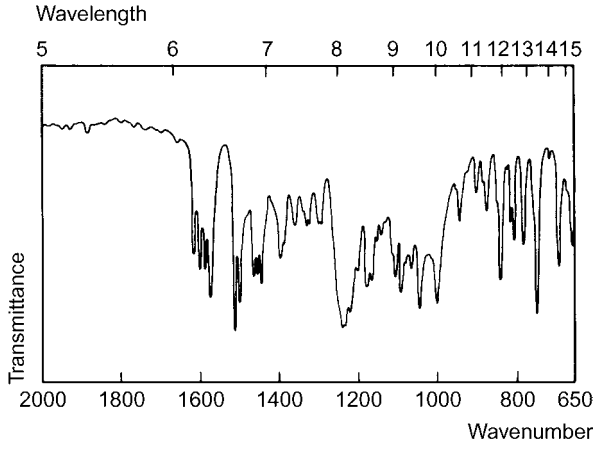
$C_{18}H_{23}NO_3$, HCl = 337.8
CAS—579-56-6
Synonym Phenoxyisopropylnorsuprifen
Proprietary Names *Dilavase*; *Dilum*; *Duvadilan*; *Duviculine*; *Fenam*; *Inibina*; *Vadosilan*; *Vasodilan*; *Vasolan*; *Vasoplex*; *Vasotran*; *Voxsuprine*; *Xuptin*.
Chemical Properties A white crystalline powder. Mp about 200°, with decomposition. Soluble 1 in 500 of water, 1 in 100 of ethanol and dilute sodium hydroxide solution, and 1 in 2500 of dilute hydrochloric acid; practically insoluble in chloroform and ether.

Colour Tests Mandelin's test—green; Marquis test—red-violet.
Thin-layer Chromatography System TA—R_f 0.78; system TB—R_f 0.03; system TC—R_f 32; system TE—R_f 0.62; system TL—R_f 0.53; system TAE—R_f 0.62; system TAF—R_f 0.81; system TAJ—R_f 0.13; system TAK—R_f 0.05; system TAL—R_f 0.60 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 2300.

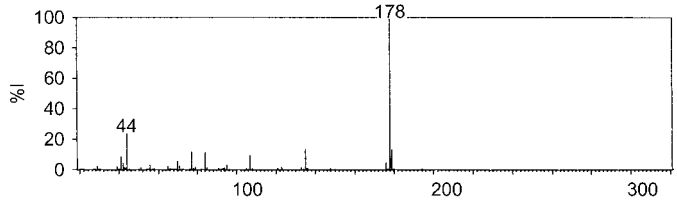
High Performance Liquid Chromatography System HA—*k* 0.8; system HX—RI 353; system HY—RI 301.
Ultraviolet Spectrum Aqueous acid—269, 274 nm (A_1^1=82a); aqueous alkali—243 (A_1^1=450a), 270, 277, 292 nm (A_1^1=78b).



Infrared Spectrum Principal peaks at wavenumbers 1514, 1240, 745, 1220, 1043, 1500 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 178, 44, 135, 179, 77, 84, 107, 41.



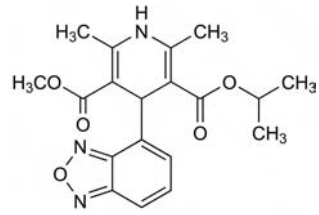
Quantification
Plasma **GC** ECD. Limit of detection, 0.5 µg/L [Cova *et al.* 1983].
Disposition in the Body Isoxsuprine is absorbed after oral administration; peak blood concentrations are attained within 1 h of a dose. It is excreted in the urine partly unchanged and partly as a conjugate.
Dose Up to 80 mg of isoxsuprine hydrochloride daily.

Cova D *et al.* (1983). Determination of isoxsuprine in human plasma by gas chromatography with electron capture detection. *Pharmacology* 27: 117–124.

Isradipine

Calcium Antagonist
$C_{19}H_{21}N_3O_5$ = 371.4
CAS—75695-93-1
IUPAC Name 3-*O*-Methyl 5-*O*-propan-2-yl 4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3, 5-dicarboxylate
Synonyms 4-(4-Benzofurazanyl)-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylic acid methyl 1-methylethyl ester; isrodipine; PN-200-110.

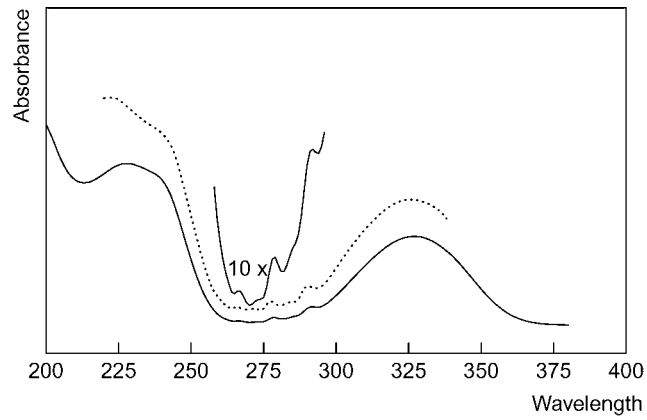
Proprietary Names *Clivoten*; *DynaCirc*; *Esradin*; *Icaz*; *Lomir*; *Prescal*; *Rebriden*; *Vascal*; *Vaslan*.



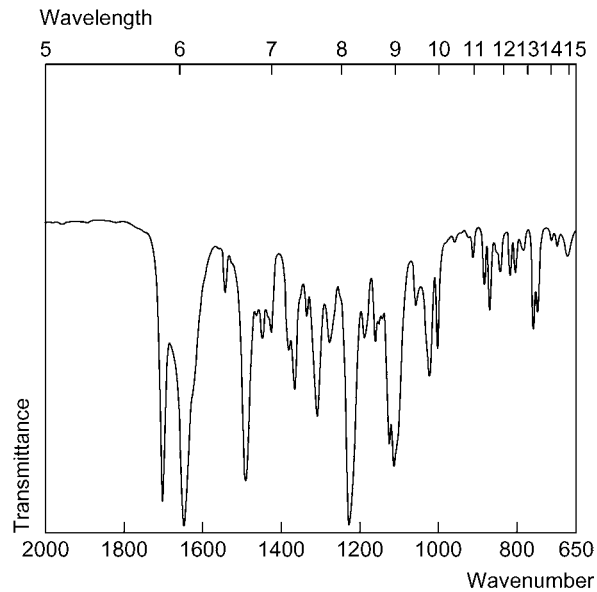
Chemical Properties A yellow crystalline powder with Mp 168° to 170°. Freely soluble in acetone, chloroform, methylene chloride; soluble in ethanol; practically insoluble in water (<10 mg/L at 37°). Log *P* (octanol/water), 4.28.
Thin-layer Chromatography System TB—R_f 0.04; system TE—R_f 0.74; system TF—R_f 0.59; system TAE—R_f 0.88.
Gas Chromatography System GP—RI 2270M (dehydro-deisopropyl)-ME; RI 2360M (dehydro-).

Gas Chromatography-Mass Spectrometry. Column: methyl silicone HP1 (0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. Detection: mass spectrometer. Retention index: 2619 [Mills, Roberson 1993a].
High Performance Liquid Chromatography System HAA—RT 22.4 min; system HX—RI 632; system HZ—RT 14.9 min.

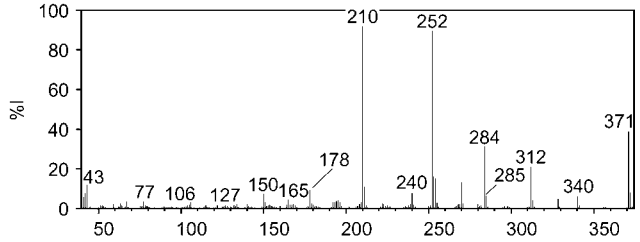
Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, 0.5 mL/min flow rate. UV diode array detection. Retention time: 3.7 min [Mills, Roberson 1993b].
Ultraviolet Spectrum Aqueous base—266, 278, 291, 326 nm.



Infrared Spectrum Principal peaks at wavenumbers 1648, 1225, 1702, 1491 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 210, 252, 371, 284, 312, 43, 178, 240.



Quantification

Plasma **GC** ECD. Limit of detection, 0.2 µg/L [Chellingsworth *et al.* 1988].

GC–MS Column: cross-linked methylsilicone (10 m × 0.53 mm i.d., 2.65 µm). Column and injector temperature: 230° and 350°, respectively. Carrier gas: methane, flow rate 10 mL/min. Detection: GM-MS. (CI, SIM at *m/z* 311). Retention time: isradipine, 2.5 min; pyridinic metabolite, 1.3 min. Limit of detection, 0.04 µg/L [Jean, Laplanche 1988].

HPLC UV detection (λ=325 nm). Limit of detection, 0.1 to 0.6 µg/L [Boutagy *et al.* 1989].

Disposition in the Body Isradipine is rapidly and almost completely absorbed (90 to 95%) after oral administration with peak plasma concentrations after 2 h. It undergoes rapid and extensive first-pass hepatic metabolism to produce inactive pyridine and carboxylic acid derivatives. Four major metabolites have been isolated, but only one has considerable pharmacological activity. The drug is excreted as metabolites in urine (70% of the dose) and the remainder in faeces (mostly as the unchanged drug). No unchanged drug is detected in urine. Excretion is virtually complete within 120 h. The pharmacokinetics of isradipine, especially the peak concentrations, half-lives and bioavailability, are increased in the elderly and those with hepatic dysfunction.

Therapeutic Concentration

Nine patients with hypertension (6 males and 3 females), aged between 38 and 68 years, were administered a single dose of 5 mg isradipine after an overnight fast. The mean peak concentration was 6 µg/L (range, 1.6 to 18.4) which was observed after 1.5 h (range, 0.5 to 4.0). Under steady state conditions, a peak plasma concentration of 3.2 (1.2 to 6.1) µg/L was observed after 1.2 h (range, 0.5 to 2.0) [Shenfield *et al.* 1990].

Twelve healthy males, aged 20 to 39 years, were administered a single 5 or 20 mg dose or a 5 mg multiple dose after an 8-h fast. The mean peak plasma concentration was 2.1 µg/L after the 5 mg single isradipine dose and 9.1 µg/L after the 20 mg dose, and both were observed between 2 and 3 h. A peak concentration of 2.2 µg/L was detected after about 1 h for the multiple dosing study [Tse, Jaffe 1987].

Bioavailability 15 to 24% (varies between poor and extensive metabolisers).

Half-life 8 h (<4 h also reported).

Volume of Distribution 2.9 L/kg (283 L).

Clearance Plasma, 40 L/h.

Distribution in Blood Erythrocyte : plasma ratio 0.24.

Protein Binding Approximately 97%, mainly to α-1-glycoprotein acids.

For a general review of isradipine, see Grimm *et al.* [1990].

Dose 2.5 to 20 mg daily.

Itraconazole

Triazole Antifungal

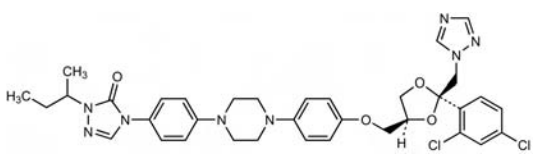
$C_{35}H_{38}Cl_2N_8O_4$ = 705.6

CAS—84625-61-6

IUPAC Name 4-[4-[4-[4-[[2-(2,4-Dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-1-piperazinyl]phenyl]-2,4-dihydro-2-(1-methylpropyl)-3*H*-1,2,4-triazol-3-one

Synonyms Oriconazole; R-51211.

Proprietary Names *Canadiol*; *Hongoseril*; *Itrizole*; *Sempera*; *Siros*; *Sporanox*; *Triasporin*.

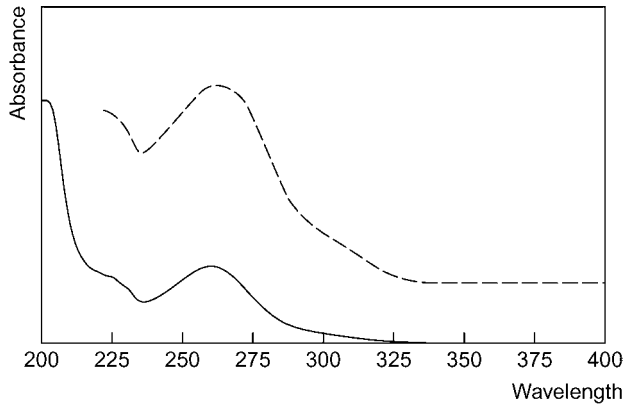


Chemical Properties A white to off-white powder; crystals from toluene. Mp 166.2°. It is soluble in dichloromethane; sparingly soluble in tetrahydrofuran; practically insoluble in water and dilute acidic solutions. pK_a 3.7. Log *P* (*n*-octanol/buffer pH 8.1), 5.66.

Thin-layer Chromatography System TB—R_f 0.01; system TE—R_f 0.79; system TF—R_f 0.11; system TAE—R_f 0.87.

High Performance Liquid Chromatography System HX—RI 725.

Ultraviolet Spectrum Aqueous acid—263 nm.



Quantification

Plasma **HPLC** UV detection (λ=254 nm). Lower limit of detection, 0.001 mg/L [Woestenborghs *et al.* 1987].

Serum **HPLC** Column: RP C_{18} RsiL C18HL (150 × 2.1 mm i.d., 5 µm). Mobile phase: water : acetonitrile (40:60), flow rate 0.5 mL/min. Internal standard (IS): R-51012. UV detection (λ=254 nm). Retention time: itraconazole, 4.3 min; IS, 5.8 min. Limit of detection, 0.01 mg/L [Gubbins *et al.* 1998]. Column: RP C_{18} Hypersil (100 × 4.5 mm i.d., 3 µm). Mobile phase: water : acetonitrile (40:60) containing 0.03% diethylamine (pH 7.8), flow rate 1 mL/min. IS: R-51012. UV detection (λ=254 nm). *k* value: itraconazole, 7.4; hydroxyitraconazole, 2.7; IS, 10.8. Limit of quantification, 0.02 mg/L for the drug and its metabolites [Law *et al.* 1994].

Bioassay For method, see Law *et al.* [1994].

Disposition in the Body Itraconazole is slowly but well absorbed after oral administration with peak concentrations reached in ~4 h. Absorption is enhanced in the presence of food and in an acidic intragastric environment. It is metabolised, mainly via oxidative pathways, to inactive metabolites which are excreted via bile and in urine. Over 30 metabolites have been isolated and most are biologically inactive, including a hydroxy metabolite (bioactive) and hydroxyitraconazole. Both the drug and hydroxyitraconazole are inhibitors of the CYP3A4 enzyme system. The drug is widely distributed throughout the body with small amounts detected in most body fluids and accumulation occurring in tissues. Itraconazole has also been detected in skin, hair and nail, but it does not easily redistribute in these tissues. 3 to 18% is excreted in the faeces as unchanged drug.

Therapeutic Concentration The trough serum therapeutic concentration is >0.25 mg/L and for the sum of the parent drug and hydroxyitraconazole metabolite, 1 to 4 g/L.

Seven healthy males and 5 females with a mean age of 34 years (range, 22 to 51) were administered a 100 mg dose of itraconazole either after a 12-h fast (group 1), after a light breakfast (group 2) or after a full breakfast (group 3). Group 1: a mean peak plasma concentration of 0.11 mg/L was observed 3.33 h after ingestion. Group 2: 0.21 mg/L at 3.67 h. Group 3: peak concentration of 0.23 mg/L after 4.17 h [Zimmermann *et al.* 1994].

Toxicity The serum toxic concentration is 6 mg/L (sum of itraconazole and its hydroxy metabolite).

Bioavailability Dose dependent, increases with increasing dosage; 55% after a 100 mg dose (as solution).

Half-life 20 h (following a 100 mg single dose); increases to 30 h on multiple dosing.

Volume of Distribution 10.7 L/kg; also reported as 561 L.

Clearance Plasma, 22.9 L/h; also reported as 18.7 L/h.

Protein Binding Approximately 99.8%, albumin.

Dose 100 to 400 mg daily depending on indications and severity.

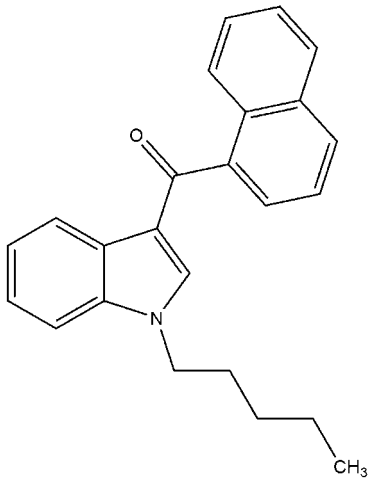
JWH-018

Analgesic, CB1 and CB2 Agonist

$C_{24}H_{23}NO = 341.5$

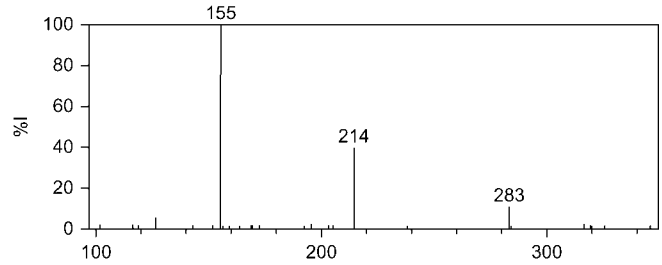
IUPAC Name Naphthalen-1-yl-(1-pentylindol-3-yl)methanone

Synonyms 1-Pentyl-3-(1-naphthoyl), herbal incense.



Chemical Properties Aminoalkylindole, which produces effects similar to tetrahydrocannabinol, is one of the active ingredients of the herbal blend 'Spice'. It is illegal in Austria, Germany and France.

Mass Spectrum Principal peaks at *m/z* 155, 214, 283.



Quantification

Blood **LC-MS** MRM acquisition mode. Limit of quantification, 0.6 μg/L, limit of detection, 0.2 μg/L [Neukamm *et al.* 2009].

Urine **LC-MS** Enhanced product ion scan. Limit of detection not reported [Kraemer *et al.* 2009].

GC-MS EI ionisation. Limit of detection not reported [Kraemer *et al.* 2009].

Hair **LC-MS** See Blood [Neukamm *et al.* 2009].

Other **LC-MS** Herbal Products. Column: UPLC HSS T3 (100 × 2.1 mm i.d., 1.8 μm). Mobile phase: 0.1% formic acid in acetonitrile : water, flow rate 0.3 mL/min. Limit of detection not reported [Uchiyama *et al.* 2009].

Kraemer, T. *et al.* (2009). Studies on the metabolism of JWH-018 and of a homologue of CP 47,497, pharmacologically active ingredients of different misused incense ('Spice') using GC-MS and LC-MS techniques. *Ann Toxicol Anal* 21: S1-21–S1-22.

Kanamycin

Antibiotic
$C_{18}H_{36}N_4O_{11}$ = 484.5
CAS—59-01-8

IUPAC Name *O*-3-Amino-3-deoxy-α-D–glucopyranosyl-(1→6)-*O*–[6-amino-6-deoxy-α-D–glucopyranosyl-(1→4)]-2-deoxy-D-streptamine
Synonym Kanamycin A
Proprietary Names *Kanapat*; *Kanibel*.

	R	R'
Kanamycin A	NH_2	OH
Kanamycin B	NH_2	NH_2
Kanamycin C	OH	NH_2

Chemical Properties An antimicrobial substance produced by the growth of *Streptomyces kanamyceticus*. A whitish powder. pK_a 7.2. Log *P* (octanol/water), −6.7.

Kanamycin Acid Sulfate

$C_{18}H_{36}N_4O_{11}$, $1.7H_2SO_4$ = 651.2
Proprietary Names *Kangen*; *Kannasyn*.
Chemical Properties A white hygroscopic powder. Soluble 1 in 1 of water; practically insoluble in ethanol, acetone, chloroform and ether.

Kanamycin Sulfate

$C_{18}H_{36}N_4O_{11}$, H_2SO_4 = 582.6
CAS—25389-94-0
Synonym Kanamycin A sulfate
Proprietary Names *Kamycine*; *Kanacolirio*; *Kanamytrex*; *Kanasig*; *Kana-Stulln*; *Kancin*; *Kanescin*; *Kan-Ophtal*; *Kantrex*.
Chemical Properties A white crystalline powder. Soluble 1 in 8 of water; practically insoluble in ethanol, acetone, chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.01; system TAE—R_f 0.00 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—249 (A^1_1 = about 3b), 306 nm.
Infrared Spectrum Principal peaks at wavenumbers 1033, 1068, 1143, 1123, 980, 1516 cm^{-1} (kanamycin sulfate, KBr disk).
Quantification
Serum **HPLC** Fluorescence detection. For method for quantification of kanamycin and dibekacin, see Kubo *et al.* [1985].
Immunoassay Fluorescence detection DeCastro *et al.* [1986].
Spectrofluorimetry Limit of detection, 50 µg/L [Csiba 1979].
Bioassay For method of quantification of aminoglycoside antibiotics in biological fluids, see Broughall [1978].
Urine **Spectrofluorimetry** See Serum [Csiba 1979].
Disposition in the Body Kanamycin is poorly absorbed after oral administration, but rapidly and completely absorbed after IM injection. Up to 95% of a dose is excreted unchanged in the urine in 24 h, most being excreted within the first 6 h. A small amount is excreted in the bile.
Therapeutic Concentration During treatment, the serum concentration should be in the range 20–25 mg/L and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing, the trough concentration immediately preceding a dose should not exceed 10 mg/L.
Toxicity Toxic effects may be produced at serum concentrations of 30 mg/L or more, or during chronic treatment if the trough serum concentration exceeds 10 mg/L.
Half-life Plasma half-life, about 2 to 4 h; increased to 4–5 days in renal failure.
Volume of Distribution About 0.3 L/kg.
Clearance Plasma clearance, about 1.4 mL/min/kg.
Protein Binding Not significantly bound.
Dose The equivalent of up to 1.5 g of kanamycin daily, by IM injection.

Broughall JM (1978). Aminoglycosides. In: Reeves DS *et al.*, eds.*Laboratory Methods in Antimicrobial Chemotherapy.* Edinburgh: Churchill Livingstone, 194–207.

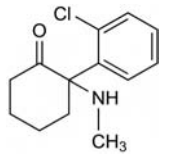
Kubo H *et al.* (1985). Rapid method for determination of kanamycin and dibekacin in serum by use of high-pressure liquid chromatography. *Antimicrob Agents Chemother* 28: 521–523.

Ketamine

Anaesthetic (General)
$C_{13}H_{16}ClNO$ = 237.7
CAS—6740-88-1

IUPAC Name 2-(2-Chlorophenyl)-2-(methylamino)cyclohexanone

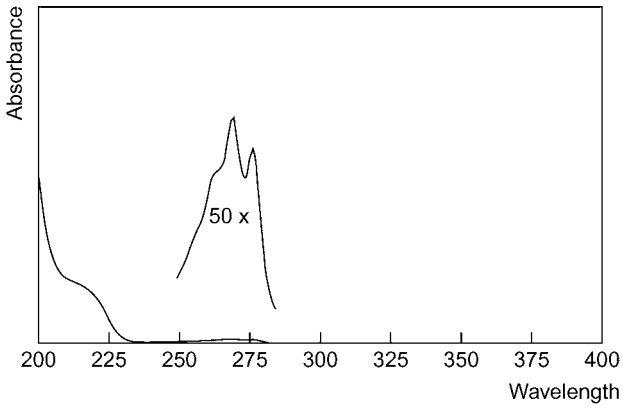


Chemical Properties Crystals Mp 92° to 93°. pK_a 7.5. Log *P* (octanol/water), 3.1. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

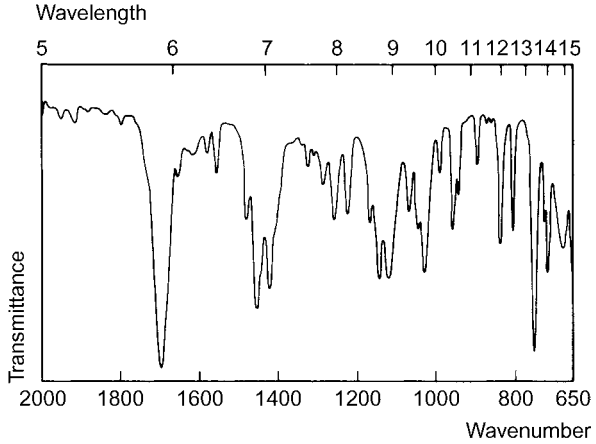
Ketamine Hydrochloride

$C_{13}H_{16}ClNO$, HCl = 274.2
CAS—1867-66-9

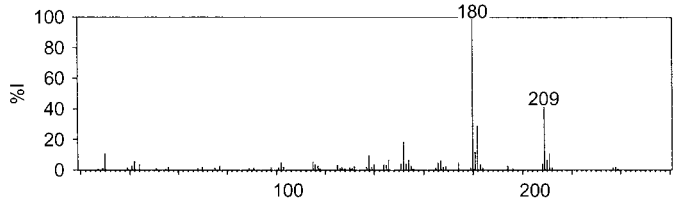
Chemical Properties A white crystalline powder. Mp 262° to 263°. Soluble 1 in 4 of water, 1 in 14 of ethanol and 1 in 6 of methanol; sparingly soluble in chloroform; practically insoluble in ether.
Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.37; system TC—R_f 0.63; system TE—R_f 0.79; system TL—R_f 0.64; system TAE—R_f 0.68; system TAF—R_f 0.72; system TAJ—R_f 0.47; system TAK—R_f 0.04; system TAL—R_f 0.43 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1840, M (nor-) RI 1810, M (nor-OH-)-H_2O RI 1960, M (nor-OH-)-NH_3 RI 1740, M (nor-di-OH-)-$2H_2O$ RI 1920; system GB—RI 1939, M (nor-) RI 1907, M (nor-OH-)-H_2O RI 2058, M (nor-OH-)-NH_3 RI 1840, M (nor-di-OH-)-$2H_2O$ RI 2009, M (nor-)-H_2O RI 1931; system GM—RRT 0.427, M (nor-) RRT 0.423 (both relative to iprindole); system GV—RRT 10.4 min.
High Performance Liquid Chromatography System HX—RI 311; system HY—RI 262; system HZ—RT 2.4 min; system HAA—RT 9.6 min.
Ultraviolet Spectrum Aqueous acid—269 (A^1_1 = 25a), 276 nm.



Infrared Spectrum Principal peaks at wavenumbers 1696, 747, 1142, 1120, 712, 1027 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 180, 209, 182, 152, 181, 30, 211, 138.



Quantification

Plasma **GC** Column: SE-30 or OV-17 (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 180° for 8 min to 225° at 15°/min for 3 min. NSD. Limit of detection, 80 µg/L [Stiller *et al.* 1982].

GC-MS Column: DB-5 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 90° to 260° at 25°/min for 10 min. EI ionisation, SIM acquisition mode. Limit of detection, 10 µg/L [Feng *et al.* 1995].

HPLC Column: Chiralcel OD. Mobile phase: *n*-hexane : propan-2-ol (98 : 2). UV detection (λ = 215 nm). Limit of detection, 5 µg/L [Yanagihara *et al.* 2000]. Column: Cyano CN (250 × 4.6 mm, 5 µm). Mobile phase: methanol : acetonitrile : orthophosphoric acid : 0.01 mol/L sodium dihydrogen phosphate (200 : 80 : 2 : 718). UV detection (λ = 215 nm) [Gross *et al.* 1999]. Column: Purospher RP-18. Mobile phase: acetonitrile : 0.03 mol/L phosphate buffer (23 : 77, pH 7.2). Limit of quantification, 5 µg/L [Bolze, Boulieu 1998]. Column: Chiral AGP. Mobile phase: 16% methanol and a 10 µmol/L phosphate buffer (pH 7.0). UV detection (λ = 220 nm). Limit of detection, 5 µg/L [Svensson, Gustafsson 1996]. Column: C_{18}. Mobile phase: acetonitrile : 0.05 mol/L sodium phosphate buffer (pH 4.45, 30 : 70), flow rate 1 mL/min. UV detection (λ = 210 nm). Limit of detection, 5 µg/L [Adams *et al.* 1992]. See also Geisslinger *et al.* [1991].

Serum **GC** FID. Limit of detection, 25 µg/L [Wieber *et al.* 1975].

Urine **GC** See Plasma [Stiller *et al.* 1982]. See Serum [Wieber *et al.* 1975].

GC-MS Column: DB 5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 90° for 2 min to 160° at 30°/min to 275° at 10°/min for 15 min. MSD, EI ionisation, SIM acquisition mode. Retention time: 10.4 min. Limit of detection, 5 µg/L [Olmos-Carmona, Hernandez-Carrasquilla 1999].

Disposition in the Body Ketamine rapidly distributes into tissues including the brain following parenteral administration. It crosses the placenta. It has a bi- or triexponential elimination pattern. In the first phase, ketamine exerts its anaesthetic effects in the CNS, and it is then redistributed into peripheral tissues and metabolised in the liver. Approximately 90% of a dose is excreted in the urine in 72 h, with ~2% of the dose as unchanged drug, 2% as norketamine, 16% as dehydronorketamine and 80% as conjugates of hydroxylated metabolites. Norketamine (which has ~17% of the potency of ketamine) and dehydronorketamine are found in the serum in concentrations similar to those of ketamine. It has been suggested that dehydronorketamine may be an analytical artefact rather than a metabolite.

Therapeutic Concentration

Following single IV injections of 2.5 mg/kg to 5 subjects, serum concentrations of ~1 mg/L were reported after 15 min [Wieber *et al.* 1975].

During continuous IV infusion at an average rate of 41 µg/kg/min to 31 subjects, a mean steady-state plasma concentration of 2.2 mg/L was reported; norketamine and dehydronorketamine had mean peak plasma concentrations of 1.1 mg/L and 0.7 mg/L, respectively, attained at ~3 h. The subjects awoke at an average plasma concentration of 0.64 mg/L [Idvall *et al.* 1979].

Following an IM injection of 0.5 mg/kg in 6 subjects, peak plasma concentrations of 0.10–0.43 mg/L (mean 0.24) were attained in ~0.3 h; norketamine attained a mean peak plasma concentration of 0.09 mg/L at ~1 h [Clements *et al.* 1982].

Toxicity Ketamine produces hallucinogenic effects similar to those of phencyclidine and may be subject to abuse.

The following postmortem tissue concentrations were reported in a fatality involving ketamine: blood 1.8 mg/L, urine 2.0 mg/L, brain 4.3 µg/g, spleen 6.1 mg/g, liver 4.9 µg/g, kidney 3.6 µg/g; ethanol was also detected at a blood concentration of 1700 mg/L [Moore *et al.* 1997].

In a fatality caused by homicidal overdose of ketamine, tissue concentrations at postmortem were as follows: blood 27.4 mg/L, urine 8.51 mg/L, bile 15.2 mg/L, brain 3.24 mg/L, liver 6.6 mg/L, kidney 3.38 mg/L; norketamine was also detected in all samples but not quantified [Licata *et al.* 1994].

Half-life Plasma half-life, ~2–3 h.

Volume of Distribution ~4 L/kg.

Clearance Plasma clearance, ~17 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~0.6.

Protein Binding ~20–50%.

Note For a study of the stability of ketamine and its metabolites in human biological samples, see Hijazi *et al.* [2001]. For a review of the recent trend of ketamine misuse in the USA, see Moore *et al.* [2001].

Dose The equivalent of 1 to 4.5 mg/kg ketamine, by slow IV injection or 6.5 to 13 mg/kg, IM.

Ketanserin

Antihypertensive, 5-HT_{2A} Receptor Antagonist

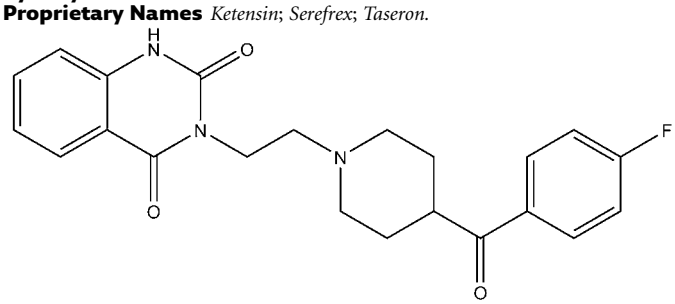
$C_{22}H_{22}FN_3O_3$ = 395.4

CAS—74050-98-9

IUPAC Name 3-[2-[4-(4-Fluorobenzoyl)-1-piperidinyl]ethyl]-2,4[1*H*,3*H*]-quinazolinedione

Synonym R-41468

Proprietary Names *Ketensin*; *Serefrex*; *Taseron.*



Chemical Properties Crystals. Mp 227° to 235°. Solubility 0.001 g/100 mL water, 0.038 g/100 mL ethanol, and 2.34 g/100 mL DMF. pK_a 7.5 [O'Neil MJ *et al.* 2006]. Log *P* (octanol/water), 3.21 [ACD 2007]. Stability of standard solutions was verified at 6° for 3 months [Kurowski 1985]. Ketanserin was stable in plasma at −20° for 3 months and there was no effect of freeze-thaw [Okonkwo *et al.* 1983; Yassen *et al.* 2003].

Ketanserin Tartrate

$C_{22}H_{22}FN_3O_3$, $C_4H_6O_6$ = 545.5

CAS—83846-83-7

Synonyms R-49945; Ket.

Proprietary Names *Perketan*; *Serepress*; *Sufrexal.*

High Performance Liquid Chromatography Column: Waters µBondapak phenyl reversed phase (300 × 3.9 mm i.d., 10 µm). Mobile phase: 5.44 g potassium dihydrogen phosphate in approx. 1200 mL water with 608 mL acetonitrile, pH 2.3 made up to 2 L, flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 50 µg/L [Simon, Somani 1982].

Quantification

Blood **HPLC** Column: Macherey Nagel Nucleosil reversed phase (250 × 2 mm i.d., 10 µm). Mobile phase: water : acetonitrile (70 : 30) with 0.2% diethylamine, flow rate 1.0 mL/min. Fluorometric detection (λ_{ex} = 270 nm, λ_{em} = 410 nm). Limit of detection, 0.5 µg/L [Okonkwo *et al.* 1983].

Plasma **HPLC** Column: Hypersil BDS (100 × 4.5 mm i.d., 3 µm). Mobile phase: 0.01 mol/L acetate buffer (pH 4.9) : methanol : acetonitrile (52 : 40 : 8), flow rate 0.9 mL/min. Fluorescence detection (λ_{ex} = 332 nm, λ_{em} = 410 nm). Limit of quantification, 2 µg/L for ketanserin, 1.7 µg/L for ketanserinol [Yassen *et al.* 2003]. Column: RP-18 Chromosorb LC-7 (30 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L ammonium acetate (pH 6.8) : 1.0 mol/L ammonium acetate (pH 6.8)-methanol–acetonitrile (10 : 45 : 45; 95 : 5 to 30 : 70 at 50 min), flow rate 1.5 mL/min. UV detection (λ = 230 or 240 nm). Limit of detection, 1 µg/L [Meuldermans *et al.* 1988]. Column: Macherey Nagel Nucleosil (250 × 4 mm i.d., 5 µm). Mobile phase: 2% acetic acid: 0.17 mol/L ammonium acetate : acetonitrile (50 : 10 : 40), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 310 nm, λ_{em} = 370 nm). Limit of detection, 200 ng/L for ketanserin, 100 ng/L for ketanserinol [Kurowski 1985]. Column: Chrompack CP Spher C_8 (250 × 4.6 mm i.d., 8 µm).

Mobile phase: acetonitrile : water (55 : 45) with buffer (pH 5.8) containing 30% acetic acid and 100% diethylamine (10 : 4.25). UV detection ($\lambda = 214$ nm). Limit of detection, 10 µg/L [Lindelauf 1983]. Column: LiChrosorb ODS reversed phase RP_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.02 mol/L sodium acetate (pH 4.5, 1 : 4 : 6), flow rate 1.0 mL/min. Limit of detection, 7.9 µg/L [Kacprowicz *et al.* 1983]. Column: Macherey Nagel Nucleosil reversed phase (250 × 2 mm i.d., 10 µm). Mobile phase: water : acetonitrile (70 : 30) with 0.2% diethylamine, flow rate 1.0 mL/min. Fluorometric detection ($\lambda_{ex} = 270$ nm, $\lambda_{em} = 410$ nm). Limit of detection, 0.5 µg/L [Okonkwo *et al.* 1983].

***Urine* HPLC** Column: RP-18 Chromosorb LC-7 (300 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L ammonium acetate (pH 6.8) : 1.0 mol/L ammonium acetate (pH 6.8)–methanol–acetonitrile (10 : 45 : 45; 95 : 5 to 30 : 70 at 50 min), flow rate 1.5 mL/min. UV detection ($\lambda = 230$ or 240 nm). Limit of detection, 1 µg/L [Meuldermans *et al.* 1988]. Column: Macherey Nagel Nucleosil (250 × 4 mm i.d., 5 µm). Mobile phase: 2% acetic acid : 0.17 mol/L ammonium acetate : acetonitrile (50 : 10 : 40), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 310$ nm, $\lambda_{em} = 370$ nm). Limit of detection, 200 µg/L for ketanserin, 100 µg/L for ketanserinol [Kurowski 1985]. Column: Macherey Nagel Nucleosil reversed phase (250 × 2 mm i.d., 10 µm). Mobile phase: water : acetonitrile (70 : 30) with 0.2% diethylamine, flow rate 1.0 mL/min. Fluorometric detection ($\lambda_{ex} = 270$ nm, $\lambda_{em} = 410$ nm). Limit of detection, 0.5 µg/L [Okonkwo *et al.* 1983].

Disposition in the Body After oral administration, ketanserin is almost completely absorbed (90%) and peak plasma concentrations are reached within 0.5 to 2 h. Less than 2% of the parent compound is excreted in the urine. The most common mechanism of metabolism of ketanserin is through ketone reduction (29%), leading to the formation of ketanserinol, which is mainly excreted in the urine. Oxidative *N*-dealkylation at the piperidine nitrogen with the formation of the urinary metabolite 1,4-dihydro-2,4-dioxo-3(2*H*)-quinazolineacetic acid accounts for approx. 20% of ketanserin metabolism, while aromatic hydroxylation at the quinazolinedione moiety and the formation of ether glucuronides accounts for the rest.

Therapeutic Concentration Following IV administration, ketanserin concentrations decay triexponentially with sequential half-lives of 0.13, 2 and 14.3 h. Following long-term oral dosing (20 or 40 mg twice daily) steady-state concentrations are reached within 4 days [Persson *et al.* 1991].

Ten healthy male volunteers were administered a 10 mg IV injection, or a 10 mg IM injection, or an oral dose of 20 mg, 40 mg or 60 mg ketanserin. The values were observed as indicated in the table below.

Pharmacokinetics and bioavailability of ketanserin in elderly subjects were in good agreement with those in young volunteers. There is a small tendency towards a longer half-life in the elderly patients, which may be explained by the physiological reduction in elimination processes in the elderly [Kurowski 1985].

Pharmacokinetic parameters in pre-eclamptic women are comparable with those in healthy non-pregnant volunteers [Yassen *et al.* 2003].

Note For a pharmacokinetic study of ketanserin in patients with renal failure, see Barendregt *et al.* [1990].

Bioavailability Approximately 50%.

Half-life Triexponentially decay of 0.13, 2 and 14.3 h after IV administration; approx. 17 h after IM or oral administration.

Volume of Distribution 3 to 6 L/kg.

Clearance Approximately 25 L/h in healthy volunteers; 38 L/h in pre-eclamptic women.

Distribution in Blood Blood : plasma concentration 0.70.

Protein Binding Approximately 95%, mainly to albumin.

Dose 40 mg twice daily.

Ketazolam

Tranquilliser

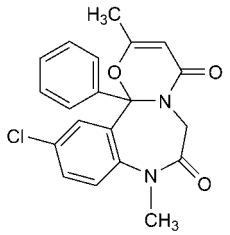
$C_{20}H_{17}ClN_2O_3 = 368.8$

CAS—27223-35-4

IUPAC Name 11-Chloro-2,8-dimethyl-12b-phenyl-6*H*-[1,3]oxazino[3,2-*d*][1,4]benzodiazepine-4,7-dione

Synonyms 11-Chloro-8,12b-dihydro-2,8-dimethyl-12b-phenyl-4*H*-[1,3]oxazino[3,2-*d*][1,4]benzodiazepine-4,7(6*H*)-dione; U-28774.

Proprietary Names *Anseren*; *Contamex*; *Loftran*; *Marcen*; *Sedotime*; *Solatran*; *Unakalm*.



Chemical Properties White crystalline powder. Mp 183°. Slightly soluble in water.

Colour Test Formaldehyde–sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.14; system TC—R_f 0.64; system TD—R_f 0.45; system TE—R_f 0.74; system TF—R_f 0.45; system TL—R_f 0.66; system TAD—R_f 0.62; system TAE—R_f 0.83; system TAF—R_f 0.80 (Dragendorff spray, positive; furfuraldehyde reagent, dark grey; acidified iodoplatinate solution, positive; mercuric chloride–diphenylcarbazone reagent, pale blue; ninhydrin spray, pale yellow; acidified potassium permanganate solution, positive).

Gas Chromatography System GA—ketazolam RI 2444, diazepam RI 2428, oxazepam RI 2325; system GB—ketazolam RI 2552, diazepam RI 2556, oxazepam RI 2438; system GG—diazepam RI 2940, oxazepam RI 2803 (rearrangement can occur on the column to form diazepam).

Gas Chromatography-Mass Spectrometry Column: SGE BP1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 65° for 1 min to 250° at 15°/min for 8 min to 300° at 10°/min for 2 min. EI ionisation, scan or SIM acquisition mode. Retention time: 14.7 min. Limit of quantification, 2.5 to 5 mg/L and 0.1 to 0.5 mg/L for scan and SIM modes, respectively [Borrey *et al.* 2001a].

High Performance Liquid Chromatography System HI—*k* 12.81; system HJ—*k* 2.45; system HK—*k* 0.04; system HX—RI 577; system HY—RI 522; system HZ—retention time 10.3 min; system HAX—retention time 7.7 min; system HAY—retention time 9.2 min; system HBH—*k* 10.78; system HBI—*k* 2.22.

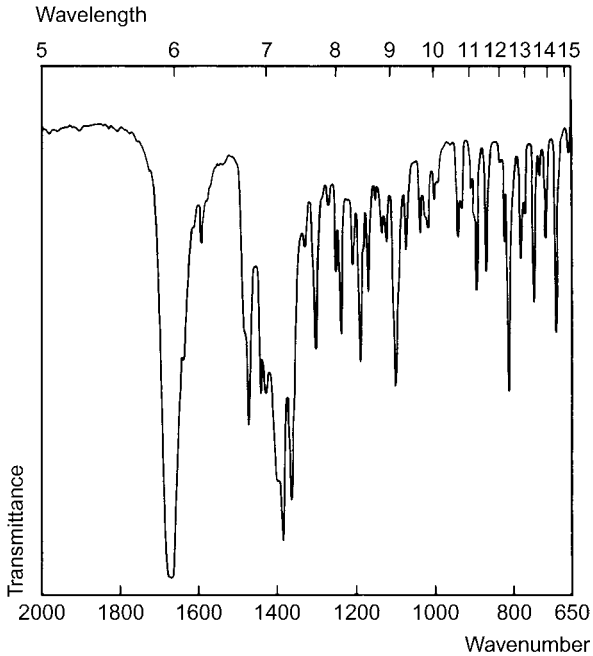
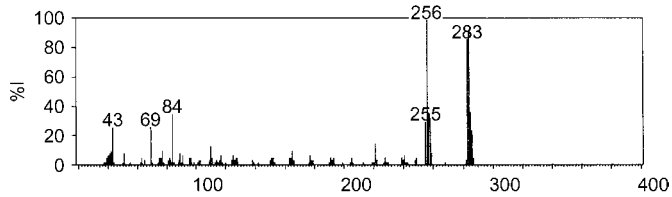
Infrared Spectrum Principal peaks at wavenumbers 1675, 820, 1105, 1195, 1308, 1242 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 256, 284, 283, 285, 84, 257, 258, 255; oxazepam 257, 77, 268, 239, 205, 267, 233, 259.



Quantification

Urine **GC-MS** Column: SGE BP1 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 65° for 1 min to 250° at 15°/min for 8 min to 300° at 10°/min for 2 min. EI ionisation, scan or SIM acquisition mode. Limit of detection, 16 and 1.1 µg/mL for scan and SIM mode, respectively [Borrey *et al.* 2001b].

Disposition in the Body Readily absorbed after oral administration. Rapidly metabolised by *N*-demethylation to desmethylketazolam and desmethyldiazepam (nordazepam). About 80% of a dose is excreted in the urine as metabolites with only traces of unchanged drug. Of the material excreted in the urine, about 56% is oxazepam and the remainder is a mixture of minor metabolites, including diazepam, desmethyldiazepam, temazepam, and other unidentified metabolites. About 20% of a dose is eliminated in the faeces, mainly as metabolites.

Therapeutic Concentration

Following a single oral dose of 30 mg of ^{14}C-labelled ketazolam, peak plasma concentrations of about 0.004 mg/L of ketazolam, 0.017 µg/L of diazepam, and 0.127 mg/L of *N*-demethylated metabolites were attained in 2, 10 and 14 h, respectively [Eberts, Jr. 1977].

Toxicity Overdoses of up to 0.5 g have been ingested without serious toxic effects.

Half-life Plasma half-life, ketazolam 1–3 h [Borrey *et al.* 2001a]

Dose 15 to 60 mg daily.

Borrey D *et al.* (2001a). Sensitive gas chromatographic–mass spectrometric screening of acetylated benzodiazepines. *J Chromatogr A* 910: 105–118.

Ketobemidone

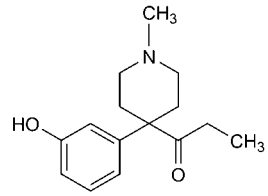
Narcotic Analgesic

$C_{15}H_{21}NO_2$ = 247.3

CAS—469-79-4

IUPAC Name 1-[4-(3-Hydroxyphenyl)-1-methylpiperidin-4-yl]propan-1-one

Synonyms Cetobemidone; 1-[4-(3-hydroxyphenyl)-1-methyl-4-piperidyl]-1-propanone.



Chemical Properties Crystals. Mp 156° to 157°.

Ketobemidone Hydrochloride

$C_{15}H_{21}NO_2$, HCl = 283.8CAS—5965-49-1

Synonyms Hoechst 10720; Win-1539.

Proprietary Names *Cliradon*; *Cymidon*; *Ketodur*; *Ketogan*; *Ketogin*; *Ketorax*.

Chemical Properties Crystals. Mp 201° to 202°. Soluble in water, slightly soluble in alcohol. pK_a 8.7 (20°). Log *P* (heptane/pH 7.4), −3.0.

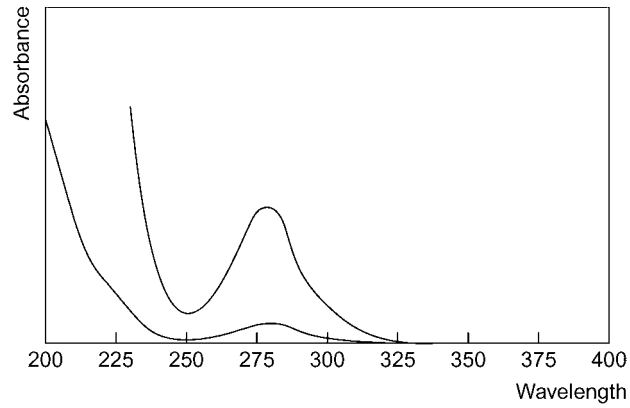
Colour Tests Mandelin's test—blue-green; Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.02; system TC—R_f 0.09; system TE—R_f 0.37; system TL—R_f 0.06; system TAE—R_f 0.26; system TAJ—R_f 0.03; system TAK—R_f 0.01; system TAL—R_f 0.40 (acidified iodoplatinate solution, positive).

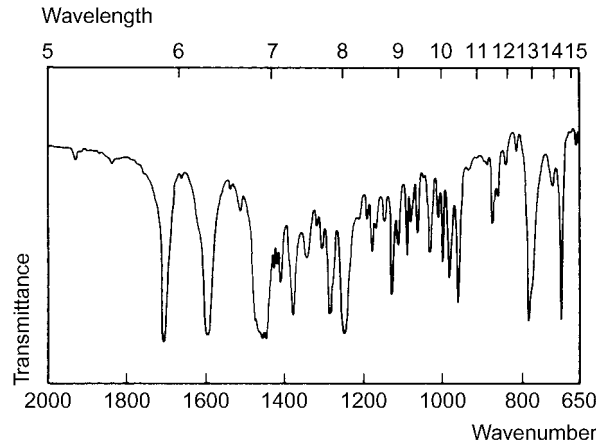
Gas Chromatography System GA—RI 2040.

High Performance Liquid Chromatography System HA—*k* 2.8 (tailing peak); system HX—RI 294; system HY—RI 245.

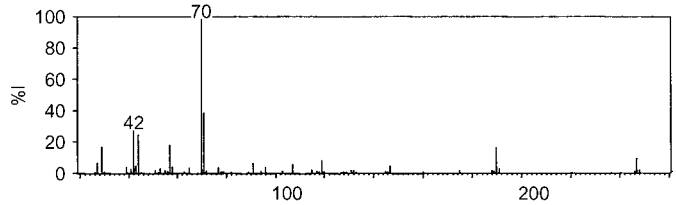
Ultraviolet Spectrum Aqueous acid—280 nm (A^{1}_{1} = 81a); aqueous alkali—300 nm (A^{1}_{1} = 126b).



Infrared Spectrum Principal peaks at wavenumbers 1705, 1597, 1248, 777, 699, 1285 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 70, 71, 42, 44, 57, 190, 29, 247.



Quantification

Blood **GC** Column: HP5 (25 m × 0.32 mm i.d., 0.52 µm). Temperature programme: 160° for 5 min to 220° at 5°/min for 8.5 min to 250° at 20°/min for 3 min. NPD. Limit of detection not reported [Steentoft, Worm 1994].

HPLC Column: RP-18. Mobile phase: acetonitrile : methanol : 10 mmol/L phosphate buffer (pH 7.0; 45 : 30 : 15), flow rate 0.9 mL/min. UV detection ($\lambda = 215$ nm) or electrochemical detection. Limit of detection not reported [Steentoft, Worm 1994].

***Plasma* GC-MS** Column: SE-30 Ultrasep capillary (25 m × 0.3 mm i.d.). Temperature: 220°. EI ionisation at 35 eV. Limit of detection, 5 µg/L [Bondesson *et al.* 1983].

LC-MS Column: Luna C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: 25 mmol/L formic acid solution containing 2% acetonitrile : 25 mmol/L formic acid solution containing 70% acetonitrile (95 : 5 to 72 : 28 at 5 min to 0 : 100 for 0.4 min to 95 : 5 for 4.6 min), flow rate 0.3 mL/min. HPLC See Blood [Steentoft, Worm 1994].

Disposition in the Body Ketobemidone is extensively metabolised by humans. A mean of 72% of an oral dose was recovered as ketobemidone and metabolites in urine, 34–56% being excreted as free and conjugated ketobemidone. The fraction excreted in urine as the *N*-demethylated metabolite norketobemidone amounted 10–31% of an oral dose [Bondesson *et al.* 1983]. Poorly absorbed after oral or rectal administration. Metabolised by *N*-demethylation.

Therapeutic Concentration

Seventeen critically ill patients, many with signs of hepatic dysfunction but no liver failure, many with signs of sepsis, and 5 with renal failure, were administered 5 mg ketobemidone via a gastric tube. The mean maximum plasma concentration was 38 nmol/L at 48 min [Al-Shurbaji, Tokics 2002].

Toxicity

In fatal intoxications in Sweden in 1992–2002, 84 were positive for ketobemidone: 40 were suicides, 12 were accidents and 32 were uncertain [Jönsson *et al.* 2004].

In 76 fatalities attributed to ketobemidone (23 also involving alcohol and 26 also involving other drugs), tissue concentrations were as follows: blood 0.2–3.2 µg/g (median 0.5) after oral administration and 0.1–1.5 µg/g (median 0.3) after injection; liver 0.2– 6.2 µg/g (median 1.3) after oral administration and 0.2–1.3 µg/g (median 0.5) after injection; muscle 0.2–0.5 µg/g (median 0.4) after oral administration and 0.1–1.1 µg/g (median 0.2) after injection. If the blood alcohol concentration was >1 mg/g, the median ketobemidone concentrations were: blood 0.1 µg/g; liver 0.4 µg/g (after both oral and IV injection) [Steentoft, Worm 1994].

Note For fatal intoxications in the Nordic population in 1984 and 1985, see Steentoft *et al.* [1989b]and Steentoft *et al.* [1989a].

Bioavailability ≈40%.

Half-life ≈2 h.

Volume of Distribution ≈2 to 3 L/kg.

Clearance ≈10 mL/min/kg.

Dose Ketobemidone has been given in doses of 5 to 10 mg.

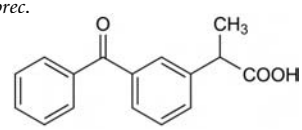
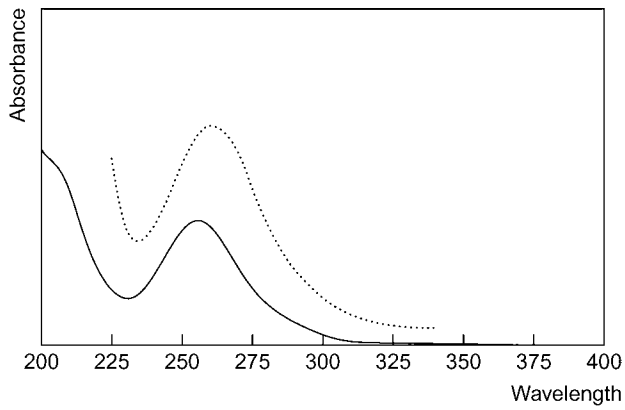
$C_{16}H_{14}O_3 = 254.3$
CAS—22071-15-4

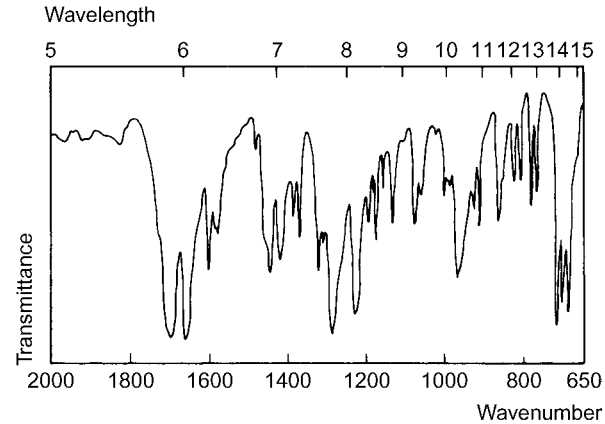
IUPAC Name 3-Benzoyl-α-methylbenzeneacetic acid
Synonym RP-19583
Proprietary Names *Actron*; *Actroneffix*; *Alrheumat*; *Alrheumun*; *Apo-Keto*; *Fastum*; *Fenoket*; *Gabrilen*; *Jomethid*; *Keral*; *Ketil*; *Ketocid*; *Ketofen*; *Ketolist*; *Ketotard*; *Ketovail*; *Ketozip*; *Ketum*; *Larafen*; *Orudis*; *Oruvail*; *Powergel*; *Profenid*; *Solpaflex*; *Topfena*; *Toprec*.



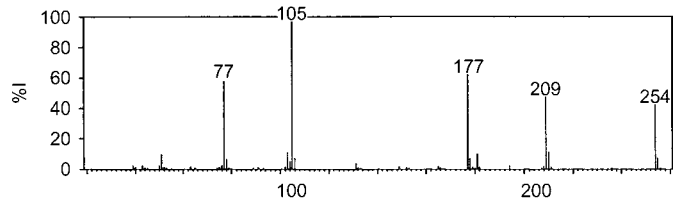
Chemical Properties A white crystalline powder. Mp 93° to 96°. Slightly soluble in water; soluble in acetone, ethyl acetate, ethanol, chloroform and ether. pK_a 4.5. Log *P* (octanol/buffer pH 7.4), 0.
Colour Tests Aromaticity (method 2)—colourless/yellow; Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TD—R_f 0.27; system TE—R_f 0.06; system TF—R_f 0.25; system TG—R_f 0.14; system TAD—R_f 0.41; system TAE—R_f 0.85; system TAJ—R_f 0.54; system TAK—R_f 0.82; system TAL—R_f 0.98 (Ludy Tenger reagent, orange).
Gas Chromatography System GA—ketoprofen RI 2245, ketoprofen-Me RI 2090; system GD—(methyl derivative) retention time 1.45 relative to n-$C_{16}H_{34}$; system GL—ketoprofen-Me RI 2090, M (OH-)-Me_2 RI 2250.
High Performance Liquid Chromatography System HAA—retention time 19.6 min; system HD—*k* 2.4; system HV—retention time 0.66 relative to meclofenamic acid; system HX—RI 495; system HZ—retention time 6.4 min.
Ultraviolet Spectrum Aqueous acid—260 nm ($A^1_1 = 665$a); aqueous alkali—262 nm ($A^1_1 = 647$a).



Infrared Spectrum Principal peaks at wavenumbers 1656, 1693, 1284, 714, 690, 1226 cm^{-1} (KBr disk). Two polymorphic forms may occur.



Mass Spectrum Principal ions at *m/z* 105, 177, 77, 209, 254, 210, 103, 181.



Quantification

Plasma **GC** ECD. Limit of detection, 130 µg/L [Stenberg *et al.* 1979].
GC–MS SIM acquisition mode. Ketoprofen and ibuprofen. Limit of detection, <2 µg/L for ketoprofen [Jack *et al.* 1992].
HPLC Limit of detection, 20 µg/L [Kokki *et al.* 2002]. Limit of detection, 1 mg/L [Rifai *et al.* 1997]. For method for quantification of ketoprofen and its acyl glucuronides, see Grubb *et al.* [1996]. UV detection. For method, see Carr *et al.* [1995]. Limit of detection, 150 µg/L for ketoprofen enantiomers [Hayball *et al.* 1991]. UV detection. Enantiomers of ketoprofen, ibuprofen and fenoprofen. Limit of detection, 0.1 mg/L for ketoprofen [Menzel-Soglowek *et al.* 1990]. UV detection. Limit of detection, 20 µg/L for ketoprofen enantiomers [Yagi *et al.* 1990]. UV detection. For method for quantification of ketoprofen and other NSAIDs, see Streete [1989]. UV detection. Limit of detection, 50 µg/L [Kaye *et al.* 1981].
Serum **HPLC** See Plasma [Streete 1989].
Urine **HPLC** See Plasma [Carr *et al.* 1995]. See Plasma [Kaye *et al.* 1981].
Cerebrospinal Fluid **HPLC** See Plasma [Kokki *et al.* 2002].
Dialysate **HPLC** See Plasma [Grubb *et al.* 1996].
Synovial Fluid **GC–MS** See Plasma [Jack *et al.* 1992].
Disposition in the Body Ketoprofen is readily absorbed after oral, rectal, or IM administration. About 75% of a single oral dose is excreted in the urine in 24 h, mostly in the first 6 h, about 90% of which is the glucuronide conjugate; hydroxylation may also occur.
Therapeutic Concentration
After oral administration of 100 mg as capsules, to 7 subjects, peak plasma concentrations of 6.0 to 14.3 (mean 10) mg/L were attained in 0.45 to 2.5 h; a single rectal dose of 100 mg produced peak plasma concentrations of 4.7 to 10.5 (mean, 7.5) mg/L in 0.75 to 1.5 h, and an IM dose of 100 mg produced peak concentrations of 8.3 to 13.2 (mean, 10.4) mg/L in 0.33 to 0.5 h. After oral doses of 50 mg four times a day to 7 subjects, mean maximum steady-state concentrations of 5.6 mg/L were reported [Ishizaki *et al.* 1980].
After administration of a single oral dose of 200 mg (as sustained-release granules) to 12 subjects, mean peak plasma ketoprofen levels of 4.51 mg/L were attained in 2 h and remained practically constant for at least 12 h. The same dose of a conventional sustained-release capsule resulted in a mean peak concentration of 5.91 mg/L at 4.17 h and administration of 100 mg ketoprofen, twice at a 12-h interval, as a prompt-release capsule produced mean peak plasma concentrations of 10.52 mg/L 1.38 h after the first dose and 12.80 mg/L 1.46 h after the second dose [Roda *et al.* 2002].
Half-life Plasma half-life, 1 to 4 h.
Volume of Distribution About 0.1 to 0.2 L/kg.
Clearance Plasma clearance, about 1 to 2 mL/min/kg.
Protein Binding About 95%.
Note For a review of the pharmacokinetics of ketoprofen, see Jamali and Brocks [1990].
Dose 100 to 200 mg daily.

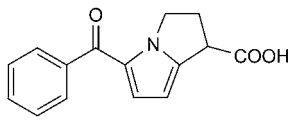
Ketorolac

Analgesic, COX Inhibitor, NSAID
$C_{15}H_{13}NO_3$ = 255.3
CAS—74103-06-3

IUPAC Name 5-Benzoyl-2,3-dehydro-1*H*-pyrrolizine-1-carboxylic acid
Synonym RS-37619



Chemical Properties Crystals from ethyl acetate/ether. Mp 160° to 161°.

Ketorolac Tromethamine

$C_{19}H_{24}N_2O_6$ = 376.4
CAS—74103-07-4
Synonyms (±)-5-Benzoyl-2,3-dehydro-1*H*-pyrrolizine-1-carboxylic acid compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1 : 1); RS-37619-00-31-3.
Proprietary Names *Acular*; *Dolac*; *Droal*; *Lixidol*; *Tarasyn*; *Tonum*; *Toradol*; *Toratex*.
Chemical Properties (+)-isomer: crystals from ethyl acetate/hexane, Mp 174° (Mp 154° to 156° also reported). (−)-isomer: crystals from ethyl acetate/hexane, Mp 169° to 170° (Mp 153° to 155° also reported). pK_a 3.49. Log *P* (octanol/water), 0.26 [Logan *et al.* 1995], 2.32. Stable through 3 freeze-thaw cycles, during storage for 6 months, during storage in an autosampler for 48 h, and in stock solutions for 48 h. Ketorolac tromethamine was also stable on plates stored for 48 h [López-Bojórquez *et al.* 2008]. Samples were stable for up to 18 months when stored at –20°, for 1 month when stored refrigerated (1–4°) and for 1 week when stored at room temperature (20–23°) [Tsina *et al.* 1996].

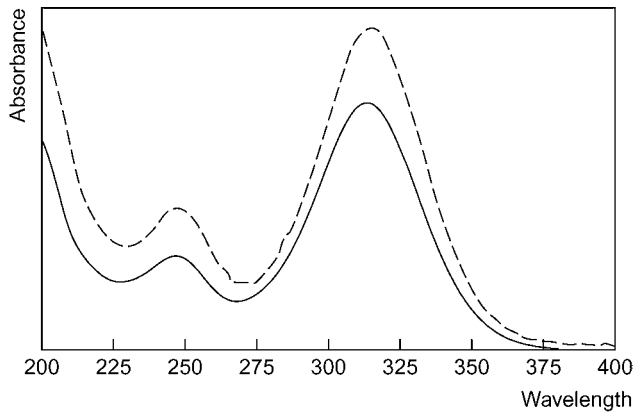
High Performance Liquid Chromatography System HAX—retention time 6.3 min; system HAY—retention time 5.6 min; system HZ—retention time 4.1 min.

Column: μBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: acetonitrile : water : acetic acid (40 : 60 : 0.2), flow rate 1.3 mL/min. UV detection (λ = 313 nm). Limit of detection not reported [Yang *et al.* 2007].

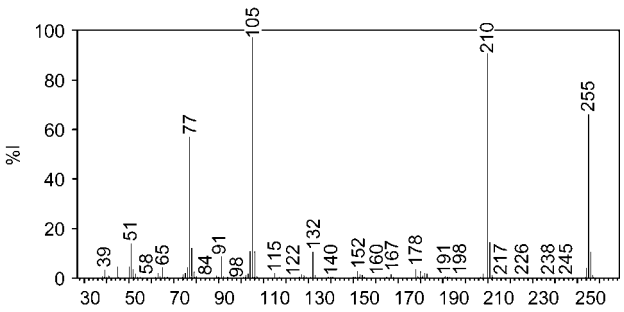
Column: Radialpak, RCM 100 radial compression module with C_{18} (100 × 8 mm i.d., 10 μm). Mobile phase: water : acetonitrile : dibutylamine phosphate (pH 2.5; 30 : 20 : 1), flow rate, 1.8 mL/min tolmetin sodium. UV detection (λ = 313 nm). Retention time: 6.5 min for ketorolac; 9.4 min for IS [Wang *et al.* 2001].

Column: RP C_{18} Nucleosil (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (with 10 mmol/L sodium dihydrogen orthophosphate, and 1 mmol/L sodium lauryl sulfate, pH 2.8; 35 : 65), flow rate 1.5 mL/min. UV detection (λ = 355 nm). Retention time: 10.3 min [Mason, Hobbs 1995].

Ultraviolet Spectrum Methanol—245, 312 nm [Logan *et al.* 1995].



Mass Spectrum Principal ions at *m/z* 105, 210, 255, 77, 51, 132, 91, 65.



Quantification

Blood **GC-MS** Column: CP-SIL fused silica WCOT (8.15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 7 psi. Temperature programme: 100° for 2.5 min to 290° at 25°/min for 3 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [Campobasso *et al.* 2008]. Column: Econocap BP-5 (30 m, 2.3 μm) 5% phenylmethyl silicone. Temperature programme: 100° to 295° over 15 min for 5 min. MSD. Limit of detection not reported [Logan *et al.* 1995].

HPLC Column: Spherisorb ODS II (150 × 4.6 mm i.d., 5 μm), ProntoSIL 120-5-C_{18}-AQ (250 × 2 mm i.d., 5 μm), or Nucleosil 120-5 C_{18} (250 × 3 mm i.d., 5 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 3.7) : acetonitrile (95 : 5 to 20 : 80 at 10 min for 2 min to 95 : 5 at 12 min in 2 min for 8 min), flow rate 1 mL/min. UV detection (λ = 270 nm). Limit of detection, 5 ng [Sultan *et al.* 2005]. Column: Lichrospher RP-8 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.05 mol/L potassium hydrogen phosphate-hydrogen phosphate buffer (pH 3; 36 : 64), flow rate 1.5 mL/min. DAD (λ = 312 nm). Limit of detection not reported [Logan *et al.* 1995]. Column: Novapak C_{18} (150 × 3.9 mm i.d., 4 μm). Mobile phase: acetonitrile : 1 mmol/L aqueous *o*-phosphoric acid (pH 3.0; 32 : 68), flow rate 1 mL/min. UV detection (λ = 313 nm). Limit of detection, 3 μg/L [Flores-Murrieta *et al.* 1994].

LC-MS Column: Hypersil BDS C_{18} (100 × 1 mm i.d., 3 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 3.7) : acetonitrile (99 : 1 to 35 : 65 in 10 min for 2 min to 99 : 1 in 2 min for 6 min), flow rate 150 μL/min. APCI, negative ion mode, full scan mode. Retention time: 9.64 min. Limit of detection, 3 mg/L [Sultan *et al.* 2005].

Plasma **HPTLC** Plates: Macherey-Nagel silica gel 60 (20 × 10 cm or 10 × 10 cm, 0.2 mm). Mobile phase: *n*-butanol: chloroform : acetic acid : ammonium hydroxide : water (9 : 3 : 5 : 1 : 2). UV detection (λ = 323 nm). R_f 0.90. Limit of quantification, 200 μg/L, limit of detection, 100 μg/L [López-Bojórquez *et al.* 2008].

HPLC Column: Zorbax Eclipse XDB-C18 (15 cm × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L ammonium acetate buffer (pH 3.0) : acetonitrile (56 : 44), flow rate 1.0 mL/min. UV detection (λ = 313 nm). Retention time: 3.9 min. Limit of quantification, 0.1 mg/L, limit of detection, 0.03 mg/L [Galán-Herrera *et al.* 2008]. Column: Zorbax eclipse XDB-C_{18} (15 cm × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L ammonium acetate buffer (pH 3.0) : acetonitrile (56 : 44), flow rate 1.0 mL/min. UV detection (λ = 313 nm). Limit of quantification, 200 μg/L; limit of detection, 100 μg/L [López-Bojórquez *et al.* 2008]. Column: Radial-Pak C_{18} (10 cm × 8 mm i.d., 10 μm). Mobile phase: water : acetonitrile : 1.0 mol/L dibutylamine phosphate (DBAP, pH 2.5, 30 : 20 : 1), flow rate 1.8 mL/min. UV detection (λ = 313 nm). Retention time: 6.5 min. Limit of detection, 0.05 mg/L [Wang *et al.* 2001]. Column: chiral AGP (100 × 4 mm i.d., 5 μm). Mobile phase: isopropanol : 0.05 mol/L phosphate buffer (pH 5.5; 5 : 95). UV detection (λ = 317 nm). Limit of quantification, 0.02 mg/L [Hamunen *et al.* 1999]. Column: μBondapak C_{18} (5 μm). Mobile phase: acetonitrile : 0.05 mol/L sodium acetate buffer (pH 6.0; 35 : 65), flow rate 1–2 mL/min. UV detection (λ = 313 nm). Limit of quantification, 5 μg/L [Kauffman *et al.* 1999].

Serum **HPLC** Column: LiChrospher 100 RP-18 (12.5 × 4 mm i.d., 5 mm). Mobile phase: acetonitrile : acetate buffer (pH 3.0; 30 : 70). UV detection (λ = 320 nm). Retention time: 4.2 min. Limit of detection, 0.05 mg/L [González-Martin *et al.* 1997]. Column: Chiral-HSA (100 × 4 mm i.d.). Mobile phase: propan-2-ol : 20 mmol/L potassium phosphate buffer (pH 5.5; 10 : 90), flow rate 0.8 mL/min. UV detection (λ = 310 nm). Limit of detection, 2 mg/L [Hayball *et al.* 1994a]. Column: μBondapak C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile : water (pH 2.8; 40 : 60), flow rate 1.4 mL/min. UV detection (λ = 313 nm). Limit of detection, 0.01 mg/L [Chaudhary *et al.* 1993].

Urine **HPLC** See Plasma [Kauffman *et al.* 1999].

Oral Fluid **HPTLC** Plates: 60F254 silica gel (10 × 10 cm, 0.2 mm). Solvent system: chloroform : ethyl acetate : glacial acetic acid (3 : 8 : 0.1). UV detection (λ = 323 nm). R_f 0.62. Limit of quantification, 40 ng, limit of detection, 20 ng [Devarajan *et al.* 2000].

Other **HPLC** *In-Vitro* Samples. Column: Novapak (100 × 8 mm i.d., 4 μm) or Chiral-AGP (100 × 4 mm i.d.). Mobile phase: acetonitrile : 20 mmol/L sodium acetate buffer (pH 3.0; 40 : 60), flow rate 1.5 mL/min. Retention time: ≈6.5 min. Scintillation counting. Limit of detection not reported [Hayball *et al.* 1994b].

Disposition in the Body Ketorolac tromethamine is more hydrophilic than ketorolac, and is rapidly absorbed after oral and IM administration. Peak plasma concentrations are reached between 30 and 60 min. The presence of food reduces the rate of absorption but not the extent. It is metabolised via conjugation and hydroxylation, but does not undergo a significant degree of pre-systemic metabolism. The major metabolites are the acyl glucuronide and *p*-hydroxyketorolac, which represent 77% and 12%, respectively, of an oral dose as urinary excretion products. However, the glucuronic acid conjugates are not detected in plasma. *p*-hydroxyketorolac has about 20% of the anti-inflammatory activity and 1% of the analgesic activity of ketorolac. A small amount is distributed in breast milk. It does not readily penetrate the blood–brain barrier but crosses the placenta.

Therapeutic Concentration The serum therapeutic concentration is 0.22–3.50 mg/L.

A study in 27 healthy Mexican adults showed that a test formulation of 30 mg sublingual ketorolac was equivalent to the reference with mean maximum plasma concentrations of 3.61 and 3.44 mg/L reached at 0.66 and 0.94 h, respectively [Galán-Herrera *et al.* 2008].

Six healthy subjects were administered a single sublingual dose of 30 mg ketorolac. The mean peak plasma concentration was ≈3.0 mg/L at ≈1 h [López-Bojórquez *et al.* 2008].

Eighteen children (6–11 years), 18 adolescents (12–17 years) and 18 adults (18–44 years) were administered 0.5 mg/kg racemic ketorolac tromethamine IV at the end of eye surgery. The pharmacokinetic parameters shown below were measured in each group:

	S(−)-Ketorolac	*R(+)-Ketorolac*
Children		
CL (mL/h/kg)	66.8 ± 13.8	21.1 ± 4.9
V_{ss} (L/kg)	0.715 ± 0.415	0.155 ± 0.034
AUC $_{(0-\infty)}$ (μg·min/mL)	2.63 ± 0.48	8.50 ± 2.18
$t_{1/2}$ (min)	13.2 ± 6.8	6.8 ± 1.4
Adolescents		
CL (mL/h/kg)	66.2 ± 17.5	21.4 ± 5.9
V_{ss} (L/kg)	0.442 ± 0.305	0.141 ± 0.030
AUC $_{(0-\infty)}$ (μg·min/mL)	2.73 ± 0.67	8.51 ± 2.3
$t_{1/2}$ (min)	9.5 ± 5.8	6.5 ± 1.0
Adults		
CL (mL/h/kg)	57.7 ± 11.0	22.2 ± 4.3
V_{ss} (L/kg)	0.282 ± 0.14	0.129 ± 0.022
AUC $_{(0-\infty)}$ (μg·min/mL)	3.04 ± 0.55	7.92 ± 1.6
$t_{1/2}$ (min)	7.6 ± 4.8	6.2 ± 1.5

[Hamunen *et al.* 1999]

Fifty children with a median age of 11.6 years (range, 3–18 years) received 0.6 mg/kg racemic ketorolac IV. The mean maximum plasma concentration was 4968 ± 1641 μg/L. The pharmacokinetic parameters shown below were measured for the ketorolac enantiomers.

Parameter	*S(−)-Ketorolac*	*R(+)-Ketorolac*
C_{max} (μg/L)	1609 ± 751	2845 ± 1007
V_d (L/kg)	0.82 ± 0.38	0.5 ± 0.34
$t_{1/2}\alpha$ (min)	17 ± 21	32 ± 29
$t_{1/2}\lambda$ (min)	107 ± 59	259 ± 131
AUC $_{(0-\infty)}$ (μg·min/mL)	126 ± 63	508 ± 208
Plasma CL (mL/min/kg)	6.2 ± 3.3	1.4 ± 0.5

[Kauffman *et al.* 1999]

Fourteen children (2–8 years) were administered a single IV dose of ketorolac 0.5 or 0.9 mg/kg. The mean maximum plasma concentration was 4.8 ± 0.59 and 9.1 ± 2 mg/L following the low and high dose, respectively [González-Martin *et al.* 1997].

Twenty adult male volunteers received either 30 mg ketorolac tromethamine IV 4 times daily (13) or placebo (7) for 5 days. Following the first dose the mean maximum plasma concentration was 5.01 mg/L at 3.2 min. Following the last dose the C_{max} was 5.42 mg/L at 4.2 min, an increase of 8% [Lucker *et al.* 1994].

Thirteen healthy men and women aged between 65 and 78 years (mean, 72 years), and 16 young male volunteers aged between 20 and 39 years (mean, 30 years) were administered an oral dose of 10 mg ketorolac or 30 mg IM. Mean peak plasma levels of 2.99 mg/L (range, 1.60 to 4.78) and 2.52 mg/L (1.45 to 3.82) were obtained for the young and elderly, respectively, after the IM dose. The times to peak concentrations were 0.75 and 0.97 h (range, 0.33 to 2.0 h). Mean peak plasma concentrations of 0.86 mg/L (range 0.55 to 1.10) and 0.90 mg/L (0.57 to 1.44) were reached with the oral dose in the elderly and young, respectively. The times to peak concentrations were 0.33 and 0.72 h (range 0.33 to 1.0), respectively [Jallad *et al.* 1990].

Note For a study on the transdermal delivery of ketorolac, see Roy *et al.* [1995].

Toxicity Adverse effects include nausea, rash oedema, headache and hypertension, occurring at ketorolac plasma concentration above 5 mg/L.

A 45-year-old Caucasian female died after acute asthmatic episodes. The postmortem blood concentration of ketorolac was 1.9 mg/L [Campobasso *et al.* 2008].

A 53-year-old female was found dead near a syringe and 3 empty vials of Toradol. The postmortem blood concentration was 8 mg/L [Oliva *et al.* 2007].

A 30-year-old Caucasian female was administered with an IM injection of 60 mg of ketorolac tromethamine after complaining of acute lower back pain. Shortly afterwards she suffered an apparent cardiac arrest. Blood postmortem examination revealed the presence of phenytoin, 31.1 mg/L, diazepam, 0.1 mg/L, lidocaine, 4.0 mg/L, procainamide, 9.8 mg/L and *N*-acetyl procainamide, 11.3 mg/L. All these drugs were administered during attempts at resuscitation. The ketorolac concentration was 2.9 mg/L and, although this is within the therapeutic range and consistent with the administered dose of 60 mg, the cause of death was ruled to be an acute anaphylactic drug reaction to ketorolac [Logan *et al.* 1995].

Bioavailability 81–100% after administration of an oral solution.

Half-life 3–6 h; 4–7 h (elderly); 9–10 h (renal impairment). 4 h in children [Kauffman *et al.* 1999].

Volume of Distribution 0.15–0.33 L/kg [Baselt 2008], 0.35 ± 0.2 L/kg in children [Kauffman *et al.* 1999], 113 ± 33 mL/kg in children [Dsida *et al.* 2002].

Clearance Oral dose: 0.39 mL/min/kg (elderly); 0.55 mL/min/kg (young). IM dose: 0.21 to 0.57 mL/min/kg (mean 0.32); 0.28 to 0.76 mL/min/kg (mean 0.44). 1.1 ± 0.5 mL/min/kg in children [Kauffman *et al.* 1999]. 0.57 ± 0.17 mL/min/kg in children [Dsida *et al.* 2002].

Protein Binding >99% [Mroszczak *et al.* 1987].

Dose Oral: 10 mg every 4 to 6 h (6 to 8 h for the elderly) with a maximum of 40 mg daily. IV: initial dose of 10 mg followed by 10 to 30 mg every 4 to 6 h. Maximum daily dose is 90 mg and 60 mg for the elderly and patients weighing <50 kg.

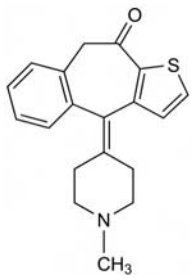
Ketotifen

Antiallergic
$C_{19}H_{19}NOS$ = 309.4
CAS—34580-13-7

IUPAC Name 4,9-Dihydro-4-(1-methyl-4-piperidinylidene)-10*H*-benzo[4,5]cyclohepta-[1,2-*b*]thiophen-10-one



Chemical Properties Crystals. Mp 151° to 153°.

Ketotifen Fumarate

$C_{19}H_{19}NOS, C_4H_4O_4$ = 425.5
CAS—34580-14-8

Proprietary Names *Airvitess*; *Asdron*; *Asmafen*; *Asmalergin*; *Asmax*; *Asmen*; *Astifat*; *Broncoten*; *Cipanfeno*; *Ketasma*; *Ketof*; *Nemesil*; *Padiatifen*; *Profilasmin*; *Profiten*; *Quefeno*; *Zaditen*; *Zaditor*; *Zatofug*.

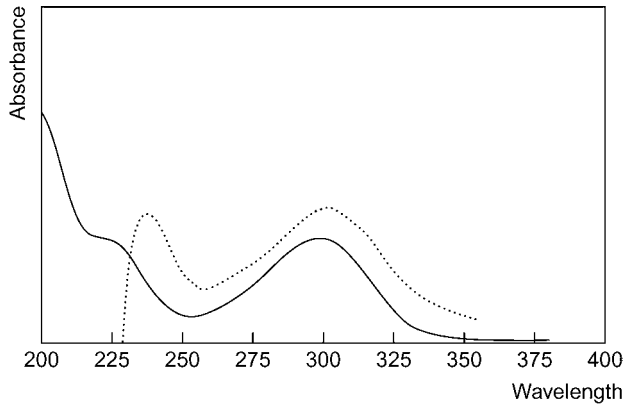
Chemical Properties A white crystalline powder. Mp 192°, with decomposition. Slightly soluble in water; soluble in ethanol; sparingly soluble in chloroform.

Thin-layer Chromatography System TB—R_f 0.24; system TE—R_f 0.52; system TAE—R_f 0.24.

Gas Chromatography System GA—RI 2607.

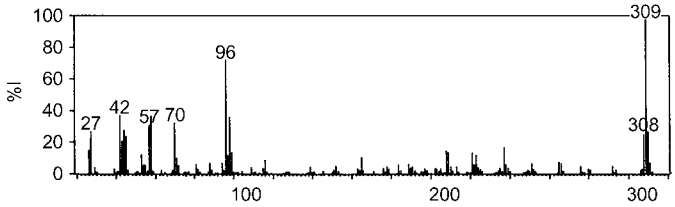
High Performance Liquid Chromatography System HX—RI 373; system HY—RI 315.

Ultraviolet Spectrum Aqueous acid—297 nm (A^1_1 = 475a); aqueous alkali—237, 302 nm.



Infrared Spectrum Principal peaks at wavenumbers 1650, 1280, 1255, 1302, 1720, 1180 cm^{-1} (ketotifen fumarate, KBr disk).

Mass Spectrum Principal ions at *m/z* 309, 96, 42, 58, 98, 70, 57, 44.



Quantification

***Plasma* GC–MS** Limit of detection, 0.01 µg/L [Tzvetanov *et al.* 1999]. Limit of detection, 0.05 µg/L for ketotifen and the desmethyl metabolite, 0.3 µg/L for 10-hydroxyketotifen [Julien-Larose *et al.* 1983].

Disposition in the Body Ketotifen is absorbed after oral administration. It is metabolised by 10-hydroxylation, *N*-demethylation, and glucuronic acid conjugation. It is excreted in the urine and faeces as unchanged drug and metabolites.

Therapeutic Concentration

Following a single oral dose of 2 mg to 3 subjects, a peak plasma concentration of about 0.0006 mg/L was attained in 2 h; a peak plasma concentration of about 0.015 mg/L of ketotifen glucuronide was attained in about 4 h [Julien-Larose *et al.* 1983].

Toxicity

In 8 cases of overdose involving ingestion of up to 120 mg, drowsiness and other toxic effects were reported, but in each case full recovery occurred within 12 h. In 3 cases involving the ingestion of 10, 50 and 120 mg, plasma concentrations were 0.016, 0.054 and 0.122 mg/L, respectively, at 5, 3 and 20 h after ingestion [Jeffreys, Volans 1981].

In a fatality involving ketotifen, a postmortem blood concentration of 1.2 mg/L was reported [Stead AH, Moffat AC, personal communication].

Dose The equivalent of 2 to 4 mg of ketotifen daily.

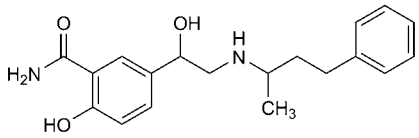
Jeffreys DB, Volans GN (1981). Ketotifen overdose: surveillance of the toxicity of a new drug. *Br Med J (Clin Res Ed)* 282: 1755–1756.
Julien-Larose C *et al.* (1983). Quantification of ketotifen and its metabolites in human plasma by gas chromatography mass spectrometry. *Biomed Mass Spectrom* 10: 136–142.
Tzvetanov S *et al.* (1999). Gas chromatographic-mass spectrometric method for quantitative determination of ketotifen in human plasma after enzyme hydrolysis of conjugated ketotifen. *J Chromatogr B Biomed Sci Appl* 732: 251–256.

Labetalol

Antihypertensive, α-Adrenoceptor Antagonist, β-Adrenoceptor Antagonist
$C_{19}H_{24}N_2O_3 = 328.4$
CAS—36894-69-6

IUPAC Name 2-hydroxy-5-[1-hydroxy-2-(4-phenylbutan-2-ylamino)ethyl] benzamide

Synonyms 2-Hydroxy-5-[1-hydroxy-2-[(1-methyl-3–phenylpropyl)amino] ethyl]benzamide; ibidomide.



Chemical Properties pK_a 7.4 (phenol), 8.7 (-NH_2) [Baselt 2008; Cheymol *et al.* 1997]. Log *P* (octanol/water), 3.09 [Hansch *et al.* 1995; Rapado Martínez *et al.* 1999]. Labetalol is stable in plasma for at least 48 h at 4° and for at least 8 weeks at –80°. Stock standard solutions were stable for at least 3 months when kept at 4° [Umezawa *et al.* 2008].

Labetalol Hydrochloride

$C_{19}H_{24}N_2O_3$,HCl = 364.9
CAS—32780-64-6

Proprietary Names *Abetol*; *Albetol*; *Alfabetal*; *Amipress*; *Hybloc*; *Ipolab*; *Labrocol*; *Normodyne*; *Presolol*; *Pressalolo*; *Trandate*.

Chemical Properties White crystalline solid. Mp ≈180°. Soluble in water and ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), 2.41 [Meylan, Howard 1995]. Labetalol hydrochloride 40 mg/mL in 3 oral liquids was stable for up to 60 days when stored in the dark at 5° and 25° [Allen, Erickson 1996]

Colour Tests Ferric chloride—violet; Folin–Ciocalteu reagent—blue; Liebermann's reagent—brown-orange; Mandelin's test—green-blue; Marquis test—red→brown-red; Nessler's reagent (100°)—black.

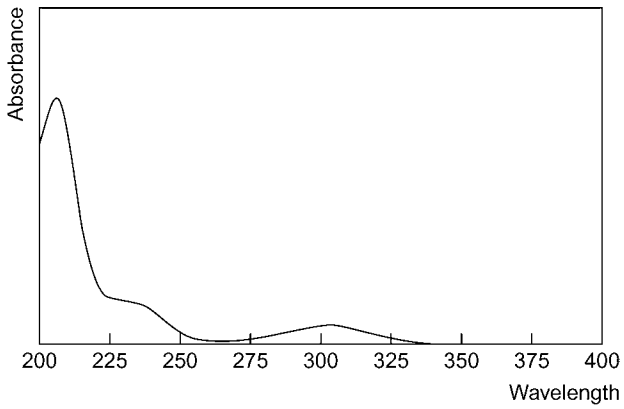
Thin-layer Chromatography System TAE—R_f 0.32; system TB—R_f 0.00; system TE—R_f 0.29; system TF—R_f 0.10.

Gas Chromatography System GA—RI 1320; system GB—RI 1270 (both for labetalol Art).

Gas Chromatography-Mass Spectrometry Column: DB-5 methylphenyl silicone (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 150° for 1 min to 260° at 10°/min. Relative retention time: 1.608 or 1.719 min for MBA, 4.191 or 4.371 min for BBA [Zamecnik 1990].

High Performance Liquid Chromatography System HA—*k* 1.7 (tailing peak); system HX—RI 365; system HY—RI 290; system HZ—retention time 3.0 min.

Ultraviolet Spectrum Aqueous acid—302 nm (A_1^1 = 95a); aqueous alkali—246 (A_1^1 = 267a), 333 nm (A_1^1 = 161a).



Infrared Spectrum Principal peaks at wavenumbers 1680, 1643, 1502, 1270, 820, 1250 cm^{-1} (labetalol hydrochloride, Nujol mull).

Quantification

Blood **HPLC** Column: Ultrasphere octyl (150 × 4.6 mm i.d., 5 um). Mobile phase: 0.01 mol/L ammonium phosphate : methanol (1 : 1, pH 3.0). UV detection (λ = 216 nm). Retention time: 5 min. Limit of detection, 10 µg/L [Hidalgo, Muir 1984]. Column: µBondapak C_{18} (30 cm). Mobile phase: acetonitrile : 0.1% phosphoric acid (28 : 72), flow rate 1.7 mL/min. UV detection (λ = 313 nm). Limit of detection not reported [Pannell *et al.* 1982].

Plasma **HPLC** Column: Hypurity C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 3.8; 10 : 90 to 35 : 65 at 25 min for 1 min), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: 21.8 min. Limit of quantification, 25 µg/L, limit of detection, 10 µg/L [Delamoye *et al.* 2004]. Column: PRP-1. Mobile phase: 0.05 mol/L: ammonium carbonate buffer (pH 9.5) : acetonitrile (72 : 28). Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 418 nm) Limit of quantification, 5 µg/L, limit of detection, 1 µg/L [Johnson *et al.* 2000]. Column: Chirex 3022 (250 × 4.0 mm i.d.). Mobile phase: hexane : 1,2-dichloroethane : ethanol : TFA (55.75 : 35 : 9 : 0.25), flow rate 0.6 mL/min. Fluorescence detection (λ_{ex} = 220 nm, λ_{em} = 412 nm). Retention time: 33, 37, 43 and 51 min for (*S,R*)-, (*S,S*)-, (*R,S*)- and (*R,R*)-labetalol, respectively. Limit of detection, 1.5–1.8 µg/mL [Dakers *et al.* 1997]. Column: ChromTech Chiral AGP (4 × 100 mm i.d., 10 µm). Mobile phase: 0.05 mol/L ammonium carbonate buffer (pH 9.5) : acetonitrile (72 : 28) or Column: LiChrosorb cyanopropyl (12.5 × 0.4 cm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 3.0). UV (λ = 220 or 305 nm) or fluorescence detection (λ_{ex} = 335 nm, λ_{em} = 370 nm). Limit of detection, 100 µg/L [Musch *et al.* 1989]. Column: PRP1 (150 × 5 mm i.d.). Mobile phase: ammonium carbonate solution : acetonitrile (73 : 27), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 334 nm, λ_{em} = 412 nm). Limit of detection, 4 µg/L [Awni *et al.* 1988]. See also Ostrovská *et al.* [1988], Bates *et al.* [1987], Chung *et al.* [1986], Luke *et al.* [1987], Alton *et al.* [1984], Hidalgo and Muir [1984], Wood *et al.* [1982], Oosterhuis *et al.* [1981], Meredith *et al.* [1981], Woodman and Johnson [1981], Dusci and Hackett [1979].

LC-MS Column: Shodex MSpak GF-310 (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 at 4 min for 5.5 min to 100 : 0 at 9.5 min for 5.5 min), flow rate 0.55 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 6.6 min. Limit of detection, 1 µg/L [Umezawa *et al.* 2008]. Column: Spherisorb ODS-2 (50 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.1 mol/L ammonium acetate (60 : 40) containing 1% formic acid, flow rate 1.0 mL/min. TSP, SIR. Limit of detection, 5 µg/L [Lant *et al.* 1987].

Note For a spectrofluorometric method for the determination of labetalol in plasma, see Abdine *et al.* [2005].

Note For a radioimmunoassay in plasma, see Kelly *et al.* [1981].

Serum **HPLC** See Blood [Hidalgo, Muir 1984]. See Plasma [Woodman, Johnson 1981].

Urine **GC-MS** Column: DB-1 fused silica (10 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 30 cm/s. Temperature programme: 100° to 200° at 15°/min to 204° at 2°/min to 300° at 30°/min. NICI, SIM acquisition mode. Limit of detection, 0.1 µg/L for enantiomers of labetalol metabolite 3-amino-1-phenylbutane [Changchit *et al.* 1991].

HPLC Column: ODS-2 (120 × 4.6 mm i.d., 5 µm). Mobile phase: 0.11 mol/L SDS : 8% propanol : 0.01 mol/L sodium dihydrogen phosphate (pH 3.0), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 210 nm, λ_{em} = 434 nm). Limit of detection, 28.3 µg/L [Carda-Broch *et al.* 1999]. Column: Spherisorb ODS-2 (120 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L SDS : 15% propanol : 1% triethylamine : 0.02 mol/L phosphate buffer, flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 440 nm). Limit of detection, 20 µg/L [Rapado Martínez *et al.* 1999]. Column: Supelcosil ABZ + Plus (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (30 : 70) containing 5 mmol/L acetate buffer, flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 10 mg/L [Ceniceros *et al.* 1998].

LC-MS Column: Radial-Pak CN-HP cyano spherical (10 cm, 4 µm). Mobile phase: 50 mmol/L ammonium acetate (pH 3.0) : methanol (60 : 40), flow rate, 1.2 mL/min. Full scan mode or MID. Relative retention: -4.38. Limit of detection, 2 and 0.2 ng for full scan and MID, respectively [Leloux *et al.* 1991].

Hair **GC-MS** Column: HP5-MS (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: He, 1.2 mL/min. Temperature programme: 110° for 1 min to 170° at 20°/min to 225° at 7°/min to 295° at 24°/min for 10 min. EI ionisation. Retention time: 17.9 min. Limit of detection, 8 pg/mg [Kintz *et al.* 2000].

Kidney **HPLC** See Blood [Pannell *et al.* 1982].

Liver **HPLC** See Blood [Pannell *et al.* 1982].

Other **HPLC** Oral Liquids. Column: Bakerbond C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L monobasic sodium phosphate : methanol (55 : 45), flow rate 1.3 mL/min. UV detection (λ = 230 nm). Retention time: 7.5 min. Limit of detection, 100 mg/L [Allen, Erickson 1996].

Disposition in the Body Well absorbed after oral administration but undergoes extensive first-pass metabolism. The major metabolites are glucuronides of labetalol. Up to ~60% of a dose is excreted in the urine in 24 h as conjugates, 1 of which has been identified as the *O*-phenylglucuronide; ~5% of a dose is excreted as unchanged drug. 3-Amino-1-phenylbutane (APB) has been found in the urine of patients receiving labetalol at concentrations of 0.5–15 mg/L [Gal *et al.* 1988].

Therapeutic Concentration

After a single oral dose of 100 mg given to 6 subjects, peak plasma concentrations of 0.09 to 0.25 mg/L (mean 0.16) were attained in about 0.5 h; following a single oral dose of 200 mg to the same subjects, peak plasma concentrations of 0.09 to 0.27 mg/L (mean 0.19) were reported at ≈1 h [McNeil *et al.* 1979].

Two normotensive volunteers were administered labetalol as an oral dose of 2 × 200 mg tablets or a dose of 1 mg/kg over 2 min IV. Following oral administration the maximum concentration was ≈600 µg/L reached at ≈50 min. The elimination half-life was 3.4 and 3.0 h [Meredith *et al.* 1981].

Following oral administration of 200 mg twice daily to 9 subjects, average steady-state plasma concentrations of 0.04 to 0.18 mg/L (mean 0.09) were reported [McNeil *et al.* 1982].

A 28-year-old anephric male was administered 1 mg/kg labetalol between haemodialyses. The terminal plasma half-life was 5 h [Wood *et al.* 1982].

Continuous infusion of labetolol (1.5 mg/kg over 5 min, followed 30-min later by 0.2 mg/kg/h for 5.5 h) administered to 6 subjects resulted in a mean steady-state plasma concentration of 264 µg/L being achieved within 2 h [Chauvin *et al.* 1987].

Sixteen healthy volunteers (mean age, 27 years) received 5 different oral formulations of labetalol on 5 different occasions every 12 hours for 5 doses. The mean V, β/F, V_{dss}/F, TBC/F, $t_{1/2\beta}$ and $AUC_{\Pi-0}$ ranged from 18.1 and 161.9 L/kg, 7.1 and 53.9 L/kg, 1.3 and 5.72 L/h/kg, 6.9 and 11.0 h and 154 and 520 µg.h/L [Awni *et al.* 1988].

When 19 hypertensive patients were administered 693 ± 465 and 680 ± 482 mg/day for men and women, respectively, the pharmacokinetic parameters were 80% higher in the females [Johnson *et al.* 2000].

Toxicity

A 44-year-old female was found dead. Postmortem concentrations of labetalol were 31.1, 14.2, 7.8, 5.4, and 5.2 µg/g in gastric contents, liver, heart, kidney, and lung, respectively [Grassin Delyle *et al.* 2008].

A 79-year-old female who overdosed and died within a short period of time had a postmortem heart blood labetalol concentration of 15 mg/L [Baselt 2008].

A 68-year-old subject suffering from chronic respiratory disease died about 1 h after inadvertently being given 200 mg of labetalol. Postmortem kidney and liver concentrations of 10.6 and 20.5 µg/g, respectively, were reported and were considered to be consistent with a therapeutic dose; death was attributed to respiratory disease [Pannell *et al.* 1982].

A 25-year-old male suffered acute renal failure about 3 days after deliberately ingesting 6 g of labetalol plus 7 pints of lager; haemodialysis for 16 days was necessary to bring about recovery [Korzets *et al.* 1990].

Note For a case of labetalol-induced hepatitis, see Marinella [2002] or Stronkhorst *et al.* [1992] and for a case of hepatocellular necrosis associated with labetalol, see Long *et al.* [2007]. For a case of acute renal failure following labetalol ingestion, see Smit *et al.* [1986]. For a case of cutaneous rash in response to labetalol, see Branford *et al.* [1978] or Finlay *et al.* [1978]. A case of iatrogenic overdose was successfully treated with amrinone Kollef [1994].

Bioavailability 10 to 80% (mean 30).

Half-life Plasma half-life, 3–6 h.

Volume of Distribution ≈3–10 L/kg (mean 7).

Clearance Plasma clearance, 10–40 mL/min/kg (mean, 25).

Protein Binding ≈50% [Martin *et al.* 1976].

Note For a review of the pharmacokinetics of labetalol, see McNeil and Louis [1984] and in hypertensive patients, see McNeil *et al.* [1982] or McNeil *et al.* [1979].

Dose 200 to 800 mg of labetalol hydrochloride daily; doses of 2.4 g daily have been given.

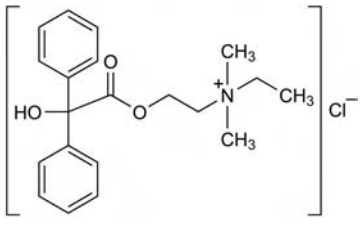
Lachesine Chloride

Anticholinergic

$C_{20}H_{26}ClNO_3 = 363.9$

CAS—1164-38-1

IUPAC Name *N*-Ethyl-2-[(hydroxydiphenylacetyl)oxy]-*N*,*N*-dimethylethanaminium chloride



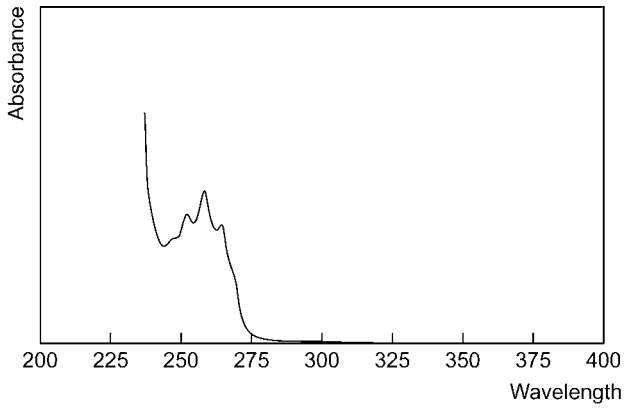
Chemical Properties A white amorphous powder. Mp 212° to 214°. Soluble 1 in 3 of water and 1 in 10 of ethanol (90%); very slightly soluble in chloroform and ether. Log *P* (octanol/water), −1.1.

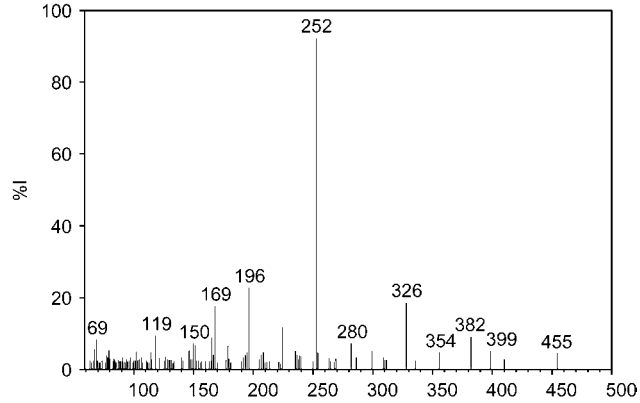
Colour Tests Mandelin's test—orange→green; Marquis test—orange→green→blue.

Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1852.

Ultraviolet Spectrum Aqueous acid—252, 258 (A^{1}_{1}=12b), 264 nm. No alkaline shift.



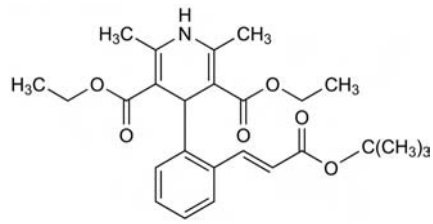


Infrared Spectrum Principal peaks at wavenumbers 1739, 1241, 699, 743, 1176, 1191 cm^{-1} (KBr disk).
Use As a 1% ophthalmic solution.

Lacidipine

Calcium Antagonist
$C_{26}H_{33}NO_6$ = 455.5
CAS—103890-78-4

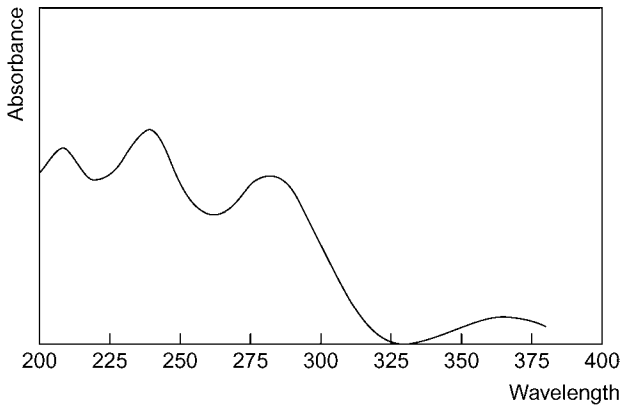
IUPAC Name (*E*)-4-[2-[3-(1,1-Dimethylethoxy)-3-oxo-1-propenyl]phenyl]-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylic acid diethyl ester
Synonyms GR-43659X; GX-1048.
Proprietary Names *Aponil*; *Caldine*; *Lacimen*; *Lacipil*; *Lacirex*; *Midotens*; *Motens*; *Viapres*; *Zascal*.



Chemical Properties A crystalline solid with Mp 174° to 175°. Log *P* (octanol/water), 5.20.
Thin-layer Chromatography System TE—R_f 0.81; system TF—R_f 0.65.
High Performance Liquid Chromatography System HX—RI 900; system HAA—retention time 27.2 min.

Column: RP C_{18} (250 × 4.6 mm i.d., 5 µm). Temperature: 30°. Mobile phase: methanol : water (70:30), containing 2 mmol/L acetate buffer (pH 5.0), flow rate 1 mL/min. Detection: ECD. Retention time: 15.7 min [Lopez *et al.* 2000].

Column: RP C_{18} Novapak (100 × 4.6 mm i.d.). Temperature: 50°. Mobile phase: methanol : acetonitrile : water (35:10:55 for 7 min to 60:10:30 in 23 min), containing 0.05 mol/L ammonium acetate (pH 5.0), flow rate 1.2 mL/min. (35:10:55 for 7 min to 60:10:30 in 23 min, to 80:10:10) in 5 min for 10 min. UV detection (λ=282 nm). Retention time not specified [Scandola 1993].
Ultraviolet Spectrum Aqueous acid—239, 209, 282, 366 nm.



Mass Spectrum Principal ions at *m/z* 252, 196, 326, 169, 119, 382, 69, 150.

Quantification
***Plasma* HPLC** In conjunction with radioimmunoassay. Limit of detection, 0.02 µg/L [Pellegatti *et al.* 1992]. Limit of detection, 0.5 µg/L [Evans *et al.* 1990].
Disposition in the Body Lacidipine is rapidly but poorly absorbed after oral administration and undergoes extensive first-pass metabolism. Two main metabolites have been identified: a pyridine analogue and a carboxylic acid analogue. It is eliminated by metabolism in the liver and the metabolites are excreted mainly via bile. Approximately 70% of an oral dose is eliminated in faeces and the remainder in urine. No parent drug has been detected in urine or faeces.
Therapeutic Concentration
Two healthy volunteers were administered 4 mg lacidipine orally after an overnight fast. The peak plasma concentrations observed were 1.918 µg/L and 3.392 µg/L, 1 h after administration of the dose [Pellegatti *et al.* 1992].

Seventeen healthy young volunteers were administered with oral doses of 4, 6 and 8 mg lacidipine. Peak concentrations of 2.8, 6.1 and 8.6 µg/L were observed about 1 h after administration [Squassante *et al.* 1994].
Bioavailability 18.5% (range 4 to 52%).
Half-life 13 to 19 h.
Volume of Distribution 0.9 to 2.3 L/kg also reported as 537 L with high inter-subject variation.
Protein Binding >95% (mainly albumin).
Dose The usual initial dose is 2 mg once daily which may be increased to 4 or 6 mg if necessary after 3 to 4 weeks.

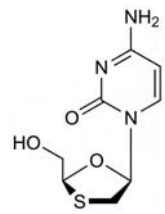
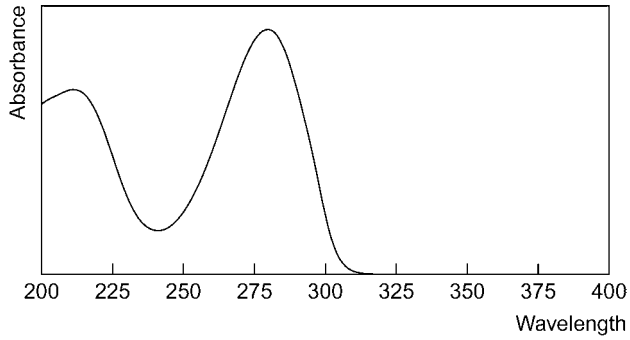
Lamivudine

Nucleoside Reverse Transcriptase Inhibitor, Antiviral
$C_8H_{11}N_3O_3S$ = 229.3
CAS—134678-17-4

IUPAC Name (2*R-cis*)-4-Amino-1-[2-(hydroxymethyl)-1,3-oxathiolan-5-yl]-2(1*H*)-pyrimidinone
Synonyms 3TC; GR-109714X; (−)-BCH-189.
Proprietary Names *Epivir*; *Zeffix*.



Chemical Properties White crystals from boiling ethanol or white solid from methanol/ethyl acetate. Mp 160° to 162°. Solubility in water at 20°, 70 mg/mL.
High Performance Liquid Chromatography System HAD—*k* 2.70.
Ultraviolet Spectrum Aqueous acid—212, 279 nm.



Quantification

Plasma **HPLC** UV detection (λ=260 nm). Limit of quantification, 0.02 mg/L [Aymard *et al.* 2000].

Serum **HPLC** UV detection (λ=250 nm). Limit of detection, 0.26 mg/L [Simon *et al.* 2001]. Column: C_{18} Keystone Aquasil (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water (15:85), 0.3 mL/min flow rate. MS–MS detection (m/z 230 to 112). Retention time: 2.5 min. Limit of quantification, 3 µg/L [Kenney *et al.* 2000].

Urine **HPLC** Limit of quantification, 0.5 mg/L [Morris, Selinger 1994].

Disposition in the Body In healthy volunteers lamivudine is rapidly absorbed following an oral administration, reaching peak plasma concentrations within 1 to 1.5 h. About 70% of the total dose is excreted unchanged in urine and between 5 and 10% undergoes hepatic metabolism to form a *trans*-sulfoxide metabolite.

Therapeutic Concentration

Group 1: 6 HIV-infected males, aged between 29 and 41 years, with creatinine clearance ≥60 mL/min. Group 2: 4 HIV-infected males and females, 29 to 68 years, with creatinine clearance between 10 and 40 mL/min. Group 3: 6 males and females (31 to 51 years old), creatinine clearance <10 mL/min. Each group was administered a single oral dose of 300 mg after an overnight fast. The mean peak plasma concentration for group 1 was 2.524 mg/L, group 2, 3.538 mg/L and group 3, 5.684 mg/L and these levels were reached within 1, 1 and 2 h, respectively [Heald *et al.* 1996].

Bioavailability 80 to 87%.

Half-life 5 to 7 h (after a single dose) and 11 h (when sampling for 48 h), which may increase in presence of renal impairment.

Volume of Distribution Approximately 100 L.

Protein Binding <36%.

Dose Adults: 100 mg daily to 150 mg every 12 h. Children (3 months to 12 years): 4 mg/kg every 12 h with a maximum of 300 mg daily.

Lamotrigine

Antiepileptic, Anticonvulsant

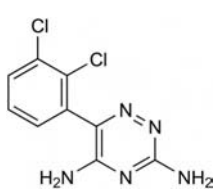
$C_9H_7Cl_2N_5$ = 256.1

CAS—84057-84-1

IUPAC Name 6-(2,3-Dichlorophenyl)-1,2,4-triazine-3,5-diamine

Synonyms BW-430C; 3,5-diamino-6-(2,3-dichlorophenyl)-1,2,4-triazine; LTG.

Proprietary Name *Lamictal*.

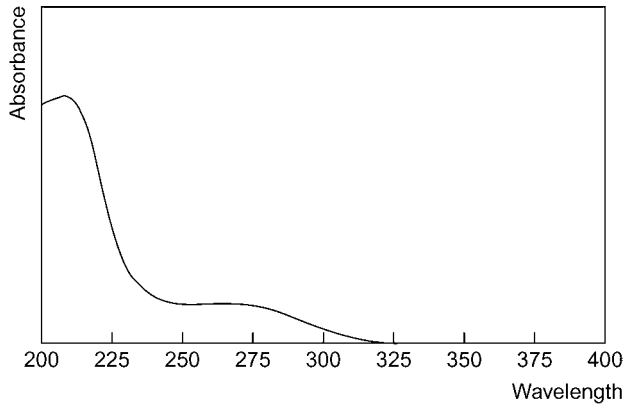


Chemical Properties White to pale cream crystals from propan-2-ol, Mp 216° to 218°. Solubility at 25°: 0.17 mg/mL in water, 4.1 mg/mL in hydrochloric acid (0.1 mol/L); practically insoluble in ethanol. pK_a 5.7. Extraction yield (chlorobutane), 0.17 [Demme *et al.* 2005].

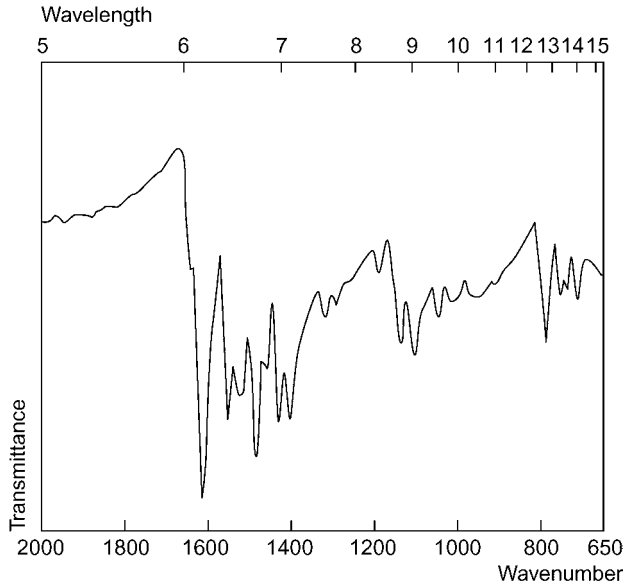
Gas Chromatography System GB—RI 2562; system GAJ—RRT 1.941 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HY—RI 272; system HZ—RT 2.3 min.

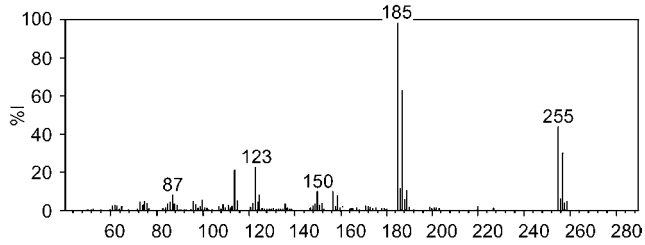
Ultraviolet Spectrum Aqueous acid (0.025 mol/L sulfuric acid)—208, 264.5 nm; (0.1 mol/L ammonium formate pH 3)—267 nm; ethanol—307.5 nm.



Infrared Spectrum Principal peaks at wavenumbers 1614, 1488, 1429, 1404 cm^{-1} KBr disk.



Mass Spectrum Principal ions at *m/z* 185, 187, 255, 257, 123, 117, 157, 150.



Quantification

Plasma **HPLC** Column: Reversed phase monolithic. Mobile phase: 0.1 mol/L (pH 6.5) phosphate buffer : methanol : acetonitrile (77 : 20 : 3). UV detection (λ= 210 nm) [Heideloff *et al.* 2010]. Column: Synergi Hydro-RP (250 × 4.6 mm i.d., 4 µm). Mobile phase: potassium dihydrogen phosphate buffer (50 µmol/L, pH 4.5) : acetonitrile : methanol (65 : 26.2 : 8.8), flow rate of 0.8 mL/min. UV detection (λ= 210 nm). Limit of quantification, 2 µg/L [Contin *et al.* 2010]. DAD [Zufia *et al.* 2009]. Column: C_8 RP. Mobile phase: methanol : 0.45 µmol/L (pH 3.5) phosphate buffer containing 0.17% TEA (24 : 76). DAD (λ= 220 nm) [Saracino *et al.* 2007a]. Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 50.0 mmol/L phosphate buffer (pH 3.5, 27 : 73). UV detection (λ= 220 nm) [Saracino *et al.* 2007b]. LC-MS Column: Shimdazu Shimpack XR-ODS (50 × 4.6 mm, i.d., 2.2 μm). Mobile phase: acetate buffer : methanol: acetonitrile : tetrahydrofuran. APCI, SIM acquisition mode [Subramanian *et al.* 2008].

CE CZE based [Theurillat *et al.* 2002].

Serum **HPLC** Column: Chromolith RP-18e (50 × 4.6 mm i.d.). Mobile phase: acetonitrile : 15 mmol/L phosphate buffer (pH 7.0, 20 : 80), flow rate 2.0 mL/min. UV detection (λ = 215 nm). Limit of detection, 2 μg/L [Brunetto *et al.* 2009]. See Plasma [Heideloff *et al.* 2010].

CE See Plasma [Theurillat *et al.* 2002].

Urine **HPLC** Column: Reversed phase C_{18} (250 × 4.6 mm). Mobile phase: potassium phosphate buffer : acetonitrile : methanol (70 : 16 : 14). Limit of detection, 30 μg/L [Ren *et al.* 1998]. Limit of detection, 100 ng [Doig, Clare 1991].

Brain **HPLC** See Urine [Ren *et al.* 1998].

Disposition in the Body Lamotrigine is readily and virtually completely absorbed, reaching peak concentrations in ~1.5–5 h. The presence of food does not affect the drug's absorption. A second peak may be seen 4–6 h after administration. Elimination is mainly via the kidneys (70% of dose in urine) with 10% as the unchanged drug: ~75–90% as glucuronide conjugate, trace amounts as the 2-*N*-methyl metabolite and <5% as the other metabolites. Approximately 2% is eliminated in faeces. The amount of unchanged drug excreted is 30% greater in Gilbert's syndrome.

Therapeutic Concentration The serum therapeutic concentration is 4–10 mg/L, with trough of 2–5 mg/L.

A group of 5 healthy males, aged between 27 and 49 years, were administered with a weekly doubling dose from 7.5 to 240 mg. A second group of 10 healthy male and females, 19 to 61 years of age, received a single dose of 120 mg lamotrigine. The mean peak plasma concentrations for group 1 were 0.40, 0.80, 1.60 and 3.16 mg/L for a 30- 60- 120- and 240- mg dose, respectively, observed ~1.9, 1.7, 2.1 and 3.1 h after administration, respectively. Group 2 showed a mean peak concentration of 1.56 mg/L (range 1.19–1.93), which was reached at 0.5–4 h (mean, 2.8 h) after dosing. [Kilpatrick *et al.* 1996].

Toxicity

No serious toxicity was seen in a patient who took 1.35 g lamotrogine and was subsequently treated with gastric lavage and activated charcoal [Buckley *et al.* 1993]. Similarly a patient who ingested between 4 and 5 g was admitted to hospital with coma, which lasted 8–12 h, followed by recovery over the next 2–3 days. Another patient who ingested 5.6 g was found unconscious and recovered after treatment with activated charcoal and sleeping for 16 h.

Bioavailability Oral formulation, 98%.

Half-life Mean range (administration with no other medication) is 25 ± 10 h. After a single dose in healthy volunteers, half-life is 24.1 ± 5.7 h; after multiple doses over 7 days in healthy volunteers, it is 25.5 ± 10.2 h. In the elderly (mean age 71 years, healthy volunteers), half-life is 31.2 ± 5.4 h. In adults with epilepsy, half-life is 13.5 h. After a single dose co-administration with carbamazepine and phenytoin, the mean half-life is 15 h (range 7.8–33.3) and after a single dose co-administration with valproic acid, the mean is 59 h (range 30.5–88.8). Plasma elimination half-life is lower (37%) in those with Gilbert's syndrome. Half-life in chronic renal failure (creatinine clearance ~18 mL/min) is 36 h.

Volume of Distribution 1–1.4 L/kg for healthy volunteers administered with a single 120–mg dose and 0.77–1.04 L/kg for healthy males administered with a weekly doubling dose of 30 to 240 mg. The mean apparent volume of distribution is 12% lower in the elderly (mean age 71 years, healthy volunteers).

Clearance 20.7–52.3 (mean, 41.7) mL/min for healthy volunteers receiving a 120–mg single dose and 22.4–37.7 (mean 29.6) mL/min for those administered with a weekly doubling dose between 30 and 240 mg. The mean apparent clearance is 37% lower in the elderly (mean age 71 years, healthy volunteers). The mean oral clearance is 32% lower in Gilbert's syndrome and reduced by 9-fold in chronic renal failure.

Protein Binding 56%.

Dose 50 to 400 mg per day.

Lanatoside C

Cardiac Glycoside

$C_{49}H_{76}O_{20}$ = 985.1

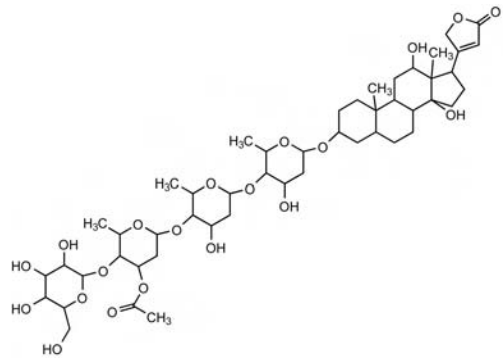
CAS—17575-22-3

IUPAC Name (3β,5β,12β)-3-[(*O*-β-D-Glucopyranosyl-(1→4)-*O*-3-*O*-acetyl-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12,14-dihydroxycard-20(22)-enolide

Synonym Celanide

Proprietary Names *Allocor*; *Cedilanid*; *Ceglunat*; *Celadigal*; *Cetosanol*; *Lanimerck*.

Note The name *Cedilanid* is also applied to a preparation of deslanoside.

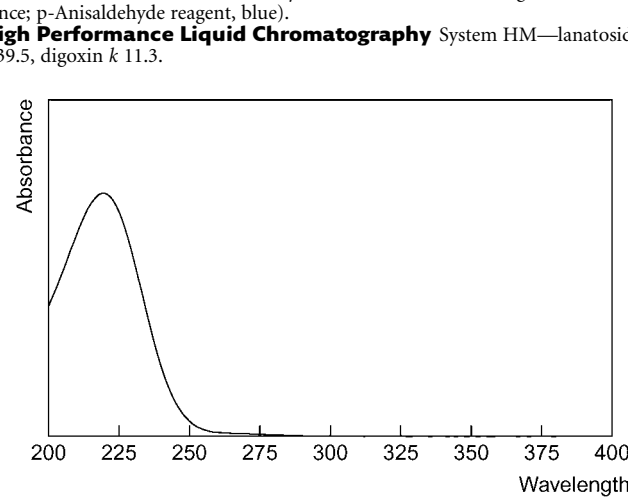


Chemical Properties A glycoside obtained from the leaves of the woolly foxglove, *Digitalis lanata* (Scrophulariaceae). Colourless or white hygroscopic crystals or white crystalline powder. Mp 240° with decomposition. Practically insoluble in water and ether; sparingly soluble in ethanol; soluble 1 in 2000 of chloroform and 1 in 20,000 of methanol; freely soluble in dioxane and pyridine. Log *P* (octanol/water), 0.1.

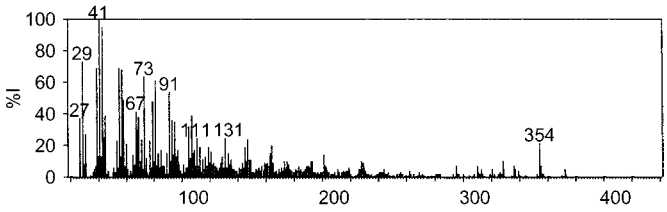
Colour Tests Antimony pentachloride—yellow→brown→black-violet; dissolve 2 to 3 mg in 5 mL of a solution containing 0.5 mL of 9% ferric chloride solution and 100 mL of acetic acid; underlay with 5 mL of sulfuric acid—an intense blue colour forms in the acetic acid layer and a brown ring free from red at the junction of the two liquids (see also Deslanoside).

Thin-layer Chromatography System TE—R_f 0.06; system TAE—R_f 0.89 (perchloric acid solution, followed by examination under UV light, blue fluorescence; p-Anisaldehyde reagent, blue).

High Performance Liquid Chromatography System HM—lanatoside C *k* 39.5, digoxin *k* 11.3.



Mass Spectrum Principal ions at *m/z* 41, 43, 29, 55, 39, 57, 73, 81; digoxin 73, 58, 57, 43, 41, 39, 29, 45 (no peaks above 360).



Quantification

Plasma **HPLC–MS** Lanatocide C and other cardiac glycosides. Limit of detection, 0.6 µg/L for lanatocide C [Tracqui *et al.* 1997].

Serum **Radioimmunoassay** For method, see Moffat [1974].

Disposition in the Body Lanatoside C is poorly absorbed after oral administration; it is converted to digoxin in the gastrointestinal tract and very little unchanged drug is found in the plasma or urine after oral administration. Hydrolysis to derivatives of digoxigenin and deacetylation to deslanoside also occur. After an oral dose, about 18% is excreted in the urine in 24 h, mostly as digoxin and metabolites of digoxigenin; after IV administration, about 30% of a dose is excreted in the urine in 24 h with about 70% of the urinary material consisting of unchanged drug and the remainder being digoxin and deslanoside. A total of about 60% of an IV dose is excreted in the urine in 5 days.

Therapeutic Concentration In serum, usually in the range 0.0004 to 0.001 mg/L. Following a single oral dose of 0.5 mg of ^{3}H-lanatoside C to 9 subjects, peak plasma concentrations of unchanged drug plus metabolites of about 0.002 mg/L were attained after about 1 h and a second peak of approximately the same concentration was reported in each subject after 5 to 8 h [Aldous *et al.* 1972].

Toxicity

A postmortem blood concentration of 0.047 mg/L was reported in a fatality involving an overdose of lanatoside C; death occurred 48 h after ingestion [Moffat 1974].

Distribution in Blood Plasma : whole blood ratio, 1.2.

Protein Binding About 25%.

Dose For slow digitalisation, 1.5 to 2 mg daily for 3 to 5 days; maintenance, 0.25 to 1.5 mg daily.

Aldous S *et al.* (1972). *Aust J Pharm Sci* 1: 35–41.

Landiolol

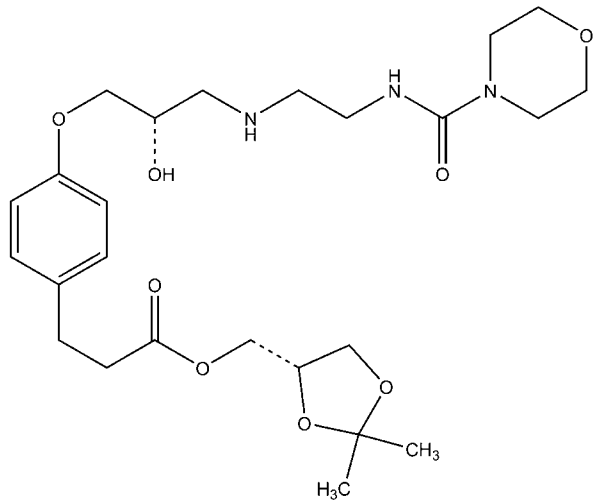
β_1-Adrenoceptor Antagonist, Antiarrhythmic

$C_{25}H_{39}N_3O_8$ = 509.6

CAS—133242-30-5

IUPAC Name [(4*S*)-2,2-Dimethyl-1,3-dioxolan-4-yl]methyl 3-[4-[(2*S*)-2-hydroxy-3-[2-(morpholine-4-carbonylamino)ethylamino]propoxy]phenyl]propanoate

Synonyms (−)-2,2-Dimethyl-1,3-dioxolan-4*S*-ylmethyl-3-[4-[3-[2-(morpholinocarbonylamino) ethyl]amino-2*S*-hydroxypropoxy]phenyl]propionate; 4-[(*S*)-2-hydroxy-3-[[2-[(4-morpholinylcarbonyl)amino]ethyl]amino]propoxy]benzenepropanoic acid [(4*S*)-2,2-dimethyl-1,3-dioxolan-4-yl]methyl ester.



Landiolol Hydrochloride

$C_{25}H_{39}N_3O_8$.HCl = 546.1

CAS—144481-98-1

IUPAC Name (−)-[(*S*)-2,2-Dimethyl-1,3-dioxolan-4-yl]methyl *p*-(*S*)-2-hydroxy-3-{[2-(4-morpholinecarboxamido)ethyl]amino}propoxy)hydrocinnamate hydrochloride

Synonym ONO-1101

Proprietary Name *Onoact*

Chemical Properties Mp 125.4°.

Thin-layer Chromatography Plates: Kiesel gel 60F_{254}, (0.25 mm). Solvent system: ethyl acetate : methanol (4 : 1). R_f 0.163 [Iguchi *et al.* 1992].

Disposition in the Body Rapidly metabolised by serum pseudocholinesterase and carboxyesterase in the liver to an inactive metabolite, which is subsequently excreted in urine.

Therapeutic Concentration

A group of 19 patients with various tachyarrhythmias was administered landiolol hydrochloride IV at 10, 20, 40 or 80 µg/kg/min for 5 min. Blood landiolol concentrations at the end of the infusion were reported as follows:

Dose (µg/kg/min)	*Blood landiolol at 5 min (µg/L)*	*Elimination Half-life (min)*
10	243	4.02
20	475	3.10
40	969	2.34
80	1861	2.40

[Atarashi *et al.* 2000]

In a separate study, patients with ventricular premature contraction were administered 20, 40 or 80 µg/kg/min IV over 15 min. Blood landiolol concentrations were as follows:

Dose (µg/kg/min)	*Blood landiolol (µg/L)*		*Elimination half-life (min)*
	5 min	*15 min*	
20	342	549	3.07
40	693	900	3.05
80	1570	1451	3.34

[Atarashi *et al.* 2000]

Six healthy volunteers and 6 patients with hepatic impairment were administered a 1 min loading infusion of 60 µg/kg/min landiolol hydrochloride, followed by another 60 min infusion of 20 µg/kg/min. Peak plasma concentrations and concentrations at 61 min (C_{61}) for landiolol hydrochloride and its metabolite (M1) were reported as follows:

Parameter	*Hepatic impairment*	*Healthy volunteers*
Landiolol HCl		
C_{max} (µg/L)	942	665
C_{61} (µg/L)	866	641
Half-life (min)	4.0	4.0
M1		
C_{max} (µg/L)	1380	1340
Half-life (min)	180	140

A small fraction of landiolol was detected unchanged in urine (6.2 and 4.7% for patients and healthy volunteers, respectively) with the remainder identified as M1 (71.3 and 57.7% for patients and healthy volunteers, respectively) [Takahata *et al.* 2005].

Half-life Approximately 4 min.

Volume of Distribution In healthy volunteers, 0.20 L/kg; in patients with hepatic impairment, 0.14 L//kg.

Clearance In healthy volunteers, 0.035 L/min/kg; in patients with hepatic impairment, 0.024 mL/min/kg.

Protein Binding Approximately 1.5 to 7.0%.

Note May be restricted in certain sports, as it is considered to be a member of a prohibited group (β-blockers).

Dose Given IV as the hydrochloride in the management of intra-operative cardiac arrhythmias.

Atarashi H *et al.* (2000). Pharmacokinetics of landiolol hydrochloride, a new ultra-short-acting beta-blocker, in patients with cardiac arrhythmias. *Clin Pharmacol Ther* 68: 143–150.

Iguchi S *et al.* (1992). Development of a highly cardioselective ultra short-acting beta-blocker. ONO-1101. *Chem Pharm Bull (Tokyo)* 40: 1462–1469.

Takahata T *et al.* (2005). Influence of hepatic impairment on the pharmacokinetics and pharmacodynamics of landiolol hydrochloride, an ultra-short-acting beta1-blocker. *Drugs R.D* 6: 385–394.

Lanreotide

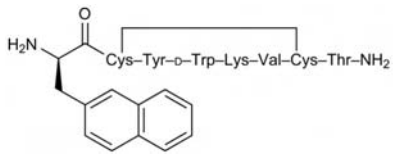
Antineoplastic

$C_{54}H_{69}N_{11}O_{10}S_2 = 1096.3$

CAS—108736-35-2

IUPAC Name 3-(2-Naphthalenyl)-D-alanyl-L-cysteinyl-L-tyrosyl-D-tryptophyl-L-lysyl-L-valyl-L-cysteinyl-L-threoninamide cyclic (2→7)-disulfide

Synonyms Angiopeptin; BIM-23014; DC 13-116.



Lanreotide Acetate

$C_{54}H_{69}N_{11}O_{10}S_2,xC_2H_4O_2$

CAS—127984-74-1

Proprietary Name *Somatuline LP*

Disposition in the Body Following the IM administration of sustained-release lanreotide, an initial rapid liberation of the drug is followed by more prolonged release.

Therapeutic Concentration

Eight healthy males were administered 30 mg lanreotide IM. Peak plasma concentration rose to 38.8 µg/L after 2 h, then decreasing progressively to 1.5 µg/L 11 days later and finally reaching 0.92 µg/L 2 weeks after injection [Kuhn *et al.* 1994].

Bioavailability About 50%.

Half-life Approximately 5 days.

Dose Given as a long-acting IM depot in the treatment of acromegaly.

Kuhn JM *et al.* (1994). Pharmacokinetic and pharmacodynamic properties of a long-acting formulation of the new somatostatin analogue, lanreotide, in normal healthy volunteers. *Br J Clin Pharmacol* 38: 213–219.

Lansoprazole

Proton Pump Inhibitor

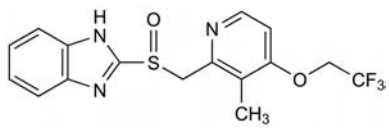
$C_{16}H_{14}F_3N_3O_2S = 369.4$

CAS—103577-45-3

IUPAC Name 2-[[[3-Methyl-4-(2,2,2-trifluoro-ethoxy)-2-pyridinyl]methyl] sulfinyl]-1*H*-benzimidazole

Synonyms A-65006; AG-1749; lanzoprazole.

Proprietary Names *Agopton*; *Bamalite*; *Dakar*; *Lansox*; *Lanzor*; *Limpidex*; *Ogast*; *Opiren*; *Prevacid*; *Takepron*; *Zoton*. It is also an ingredient of *Prevpac*.



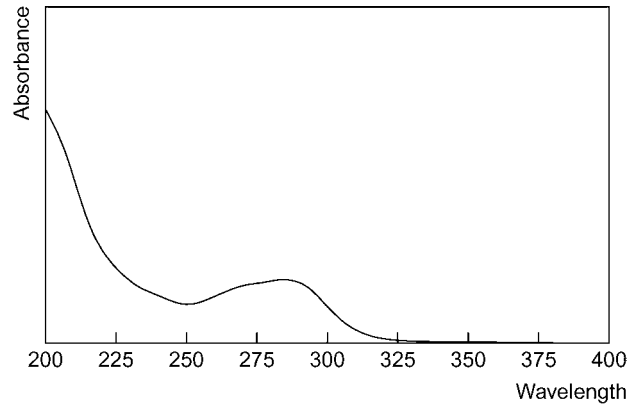
Chemical Properties White to brownish-white odourless crystalline powder. Mp 166°. Freely soluble in dimethylformamide; soluble in methanol; sparingly soluble in ethanol; slightly soluble in ethylacetate, dichloromethane and acetonitrile; very slightly soluble in ether and practically insoluble in water and hexane.

High Performance Liquid Chromatography System HAA—retention time 16.6 min.

Column: Chiralcel OD-R (250 × 4.6 mm i.d., 5 µm). Temperature 30°. Mobile phase: methanol : water (75:25), flow rate 0.5 mL/min. Internal standard (IS) : isobutyl 4-hydroxybenzoate. UV detection (λ=285 nm). Retention time: (+)-lansoprazole, 15.7 min; (−)-lansoprazole, 18.1 min; 5-hydroxylansoprazole, 10.7 min; lansoprazole sulfone, 13.6 min; IS, 12.3 min [Katsuki *et al.* 2001].

Column: C_{18} ODS (250 × 4.6 mm i.d., 5 µm). Temperature: 40° to 43°. Mobile phase (premix): 35% aqueous acetonitrile solution with 1 mL/L n-octylamine and 5 mmol/L *N*-acetohydroxamic acid, (pH 7), flow rate, 1.0 mL/min for 15 min then 2.5 mL/min. IS: omeprazole. UV detection (λ=285 nm). Retention time: lansoprazole, 13.2 min; metabolites: sulfide, 22.4 min, hydroxylated sulfide, 12.0 min, hydroxylated sulfinyl, 6.5 min, sulfone, 16.4 min; IS, 7.6 min [Karol *et al.* 1995].

Ultraviolet Spectrum Aqueous acid—284 nm.



Quantification

Plasma **HPLC** UV detection (λ=285 and 303 nm). Limit of quantification, 2 µg/L for lansoprazole, 3 to 5 µg/L for its metabolites [Landes *et al.* 1992].

Serum **HPLC** UV detection (λ=285 nm). Limit of quantification, 5 µg/L [Aoki *et al.* 1991].

Urine **HPLC** See Serum [Aoki *et al.* 1991].

Disposition in the Body Lansoprazole is rapidly absorbed after oral administration and peak plasma concentrations are reached within ~1.5 h. The drug is extensively metabolised in the liver to its sulfide and sulfone metabolites, and the 5-hydroxy metabolites of these. The drug and its metabolites, in the form of glucuronides, are excreted mainly in faeces via bile with 15 to 30% of an administered dose in urine. No unchanged drug has been detected. Clearance is reduced in elderly patients and in those with liver disease.

Therapeutic Concentration

Ten healthy male volunteers were administered an oral 30 mg dose of the enteric coated formulation in a fasted state. The maximum serum concentration was ~0.8 mg/L and was reached within 2 to 3 h [Aoki *et al.* 1991].

Group 1: 6 patients with mild renal dysfunction (creatinine clearance 40 to 60 mL/min). Group 2: 6 patients with moderate dysfunction (creatinine clearance 20 to 40 mL/min). Group 3: 5 patients with severe dysfunction (creatinine clearance <20 mL/min). Group 4: 8 patients with hepatitis. Group 5: 8 patients with compensated cirrhosis. Group 6: 8 patients uncompensated cirrhosis. All patients were aged between 34 and 74 years, male and female, and administered a 30 mg dose of lansoprazole, as were a control group of 18 healthy volunteers aged between 20 and 32 years. Peak plasma concentrations for the groups of individuals were 1.279, 0.94, 0.942, 1.08, 1.44 and 1.14 mg/L, respectively, which were reached in 1.6, 1.7, 1.4, 1.4, 2.1 and 2.1 h, respectively. The healthy individuals reached peak concentrations of 1.033 mg/L in 1.5 h [Delhotal-Landes *et al.* 1993].

Bioavailability 80 to 90%; may be reduced by antacids and sucralfate if taken within one hour of taking lansoprazole.

Half-life 1.4 to 2 h.

Volume of Distribution 0.45 L/kg.

Clearance Oral, 0.26 L/h/kg.

Protein Binding 97%.

Note For an update of the pharmacological properties of lansoprazole, see Langtry and Wilde [1997].

Dose 15 to 60 mg daily.

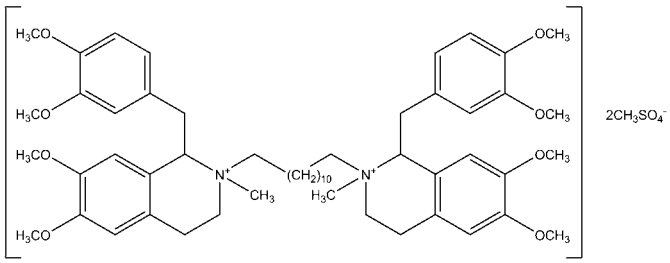
Laudexium Methyl Sulfate

Quaternary Ammonium, Muscle Relaxant

$C_{52}H_{74}N_2O_8,C_2H_6O_8S_2 = 1077.4$

IUPAC Name 1-[(3,4-Dimethoxyphenyl)methyl]-2-[10-[1-[(3,4-dimethoxyphenyl)methyl]-6,7-dimethoxy-2-methyl-3,4-dihydro-1*H*-isoquinolin-2-ium-2-yl] decyl]-6,7-dimethoxy-2-methyl-3,4-dihydro-1*H*-isoquinolin-2-ium methyl sulfate

Synonyms Compd 20; curarexium methylsulfate; decamethylene-α-ω-bis[1-(3′,4′-dimethoxybenzyl)-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methylisoquinolinium methosulfate]; 2-decamethylenebis[1,2,3,4-tetrahydro-6,7-dimethoxy-1-(3,4-dimethoxybenzyl)-2-methylisoquinolinium methyl sulfate]; 2′-decamethylenebis[1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-1-veratrylisoquinolinium methyl sulfate]; 2,2′-(1,10-decanediyl)bis[1-[(3,4-dimethoxyphenyl)methyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methylisoquinolium] bis(methyl sulfate).
Proprietary Name *Laudolissin*



Chemical Properties Cream-coloured granules from alcohol and ether. Mp 172° to 174° [O'Neil *et al.* 2006].
Colour Tests Ammonium molybdate test—blue→purple→brown (limit of detection, 0.1 µg); ammonium vanadate test—blue→purple→brown (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—dull purple (limit of detection, 1.0 µg); Vitali's test—yellow/brown/brown (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.01 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—231, 280 nm.
Disposition in the Body
Toxicity In mice the LD_{50} (SC) is 2.95 mg/kg [Collier, Macauley 1954].
Note Laudexium does not inhibit cholinesterases *in vitro* [Brown 1954].

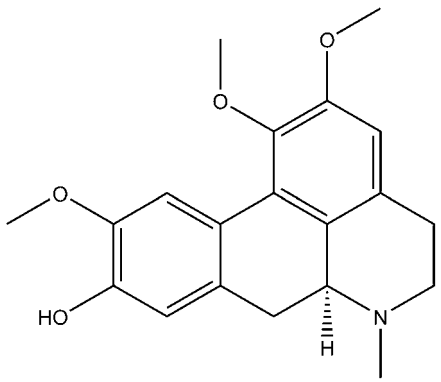
Lauroscholtzine

Anxiolytic, Isoquinoline Alkaloid
$C_{20}H_{23}NO_4$ = 341.4
CAS—2169-44-0

Synonyms *N*-Methyllaurotetanine; NSC 247506; NSC 247564; rogersine; (*S*)-5,6,6a,7-tetrahydro-1,2,10-trimethoxy-6-methyl-4*H*-dibenzo[d,e,g]quinolin-9-ol; 1,2,10-trimethoxy-6a-α-aporphin-9-ol.
Proprietary Name It is an ingredient of the phytopharmaceutical *Sympathyl* as a component of *Eschscholtzia californica*.



Chemical Properties Aporphine (isoquinoline) alkaloid present in the leaves of the South American shrub *Peumus boldus* Molina (Monimiaceae, 'boldo leaves'), from leaves of *Guatteria dumetorum,* and from *Eschscholtzia californica* (Papaveraceae, 'California poppy' or 'Yellow poppy') [Correa *et al.* 2006; Hanus *et al.* 2004; Hughes *et al.* 1968]. Yellow needles from chloroform. Mp 237° to 238° [Chang *et al.* 1998].
High Performance Liquid Chromatography Column: C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.02 mol/L phosphoric acid (pH 4.3) : acetonitrile : methanol (45 : 12 : 1), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Retention times: lauroscholtzine 13.0 min, glaziovine 4.2 min, laurolitsine 5.6 min, boldine 6.0 min, isoboldine 8.0 min, isocorydine 10.4 min, laurotetanine 11.8 min, isodomesticine 14.0 min. Limit of quantification not reported [Sun *et al.* 1996].
Quantification
Other **HPLC** Leaf Samples (*G. dumetorum*). Column: C_{18} (250 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : water : TEA (70 : 30 : 0.1), flow rate 2.0 mL/min. UV and MS (Chemical ionisation) detection. Retention time: 32 min. Limit of quantification not reported [Correa *et al.* 2006]. Leaf Samples (*E. californica*). Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water containing 1 mmol/L SDS and 10 mmol/L TEA (pH 2.5; 80 : 20 to 60 : 40 over 40 min for 5 min to 0 : 100 over 5 min for 5 min), flow rate 1.0 mL/min. UV detection (λ = 280 nm) and MS detection (ESI). Retention times: lauroscholtzine 34.8 min, protopine 37.7 min, californidine 38.7 min (11 further alkaloids detected). Limit of quantification not reported [Fabre *et al.* 2000].
Disposition in the Body
Toxicity *Eschscholtzia* has been described as a substitute drug for marijuana, causing similar mild euphoria after ingestion or smoking, which lasts for 20 to 30 min. Gradual increase of the dose is recommended until the desired effect occurs. Regular and prolonged use is not thought to be habit-forming.
Dose Plant sources of lauroscholtzine are used in phytotherapy preparations for the treatment of anxiety disorders. They are also misused as herbal drugs of abuse (marijuana substitutes).

Lead

Metal
Pb = 207.2
CAS—7439-92-1

Synonyms Olow; pigment metal; plumbum.
Proprietary Name *CI77575*
Chemical Properties Bluish-grey solid. Mp 327.4°. Bp 1740°. Insoluble in water, organic solvents; soluble in nitric acid, hot concentrated sulfuric acid. Valencies: Pb(0), Pb(+2), Pb(+4). Naturally occurring metal found in small amounts in the earth's crust. Used in alloys; lead–acid batteries; as construction material for tank linings and piping; in the metallurgy of steel and other metals; for X-ray and radiation protection; in ceramics, plastics and electronic devices.

Lead Acetate
$PbC_4H_6O_4$ = 325.3
CAS—301-04-2
Synonyms Lead (+2) acetic acid; plumbous acetate.
Proprietary Names *Salt of Saturn*; *Sugar of Lead*; *Unichem PBA*.
Chemical Properties White solid with a slightly acetic odour. Mp 280°. Very soluble in water; soluble in glycerol; very slightly soluble in alcohol. Used as a mordant in cotton dyes; drier in paints, varnishes and pigment inks; colorant in hair dyes; astringent; in lead coating for metals.

Lead Azide
PbN_6 = 291.3
CAS—13424-46-9
Synonym Initiating explosive (lead azide, dextrinated type only)
Chemical Properties White needles or powder. Explodes at 350°. Slightly soluble in water; soluble in acetic acid. Used as a primer in explosives.

Lead Chloride
$PbCl_2$ = 278.1
CAS—7758-95-4
Synonyms Lead (+2) chloride; lead (II) chloride; plumbous chloride.
Chemical Properties White crystalline powder. Mp 501°. Bp 950°. Soluble in water; insoluble in alcohol. Used in the manufacture of Pattison's white lead, Verona yellow, Turner's Patent Yellow, lead oxychloride; as solder and flux.

Lead Chromate
$PbCrO_4$ = 323.2
CAS—7758-97-6
Synonyms Lead chromate (VI); phoenicochroite.
Proprietary Names *40-2250*; *Canary Chrome Yellow*; *Cologne Yellow*; *King's Yellow*.
Chemical Properties Orange-yellow solid. Mp 844°. Slightly soluble in water; soluble in dilute acid; insoluble in acetic acid. Used as pigment for paints and inks, in oil and water colours, in printing fabrics, in decorating china and porcelain, in traffic paints.

Lead Iodide
PbI_2 = 461.0
CAS—10101-63-0
Synonyms Lead diiodide; lead (II) iodide; plumbous iodide.
Chemical Properties Bright or golden yellow hexagonal crystals. Slightly soluble in water; soluble in concentrated solutions of alkali iodides; freely soluble in solution of sodium thiosulfate; soluble in hot aniline; insoluble in alcohol or cold HCl. Used in bronzing, gold pencils, mosaic gold, printing, photography.

Lead Nitrate
PbN_2O_6 = 331.2
CAS—10099-74-8
Synonyms Lead dinitrate; lead (II) nitrate; nitric acid lead (+2) salt; plumbous nitrate.
Chemical Properties White or colourless translucent crystals. Very soluble in water; soluble in methanol; very sparingly soluble in alcohol, insoluble in concentrated nitric acid. Used in the manufacture of matches and special explosives; as mordant in dyeing and printing on textiles, for staining horn, and for mother-of-pearl; as an oxidiser in dye industry; as sensitiser in photography; for process engraving.

Lead Oxide
PbO = 223.2
CAS—1317-36-8
Synonyms Lead monoxide; lead protoxide; litharge; massicot; plumbous oxide.
Proprietary Names *CI77577*; *CI Pigment Yellow 46*.
Chemical Properties Reddish-yellow crystals at ordinary temperature, yellow crystals above 489°. Mp 886° (litharge). Slightly soluble in water; soluble in nitric acid, alkali chlorides; insoluble in alcohol. Used in ointments, plasters, glazing pottery, lead glass, varnishes, pigment for rubber, assay of gold and silver ores.

Lead Sulfate
$PbSO_4$ = 303.3
CAS—7446-14-2
Synonyms Lead (II) sulfate; sulfuric acid (+2) salt; occurs as the minerals anglesite and lanarkite.
Proprietary Names *CI77630*; *Fast White*; *Lead Bottoms*; *Mulhouse White*.
Chemical Properties White solid. Mp 1170°. Slightly soluble in water, nitric acid, hot concentrated sulfuric acid; insoluble in alcohol. Used as a pigment instead of white lead; in manufacture of batteries; in lithography, oil varnishes, weighting fabrics.

Lead Sulfide
PbS = 239.3
CAS—1314-87-0
Synonyms Lead monosulfide; lead (+2) sulfide; natural galena; plumbous sulfide.
Chemical Properties Black, blue or silvery cubic or metallic crystals with a pleasant, musty sweet odour. Mp 1114°. Bp 1281°. Very sparingly soluble in water; soluble in nitric acid, hot concentrated sulfuric acid; insoluble in alcohol. Used on glazing earthenware.

Colour Test Applicable to gastric contents and scene residues. Add 0.1 mL of sodium tartrate buffer (pH 2.8; prepared by mixing sodium bitartrate [19 g/L] and tartaric acid [15 g/L] in purified water) to 0.1 mL of test solution and vortex for 5 s. Apply 50 µL of the solution to a phase-separating filter paper and add 50 µL of sodium rhodizonate solution (10 g/L)—Lead salts give a purple colour. Coloured complexes are also formed by a number of other metals. Limit of detection, 2 mg/L.

Quantification Specimen collection: Blood—5 mL K-EDTA tube (must be lead free); urine—20 mL plastic universal container.

Note For reference values for lead in the German population, see Wilhelm *et al.* [2004].

Blood **DPASV** Limit of detection, 0.5 µg/L [Moreno *et al.* 1999].

AAS Perkin-Elmer 5000 Zeeman. Limit of detection, 1.0 µg/L [Palminger Hallén *et al.* 1995].

FAAS Perkin-Elmer 303 (λ = 283.3 nm). Air: acetylene flame, flow rate 4.0 and 22.8 L/min. Limit of detection, 11.9 µg/L [Delves 1970].

ETAAS Perkin-Elmer 1200. Perkin-Elmer 4100ZL. Limit of detection, 0.1 pg [Manton *et al.* 2001]. Perkin-Elmer 5100. Limit of detection, 4.0 µg/L [White 1999]. Dry cycle: 110° to 120°. Char cycle: 350°. Atomisation cycle: 2000° (λ = 283.3 nm). Limit of detection not reported [Baranowska 1995]. Carrier gas: Ar, 300 L/min. Dry cycle: 120° at 5 s for 15 s. Char cycle: 260° in 1 s for 5 s to 800° in 5 s for 27 s. Atomisation cycle: 1600° for 5 s, gas stop. Lead hollow cathode lamp (λ = 283.3 nm). Limit of detection, ~2.5 µg/L, [Bannon *et al.* 1994]. Carrier gas: Ar, 300 mL/min. Dry cycle: 150° at 1 s for 30 s. Char cycle: 550° in 1 s for 30 s to 950° in 10 s for 40 s. Atomisation cycle: 1900° for 2 s, gas stop. Perkin-Elmer/Zeeman 5000 (283.3 nm). Limit of quantification, 0.25 µmol/L, limit of detection, 0.08 µmol/L [Shuttler, Delves 1986].

ICP-MS Plasma gas: 15 L/min. Auxiliary gas: 1.13 L/min. Nebuliser gas: 1.0 mL/min. Limit of detection, not reported [Rainska *et al.* 2007]. Plasma gas: Ar, 14.8 L/min. Auxiliary gas: Ar, 0.9 L/min. Carrier gas: 1.1 L/min. Babington nebuliser (*m/z* 27). Limit of detection not reported [Botta *et al.* 2006]. Plasma gas: 16 L/min. Auxiliary gas: 1 L/min. Nebuliser gas: 1.15 or 1.33 mL/min. Limit of detection, 2 µg/L [De Boer *et al.* 2004]. Perkin-Elmer Sciex Elan 5000. Nebuliser gas: 1.0 mL/min. Limit of detection, 0.1 µg/L [White 1999]. Limit of detection, 3 µg/L [Bergdahl *et al.* 1998]. See also Schutz *et al.* [1996] and Delves, Campbell [1988].

Plasma **ICP-MS** Limit of detection, 0.1 µg/L [Bergdahl *et al.* 1998]. Plasma gas: 1.0 mL/min. Nebuliser gas: 0.9 L/min. Intermediate gas: 0.8 L/min. Outer gas: 13 L/min. Limit of detection, 0.012 to 0.015 ng/L [Schutz *et al.* 1996]. Outer gas: Ar, 12 L/min. Nebuliser gas: Ar, 0.75 L/min. Limit of quantification, 3.8 nmol/L; limit of detection, 0.23 nmol/L [Mauras *et al.* 1993].

Serum **ETAAS** Perkin-Elmer 4100ZL. Limit of detection, 0.1 pg [Manton *et al.* 2001].

ICP-AES External gas: 14.0 L/min. Indirect gas: 0.5 L/min. Bearing gas: 1.0 L/min. Meinhard nebuliser (λ = 165 to 460 nm). Limit of detection not reported [Olszewski *et al.* 2006].

ICP-MS Plasma gas: Ar, 11.0 L/min. Auxiliary gas: Ar, 1.4 L/min. Nebuliser gas: Ar, 0.9 to 1.0 L/min. Limit of detection, 0.04 µg/L [Gercken, Barnes 1991].

Urine **ETAAS** See Blood [White 1999]. Dry cycle: 110° for 20 s. Char cycle: 700° for 20 s. Atomisation cycle: 2000° for 2 s. Carbon furnace mode (λ = 283.3 nm). Limit of detection not reported [Smith, Griffiths 1982].

ICP-AES Perkin-Elmer 40 (λ = 220 nm). Plasma gas: Ar, 10 to 12 L/min. Auxiliary gas: Ar, 0.8 to 1.0 L/min. Nebuliser gas: 2.9 L/min. Limit of detection, 6.2 µg/L [Lopez-Artiguez *et al.* 1993].

ETV-ID-ICP-MS Outer gas: 15.0 L/min. Intermediate gas: 0.74 L/min. Carrier gas: 1.08 L/min. Dry cycle: 90° at 30 s for 10 s to 130° in 10 s for 10 s. Char cycle: 300° in 10 s for 20 s. Atomisation cycle: 1000° in 1 s for 20 s. Limit of detection, 5 ng/L [Lee *et al.* 1998].

ICP-MS See Blood [Rainska *et al.* 2007; Botta *et al.* 2006]. Limit of detection, 1 µg/L [De Boer *et al.* 2004]. Plasma gas: 15 L/min. Nebuliser gas: 0.825 L/min. Auxillary gas: 0.8 L/min. Limit of detection, 0.03 µg/L [Schramel *et al.* 1997].

Colostrum **ETAAS** Dry cycle: 50° to 120° at 20 s for 20 s. Char cycle: 120° to 900° in 30 s for 30 s. Atomisation cycle: 1600° for 7 s. Limit of detection, 0.92 µg/L [Turan *et al.* 2001].

Milk **ETAAS** Perkin-Elmer 5100 PC/HGA 600 with Zeeman background correction. Limit of detection, 1.0 µg/L [Palminger Hallén *et al.* 1995].

Ocular Fluid **ICP-MS** Perkin-Elmer Sciex Elan 6100. Limit of detection, 5 µg/L [Erie *et al.* 2005].

Oral Fluid **ICP-MS** Plasma gas: 13 L/min. Auxillary gas: 0.55 L/min. Nebuliser gas: 0.1 L/min. Limit of detection, 0.05 µg/L [Menegario *et al.* 2001].

Placenta **ETAAS** Perkin-Elmer 5100 (λ = 283.3 nm). Limit of detection not reported [Zagrodzki *et al.* 2003]. See Blood [Baranowska 1995].

Synovial Fluid **ICP-MS** Coolant gas: Ar, 15.0 L/min. Auxiliary gas: 0.99 L/min. Nebuliser gas: 1.0 L/min. Limit of detection, low ng/L [Krachler *et al.* 2000].

Bone **ETAAS** Dry cycle: 110° to 120° in 30 s. Char cycle: 300° to 350° in 30 s. Atomisation cycle: 2000° for 20 s. Carrier gas: Ar, 200 mL/min (λ = 283.3 nm). Limit of detection, 0.025 mg/L [Baranowska *et al.* 1995].

Hair **ETAAS** Dry cycle: 80° to 120° in 10 s. Char cycle: 300° to 400° at 10 s. Atomisation cycle: 2700° to 2800° in 5 s. Carrier gas: 200 mL/min. Hitachi model 180-50, S.N.5721-2 (λ = 193.8 nm). Limit of detection not reported [Kazi *et al.* 2006].

ICP-MS Limit of detection, 0.03 mg/kg [Nadal *et al.* 2005]. Plasma gas: 15 L/min. Auxiliary gas: 0.8 L/min. Nebuliser gas: 0.8 L/min. Limit of detection not reported [Samanta *et al.* 2004].

Note For a study following the trace element hair analysis of one man over 2 decades, see Klevay *et al.* [2004].

Iliac Crest **ETAAS** Dry cycle: 60° to 90° in 10 s for 5 s to 100° in 10 s for 5 s to 150° in 10 s, 200 mL/min. Char cycle: 150° to 1000° in 10 s for 20 s, 100 mL/min. Atomisation cycle: 2700° for 4 s. Lamp current: 10.0 mA (λ = 283.3 nm). Limit of detection, 1.0 µg/L [Scancar *et al.* 2000].

Liver **ICP-MS** Perkin-Elmer Elan 6000. Nebuliser gas: Ar, 1.04 L/min. Limit of detection, 171 ng/L [Patriarca *et al.* 1999].

Nail **ICP-MS** See Hair [Samanta *et al.* 2004].

Other **DPASV** Yemeni Khat. Limit of detection, 0.3 µg/kg [Matloob 2003].

ETAAS Eggs and Chicken Feed. Dry cycle: 120° at 1 s for 50 s. Char cycle: 1400° in 1 s for 30 s to 20° in 1 s for 5 s. Carrier gas: Ar, 300 mL/min. Atomisation cycle: 2300° for 5 s, gas stop. Limit of detection, 0.52 mg/kg [Fakayode, Olu-Owolabi 2003]. Cocaine Samples. Char cycle: 1000°. Atomisation cycle: 2400° (λ = 283.3 nm). Limit of detection not reported [Bermejo-Barrera *et al.* 1999].

ICP-AES Argentine Wine. Outer gas: 8.5 L/min. Auxiliary gas: 1.0 L/min. Nebuliser gas: 1.0 L/min. (λ = 220.4 nm). Limit of detection, 0.28 µg/L [Lara *et al.* 2005].

ICP-MS Solid and Liquid Food Samples. Limit of quantification, solid samples 2 µg/kg, liquid samples,0.2 µg/L; limit of detection, solid samples 0.6 µg/kg, liquid samples 0.06 µg/L [Cheung Chung *et al.* 2008]. Seafood. Perkin-Elmer Elan 6000. Limit of detection, 0.02 mg/kg [Falcó *et al.* 2006]. Gunshot residue. Coolant gas: 15 L/min. Auxiliary gas: 1.1 L/min. Sample gas: 0.97 L/min. Limit of detection, 0.117 µg/L [Reis *et al.* 2003]. Food. Varian-Vista with an ultrasonic nebuliser. Limit of detection, 0.04 mg/kg [Llobet *et al.* 2003]. Meals from Catering Eestablishments. Plasma gas: 15 L/min. Auxiliary gas: 0.9 L/min. Nebuliser gas: 0.73 L/min. Limit of quantification, 26 µg/kg [Noel *et al.* 2003]. Beverages. Limit of detection, 0.2 µg/kg [MacIntosh *et al.* 2000].

Disposition in the Body Only 5 to 10% of lead orally ingested from the diet is absorbed. Lead accumulates in the body from birth and the total body burden (in adults) ranges from 100 to 400 mg, with 90% deposited in the bones as insoluble lead phosphate. Minor amounts are excreted in hair, nails and urine. Normal output via the kidneys is less than 10 µg/day (50 µmol/day). In blood, 99% of lead is contained in the erythrocytes.

Normal concentrations in blood: Urban exposure (adults and children), <100 µg/L (0.5 µmol/L). UK guidelines for occupational exposure: women of child-bearing age, <250 µg/L (1.2 µmol/L); men, <500 µg/L (2.4 µmol/L). Concentrations in the body: brain—0.02 to 0.78 mg/kg, hair—1.0 to 20 mg/kg, kidney—0.15 to 1.9 mg/kg, liver—0.18 to 3.1 mg/kg, nails—0.65 to 15 mg/kg, urine—0.01 to 0.19 mg/kg.

Toxicity Prior to 1970, blood concentrations greater than 60 µg/L signified lead poisoning. In 1971 the threshold was reduced to 40 µg/L. This was subsequently reduced to 30 µg/L in 1975 and 25 µg/L in 1985. In 1991 the Centers for Disease Control and Prevention in the USA redefined elevated blood lead concentrations in children as those ≥10 µg/L and recommended a new set of guidelines for treatment of lead concentrations ≥15 µg/L [Papanikolaou *et al.* 2005]. Ongoing studies are investigating whether the regulatory limit for children should be reduced to 5 µg/L [McQuirter *et al.* 2001]. Lead damages many enzyme systems, notably those involved in haem synthesis. Chronic exposure leads to gastrointestinal colic, anaemia, weight loss, muscle weakness and kidney damage. Blood lead measurements in children of industrially exposed fathers showed that 42% had concentrations above 0.3 mg/L with 11% having concentrations higher than 0.8 mg/L [Baker *et al.* 1977].

Three employees exposed to lead had blood lead concentrations of 159, 114 and 108 µg/L [Coyle *et al.* 2005].

The hair of autistic children had lead concentrations of 6.75 mg/kg compared with 3.20 mg/kg in controls [Fido, Al Saad 2005].

A 45-year-old woman presented with gastrointestinal problems. Her blood lead concentration was 100 µg/L and she was treated with chelation therapy with dimercaptosuccinic acid (DMSA). Ten years later her blood lead concentration was 210 µg/L, at which point DMSA therapy was started again. Four months later her blood lead concentration was 550 µg/L. An X-ray of her abdomen revealed a dense metal object 6 mm in diameter. During a bout of gastroenteritis, the pellet was excreted and it was identified as a lead shot pellet used for game hunting [Gustavsson, Gerhardsson 2005].

A 4-year-old boy presented with intermittent abdominal pain. An X-ray revealed a metallic foreign body in his stomach. His blood lead concentration was 123 µg/L. After 48 h dimercaprol and 4 days of EDTA his blood lead concentration fell to 57 µg/L. The patient was switched to oral DMSA but EDTA was resumed when his blood lead concentration rebounded to 69 µg/L. Following three 19-day courses of DMSA his blood concentration was <40 µg/L [VanArsdale *et al.* 2004].

A 66-year-old man worked for 20 years as a repairer in a glassworks. The hard tissue lead content of one of his teeth was 14.0 ppm [Bachanek *et al.* 2000]

A 12-month-old girl chewed the layers of paint from the top of her cot over a 2 month period. On admission to hospital, her blood lead concentration was 122.9 µmol/L. She died of acute lead encephalopathy before her lead concentrations could be reduced [Holmes 1994].

A 37-year-old woman who survived the ingestion of 7 g of a lead salt had a blood lead concentration of 2.28 mg/L [Karpatkin 1961].

Three children with histories of pica died from lead poisoning with blood lead concentrations of 1.11 to 3.50 mg/L [Alexander, Delves 1972].

A 32-year-old man sustained a gunshot wound to his elbow 6 years before presenting to a hospital. His serum lead concentration was 143 µg/L. A synovial biopsy was performed and the lead concentrations were in excess of 1000 µg/L [Sokolowski, Sisson 2005].

A 45-year-old man who had been shot in the wrist 16 months previously had a serum lead concentration of 84 µg/L and a urine lead concentration of 178 µg/L [Viegas, Calhoun 1986].

A 54-year-old woman who died 5 months after being shot in the leg and who absorbed lead from the retained bullet had a postmortem blood lead concentration of 5.3 mg/L [DiMaio *et al.* 1983].

Three patients with lead toxicity following gunshot wounds had blood concentrations of 525, 140 and 67 µg/L [Linden *et al.* 1982].

Fire-arms instructors exposed to lead fumes in an indoor pistol range complained of abdominal pain and had blood lead concentrations of 1.09 to 1.39 mg/L [Landrigan *et al.* 1975].

In a fatal case of lead poisoning in a child, tissue lead concentrations of 5.8 mg/kg (brain), 40 mg/kg (liver), 8.8 mg/L (kidney), 268 mg/kg (flat bone), and 132 mg/kg (long bone) were reported [Baselt 2005].

Five cases of toxicity following the self-injection of lead and opium resulted in blood lead concentrations of 4.56 to 2.02 µg/L. Postmortem concentrations in the 2 patients who died were as follows:

	Patient 1	*Patient 2*
Liver (mg/kg)	7.07	157
Kidney (µg/kg)	225	–
Skeletal muscle (µg/kg)	136	–
Heart (µg/kg)	124	–
Brain (µg/kg)	118	–
Blood (mg/kg)	–	2.5

[Beattie *et al.* 1975].

Traditional herbal medicines can contain up to 8 mg of lead per dose unit.

Two patients with lead poisoning following the ingestion of Indian herbal remedies had blood concentrations of 46 and 65 µg/L and urinary concentrations of 2489 and 1711 µg/24 h following IV EDTA [Muzi *et al.* 2005].

A lead-containing aphrodisiac from Bangladesh caused gastrointestinal symptoms in a 24-year-old man, who had a blood lead level of 1.36 mg/L [Waldron 1979].

A 4-month-old infant who was given herbal medicine treatment became unconscious and developed a blood lead concentration of 1.37 mg/L, but recovered with treatment [Chan *et al.* 1977].

A 59-year-old woman who was treated with a Chinese herbal medicine had joint pain and insomnia and a blood lead concentration of 0.9 mg/L [Kalman 1977].

Note For an evaluation of metal levels in welders, see Iarmarcovai *et al.* [2005]; for a study on the environmental influences on the trace element content of teeth, see Brown *et al.* [2004]; for a comparison of trace metal profiles in hair samples from children in urban or rural areas, see Hasan *et al.* [2004]; for a study of lead in the blood, serum, and red blood cells of patients with motor neuron disease, see Pamphlett *et al.* [2001]. Rahil-Khazen *et al.* [2002] have studied trace element levels in the postmortem tissue of 30 Norwegians. For biological monitoring of lead in workers in hazardous-waste incineration, see Schuhmacher *et al.* [2002]; for workers in glass manufacturing, see Arai *et al.* [1994] or Ludersdorf *et al.* [1987]. For a review of lead poisoning, see Markowitz [2000]. For blood lead concentrations in copper smelter workers in Japan, see Karita *et al.* [2000].

Half-life 0.4–3.6 years.

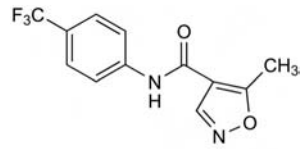
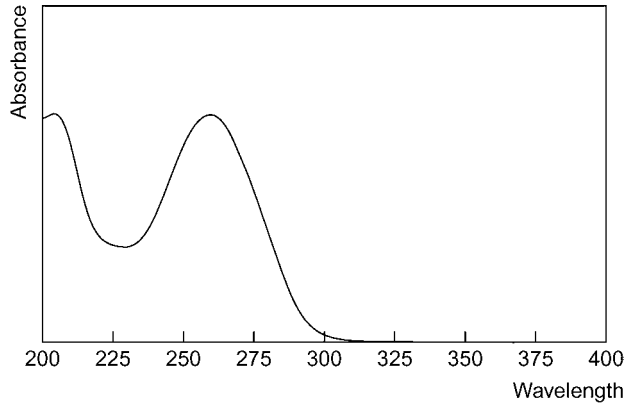
Leflunomide

Antirheumatic
$C_{12}H_9F_3N_2O_2 = 270.2$
CAS—75706-12-6

IUPAC Name 5-Methyl-*N*-[4-(trifluoromethyl)phenyl]-4-isoxazolecarboxamide
Synonym HWA-486
Proprietary Name *Arava*



Chemical Properties White crystalline powder (two polymorphic forms). Mp 165° to 167°. pK_a (23°) 10.8.
Ultraviolet Spectrum Principal peaks at 206, 261 nm.



Quantification

Blood **HPLC** UV detection (λ=280 nm). Limit of detection, 400 µg/L (0.25 mL sample), 40 µg/L (1.0 mL sample) [Dias *et al.* 1995].
Plasma **HPLC** See Blood [Dias *et al.* 1995].
Disposition in the Body Leflunomide is rapidly and extensively metabolised, after absorption, to an active metabolite, A771726, responsible for the majority of the drug's immunosuppressive activity. The exact site of metabolism is not known, but is possibly the gut wall, plasma and the liver. The metabolite undergoes enterohepatic circulation and biliary recycling. The parent drug is not detected in plasma, only the metabolite. Peak plasma concentrations of the metabolite are observed 6 to 12 weeks after administration and bioavailability is not affected by the presence of food. Elimination of the metabolite is very slow (6 to 40 days) and approx. Ninety percent of the dose is recovered in faeces and urine. In faeces, leflunomide is primarily excreted as the metabolite, and in urine as leflunomide glucuronides and the oxanilic acid derivative of the metabolite. Small amounts are distributed into breast milk. Steady state concentrations are reached after ~20 weeks of leflunomide dosing.
Therapeutic Concentration
Fifty-four patients with rheumatoid arthiritis were administered 10 or 25 mg leflunomide daily. Steady state metabolite concentrations were 18 and 63 mg/L, respectively, after 24 days [Hoechst Marion Roussel Ltd. 1998].
Bioavailability About 80%.
Half-life 7 to 8 days (after a single dose); average, 11.1 days (range, 3.7 to 28.4 days) (after multiple dosing for 14 days).
Volume of Distribution 0.13 L/kg (metabolite).
Clearance 0.031 L/h (metabolite).
Protein Binding 99.4%, mainly to albumin (metabolite).
Note For a review of leflunomide, see Prakash and Jarvis [1999].
Dose 100 mg once daily for the first 3 days and then a maintenance dose of 10 to 20 mg once daily.

Dias VC *et al.* (1995). Measurement of the active leflunomide metabolite (A77 1726) by reverse-phase high-performance liquid chromatography. *Ther Drug Monit* 17(1): 84–88.
Hoechst Marion Roussel Ltd. (1998). Data on file. Kansas City.
Prakash A, Jarvis B (1999). Leflunomide: a review of its use in active rheumatoid arthritis. *Drugs* 58: 1137–1164.

Lepirudin

Anticoagulant, Thrombolytic
$C_{287}H_{440}N_{80}O_{111}S_6 = 6979.4$
CAS—138068-37-8

IUPAC Name 1-L-Leucine-2-L-threonine-63-desulfohirudin (Hirudo medicinalis isoform HV1)
Synonyms HBW-0.23; recombinant hirudin.
Proprietary Name *Refludan*
Chemical Properties A white powder.
Disposition in the Body Lepirudin is rapidly distributed and essentially confined to extracellular fluids. Metabolism and excretion mainly take place in the

kidneys with little in the liver. Approximately 48% of an administered dose is detected in urine with 35% as the unchanged drug. Metabolic pathways are not fully established. It is thought that catabolic hydrolysis of the parent drug causes a release of amino acids. Plasma concentrations increase proportionally with the dose and there is no evidence of accumulation.

Therapeutic Concentration The maximum plasma concentration after a single IV dose is 0.6 to 1 mg/L.

Half-life 1.3 h.

Volume of Distribution 12.2 L (young and healthy); 18.7 L (healthy elderly); 18.0 L (renally impaired); 32.1 L (patients with heparin induced thrombocytopenia).

Clearance Mean, 164 mL/min (young and healthy); 139 mL/min (elderly and healthy); 61 mL/min (patients with renal impairment); 114 mL/min (patients with heparin induced thrombocytopenia). In female patients, systemic clearance is ~25% lower compared with male patients.

Protein Binding <10%.

Dose The initial dose administered is 0.4 mg/kg (maximum 44 mg) with a maintenance dose of 0.15 mg/kg/h (maximum 16.5 mg).

Letrozole

Antineoplastic

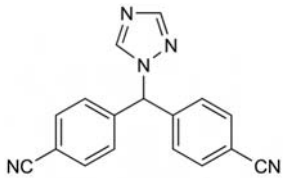
$C_{17}H_{11}N_5$ = 285.3

CAS—112809-51-5

IUPAC Name 4, 4′-(1*H*-1,2,4-Triazol-1-ylmethylene)bisbenzonitrile

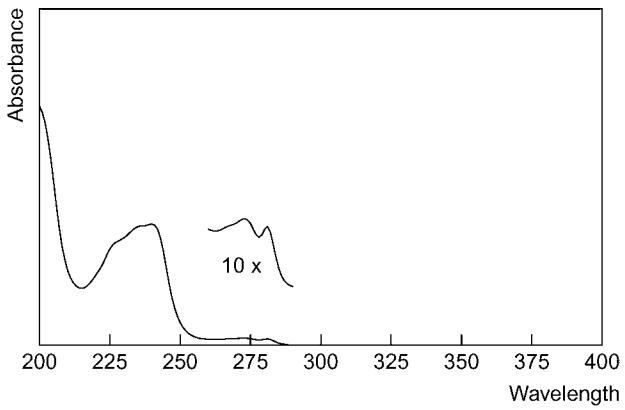
Synonym CGS-20267

Proprietary Names *Femar*; *Femara*.

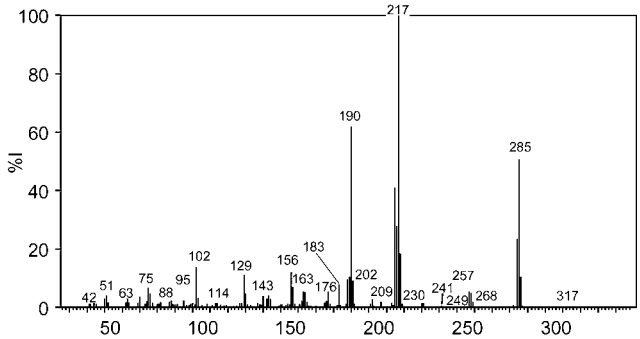


Chemical Properties A white to yellowish crystalline powder. Mp 181° to 183°, also reported as 184° to 185°. Freely soluble in dichloromethane; slightly soluble in ethanol; practically insoluble in water.

Ultraviolet Spectrum Aqueous acid—240, 273, 281 nm.



Mass Spectrum Principal ions at *m/z* 217, 190, 285, 215, 216, 284, 102, 218.



Quantification

Plasma **HPLC** UV detection (λ=234 nm). Limit of quantification, 8.9 nmol/L [Sioufi *et al.* 1997]. Column: ODS Hypersil C_{18} (200 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L phosphate buffer (pH 7) : acetonitrile (70:30), flow rate 1.5 mL/min. Internal standard (IS): CGP-47645. Fluorescence detection (λ_{ex}=230 nm, λ_{em}=295 nm). Retention time: letrozole, 11.3 min; metabolite 1 (CGP-44645), 13.3 min; IS, 16.7 min. Limit of quantification 0.4 µg/L [Marfil *et al.* 1996]. Column: RP-8 Lichrospher 100 (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 60 mmol/L phosphate buffer, (pH 7 39:6:55), flow rate 0.8 mL/min. IS: CGS-18320. UV detection (λ=234 nm). Retention time: letrozole, 8.9 min; IS, 10.7 min. Limit of quantification, 8 µg/L [Pfister *et al.* 1994].

Bioassay Limit of detection, 0.1 mg [Pfister *et al.* 1994].

Urine **HPLC** Fluorescence detection (λ_{ex}=230 nm, λ_{em}=295 nm). Limit of quantification 0.8 µg/L [Marfil *et al.* 1996]. See Plasma. Limit of quantification, 52 µg/L [Pfister *et al.* 1994].

Bioassay Limit of detection, 0.1 mg [Pfister *et al.* 1994].

Disposition in the Body Letrozole is rapidly and completely absorbed after oral administration, which can be affected by the presence of food. Peak concentrations tend to be larger when the drug is administered without food and these concentrations are reached in about half the time compared with individuals who are administered letrozole with food. It is rapidly and extensively distributed to cells. It is metabolised slowly in the liver to an inactive carbinol metabolite, 4,4′-methanol-bisbenzonitrile, which undergoes subsequent glucuronidation, and the conjugates are excreted by the renal route. Approximately 90% of the dose is excreted in urine; 75% as the glucuronide of the metabolite, 9% unidentified metabolites and 6% unchanged drug. Steady state plasma concentrations are reached within 2 to 6 weeks and remain constant over time without accumulation of the drug.

Therapeutic Concentration

Twelve healthy male volunteers, 28 to 44 years old, were fasted overnight and administered 2.5 mg letrozole with or without a standard high-fat breakfast. Those administered the drug in the fasting state were fasted for an additional hour after dosing. The peak plasma concentrations for the fasted volunteers were 129 (range, 94 to 164) nmol/L observed at 0.5 to 1.5 h and for the fed volunteers, 98.7 (74.5 to 146.0) nmol/L at 0.5 to 3.5 h [Sioufi *et al.* 1997].

Twelve healthy, post-menopausal women and 22 patients with breast cancer were administered 2.5 mg letrozole. Peak concentrations reached 115 nmol/L at ~1.0 h. The trough steady state concentration observed was ~400 nmol/L [Lamb, Adkins 1998].

Bioavailability 99.9%.

Half-life Approximately 2 days.

Volume of Distribution 1.9 L/kg.

Clearance Body clearance, 2.21 L/h.

Distribution in Blood The concentration of letrozole in erythrocytes is ~80% of that found in plasma.

Protein Binding 60% (mainly albumin).

Note For a review of letrozole, see Lamb and Adkins [1998]. For a general review of aromatase inhibitors, see Njar and Brodie [1999].

Dose 2.5 mg daily until tumour progression is evident.

Sioufi A *et al.* (1997). Comparative bioavailability of letrozole under fed and fasting conditions in 12 healthy subjects after a 2.5 mg single oral administration. *Biopharm Drug Dispos* 18(6): 489–497.

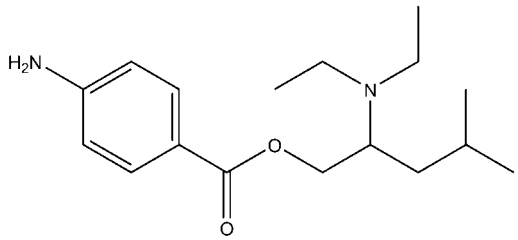
Leucinocaine

Anaesthetic (Local)

$C_{17}H_{28}N_2O_2$ = 292.4

IUPAC Name (2-Diethylamino-4-methylpentyl) 4-aminobenzoate

Synonym 2-Diethylamino-5-methylpentyl *p*-aminobenzoate



Chemical Properties Leucinocaine is extracted by organic solvents from aqueous alkaline solutions.

Leucinocaine Mesylate

$C_{17}H_{28}N_2O_2,CH_3SO_3H$ = 388.5

CAS—135-44-4

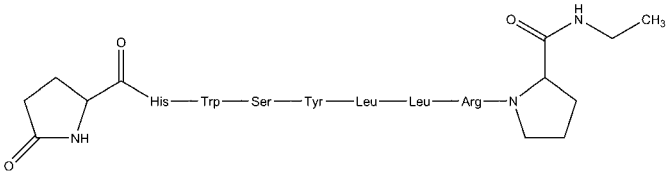
Synonyms *p*-Aminobenzoic acid β-diethylaminoisohexyl ester methanesulfonate; *p*-aminobenzoic acid *N,N*-diethylleucinol ester; *p*-aminobenzoyl-*N*-1-diethylamino-1-isobutylethanol methanesulfonate; 2-(diethylamino)-4-methyl-1-pentanol 4-aminobenzoate (ester) monomethanesulfonate (salt); 2-diethylamino-4-methylpentyl *p*-aminobenzoate methanesulfonate; methanesulfonate; 2-methyl-4-diethylaminopentan-5-ol *p*-aminobenzoate.
Proprietary Name *Panthesin*. It is an ingredient of *Hypacom*.
Chemical Properties Powder. Mp 157° to 159°. Soluble 1 in 3 of water; soluble in ethanol.

Colour Tests *p*-Dimethylaminobenzaldehde test—yellow; Vitali's test—yellow/bright yellow (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.62 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—279 nm with infexions at 273 and 290 nm.

Leuprorelin

Antineoplastic (Hormonal), Gonadorelin Analogue, LH-RH Agonist
$C_{59}H_{84}N_{16}O_{12}$ = 1209.4
CAS—53714-56-0

IUPAC Name *N*-[1-[[1-[[1-[[1-[[1-[[1-[[5-(Diaminomethylideneamino)-1-[2-(ethylcarbamoyl)pyrrolidin-1-yl]-1-oxopentan-2-yl]amino]-4-methyl-1-oxopentan-2-yl]amino]-4-methyl-1-oxopentan-2-yl]amino]-3-(4-hydroxyphenyl)-1-oxopropan-2-yl]amino]-3-hydroxy-1-oxopropan-2-yl]amino]-3-(1*H*-indol-3-yl)-1-oxopropan-2-yl]amino]-3-(1*H*-imidazol-5-yl)-1- oxopropan-2-yl]-5-oxopyrrolidine-2-carboxamide
Synonyms (D-Leu6)-des-Gly10-LH–RH-ethylamide; 6-DL-leucine-9-(*N*-ethyl-L-prolinamide)-10-deglycinamide luteinizing hormone-releasing factor (pig); leuprolide; 5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-D-leucyl-L-leucyl-L-arginyl-*N*-ethyl-L-prolinamide.



Chemical Properties A white or almost white hygroscopic powder. Store in airtight containers at a temperature not exceeding 30°. Protect from light.

Leuprorelin Acetate

$C_{59}H_{84}N_{16}O_{12}.C_2H_4O_2$ = 1269.5
CAS—74381-53-6
Synonyms Abbott-43818; leuprolide acetate; TAP-144.
Proprietary Names *Carcinil*; *Daronda*; *Depo-Eligard*; *Eligard*; *Enantone*; *Lectrum*; *Leuplin*; *Lorelin*; *Lucrin*; *Luprolex*; *Lupron*; *Procren*; *Prostap*; *Reliser*; *Trenantone*; *Viadur*.

Quantification

Serum **HPLC** Column: ODS (150 × 4.6 mm i.d.). Mobile phase: acetonitrile–water (10 : 90) with 0.1% trifluoroacetic acid : acetonitrile–water (40 : 60) with 0.1% trifluoroacetic acid (100 : 0 to 60 : 40 over 4 min to 40 : 60 over 20 min to 0 : 100 over 0.1 min for 3.9 min), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: leuprorelin 23.0 min, M1 15.3 min, M2 21.0 min, M3 8.9 min, M4 1.8 min. Limit of detection, 0.05 µg/L for leuprorelin and M1 [Ueno, Matsuo 1991].
Urine **HPLC** See Serum [Ueno, Matsuo 1991].
Disposition in the Body Leuprorelin has poor membrane permeability and undergoes significant deactivation by intestinal proteolytic enzymes. Therefore, it is not active when given orally but is well absorbed on SC or IM injection. Metabolism and excretion of leuprorelin have not been extensively studied in humans, although the pentapeptide 5–9 has been detected in serum and urine and is thought to be the major metabolite, formed by peptidase cleavage of the Ser^4–Tyr^5 bond. Other metabolites detected in animal studies include the tripeptides 1–3 and 5–7, and dipeptide 1–2.
Therapeutic Concentration

A group of 23 healthy male volunteers was administered 3 different formulations of leuprorelin acetate given as aerosol sprays. Formulation A consisted of a solution containing 0.5 mg leuprorelin acetate together with a number of solvents and excipients; formulations B and C were suspensions of 0.5 mg and 1.0 mg leuprorelin acetate, respectively, in 0.5% sorbitan triolate. Mean peak plasma concentrations of leuprorelin acetate for the three formulations and the IV control were reported as:

Formulation	*Dose (mg)*	*C_{max} (µg/L)*	*Time (h)*
A	1	0.970	2.3
B	1	4.380	1.6
C	2	11.37	1.1
IV control	1	133.2	N/A

The absolute bioavailabilities of the three aerosol formulations A, B and C were calculated as 4.3, 18.3 and 14.3%, respectively. The extent of pulmonary absorption of leuprorelin acetate was approx. 50% (range 43 to 55%) [Adjei, Garren 1990].

A group of 117 patients diagnosed with prostate cancer were administered a SC depot dose of 7.5 mg of leuprorelin acetate at monthly (28-day) intervals for 6 months. The mean peak serum leuprorelin acetate concentration was 26.3 µg/L reached after 4.7 h. Serum leuprorelin acetate was detectable for a mean of 37 days (range 28 to 49 days) [Perez-Marreno *et al.* 2002].

A group of 26 patients diagnosed with prostate cancer were administered a SC depot dose of 45 mg leuprorelin acetate at 6-monthly intervals (at day 1 and day 168). Mean peak serum concentrations of leuprorelin acetate were 82.0 µg/L at 4.4 h after the first injection and 102.4 µg/L at 4.8 h after the second. Serum leuprorelin acetate decreased slowly from day 3 to day 168 (plateau phase). During the plateau phase, mean serum leuprorelin acetate generally remained between 0.2 and 2.0 µg/L [Crawford *et al.* 2006].

Bioavailability Less than 1%.
Half-life After parenteral administration, approx. 3 h.
Volume of Distribution Approximately 27.4 to 37.1 L.
Clearance Approximately 9.1 L/h.
Note For a review of the pharmacokinetics of depot leuprorelin, see Periti *et al.* [2002].
Dose In the management of advanced prostate cancer, leuprorelin acetate may be given by SC injection in a usual single daily dose of 1 mg. It is also given SC or IM as depot preparations (3.75 mg once a month, by SC or IM injection, or 11.25 mg SC every 3 months). A depot preparation of 45 mg given SC once every 6 months is also used in the USA. For the management of endometriosis and uterine fibroids, leuprorelin acetate 3.75 mg monthly may be given as a single depot injection, IM or SC. Alternatively, 11.25 mg may be given as an IM depot every 3 months. In the management of central precocious puberty leuprorelin acetate has been given by IM depot injection in a dose of 300 µg/kg every 4 weeks, adjusted according to response. Doses of 50 µg/kg daily by SC injection, adjusted according to response, have also been used.

Leuprorelin acetate has also been given in other sex-hormone-related disorders and has been tried in some gastrointestinal disorders such as irritable bowel syndrome.

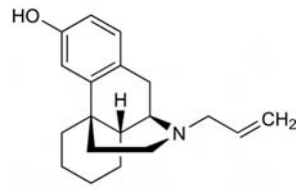
Levallorphan

Narcotic Antagonist
$C_{19}H_{25}NO$ = 283.4
CAS—152-02-3
IUPAC Name 17-(2-Propenyl)morphinan-3-ol



Chemical Properties White crystals. Mp 180° to 182°. pK_a 4.5, 6.9. Log *P* (octanol/buffer pH 7.4), 2.3.

Levallorphan Tartrate

$C_{19}H_{25}NO.C_4H_6O_6$ = 433.5
CAS—71-82-9
Proprietary Names *Lorfan*. It is an ingredient of *Pethilorfan*.
Chemical Properties A white crystalline powder. Mp 174° to 177°. Soluble 1 in about 20 of water, 1 in 100 of ethanol, 1 in 3300 of chloroform, 1 in 5000 of ether and 1 in 13 of methanol.

Colour Tests Aromaticity (method 2)—yellow/orange; Liebermann's reagent—black.

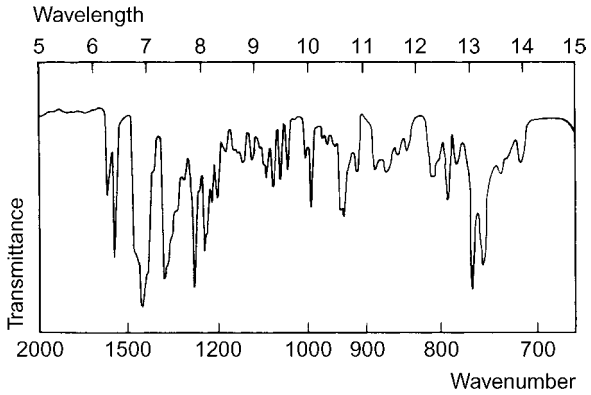
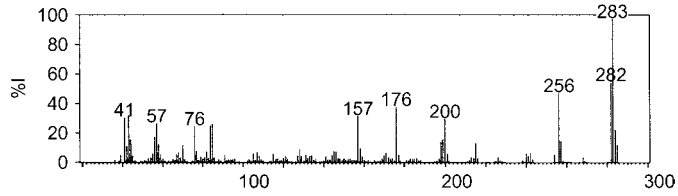
Infrared Spectrum Principal peaks at wavenumbers 759, 1271, 747, 1575, 1242, 932 cm^{-1} (Nujol mull).



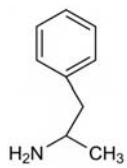
Mass Spectrum Principal ions at *m/z* 283, 282, 256, 176, 157, 43, 41, 57.



Disposition in the Body Levallorphan is effective within 1 min of IV injection and the effects may last up to 4 h. It is metabolised by *N*-dealkylation and glucuronic acid conjugation.
Toxicity The estimated minimum lethal dose is 0.2 g or 2 g for an addict.
Dose 0.5 to 1 mg of levallorphan tartrate intravenously, repeated if necessary.

Levamfetamine

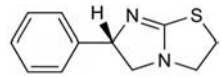
Anorectic, CNS Stimulant
$C_9H_{13}N$ = 135.2
CAS—156-34-3
IUPAC Name (−)-α-Methylbenzeneethanamine
Synonyms (−)-Amfetamine; laevo-amfetamine; levamphetamine.



Chemical Properties pK_a 10.1 (20°). Log *P* (octanol/water), 1.8.
Note For analytical data see under Amfetamine.

Levamisole

Anthelmintic
$C_{11}H_{12}N_2S$ = 204.3
CAS—14769-73-4
IUPAC Name (6*S*)-2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole
Synonym l-Tetramisole
Proprietary Names *Anthelpor* (vet.); *Levadin* (vet.).

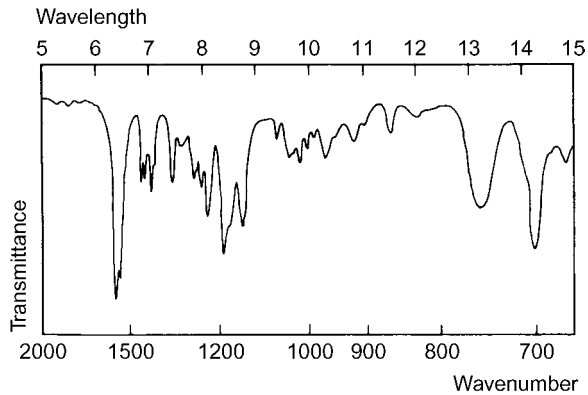


Chemical Properties A white crystalline powder. Mp 60° to 61.5°. Soluble in dilute acetic acid and in chloroform. pK_a 8.0. Log *P* (octanol/water), 1.8.

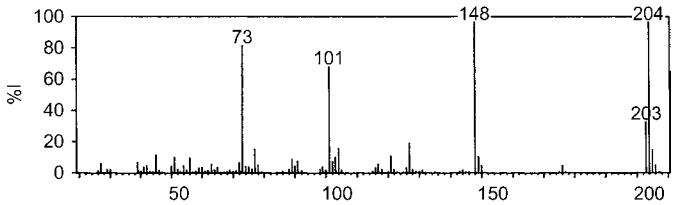
Levamisole Hydrochloride

$C_{11}H_{12}N_2S,HCl$ = 240.8
CAS—16595-80-5
Proprietary Names *Armadose* (vet.); *Ascaridil*; *Chanaverm* (vet.); *Decaris*; *Decazole* (vet.); *Ergamisol*; *Ketrax*; *Levacide* (vet.); *Levacur* (vet.); *Levasole* (vet.); *Nemicide* (vet.); *Nilverm* (vet.); *Ripercol* (vet.); *Solaskil*; *Spartakon* (vet.); *Sure* (vet.); *Tramisole* (vet.); *Vermisole* (vet.); *Wormaway* (vet.).
Chemical Properties A white to pale cream-coloured crystalline powder. Mp 227° to 229°. Soluble 1 in 2 of water and 1 in 5 of methanol; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—orange→grey-green.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.18; system TC—R_f 0.48; system TE—R_f 0.65; system TL—R_f 0.42; system TAE—R_f 0.53; system TAF—R_f 0.52 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1928.
High Performance Liquid Chromatography System HY—RI 238; system HAA—retention time 7.0 min.
Infrared Spectrum Principal peaks at wavenumbers 1587, 1575, 1197, 699, 1150, 1248 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 204, 148, 73, 101, 203, 127, 104, 205.



Quantification
Plasma **GC** FID. Limit of detection, 2 µg/L [Kouassi *et al.* 1986]. AFID. Limit of detection, 4 µg/L [Rousseau *et al.* 1981].
HPLC UV detection. Limit of detection, 21 µg/L [Vandamme *et al.* 1995].
Urine **GC** FID. For method, see Kouassi *et al.* [1986].
HPLC UV detection. Limit of detection, 0.5 mg/L for *p*-hydroxylevamisole [Kouassi *et al.* 1986].
Other UV detection (in sheep or cattle plasma). Limit of detection 20 µg/L, UV detection [Marriner *et al.* 1980].
Disposition in the Body Levamisole is readily absorbed after oral administration, but extensively metabolised. It is almost completely excreted in the urine and faeces within 48 h.
Therapeutic Concentration
Following single oral doses of 2.5 mg/kg and 5 mg/kg to 11 subjects, mean peak plasma concentrations of 0.7 and 1.5 mg/L, respectively, were attained within 2 h [Luyckx *et al.* 1982].
Half-life Plasma half-life, about 4 h.
Dose The equivalent of 2.5 to 5 mg/kg of levamisole daily, for 2 or 3 days.

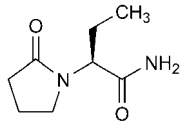
Levetiracetam

Antiepileptic
$C_8H_{14}N_2O_2 = 170.2$
CAS—102767-28-2

IUPAC Name (2*R*)-2-(2-Oxopyrrolidin-1-yl)butanamide
Synonyms (α*S*)-α-Ethyl-2-oxo-1-pyrrolidineacetamide; (*S*)-α-Ethyl-2-oxo-1-pyrrolidine acetamide; SIB-S1; UCB-L059.
Proprietary Name *Keppra*



Chemical Properties White to off-white crystalline powder with a faint odour and bitter taste. Crystals from ethyl acetate. Mp 117°. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005]. It is very soluble in water (104 g/100 mL); freely soluble in chloroform (65.3 g/100 mL) and methanol (53.6 g/100 mL); soluble in ethanol (16.5 g/100 mL); sparingly soluble in acetonitrile (5.7 g/100 mL); practically insoluble in *n*-hexane. Stable in plasma in the autosampler at 25° for 24 h, after 5 freeze–thaw cycles and for 30 days when kept frozen at –80° [Matar 2008]. Stock solutions were stable at room temperature for 24 h and at 2 to 8° for 17 days. Leviracetam in control human plasma was stable at room temperature for at least 6 h. Leviracetam was stable for at least 3 freeze-thaw cycles. Leviracetam-spiked plasma samples stored at –70° were stable for 66 days [Jain *et al.* 2006].

Gas Chromatography System GB—RI 1629.

Column: (analytical) DB-FFAP megabore (30 m × 0.53 mm i.d., 1 µm). Carrier gas: He, 30 mL/min. Temperature programme: 70° to 190° at 40°/min to 250° at 5°/min for 2 min. IS: UCB -G025. NPD. Retention time: levetiracetam, 14.0 min; IS, 11.5 min [Vermeij, Edelbroek 1994].

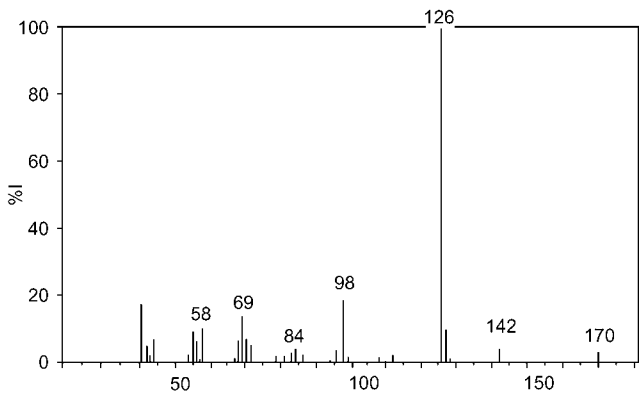
Gas Chromatography-Mass Spectrometry Column: 6-TBDMS-2,3-perme-β-cyclodextrin (20% w/w) in SE52 fused-silica capillary (10 m × 0.25 mm i.d., 0.5 µm). Carrier gas: He, 40 cm/s. Temperature programme: 110° for 2 min to 170° at 10°/min for 5 min. IS: *N*-dimethylvalproyl glycinamide. SIM acquisition mode (*m/z*: 69, 98, 126 for levetiracetam; *m/z*: 129, 157, 186 for IS). Retention time: (*S*)-levetiracetam, 8.6 min; (*R*)-levetiracetam, 8.8 min; IS, 10.3 min. [Isoherranen *et al.* 2000].

High Performance Liquid Chromatography Column: LiChrospher, 60 RP-select B (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 5.6; 15 : 85), flow rate 0.8 mL/min. IS: UCB-17025. UV detection (λ = 220 nm). Retention time: levetiracetam, 5.4 min; IS, 6.8 min [Ratnaraj *et al.* 1996].

Column: Spherisorb, RP 3ODS2 (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water (6 : 94 to 20 : 80 in 5 min to 40 : 60 in 1 min for 10 min to 6 : 94 in 1 min), flow rate 1.0 mL/min. IS: UCB-G025. DAD (λ = 205 nm). Retention time: levetiracetam 6.4 min; IS 7.8 min [Vermeij, Edelbroek 1994].

Capillary Electrophoresis Column: uncoated fused silica (total/effective length 50/41 cm, 50 µm i.d.). Rinse: 1.0 mol/L sodium hydroxide for 10 min, 0.1 mol/L sodium hydroxide for 10 min, distilled water for 10 min and background electrolyte (BGE) for 10 min. Microemulsions: with 1-propanol and 1-butanol as cosurfactants: 10 mmol/L aqueous borate buffer (pH 9.2) : *n*-octane : SDS : alcohol (93.76 : 0.48 : 1.80 : 3.96); with 1-pentanol as cosurfactant: aqueous borate buffer: *n*-octane : SDS : alcohol (96.41 : 0.50 : 2.07 : 1.02); with 1-hexanol as cosurfactant : aqueous borate buffer : *n*-octane : SDS : alcohol (96.87 : 0.51 : 2.10 : 0.52). Limit of quantification, ≈10 ppm [Ivanova *et al.* 2003].

Mass Spectrum Principal ions at *m/z* 126, 98, 41, 69, 58, 55, 127, 44.



Quantification

Plasma **GC** Column: HP-FFAP fused silica capillary (25 m × 0.32 mm i.d.). NPD. Limit of quantification, 4.0 mg/L, limit of detection, 0.5 mg/L [Fay *et al.* 2005]. Column: fused silica capillary FFAP (15 m × 0.32 mm i.d.). Carrier gas: 20 mL/min. Temperature: 230°. NPD. Retention time: 7 min. Limit of quantification, 0.5 mg/L [Perucca *et al.* 2003].

GC-MS Column: 6-TBDMS-2,3-perme-β-cyclodextrin (10%) in SE52 (10 m × 0.25 mm i.d., 0.5 µm). Carrier gas: He, 40 cm/s. Temperature programme: 110° for 2 min to 170° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 2.35 pg/L, limit of detection, 0.94 pg/L [Isoherranen *et al.* 2000].

HPLC Column: Synergi Hydro-RP (150 × 4.6 mm, 4 µm). Mobile phase: 50 mmol/L potassium dihydrogen phosphate buffer (pH 4.5) : acetonitrile (94 : 6), flow rate 1.5 mL/min. UV detection (λ = 205 nm). Retention time: 7.2 min. Limit of quantification, 2.0 mg/L, limit of detection, 1.0 mg/L [Contin *et al.* 2008]. Column: XTerra MS C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium buffer (pH 10; 30 : 70), flow rate 0.8 mL/min. DAD (λ = 200 nm). Retention time: 6 min. Limit of quantification, 0.5 mg/L [Lancelin *et al.* 2007]. Column: Luna phenyl hexyl (150 × 2.0 mm i.d., 5 µm). Mobile phase: water : dibutylammonium phosphate : methanol (100 : 1 vial : 100), flow rate 0.5 mL/min. UV detection (λ = 220 nm). Retention time: 1.33 min. Limit of quantification, 5 mg/L [Juenke *et al.* 2006]. Column: ResElut reversed phase C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 3 mmol/L phosphate buffer containing 0.5 mL triethylamine (6 : 5 : 89), flow rate 1.0 mL/min. DAD (λ = 205 nm). Retention time: 7.3 min. Limit of quantification, 500 µg/L, limit of detection, 150 µg/L [Pucci *et al.* 2004]. Column: LiChrospher 60 RP-select B (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 5.6; 15 : 85), flow rate 0.8 mL/min. UV detection (λ = 220 nm). Retention time: 5.4 min. Limit of quantification, 5 µmol/L, limit of detection, 1 µmol/L [Ratnaraj *et al.* 1996].

LC-MS Column: Symmetry C_{18} (50 × 3.9 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (97 : 0.3 : 0.25), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 1.0 mg/L [Matar 2008]. Column: Supelco LC-18-DB (3.3 cm × 3.0 mm i.d., 3 µm). Mobile phase: 15 mmol/L ammonium acetate-methanol (98 : 2) : 16 mmol/L ammonium acetate-methanol (3 : 97) both containing 0.1% acetic acid (100 : 0 for 2.5 min to 0 : 100 at 2.51 min for 2.5 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 2.9 min. Limit of detection, 0.1 mg/L [Guo *et al.* 2007]. Column: Alltech C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 2 mmol/L ammonium acetate : acetonitrile : 0.1% formic acid (60 : 30 : 30). Limit of detection, 0.1 mg/L [Zhao *et al.* 2007]. Column: Betasil C_{18} (100 × 3.0 mm i.d., 3 µm). Mobile phase: buffer (pH 3.2) : acetonitrile (20 : 80), flow rate 500 µL/min. TIS, positive ion mode, SRM acquisition mode. Retention time: 0.87 min. Limit of quantification, 0.5 mg/L [Jain *et al.* 2006].

CE Capillary: fused silica (total/effective length 32/23.6 cm, 50 um i.d.). Running buffer: 100 mmol/L phosphate buffer (pH 8.0). UV detection (λ = 215 nm). Retention time: <8 min [Mertzman, Foley 2004]. Capillary: uncoated fused silica (total/effective length 50/41 cm, 50 µm i.d., 360 µm o.d.). Running buffer: 30 mmol/L borate buffer (pH 9.2) with 50 mmol/L SDS. UV detection (λ = 214 nm). Limit of quantification, ≈10 ppm [Ivanova *et al.* 2003].

Serum **GC** Column: DB-FFAP (30 m × 0.53 mm i.d., 1 µm). Carrier gas: He, 30 mL/min. Temperature programme: 70° to 190° at 40°/min to 250° at 5°/min for 2 min. NPD. Retention time: 14 min. Limit of quantification, 0.29 mg/L [Vermeij, Edelbroek 1994].

HPLC Column: Thermo Hypercarb (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.423% hydrogen phosphate : acetonitrile (95 : 5 to 70 : 30 at 8 min to 0 : 100 for 4 min), flow rate 1 mL/min. UV detection (λ = 205 nm). Retention time: 6.8 min. Limit of detection, 0.1 mg/L [Martens-Lobenhoffer, Bode-Böger 2005]. See Plasma [Ratnaraj *et al.* 1996]. Column: Spherisorb 3ODS2 (15 × 0.46 cm i.d.). Mobile phase: acetonitrile : water (6 : 94 to 20 : 80 at 5 min to 40 : 60 at 6 min for 4 min to 6 : 94 at 11 min for 4 min. DAD (λ = 205 nm). Retention time: 6.4 min. Limit of quantification, 0.36 mg/L [Vermeij, Edelbroek 1994].

LC-MS See Plasma [Guo *et al.* 2007].

CE Column: untreated capillary (35 cm × 50 µm). Running buffer: 140 mmol/L boric acid (pH 8.9) containing 40 g (13.8 mmol/L) SDS and 250 mL methanol/L. UV detection (λ = 214 nm). Retention time: 6.5 min. Limit of detection, ≈3 mg/L [Shihabi *et al.* 2003].

Urine **GC-MS** See Plasma. Limit of quantification 15 pg/L [Isoherranen *et al.* 2000].

Oral Fluid **LC-MS** See Plasma [Guo *et al.* 2007].

Disposition in the Body Levetiracetam is rapidly and almost completely absorbed after oral administration. The extent of absorption is not affected by food [Fay *et al.* 2005] but peak plasma concentrations may be reduced by ≈20%, and time to reach these concentrations may be prolonged by ≈1.5 h. Peak plasma concentrations are reached, generally, within 1 h and steady state achieved after two days of multiple twice-daily dosing. The major metabolic pathway is enzymatic hydrolysis, which is not extensive and occurs in several tissues (including blood cells). A carboxylic acid metabolite, ucb LO57, is produced. Two other minor metabolites have been detected; they are products of hydroxylation. Levitaracetam is not metabolised by the hepatic CYP450 system and thus avoids interactions with other antiepileptic drugs. The drug and its metabolites are excreted renally, with 66% of a dose excreted unchanged in urine, whereas 27% as an inactive hydrolysis product (on the acetamido group) [Neels *et al.* 2004; Radtke 2001].

Therapeutic Concentration In serum, 10–37 mg/L [Neels *et al.* 2004].

Sixty-nine patients (39 males and 30 females) aged 18–78 years were treated with 500–3000 mg/day levetiracetam associated with one or more

antiepileptic drug. In patients treated with 500, 1000, 1500, 2000 and 3000 mg/day the mean ± SD concentrations were 3.1 ± 0.9, 6.5 ± 2.4, 10.7 ± 5.1, 12.4 ± 4.5, and 16.8 ± 5.9 mg/L, respectively [Lancelin *et al.* 2007].

Twenty-six healthy male Chinese subjects were administered 500 or 1500 mg levetiracetam as a single dose. Mean maximum plasma concentrations were 13.6 ± 3.2 and 47.1 ± 12.1 mg/L at 0.5 h for each dose, respectively [Zhao *et al.* 2007].

Seventeen healthy subjects were administered a single 1500-mg dose of levetiracetam as a 15-min IV infusion or as an oral dose. The mean maximum plasma concentration following the IV infusion was 50.5 mg/L compared with 47.7 mg/L after the oral dose [Ramael *et al.* 2006].

Following a twice daily dose of 1 mg/kg levetiracetam to 590 epilepsy patients concentrations were 2.1 and 0.8 mg/L at 1 and 12 h, respectively [Perucca *et al.* 2003].

Seven male patients with intractable epilepsy, mean age 41 years (range, 24 to 71 years) and having epilepsy for 2 days to 19 years (mean, 9.7 years) with 1 or more seizures a week participated in the study. Patients were administered with ascending doses of levetiracetam between 0.5 and 2.0 g daily; increased by 0.5 g every 4 weeks according to its tolerability and safety as determined by an initial trial period. The doses administered varied between 5.4 mg/kg and 32.2 mg/kg (mean, 15.96 mg/kg) and these produced peak plasma concentrations of 6.29 and 38.17 mg/L (mean, 22.25 mg/L) [Sharief *et al.* 1996].

Toxicity Overdose causes sedation and coma as well as respiratory depression. A 12-year-old female with idiopathic partial epilepsy developed acute psychosis 10 days after the administration of leviracetam. The psychotic behaviour resolved soon after discontinuation of the drug [Youroukos *et al.* 2003]. Four other cases in children have been reported by Kossoff *et al.* [2001] whereas a psychotic episode following levitacetam consumption in a 30-year-old female has been reported [Bayerlein *et al.* 2004].

A 38-year-old female was admitted into hospital 6 h after ingesting 60 tablets of 500 mg levetiracetam. Her serum concentrations were 400, 72, 60 mg/L at 6, 18, and 20.5 h, respectively. No other drugs were detected and she recovered the next day without sequelae [Barrueto, Jr. *et al.* 2002].

Note For 2 cases of overdose in children, see Awaad [2007].

Bioavailability Oral, almost 100% [Franco Spinola *et al.* 2008].

Half-life 6–8 h; increased in the elderly [Patsalos 2000] and in subjects with renal impairment.

Volume of Distribution 0.5–0.7 L/kg [Neels *et al.* 2004; Radtke 2001].

Clearance Total body, 0.96 mL/min/kg; reduced in the elderly and those with renal impairment – 40% in patients with mild impairment, 50% moderate impairment and 60% for those with severe impairment; increased in paediatric patients by ≈40%.

Protein Binding <10% [Grim *et al.* 2003; Neels *et al.* 2004; Radtke 2001].

Note For a review of the pharmacokinetic profile of levetiracetam, see Patsalos [2000] and for a safety profile of levetiracetam, see Harden [2001].

Dose The usual dose is 500 mg twice daily which may be increased in increments of 1 g daily every 2 weeks; maximum 3 g daily. The dose may be adjusted for patients with renal impairment.

Levobunolol

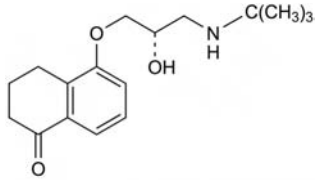
β-*Blocker*

$C_{17}H_{25}NO_3$ = 291.4

CAS—47141-42-4

IUPAC Name 5-[(2*S*)-3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydro-1(2*H*)-naphthalenone

Synonyms *l*-Bunolol; W-6421A.



Chemical Properties pK_a 9.4. Log *P* (octanol/water), 2.40.

Levobunolol Hydrochloride

$C_{17}H_{25}NO_3$,HCl = 327.9

CAS—27912-14-7

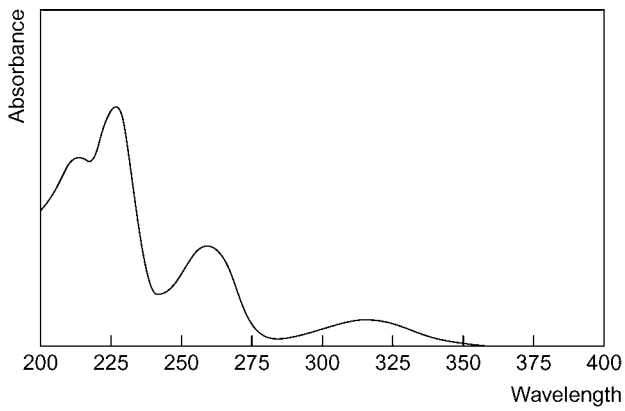
Synonyms (−)-Bunolol hydrochloride; *l*-bunolol hydrochloride; W-7000A;

Proprietary Names *Betagan*; *Gotensian*; *Vistagan*.

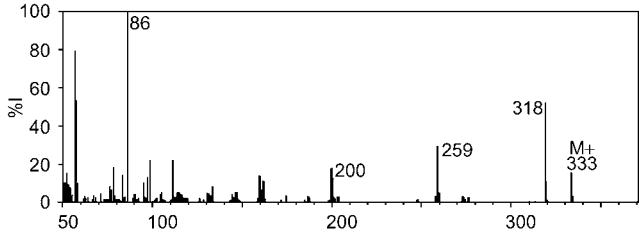
Chemical Properties A white or pinkish-white, odourless crystalline powder. Mp 209° to 211°. Soluble to freely soluble in water; slightly to sparingly soluble in alcohol; soluble in methyl alcohol; slightly soluble in chloroform.

Gas Chromatography Mass Spectrometry. Column: HP capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 0.33 μm). Temperature programme: 100° to 310° at 30°/min. Carrier gas: He, 2 mL/min. Retention index: 2460 [Maurer, Pfleger 1986].

Ultraviolet Spectrum Aqueous acid—223, 209, 256, 313 nm.



Mass Spectrum Principal ions at *m/z* 86, 57, 318, 259, 99, 112, 200, 333 (levobunolol acetylated derivative).



Quantification

Blood **HPLC** Column: μBondapak C_{18} (250 × 4.6 mm i.d., 10 μm). Mobile phase: methanol : water (48:52), flow rate 2 mL/min. Internal standard (IS): metoprolol. Fluorescence detection (λ_{ex}=225 nm, λ_{em}=295 nm). Retention time: dihydrolevobunolol, 3.8 min; IS, 4.6 min. Limit of detection, 0.5 to 1 μg/L [Hengy *et al.* 1985].

Urine **HPLC** See Blood [Hengy *et al.* 1985].

Disposition in the Body Some systemic absorption occurs following topical application, but after oral administration levobunolol is rapidly and almost completely absorbed from the gastrointestinal tract. It is extensively metabolised in the liver and the principal metabolite is dihydrolevobunolol, which possesses β-blocking activity, ~65% of that of the parent drug. Other metabolites include bunolol glucuronide, bunolol sulfate and dihydrobunolol glucuronide. Levobunolol and its metabolites are subsequently glucuronidated. Metabolites and some of the unchanged drug are excreted in urine (78%) and in faeces (3%), in 4 days. The metabolism of levobunolol following ophthalmic application has not been clearly determined. Peak levels of the drug and metabolite are reached within 1 h and the duration of action is 12 to 14 h. Distribution has not been determined.

Therapeutic Concentration

After oral administration to 6 healthy volunteers, the peak plasma concentration reached was 22.9 μg/L after ~3 h [Kolle *et al.* 1983].

Toxicity Respiratory and cardiac reactions have been reported, rarely resulting in death caused by bronchospasm or associated with cardiac failure. No data available on human overdose.

Bioavailability 75%.

Half-life Mean (levobunolol) 6.1 h; (metabolite, dihydrolevobunolol) between 5.7 and 7.1 h.

Volume of Distribution 5.5 L/kg.

Clearance Total plasma clearance, 0.66 L/h/kg.

Dose Eye drops applied once or twice daily.

Hengy H *et al.* (1985). Determination of levobunolol and dihydrolevobunolol in blood and urine by high-performance liquid chromatography using fluorescence detection. *J Chromatogr* 338: 444–449.

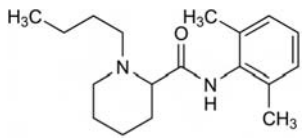
Levobupivacaine

Anaesthetic

$C_{18}H_{28}N_2O$ = 288.4

CAS—27262-47-1

IUPAC Name (*S*)-1-Butyl-*N*-(2,6-dimethylphenyl)-2-piperidinecarboxamide



Chemical Properties Crystals from isopropanol. Mp 135° to 137°. pKa 8.09. Log *P* (oleyl alcohol/water), 1624.

Levobupivacaine Hydrochloride

$C_{18}H_{28}N_2O$,HCl = 324.9

CAS—27262-48-2

Proprietary Name *Chirocaine*

Chemical Properties Mp 255° to 257°. Solubility in water (20°): 100 mg/mL.

Quantification

Plasma **HPLC** UV detection (λ=210 nm). Limit of quantification, 0.3 mg/L [Bardsley *et al.* 1998].

Disposition in the Body Levobupivacaine is extensively metabolised (NADPH dependent) in the liver, by the cytochrome P450 system. The major metabolite is 3-hydroxylevobupivacaine, which may be subsequently converted to glucuronic acid and sulfate ester conjugates. Approximately 70% of a dose is excreted in urine as its metabolites and a little in faeces. No parent drug has been detected in urine or faeces. Approximately 95% of a dose is recovered within 48 h of dosing. Levobupivacaine crosses the placenta.

Therapeutic Concentration

Fourteen healthy male volunteers, aged 19 to 40 years (mean 29.5 years) were fasted overnight and IV administered a maximum of 150 mg at an infusion rate of 10 mg/min for 2 to 15 min. The mean dose administered was 56.1 mg which produced a mean maximum plasma concentration of 2.62 mg/L shortly after the end of infusion. At 5 and 10 min after infusion, the mean maximum concentration was 1.93 mg/L before decreasing to a range of 0.3 to 0.6 mg/L, 45 to 120 min after infusion [Bardsley *et al.* 1998].

Ten patients, aged 18 to 80 years, were scheduled to undergo elective lower abdominal surgery, with epidural anaesthesia. They were premedicated with midazolam and 1% lidocaine, and subsequently administered an epidural injection of 0.75% concentration (total dose 150 mg) levobupivacaine. The peak plasma concentration was 0.84 mg/L at 0.04 h. The concentration of the (*S*)-isomer was larger than that observed for the (*R*)-isomer [Kopacz *et al.* 2000].

Eighteen patients scheduled for varicose vein surgery, under extradural anaesthesia, were administered 15 mL 0.5% levobupivacaine (total dose of 75 mg) and 0.75% (total dose 112.5 mg) as an epidural injection. The peak plasma concentrations for the two doses were 0.58 and 0.81 mg/L observed at 0.37 and 0.29 h, respectively [Faccenda *et al.* 1998].

Toxicity IV administration of levobupivacaine can be associated with cardiac arrest.

Half-life 1.3 h.

Volume of Distribution 66.9 L.

Clearance Plasma, 39.1 L/h.

Protein Binding >97%.

Dose For surgical anaesthesia, the maximum dose is 150 mg depending on the type of surgery undertaken. For acute pain, 15 to 25 mg (as a 2.5 mg/mL solution).

Bardsley H *et al.* (1998). A comparison of the cardiovascular effects of levobupivacaine and racbupivacaine following intravenous administration to healthy volunteers. *Br J Clin Pharmacol* 46 (3): 245–249.

Levocabastine

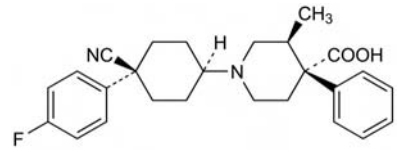
Antihistamine (Topical)

$C_{26}H_{29}FN_2O_2$ = 420.5

CAS—79516-68-0

IUPAC Name [3*S*-[1(*cis*),3α,4β]]-1-[4-Cyano-4-(4-fluorophenyl)cyclohexyl]-3-methyl-4-phenyl-4-piperidinecaboxylic acid

Synonym (−)-Cabastine



Cabastine (racemate of Levocabastine)

CAS—79449-98-2

Levocabastine Hydrochloride

$C_{26}H_{29}FN_2O_2$,HCl = 457.0

CAS—79547-78-7

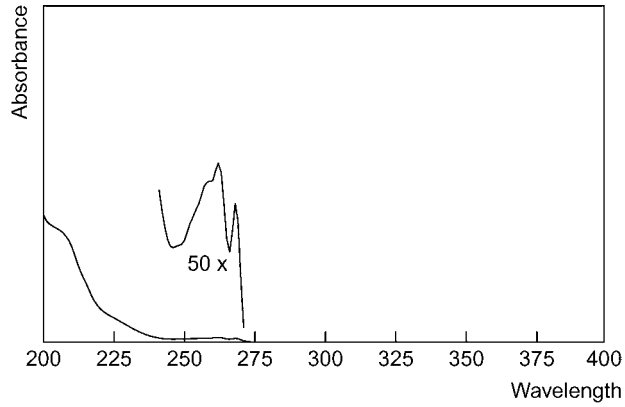
Synonym R-50547

Proprietary Names *Levophta*; *Livostin*.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.12; system TF—R_f 0.02; system TAE—R_f 0.76.

High Performance Liquid Chromatography System HX—RI 431.

Ultraviolet Spectrum Aqueous acid—258, 263, 269 nm.



Disposition in the Body Levocabastine is rapidly and completely absorbed after intranasal, ocular and oral administration, but peak plasma concentrations are low. First-pass metabolism is negligible and it is excreted in urine as the unchanged

drug (70%) and as an acetylglucuronide metabolite which is biologically inactive (10%). The remaining proportion of the unchanged drug is excreted in faeces (20%). Trace amounts of the drug are found in breast milk.

Therapeutic Concentration

Healthy volunteers were administered single doses of 0.5, 1.0 and 2.0 mg. Peak plasma concentrations of 7.3, 12.1 and 22.2 μg/L, respectively, were observed within 2 h of administration. Volunteers administered with a 0.2 mg dose of levocabastine by nasal administration gave peak concentrations between 1.4 and 2.2 μg/L within 1 to 2 h. A 0.04 mg dose, administered as eye drops, produced a concentration of 0.26 to 0.29 μg/L within 1 to 2 h [Heykents J. *et al* 1984].

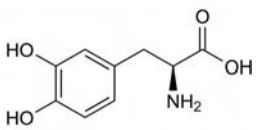
Bioavailability 60 to 80% (intranasal); 30 to 60% (ocular); 100% (oral).
Half-life 33 to 40 h.
Volume of Distribution 1.14 L/kg (82 L).
Clearance Plasma, 1.8 L/h.
Protein Binding 55%
Note For a review of levocabastine, see Noble and McTavish [1995].
Dose 0.5 mg/mL suspension: two sprays per nostril or one drop per eye twice daily. Three to four times daily if necessary.

Heykents J *et al.* (1984). Unpublished reports. *Janssen Research Foundation, Beerse.*
Noble S, McTavish D (1995). Levocabastine. An update of its pharmacology, clinical efficacy and tolerability in the topical treatment of allergic rhinitis and conjunctivitis. *Drugs* 50: 1032–1049.

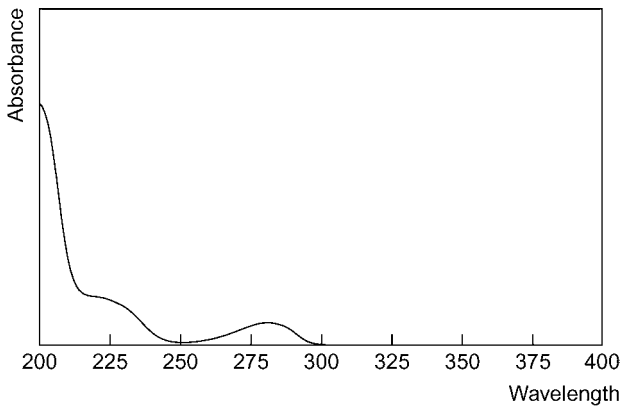
Levodopa

Antiparkinsonian
$C_9H_{11}NO_4 = 197.2$
CAS—59-92-7

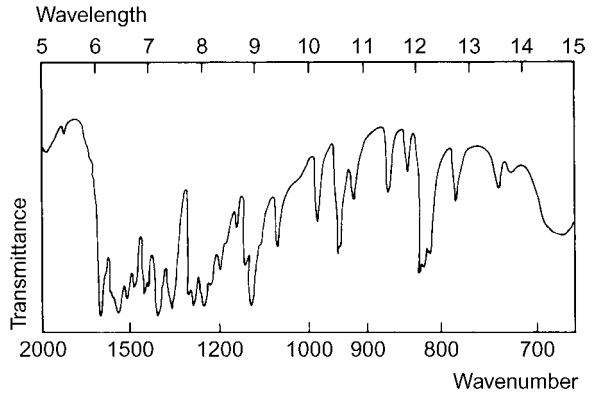
IUPAC Name (2*S*)-2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid
Synonyms Dihydroxyphenylalanine; dopa; L-dopa; 3-hydroxy-L-tyrosine; laevodopa.
Proprietary Names *Bendopa*; *Cidanopa*; *Deadopa*, *Dopaflex*; *Dopar*; *Doparl*; *Dopasol*; *Dopaston*; *Dopastral*; *Doprin*; *Eldopal*; *Eurodopa*; *Larodopa*; *Ledopa*; *Levopa*; *Levomet*; *Syndopa*; *Veldopa*. It is an ingredient of Atamet, *Madopar*, *Prolopa* and *Sinemet*.



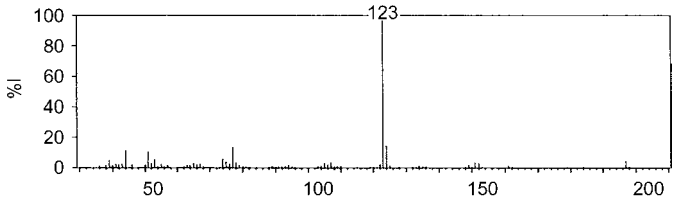
Chemical Properties A white or slightly cream-coloured crystalline powder, which darkens on exposure to air and light. Mp about 275°, with decomposition. Soluble 1 in 300 of water; practically insoluble in benzene, ethyl acetate, ethanol, chloroform and ether; soluble in aqueous solutions of mineral acids and alkali carbonates. pK_a 2.3, 8.7, 9.7, 13.4 (25°). Log *P* (octanol/water), −2.4. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Colour Tests Ammoniacal silver nitrate—yellow→brown/black; ferric chloride—green; Folin–Ciocalteu reagent—blue; methanolic potassium hydroxide—pink→red-brown; Millon's reagent (cold)—brown-red; Nessler's reagent—black; palladium chloride—orange (→brown); potassium dichromate (method 1)—green→brown.
Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAD—R_f 0.00; system TAE—R_f 0.11; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.00.
High Performance Liquid Chromatography System HX—RI 65; system HAA—retention time 3.6 min.
Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=141a).



Infrared Spectrum Principal peaks at wavenumbers 1647, 1562, 1117, 1241, 1274, 1520 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 123, 124, 77, 44, 51, 74, 53, 39.



Quantification

Plasma **GC** ECD. For method of quantification for levodopa and dopamine, see Mizuno [1977].

HPLC Amperometric detection. Levodopa, carbidopa and their metabolites. Limit of detection, 5 μg/L for levodopa [Sagar, Smyth 2000]. Electrochemical detection. Urine **HPLC** See Plasma [Sagar, Smyth 2000]. See Plasma [Titus *et al.* 1990]. UV and fluorescence detection. For method for quantification of levodopa and metabolites, see Seki *et al.* [1981].

Platelets **HPLC** See Plasma [Blandini *et al.* 1997].

Disposition in the Body Levodopa is rapidly absorbed from the small bowel after oral administration and widely distributed in the tissues; <1% of a dose reaches the brain. It is extensively metabolised, mainly by decarboxylation to dopamine which is further metabolised, and also by methylation to 3-*O*-methyldopa which accumulates in the central nervous system; most of a dose is decarboxylated by the gastric mucosa before entering the systemic circulation; the decarboxylase activity is inhibited by carbidopa and benserazide. Dopamine is further metabolised to noradrenaline [norepinephrine], 3-methoxytyramine, and to the two major excretory metabolites, 3,4-dihydroxyphenylacetic acid (DOPAC) and 3-methoxy-4-hydroxyphenylacetic acid (homovanillic acid, HVA). During prolonged therapy, the rate of levodopa metabolism appears to increase, possibly due to enzyme induction. About 70 to 80% of a dose is excreted in the urine in 24 h. Of the material excreted in the urine, about 50% is DOPAC and HVA, 10% is dopamine, up to 30% is 3-*O*-methyldopa, and <1% is unchanged drug. Less than 1% of a dose is eliminated in the faeces. During prolonged therapy the ratio of the amount of DOPAC produced to that of HVA may be increased.

Therapeutic Concentration There is considerable inter-subject variation in plasma concentrations and there appears to be no significant correlation between plasma concentrations of levodopa or its metabolites and therapeutic effect.

Following single oral doses of 1.5 g to 42 subjects, peak plasma-levodopa concentrations averaged about 1 mg/L at 1 to 2 h but there was a tenfold variation in peak concentrations. Peak plasma concentrations of 3-*O*-methyldopa of about 1.5 mg/L were attained in about 4 h and concentrations of HVA in the cerebrospinal fluid reached a maximum of about 0.15 mg/L in 8 h [Bergmann *et al.* 1974].

Ten subjects receiving 300 to 1500 mg levodopa orally daily (treatment duration 3 to 25 years) were studied during daily activity at home and work. Steady-state plasma concentrations varied widely (0.5 to 7.1 (mean, 2.0) mg/L for levodopa and 2.4 to 20.8 (mean, 7.1) mg/L for 3-*O*-methyldopa) [Nyholm *et al.* 2002].

Bioavailability About 33%.
Half-life Plasma half-life, about 1 h which may be increased by concomitant administration of peripheral decarboxylase inhibitors; 3-*O*-methyldopa about 13 h.

Clearance Plasma clearance, about 23 mL/min/kg.
Dose Initially, 0.25 to 1 g daily; maintenance, up to 8 g daily.

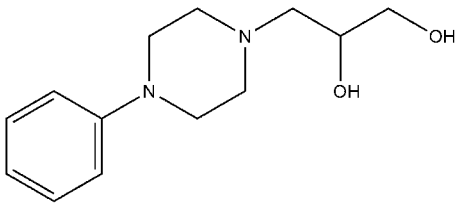
L

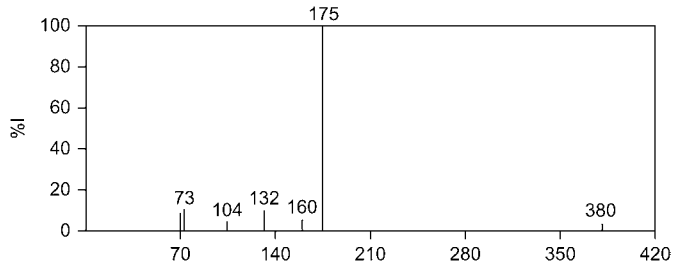
Levodropropizine

Cough Suppressant
$C_{13}H_{20}N_2O_2$ = 236.3
CAS—99291-24-4

IUPAC Name (2*S*)-3-(4-Phenylpiperazin-1-yl)propane-1,2-diol
Proprietary Names *Danka (Mediolanum)*; *Levotuss (Dompé)*; *Rapitux (De Angeli)*.



Chemical Properties Levo isomer of dropropizine. White solid from acetone. Mp 104° to 105°.
Mass Spectrum Principal peaks at *m/z* 175, 73, 70, 132, 160, 104 [Zaratin *et al.* 1988].



Quantification
Plasma GC-MS Column: SPB 5 Supelco (30 m × 0.32 mm i.d.). Temperature: 245°. EI ionisation at 70 eV. Limit of detection, 5 µg/L [Zaratin *et al.* 1988].

HPLC Column: Bio-Gel PRP 70-5 poly(styrene–divinylbenzene) (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L potassium monobasic phosphate buffer (pH 3): methanol(70 : 30), containing 0.5% tetrahydrofuran, flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}= 240 nm, λ_{em}= 350 nm). Limit of detection, 3 µg/L [Tagliaro *et al.* 1996].

LC-MS Column: Nucleosil C18 (100 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate with 1% formic acid: methanol (55 : 45), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.25 µg/L [Tang *et al.* 2005].

Protein Binding 11–14%.

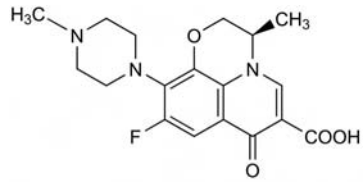
Levofloxacin

Antibacterial
$C_{18}H_{20}FN_3O_4$ = 361.4
CAS—100986-85-4

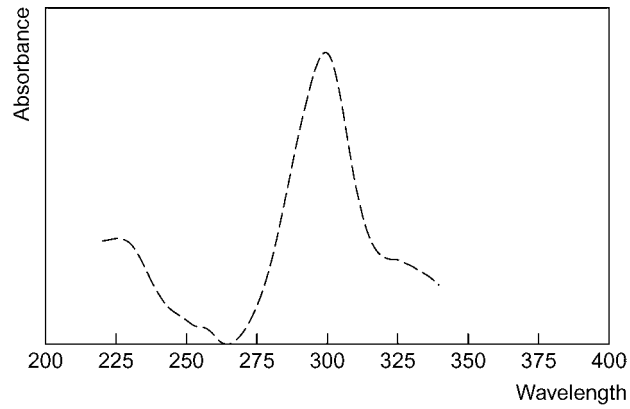
Synonyms DR-3355; (−)-(*S*)-9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7*H*-pyrido[1,2,3-*de*]-1,4-benzoxazine-6-carboxylic acid; HR-355; RWJ-25213; *S*-(−)-ofloxacin.
Proprietary Names *Cravit*; *Levaquin*; *Quixin*; *Tavanic*.



Chemical Properties Light-yellow to yellow-white crystals. Freely soluble in glacial acetic acid and chloroform; sparingly soluble in water.

Levofloxacin Hemihydrate
$C_{18}H_{20}FN_3O_4, {}^1/_2H_2O$ = 370.4
CAS—138199-71-0
Chemical Properties Needle-like crystals from ethanol/ethyl ether with Mp 225° to 227° (dec).

Ultraviolet Spectrum Ethanol—226, 300 nm.



Quantification
Plasma **HPLC** Column: RP ODS-2 Inertsil (250 × 4.6 mm i.d., 5 µm). Temperature: 35°. Mobile phase: methanol : 5 mmol/L copper (II) sulfate pentahydrate (containing 10 mmol/L L-isoleucine) (12.5:87.5), flow rate 1 mL/min. Internal standard (IS): ciprofloxacin. UV detection (λ=330 nm). Retention time: levofloxacin, 8 min; IS, 13 min. Limit of quantification, 80 µg/L [Wong *et al.* 1997]. Fluorescence detection (λ_{ex}=298 nm, λ_{em}=458 nm). Limit of detection 3 µg/L [Lehr, Damm 1988].
Urine **HPLC** See Plasma [Wong *et al.* 1997]. See Plasma. Limit of detection 80 µg/L [Lehr, Damm 1988].
Disposition in the Body Levofloxacin is rapidly absorbed after oral administration with maximum plasma concentrations being reached ~1 h after a dose. The absorption of levofloxacin is little affected by the presence of food in the gastrointestinal tract but administration with a high-fat meal may slightly prolong the time to peak concentration. It is widely distributed throughout the body, crosses the placenta and has been detected in breast milk. Levofloxacin undergoes limited metabolism and is excreted mainly as the unchanged drug in urine (80 to 85%) and faeces (2%) within 24 h. The major urinary metabolites are desmethyllevofloxacin and levofloxacin *N*-oxide, each accounting for only 2% of a dose.
Therapeutic Concentration
Five non-fasting, healthy male volunteers, aged between 27 and 36 years, were administered a 100 mg dose of levofloxacin. The mean peak plasma concentration was 1.35 mg/L and was observed about 1.8 h after ingestion [Okazaki *et al.* 1991].
Bioavailability 100%.
Half-life 6 to 8 h; may be prolonged in renal impairment.
Volume of Distribution 1.0 to 1.25 L/kg (single doses, healthy subjects). Also reported as 89 to 112 L.

Clearance 8.51 L/h/1.73 m^2 or 144 to 226 mL/min (mean body clearance); 7.14 L/h/1.73 m^2 or 96 to 142 mL/min (mean renal clearance).
Protein Binding 30 to 40% (mainly to albumin); a figure of 47 to 52% has been reported (assessed by measuring the *S*(−)-enantiomer of ofloxacin at a drug concentration of 1 mg/L).
Dose The usual dose is 250 to 500 mg daily.

Levomepromazine

Phenothiazine, Tranquilliser
$C_{19}H_{24}N_2OS$ = 328.5
CAS—60-99-1

IUPAC Name 3-(2-Methoxyphenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine
Synonyms CL-36467; CL-39743; methotrimeprazine; (βR)-2-methoxy-*N*,*N*,β-trimethyl-10*H*-phenothiazine-10-propanamine; RP-7044; SKF-5116.
Proprietary Names *Levium*; *Levocina*; *Levoprome*; *Levozin(e)*; *Methozane*; *Minozinan*; *Neozine*; *Neurocil*; *Novo-Meprazine*; *Nozinan*; *Sinogan*. It is an ingredient of *Immobilon* (for small animals). (Includes proprietary names of salts of levomepromazine).
Chemical Properties Fine, white, crystalline powder. Mp ≈126°. Practically insoluble in water; sparingly soluble in ethanol; soluble 1 in 2 of chloroform and 1 in 10 of methanol; freely soluble in ether. pK_a 9.19 [Sangster 1997]. Log *P* (octanol/water), 4.68 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Plasma samples were stable at –20° for 2 months [Mercolini *et al.* 2007]. Serum samples were stable for up to 8 h at room temperature and up to 2 weeks when stored at 4° or –20° [Tanaka *et al.* 2007].

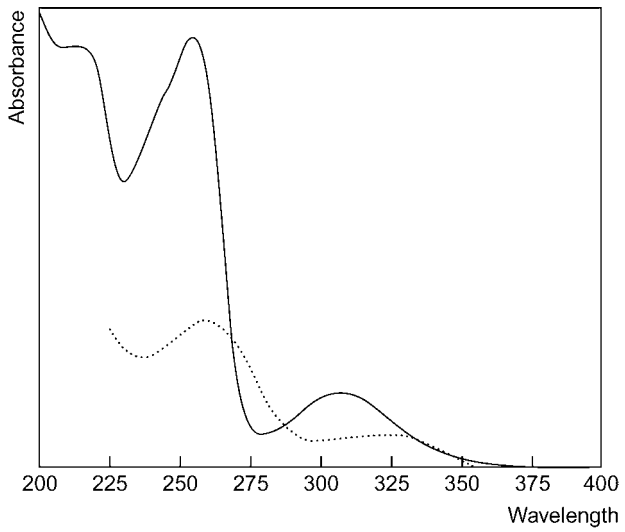
Levomepromazine Hydrochloride

$C_{19}H_{24}N_2OS,HCl$ = 364.9
CAS—4185-80-2
Chemical Properties Very soluble in water and ethanol.

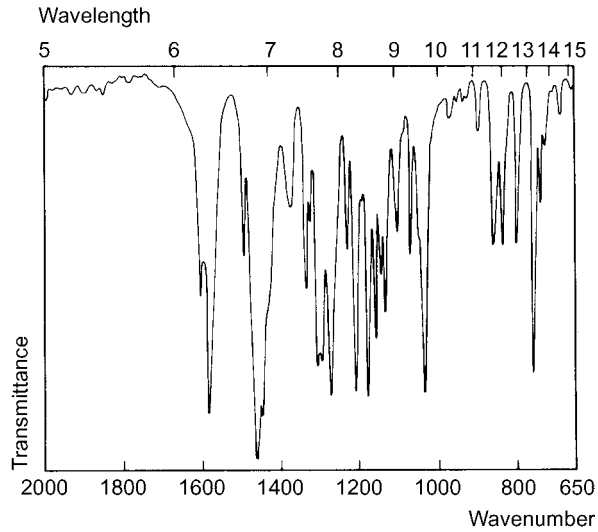
Levomepromazine Maleate

$C_{19}H_{24}N_2OS,C_4H_4O_4$ = 444.5
CAS—7104-38-3; 17086-29-2
Synonym Levomepromazine hydrogen maleate
Chemical Properties White crystalline powder. Mp ≈190°, with decomposition. Sparingly soluble in water and ethanol.

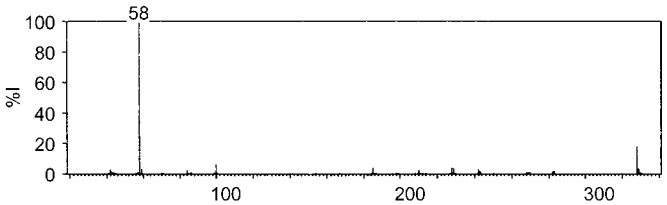
Colour Tests Formaldehyde–sulfuric acid—blue; Forrest reagent—violet; FPN reagent—violet; Mandelin's test—blue-violet; Marquis test—blue-violet.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.47; system TC—R_f 0.38; system TE—R_f 0.76; system TL—R_f 0.46; system TAE—R_f 0.32; system TAF—R_f 0.49; system TAJ—R_f 0.27; system TAK—R_f 0.19; system TAL—R_f 0.81 (Dragendorff spray, positive; FPN reagent, violet; acidified iodoplatinate solution, positive; Marquis reagent, violet).
Gas Chromatography System GA—RI 2514; system GB—levomepromazine RI 2641, M (norsulfoxide) RI 3088, M (sulfoxide) RI 3114; system GF—RI 2965; system GW—retention time 23.6 min.
High Performance Liquid Chromatography System HA—*k* 3.2; system HX—RI 435; system HY—RI 381; system HZ—retention time 7.5 min; system HAX—retention time 15.2 min; system HAY—retention time 7.2 min; system HAM—RT not detected; system HAZ—*k* 1.82.
Ultraviolet Spectrum Aqueous acid—250 (A^1_1 = 783a), 302 nm; aqueous alkali—259, 323 nm.



Infrared Spectrum Principal peaks at wavenumbers 1580, 1270, 1175, 1030, 1205, 752 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 328, 100, 228, 185, 329, 242, 229.



Quantification

Blood **GC** Column: cross-linked methylsilicone (25 m × 0.2 mm i.d., 0.11 μm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min. NPD. Retention time: 8.52 min. Limit of quantification, 172 μg/L, limit of detection, 52 μg/L. [Sánchez de la Torre *et al.* 2005]. Column: DB-1 capillary (0.32 mm i.d., 0.25 μm). Carrier gas: He, I mL/min. Temperature programme: 110° to 320° at 8°/min. NPD. Limit of detection not reported [Avis, Holzbecher 1996]. Column: Shimadzu CBP-1 bonded methylsilicone (12 m × 0.53 mm i.d., 1.0 μm). Carrier gas: He, 10 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min for 2 min. NPD. Limit of detection not reported [Jitsufuchi *et al.* 1995]. Column: DB-1 fused silica (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 22 cm/s. Temperature programme: 120° to 280° at 6°/min. SID. Retention time: 23.6 min. Limit of detection, 250–500 ng/L [Hattori *et al.* 1992]. Column: SPB-1 (30 m × 0.75 mm i.d., 1.0 μm). Carrier gas: He, 8 mL/min. Temperature programme: 100° for 2 min to 200° at 20°/min to 280° at at 7.5°/min for 4 min. FID. Limit of detection not reported [Klys, Brandys 1988]. Column: 3% OV-17 on 80/100 mesh Supelcoport (100 cm × 2 mm i.d.). Carrier gas: N_2, 25 mL/min. Temperature programme: 255° for 4 min to 280° at 32°/min for 7 min. AFID. Limit of detection, 25 μg/L [Dahl *et al.* 1982].

GC-MS Column: 3% OV-17 on 80/100 mesh Supelcoport (100 cm × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature: 250°. EI ionisation at 70 eV. Retention time: 2.5 min. Limit of detection not reported [Dahl *et al.* 1982].

Plasma **GC** Column: SGE BPX-5 capillary (30 m × 0.53 mm i.d., 1 μm). Carrier gas: N_2, 20 mL/min. Temperature programme: 160° to 260° at 40°/min to 274° at 4°/min for 1 min NPD. Retention time: 4.5 min. Limit of quantification, 5 μg/L, limit of detection, 2 μg/L [Kruggel, Ulrich 2000]. Column: Shimadzu CBP1-bonded methyl silicone (12 m × 0.53 mm i.d., 1 μm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. NPD. Limit of detection, 50–100 μg/L [Tokunaga *et al.* 1996; Tokunaga *et al.* 1997]. See Blood [Dahl *et al.* 1982].

GC-MS Column: 3% OV-17 on 80/100 mesh Gas Chrom Q (120 cm × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 242°. EI ionisation at 70 eV. Limit of detection not reported [Dahl, Garle 1977].

HPLC Column: Discovery reversed phase pentafluorophenylpropyl (150 × 4.6 mm i.d., 5 μm). Mobile phase: 3.8 mmol/L phosphate buffer (pH 1.9) containing 0.18% triethylamine : acetonitrile (68 : 32), flow rate 1.5 mL/min. Electrochemical detection. Retention time: 20.3 min. Limit of quantification, 0.5 μg/L, limit of detection, 0.17 μg/L [Saracino *et al.* 2008]. Column: C_8 reversed phase (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 34 mmol/L phosphate buffer (pH 2.0) containing 0.3% triethylamine (29 : 71), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of quantification, 9 μg/L, limit of detection, 3 μg/L [Mercolini *et al.* 2007]. Column: Symmetry C_8 (150 × 3.9 mm i.d., 5 μm). Mobile phase: 0.1 mol/L potassium dihydrogen phosphate (pH 3.5) with 17% phosphoric acid : acetonitrile (70 : 30), flow rate 1.3 mL/min. DAD (λ = 250 nm). Retention time: 8.61 min. Limit of quantification, 4.1 μg/L, limit of detection, 3.7 μg/L [ter

Horst *et al.* 2003]. Column: Supelcosil C_{18}-DB (250 nm × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L SDS in 500 mmol/L ammonium acetate buffer (pH 5.0) : acetonitrile (50 : 50), flow rate 1.5 mL/min. Retention time: 24.5 min. Limit of detection not reported [Loennechen, Dahl 1990]. Column: Spherisorb S5 ODS (15 cm × 4.6 mm, 5 µm). Mobile phase: 0.01 mol/L potassium phosphate buffer (pH 5.5) : methanol : acetonitrile (20 : 30 : 50). UV detection (λ = 254 nm). Limit of detection, 2 µg/L [Holt *et al.* 1982].

See also [Murakami *et al.* 1982]

Serum **HPLC** Column: Inertsil ODS-SP (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 30 mmol/L sodium dihydrogen phosphate (pH 5.6; 300 : 200 : 500), flow rate 0.9 mL/min. UV detection (λ = 250 nm). Limit of quantification, 4.5 µg/L [Tanaka *et al.* 2007]. Column: Supelcosil-C_{18}-DB reversed phase (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L SDS in 0.5 mol/L ammonium acetate buffer (pH 5) : 5% tetrahydrofuran in acetonitrile (50 : 50), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection, <0.028 µmol/L [Loennechen *et al.* 1990]. Column: Develosil C_8-5 and Develosil CN-5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% potassium dihydrogen phosphate (pH 6.0) : acetonitrile (65 : 35). UV detection (λ = 254 nm). Limit of detection, 5 µg/L [Ohkubo *et al.* 1993]. Column: Nucleosil 100 CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : pyridine : 0.14 mol/L sodium acetate (pH 3.1; 698 : 2 : 300), flow rate 0.9 mL/min. Electrochemical detection. Limit of detection, 0.2 µg/L [Bagli *et al.* 1994].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.47 µg/L [Kirchherr, Kühn-Velten 2006].

Urine **GC** See Blood [Avis, Holzbecher 1996]. Column: 5% OV-1 80/100 mesh (1.8 m × 4 mm i.d.). Carrier gas: N_2, 70 mL/min. Temperature: 230°. FID. Retention time: 4 min 39 s [De Leenheer, Heyndrickx 1972].

GC-MS Column: SPB-5 Supelco (30 m × 0.2 mm i.d., 0.2 µm). Carrier gas: He. Temperature programme: 45° for 2 min to 250° at 20°/min. EI ionisation at 70 eV, positive ion mode, full scan acquisition mode. Limit of detection not reported [Hals, Dahl 1995]. Column: 3% OV-17 on 80/100 Supelcoport. Carrier gas: N_2, 30 mL/min. Temperature: 260°. NPD. Retention time: 2.5 min. Limit of detection not reported [Johnsen, Dahl 1982]. See Plasma [Dahl, Garle 1977].

HPLC Column: LiChrosorb C_8 (150 × 4.6 mm i.d.)-LiChrosorb C_{18} (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid : triethylamine (40 : 40 : 20 : 2), flow rate 0.5 mL/min. UV detection (λ = 250 nm). Limit of quantification, 200 µg/L, limit of detection, 60 µg/L [Cruz-Vera *et al.* 2009]. See Serum. Limit of detection, 15 nmol/L [Loennechen *et al.* 1990]. Column: Nucleosil C_{18} (150 × 4 mm i.d., 5 µm). Mobile phase: pyridine : tetrhydrofuran : 0.1 mol/L acetate buffer (pH 3.5) : acetonitrile (0.1 : 1.0 : 30.0 : 68.9) containing 20 mmol/L sodium perchlorate, flow rate 0.7 mL/min. Electrochemical detection. Retention time: 7.0 min. Limit of detection, 0.5 µg/L [Murakami *et al.* 1982].

Bile **GC** See Blood [Avis, Holzbecher 1996].

Breast Milk **HPLC** See Serum. Mobile phase: 0.5% potassium dihydrogen phosphate (pH 4.5) : acetonitrile (65 : 35). [Ohkubo *et al.* 1993].

Vitreous Humour **GC** See Blood [Avis, Holzbecher 1996].

Brain **GC** See Blood [Jitsufuchi *et al.* 1995].

Kidney **GC** See Blood [Jitsufuchi *et al.* 1995].

Liver GC See Blood [Jitsufuchi *et al.* 1995].

Muscle **GC** See Blood [Jitsufuchi *et al.* 1995].

Disposition in the Body Readily absorbed after oral administration and widely distributed throughout the body. Approximately 50% of an oral dose may reach the systemic circulation. Extensively metabolised to numerous phase-I and -II metabolites, it is not metabolised to a great extent by CYP2D6 [Bagli *et al.* 1995]. The major metabolites are the sulfoxide and *N*-monodesmethyl derivative (active); hydroxylation also occurs. Less than 1% of a dose is excreted in the urine as unchanged drug in 24 h [Afifi, Way 1968]. Approximately 10% of a dose is excreted in the urine as the sulfoxide.

Therapeutic Concentration 0.03–0.15 mg/L.

After a single oral dose of 50 mg to 5 male psychiatric subjects, peak plasma concentrations of 0.016–0.04 mg/L were attained in 1–4 h; concentrations of the sulfoxide metabolite exceeded those of unchanged drug in each case [Dahl 1976].

Following daily oral doses of 300–400 mg to 4 subjects, steady-state plasma concentrations of 0.05–0.14 mg/L (mean 0.08) were reported; steady-state plasma concentrations of the sulfoxide metabolite ranged from 0.26–0.39 mg/L (mean 0.33); the *N*-monodesmethyl metabolite was also detected [Dahl, Garle 1977].

The concentration of levomepromazine in human breast milk from a patient receiving 10 mg/day levomepromazine was 7.5 µg/L and the concentration in the serum of patients receiving 200–700 mg/day was 14–99 µg/L [Ohkubo *et al.* 1993].

Toxicity 0.5 mg/L.

In 3 postmortem examinations of a 40-, a 19- and a 35-year-old female the serum concentrations of levomepromazine were 36 µg/L, 1119 µg/L, and 772 µg/L, respectively [Tanaka *et al.* 2007].

In a 42-year-old male who committed suicide by ingesting methotrimeprazine, the following postmortem body-fluid concentrations of methotrimeprazine, desmethylmethotrimeprazine, and methotrimeprazine sulfoxide were reported, respectively: blood 4.1, 2.0, and 1.8 mg/L, urine 0.80, 1.2, and 8.9 mg/L, bile 70, 35, and 26 mg/L, vitreous humour 0.25, 0.20, and 0.90 mg/L. No other drugs were detected [Avis, Holzbecher 1996].

A 46-year-old schizophrenic male died in hospital. The concentration of levomepromazine, amongst other antipsychotcs, in his blood, brain, kidney, liver and muscle was 750, 1284, 4128, 11570, and 1173 ng/g respectively. Cause of death was asphyxia [Jitsufuchi *et al.* 1995].

A 30-year-old female took an unknown amount of psychotropic drugs. At postmortem the concentration of levomepromazine in the blood, liver and kidney was 5.0, 4.1 and 2.1 mg/kg, respectively [Klys, Brandys 1988].

The following postmortem concentrations were reported in a fatality attributed to levomepromazine overdose: blood 8 mg/L, liver 160 µg/g [Bonnichsen *et al.* 1970].

Half-life Plasma half-life, methotrimeprazine 16–78 h (mean 27), sulfoxide metabolite 10–30 h (mean 20).

Volume of Distribution ≈30 L/kg.

Distribution in Blood Plasma : whole blood ratio, ≈1.2 but there is considerable inter-subject variation.

Dose Usually 25 to 50 mg of methotrimeprazine maleate daily; up to 1 g daily has been given.

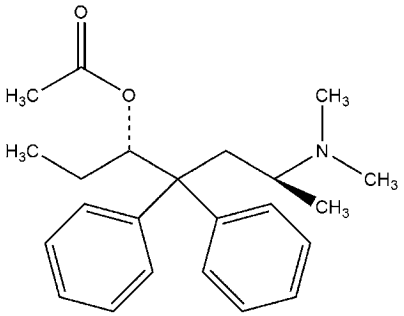
Levomethadyl Acetate

Diphenylheptane Derivative, μ *Opioid Receptor Agonist, Narcotic Analgesic*
$C_{23}H_{31}NO_2 = 353.5$
CAS—1477-40-3

IUPAC Name [(3*S*,6*S*)-6-Dimethylamino-4,4-di(phenyl)heptan-3-yl] acetate
Synonyms α-$_L$-Acetylmethadol; (−)-6-(dimethylamino)-4,4-diphenyl-3-heptanol acetate (ester); (α*S*)-β-[(2*S*)-2-(dimethylamino)propyl]-α-ethyl-β-phenylbenzeneethanol acetate (ester); LAAM; levo-α-acetylmethadol.



Chemical Properties pK_a 8.3 [Wilkins *et al.* 1998]. Log *P* (octanol/water) 6.14 [Wishart 2006]. Analytes were stable after 3 freeze-thaw cycles, room temperature storage for 20 h, and extracts were stable both at −20° for 6 days and in the autosampler (10°) for 4 days [Huang *et al.* 2003].

Levomethadyl Acetate Hydrochloride

$C_{23}H_{31}NO_2$,HCl = 390
CAS—43033-72-3
Synonym LAM
Proprietary Name *ORLAAM*
Chemical Properties Crystals. Mp 215°. Soluble in water. Log *P* (octanol/water) 5.82 [Sigma-Aldrich 2007].

Mass Spectrum Principal ions at *m/z* 72, 171, 294, 105, 207, 354, 46.

Quantification

Plasma **GC-MS** Column: Supelco SPB-5 5% diphenylsiloxane 95% dimethylsiloxane fused silica (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 50 mL/min. Temperature programme: 160° to 260° at 30°/min. SIM acquisition mode. Limit of quantification, 4 μg/L [Eap *et al.* 2004]. Column: 5% phenylmethylsiloxane fused capillary (15–20 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H_2, 80 cm/s. Temperature programme: 140° to 285° at 15°/min. CI, positive ion mode. Limit of quantification, 5 μg/L [Moody *et al.* 1995]. Column: DB-1701 capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 90° for 1.5 min to 260° at 50°/min for 2 min to 300° at 25°/min. CI, SIM acquisition mode. Retention time: 6.0 min for levomethadyl acetate (LAAM), 7.0 min for dinor-LAAM and 7.3 min for nor-LAAM. Limit of quantification, 1.0 μg/kg, limit of detection, 0.5 μg/kg [Thomas *et al.* 1994].

LC-MS Column: Zorbax Eclipse XDB-C_{18} (50 × 2.1 mm i.d., 5 μm). Mobile phase: 0.05% trifluoroacetic acid in methanol : 0.05% trifluoroacetic acid in water (55 : 45 for 1 min to 90 : 10 over 3 min for 2 min to 55 : 45 for 4 min), flow rate 0.25 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention times 4.7 min for LAAM, 4.9 min for nor-LAAM and 5.1 min for dinor-LAAM. Limit of quantification, 2.0 μg/L for LAAM, 1.0 μg/L for nor-LAAM and dinor-LAAM [Kharasch *et al.* 2005]. Column: InertSil ODS3 (100 × 2.1 mm i.d., 5 μm). Mobile phase: methanol : 0.1% formic acid (45 : 55), flow rate 0.2 mL/min. ESI. Limit of quantification, 0.25 μg/L for LAAM, nor-LAAM and dinor-LAAM [Huang *et al.* 2003].

Serum **HPLC** Column: OV-1 open tubular fused silica capillary (25 m × 0.2 mm i.d.). Carrier gas: He, 0.5 mL/min. Temperature programme: 190° for 35 s to 220° at 30°/min for 5.8 min to 240° at 18°/min for 2 min. NPD. Retention times, 5.59 min for LAAM, 10.10 min for nor-LAAM and 9.13 min for dinor-LAAM. Limit of detection, 5 μg/L for for LAAM, nor-LAAM and dinor-LAAM [Verebey *et al.* 1985].

Urine **GC-MS** Column: 5% phenyl methyl silicone fused capillary (15–20 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H_2, 80 cm/s. Temperature programme: 140° to 285° at 15°/min. CI, positive ion mode. Limit of quantification, 10 μg/L [Moody *et al.* 1995].

HPLC Column: Varian Micro-Pak LiChrosorb Si-60 (300 × 4 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile-0.015% ammonium hydroxide (70 : 30), flow rate 1.5 mL/min. UV detection (λ = 218 nm). Limit of detection, 10 μg/L [Kiang *et al.* 1981].

LC-MS Column: Zorbax Eclipse XDB-C_{18} (50 × 2.1 mm i.d., 5 μm). Mobile phase: 0.05% trifluoroacetic acid in acetonitrile : 0.05% trifluoroacetic acid in water (40 : 60 to 55 : 45 over 3 min to 90 : 10 over 0.5 min for 0.5 min to 40 : 60 over 0.5 min for 4 min), flow rate 0.25 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 2.1 min for LAAM, 2.4 min for nor-LAAM and 2.7 min for dinor-LAAM. Limit of quantification, 8 μg/L for LAAM, 40 μg/L for nor-LAAM and dinor-LAAM [Kharasch *et al.* 2005]. Column: InertSil ODS3 (100 × 2.1 mm i.d., 5 μm). Mobile phase: methanol : 0.1% formic acid (45 : 55), flow rate 0.2 mL/min. ESI. Limit of quantification, 0.25 μg/L for LAAM, nor-LAAM and dinor-LAAM [Huang *et al.* 2003]

Placenta **HPLC** Column: Phenomenex Luna C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 3.5 g/L ammonium carbonate in methanol : water (80 : 20), flow rate 1 mL/min. UV detection (λ = 218 nm). Limit of detection, 25 μg/L for nor-LAAM and 50 μg/L for dinor-LAAM [Deshmukh *et al.* 2004].

Hair **GC-MS** Column: DB-5MS capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 165° for 0.5 min to 310° at 25°/min for 0.5 min. CI, positive ion mode. Limit of quantification, 0.5 μg/kg for LAAM and 0.3 μg/kg for nor-LAAM and dinor-LAAM [Wilkins *et al.* 1997].

Other **GC-MS** Rat Plasma, Liver and Brain. Column: 5% phenyl methyl silicone fused capillary (15–20 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H_2, 80 cm/s. Temperature programme: 140° to 285° at 15°/min. CI, positive ion mode. Limit of quantification, 10 μg/L [Moody *et al.* 1995].

LC-MS Microsomes. Column: InertSil ODS3 (100 × 2.1 mm i.d., 5 μm). Mobile phase: methanol : 0.1% formic acid (45 : 55), flow rate 0.2 mL/min. ESI. Limit of quantification, 0.25 μg/L for LAAM, nor-LAAM and dinor-LAAM [Huang *et al.* 2003].

Disposition in the Body LAAM undergoes extensive first-pass metabolism by CYP3A4 (and to a lesser extent CYP2B6 and CYP2C18) to the active demethylated metabolite nor-LAAM, which is further demethylated to a second active metabolite, dinor-LAAM. These metabolites are more potent than the parent drug. Other metabolic pathways of LAAM involve hydrolytic cleavage of the acetyl–ester bond.
Note For a study on the metabolism of LAAM in human placenta, see Deshmukh *et al.* [2004].

Therapeutic Concentration Six opioid-experienced male volunteers (age 28 to 46 years) who were not physically dependent on opioids were administered 20 or 40 mg/70 kg LAAM either IV or orally. Pharmacokinetic parameters for LAAM, nor-LAAM and dinor-LAAM were as follows:

	20 mg IV	*40 mg IV*	*20 mg oral*	*40 mg oral*
LAAM				
C_{max} (μg/L)	212 ± 32	756 ± 229	39 ± 7	63 ± 8
t_{max} (h)	0.06 ± 0.01	0.06 ± 0.01	2.5 ± 0.4	2.6 ± 0.2
$t_{1/2}$ (h)	14.3 ± 1.7	20.9 ± 3.6	7.9 ± 1.2	18.5 ± 4.9
Nor-LAAM				
C_{max} (μg/L)	13 ± 1	26 ± 2	26 ± 3	44 ± 4
t_{max} (h)	4.5 ± 1.7	8.0 ± 3.4	3.1 ± 0.5	3.9 ± 0.7
$t_{1/2}$ (h)	30.0 ± 5.2	37.9 ± 5.4	33.6 ± 4.2	23.9 ± 3.2
Dinor-LAAM				
C_{max} (μg/L)	9 ± 0	15 ± 1	12 ± 1	19 ± 1
t_{max} (h)	40.8 ± 7.4	48.0 ± 6.2	17.9 ± 7.3	31.0 ± 9.6
$t_{1/2}$ (h)	88.9 ± 39.9	80.5 ± 14.7	75.6 ± 15.4	65.8 ± 10.1

[Walsh *et al.* 1998].

Toxicity As a derivative of methadone, LAAM was used in the treatment of opioid dependence. However, its proarrhythmic effects have led to its withdrawal from markets in the European Union and the USA.
Bioavailability ≈47–48%.
Half-life 2.6 days.
Clearance LAAM IV: 352 ± 25 and 295 ± 35 mL/h/kg for 20 and 40 mg, respectively; LAAM oral dose: 357 ± 25 and 296 ± 35 mL/h/kg for 20 and 40 mg, respectively.
Protein Binding ≈80%.
Dose 20 to 40 mg a day or higher but no more than 120 mg.

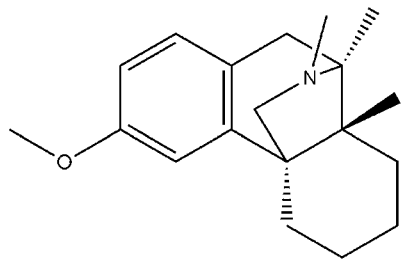
Levomethorphan

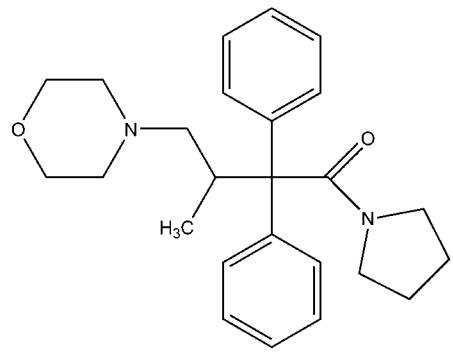
Antitussive, Cough Suppressant, NMDA Antagonist, Narcotic Analgesic
$C_{18}H_{25}NO = 271.4$
Synonyms *l*-Methorphan; (−)-3-methoxy-*N*-methylmorphinan.



Chemical Properties Methyl analogue of dextrorphan. A white crystalline powder. Soluble 1 in 65 of water and 1 in 10 of ethanol; freely soluble in chloroform; insoluble in ether.
Colour Test Ammonium molybdate test—blue→green (limit of detection, 0.25 µg).
Thin-layer Chromatography System T1—R_f 0.24 (acidified iodoplatinate spray—positive).
Gas Chromatography System G2/225—RRT 0.70 (relative to codeine).
UV Spectrum Acidic (0.05 mol/L sulfuric acid)—maximum at 278 nm (A^{1}_{1} = 78) with an inflexion at 283 nm (A^{1}_{1} = 71.3) nm.

Levomoramide

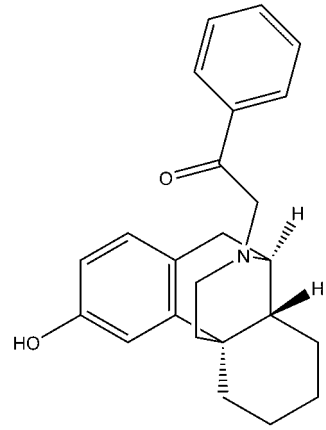
Narcotic Analgesic
$C_{25}H_{32}N_2O_2 = 392.5$
IUPAC Name 3-Methyl-4-morpholin-4-yl-2,2-di(phenyl)-1-pyrrolidin-1-yl-butan-1-one
Synonym (–)-1-(3-Methyl-4-morpholino-2,2-diphenylbutyrl)pyrrolidine



Chemical Properties Mp 190°. Levomoramide is extracted by organic solvents from aqueous alkaline solutions.
Thin-layer Chromatography System T1—R_f 0.70 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—254, 259, 265 nm.

Levophenacylmorphan

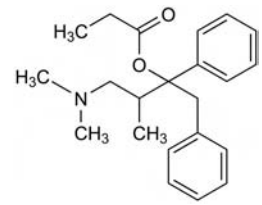
Narcotic
$C_{24}H_{27}NO_2 = 361.5$
CAS—10061-32-2
Synonyms (–)-3-Hydroxy-*N*-phenacylmorphinan; NIH 7525.



Chemical Properties Levophenacylmorphan is extracted by organic solvents from aqueous ammoniacal solutions.
Colour Tests Ammonium molybdate test—blue, fading (limit of detection, 1.0 µg); ammonium vanadate test—faint grey (limit of detection, 1.0 µg); sulfuric acid-formaldehyde test—faint purple→grey (limit of detection, 1.0 µg); Vitali's test—yellow/faint yellow/orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.15, streaking (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulphuric acid—251 nm (E1%, 1 cm 317) and inflexions at 275 and 286 nm.

Levopropoxyphene

Cough Suppressant
$C_{22}H_{29}NO_2 = 339.5$
CAS—2338-37-6
IUPAC Name α-[2-(Dimethylamino)-1-methylethyl]-α-phenylbenzeneethanol propanoate



Chemical Properties Crystals. Mp 75° to 76°. Log *P* (octanol/water), 4.2. For analytical data see under Dextropropoxyphene.

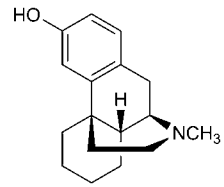
Levopropoxyphene Napsilate

$C_{22}H_{29}NO_2,C_{10}H_8O_3S,H_2O = 565.7$
CAS—5714-90-9 (anhydrous); 55557-30-7 (monohydrate)
Synonym Levopropoxyphene naphthalene-2-sulfonate
Proprietary Names *Contratuss*; *Letusin*; *Novrad*.
Chemical Properties A white powder. Mp 158° to 165°. Very slightly soluble in water; soluble 1 in 17 of ethanol and 1 in 2 of chloroform; soluble in acetone and methanol.

Dose The equivalent of 50 to 100 mg of levopropoxyphene every 4 h.

Levorphanol

Narcotic Analgesic
$C_{17}H_{23}NO = 257.4$
CAS—77-07-6
Synonyms (-)-3-Hydroxy-*N*-methylmorphinan; levorphan; methorphinan; 17-methylmorphinan-3-ol.

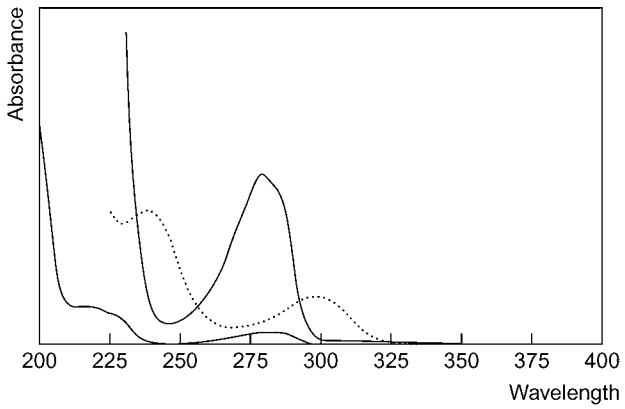


Chemical Properties Crystals. Mp 198° to 199°. pK_a 8.2 (20°). Log *P* (octanol/pH 7.4), 1.1.

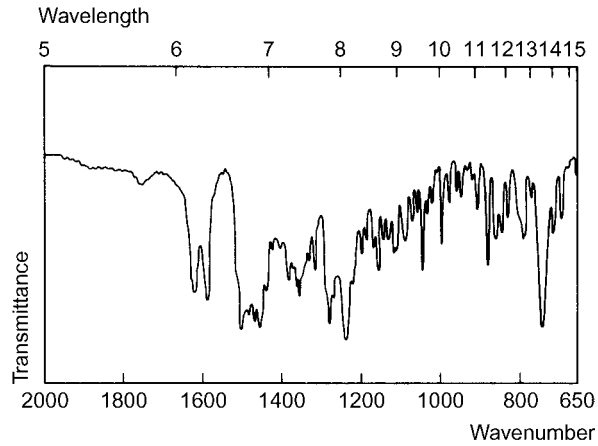
Levorphanol Tartrate

$C_{17}H_{23}NO,C_4H_6O_6,2H_2O = 443.5$
CAS—125-72-4 (anhydrous); 5985-38-6 (dihydrate)
Synonym Levorphanol bitartrate
Proprietary Names *Dromoran*; *Levo-Dromoran*.
Chemical Properties White crystalline powder. Mp 113° to 115° (dihydrate), Mp 206° to 208° (anhydrous). Soluble 1 in about 45 of water, 1 in about 110 of ethanol, and 1 in 50 of ether; practically insoluble in chloroform.

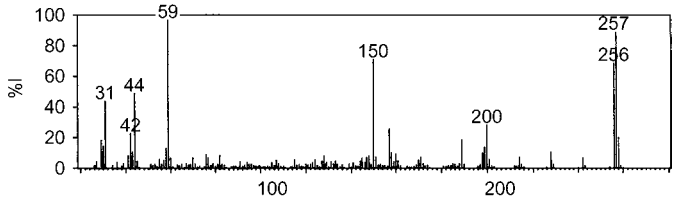
Thin-layer Chromatography System TA—R_f 0.35; system TB—R_f 0.13; system TC—R_f 0.07 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2230; system GC—RI 2230 (metabolised to dextrorphan).
High Performance Liquid Chromatography System HA—*k* 4.4 (tailing peak); system HC—*k* 3.20; system HY—RI 265.
Ultraviolet Spectrum Aqueous acid—279 nm ($A_1^1 = 79a$); aqueous alkali—240 ($A_1^1 = 339a$), 299 nm ($A_1^1 = 119a$).



Infrared Spectrum Principal peaks at wavenumbers 1238, 1495, 753, 1278, 1578, 1608 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 59, 257, 150, 256, 44, 31, 200, 157.



Quantification

Plasma **GC** Column: Restek Rtx-65TG fused silica (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 2.25 mL/min. Temperature programme: 150° for 1 min to 310° at 10°/min. ECD. Retention time: 13.7 min (pentaflurobenzoyl derivative). Limit of detection, <0.25 µg/L [Everhart *et al.* 1999].

GC-MS Column: 3% poly S-176 80/100 mesh on Chromosorb W (120 × 2 cm). Carrier gas: CH_4, 101 kPa. Temperature: 280°. SIM acquisition mode. Retention time: 2 min (pentaflurobenzoyl derivative). Limit of detection, 1 µg/L [Min *et al.* 1982].

HPLC Column: µBondapak C_{18} (300 × 4 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.01 mol/L sodium chloride (pH 4.8; 30 : 70), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 6.4 min. Limit of detection, 1.25 µg/L [Lucek, Dixon 1985].

Note For a radioimmunoassay method, see Dixon *et al.* [1981].

Disposition in the Body Absorbed after oral administration. Metabolised by 3-glucuronidation.

Therapeutic Concentration

A patient who had received 16 mg of levorphanol PO twice-daily had steady-state concentrations of 65–87 µg/L up to 3 h after drug administration. When the same patient was switched to 8 mg given IM with the same dosing schedule similar concentrations of 58–76 µg/L were observed [Lucek, Dixon 1985].

Toxicity

Postmortem concentrations in a 41-year-old female found dead after having ingested an unknown quantity of levorphanol were: blood 2.7 µg/mL, bile 24 µg/mL, brain 1.8 µg/g, kidney 3.4 µg/g, liver 5.4 µg/g, lung 17 µg/g, urine 2.3 µg/mL [Turner, Richards 1977].

A 61-year-old male ingested 30 mg of levorphanol and died about 18 h later. The antemortem blood concentration was 0.8 mg/mL. Concentrations in other fluids and tissues (samples taken after the body had been embalmed) were: bile 15 mg/mL, kidney 1 µg/g, liver 11 µg/g [Bednarczyk 1978].

Half-life Plasma half-life, ≈13 h.
Dose 1.5 to 9 mg of levorphanol tartrate daily.

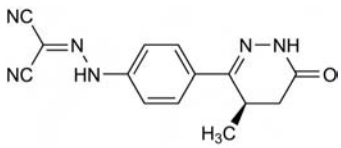
Levosimendan

Cardiotonic
$C_{14}H_{12}N_6O = 280.3$
CAS—141505-33-1
IUPAC Name [[4-[(4*R*)-1,4,5,6-Tetrahydro-4-methyl-6-oxo-3-pyridazinyl]phenyl]-hydrazono]propanedinitrile
Synonyms (*R*)-Simendan; OR-1259.
Proprietary Name *Simdax*



Chemical Properties Yellow crystalline powder. Mp 210° to 214°. Soluble in water. pK_a 6.3.

Quantification

Plasma **HPLC** Column: RP-18 LiChrosorb (250 × 4 mm i.d., 10 µm). Mobile phase: 32 mmol/L monosodium dihydrogen phosphate buffer : methanol : tetrahydrofuran (45:65:1), (pH 3.5). flow rate 1.0 mL/min. Internal standard (IS): OR-1097. UV detection (λ=380 nm). Retention time: levosimendan, 6.4 min; IS, 5.4 min. Limit of quantification and limit of detection, 5 µg/L [Karlsson *et al.* 1997]. UV detection (λ=380 nm). Limit of detection, 10 µg/L [Wikberg *et al.* 1996].

Disposition in the Body Levosimendan is rapidly absorbed after administration and distributed quickly around the body. It is completely metabolised with negligible amounts of the unchanged drug being detected in urine and faeces. The main metabolites are conjugates of the glutathione pathway and cyclic, *N*-acetylated cysteine or cysteinylglycine derivatives. These metabolites are biologically inactive and are slowly formed.

Therapeutic Concentration

Ten healthy subjects, aged 21 to 27 years (mean 24 years), were administered a single dose of levosimendan (2 mg) as an IV infusion (5 min infusion) and orally in the form of a conventional tablet; conventional capsule and a slow-release tablet. Doses were administered after an overnight fast and a washout period of 1 week was allowed between treatments. After the IV dose, the maximum plasma concentration was 180 µg/L at the end of the infusion. For oral administration, the conventional tablet and capsule gave maxima of 72 and 76 µg/L at 0.9 and 1.2 h, respectively; the slow-release formulation produced lower concentrations of 14 µg/L at 2.8 h. Metabolites were detected up to 24 h after the slow-release tablet but only up to 8 h for the other formulations. At 8 h, the metabolite concentrations were 93, 79, 53 and 1074 ng/L for the conventional tablet, conventional capsule, after the IV dose and after the slow-release tablet, respectively [Sundberg *et al.* 1998].

Bioavailability Oral, 85%.
Half-life 0.96 h (healthy individuals); 1.03 h (patients with mild congestive heart failure).
Volume of Distribution Steady state, 21.9 L (healthy); 19.5 L (patients with mild congestive heart failure). Also reported as 14.7 L.
Clearance 359 mL/min (healthy); 296 mL/min (patients with mild congestive heart failure). Also reported as 246 mL/min.
Protein Binding 97 to 98%.
Dose The usual dose (used in clinical trials) is a 6 to 12 μg/kg loading dose over 10 min followed by 0.05 to 0.2 μg/kg/min as a continuous IV infusion.

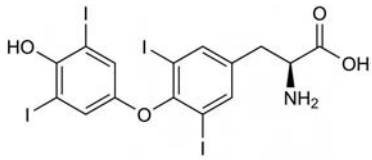
Levothyroxine

Thyroid Agent
$C_{15}H_{11}I_4NO_4$ = 776.9
CAS—51-48-9

IUPAC Name (−)-3-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]alanine
Synonyms Thyroxine; L-thyroxine. The abbreviation T_4 is often used for thyroxine in medical and biochemical reports.



Chemical Properties Crystals. Mp 235° to 236°, with decomposition. pK_a 2.2, 6.7, 10.1. Log *P* (octanol/water), 4.12.

Levothyroxine Sodium

$C_{15}H_{10}I_4NNaO_4,xH_2O$ = 798.9 (anhydrous)
CAS—55-03-8 (anhydrous); 25416-65-3 (hydrate)
Synonyms Levothyroxinnatrium; lexothyroxinum natricum; thyroxine sodium; thyroxinum natricum; tirossina; tiroxina sodica.
Proprietary Names *Dexnon*; *Elthyrone*; *Eltroxin*; *Euthyrox*; *Eutirox*; *Levaxin*; *Levotec*; *Levo-T*; *Levothroid*; *Levothyrox*; *Levoxyl*; *Oroxine*; *Synthroid*; *Thyrax*; *Thyrex*; *Tiracrin*; *Tirosint*; *Unithroid*. It is an ingredient of *Thyrolar*.
Chemical Properties A white to pale-brownish-yellow, hygroscopic, amorphous, or crystalline powder. It may assume a slight pink colour on exposure to light. Soluble 1 in 700 of water and 1 in 300 of ethanol; practically insoluble in acetone, chloroform and ether; soluble in solutions of alkali hydroxides. Alkaline solutions are unstable.

Ultraviolet Spectrum Aqueous alkali—325 nm (A_1^1=78a).
Infrared Spectrum Principal peaks at wavenumbers 1628, 1585, 1308, 1185, 1240, 1148 cm^{-1} (KBr disk).
Quantification
Serum **GC** ECD. Limit of detection, 10 μg/L for levothyroxine, 2.7 μg/L for liothyronine [Nihei *et al.* 1971].

HPLC–MS Tandem MS detection (SIM). Limit of detection, 6 pg [De Brabandere *et al.* 1998].

Enzyme immunoassay Limit of detection, 4 nmol/L [Akman *et al.* 1995].
Hair **HPLC–radioimmunoassay** For method, see Tagliaro *et al.* [1998].
Disposition in the Body Incompletely and variably absorbed after oral administration. 48 to 80% of an administered dose may be absorbed. The extent of absorption increases in the fasted state and the degree of absorption may be affected by the formulation of the drug used. It is metabolised, in the liver and kidney, by de-iodination to liothyronine (tri-iodothyronine), which is the principal active form of levothyroxine; further de-iodination to thyroacetic acid (4-*p*-hydroxyphenoxy-phenylacetic acid), and conjugation with glucuronic acid and sulfate also occur. Deamination and decarboxylation of levothyroxine to the tetrone is a further metabolic pathway. Elimination from the body is slow. About 30 to 55% of a dose is excreted in the urine and 20 to 40% is eliminated in the faeces; of the urinary material about 40% is thyroacetic acid and 20% is liothyronine.

Endogenous serum-levothyroxine concentrations range from 50 to 120 μg/L in normal subjects. A minimum amount of the drug crosses the placenta and can be detected in breast milk.
Therapeutic Concentration

Twenty-four patients with hypothyroidism, receiving treatment with levothyroxine 100 μg daily in the form of a test or a reference preparation, had a mean peak plasma concentration of 98.4 and 108 μg/L at 3 and 2 h, respectively [Vaisman *et al.* 2001].

Fourteen euthyroid goitrous patients were orally administered 150 μg levothyroxine after an overnight fast, as a tablet or in solution. The mean levothyroxine basal concentration was 90.7 μg/L for the solution administration day and 89.0 μg/L for the tablet day. The maximum serum levothyroxine concentration was reached at the second hour after administration for the solution, at 111.5 μg/L and at the third hour for the tablet formulation, maximum 118.1 μg/L [Carpi *et al.* 1993].

Thirty healthy females (mean age, 34 years) were administered a single dose of 600 μg levothyroxine as two different formulations, Synthroid (A) or Levoxine (B), after an overnight fast. Fasting continued for 5 h after dosing and a wash-out period of 35 days was allowed between doses. The mean maximum plasma concentrations of levothyroxine were 59.1 and 71.2 μg/L for the two formulations, respectively, at 3.67 and 3.03 h [Berg and Mayor 1992].
Toxicity

A 34-year-old male ingested ~900 tablets (a total of 720 mg) levothyroxine. He became lethargic 2 to 3 days after administration, had vomiting and insomnia on day 4; was agitated, aggressive, and incoherent on day 5 and was confused when he returned to hospital on day 6. While in hospital for 6 days, he was tachycardic. Free levothyroxine concentrations were >130 μg/L on day 6 and 12 μg/L on day 12. By day 15 he had lost 20 kg in weight [Hack *et al.* 1999].

The following peak serum concentrations were reported in a thyroidectomised patient who had attempted suicide by taking 2000 μg levothyroxine: levothyroxine (on second day) 315 μg/L, FT_4 0.048 μg/L, reverse triiodothyronine 0.80 μg/L, triiodothyronine (on third day) 1.92 μg/L; levothyroxine and reverse triiodothyronine levels returned to their normal range 13 to 17 days after the suicide attempt [Ishihara *et al.* 1998].

Over a one-year period, 15 cases of acute levothyroxine overdose were studied; all patients were <5-years-old and the majority were male. The estimated dose ingested by 10 patients was 1.5 to 8.8 mg (0.1 to 0.73 mg/kg) and all were examined 1 to 6 h after administration. Three patients had initial serum levothyroxine concentrations >750 μg/L and developed signs of toxicity within 12 to 48 h, including tachycardia, hypertension and agitation, which had disappeared within 24 to 60 h [Lewander *et al.* 1989].
Half-life Plasma half-life, 6 to 7 days which may be increased in pregnancy or myxoedema and decreased in hyperthyroidism.
Protein Binding >99.9%.
Dose Adult, 50 to 100 μg of anhydrous levothyroxine sodium daily; increased by increments of 50 μg until desired result (usually, 100 to 200 μg daily). Children, (up to 1 month old) 5 to 10 μg/kg daily (>1 month old); 5 μg/kg daily initially and then increased by 25 μg every 2 to 4 weeks until desired result.

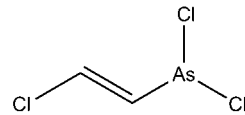
Lewisite

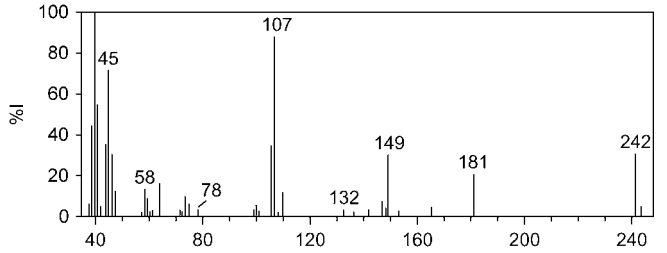
Organic Arsenical, Vesicant
$C_2H_2AsCl_3$ = 207.3
CAS—541-25-3

IUPAC Name 2-Chloroethenyldichloroarsine
Synonyms (2-Chloroethenyl)arsenous dichloride; 2-chlorovinyldichloroarsine; dew of death; dichloro(2-chlorovinyl)arsine.



Chemical Properties Colourless and odourless when pure. Oily, brown liquid with an odour of geraniums when industrially produced. Mp −18°. For a description of the stability of lewisite derivatives under various conditions, see Muir *et al.* [2005].

Mass Spectrum Principal ions at *m/z* 107, 45, 149, 242, 181, 58 Lewisite oxide (2-chlorovinylarsonous oxide (CVAO)) (1,3-propanedithiol (PDT) derivative) [Tomkins *et al.* 2001].



Quantification

Urine **GC-MS** Column: DB-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 45° for 5 min to 165° at 20°/min to 210° at 8°/min to 300° at 50°/min for 5 min. SIM acquisition mode. Limit of detection, 7.4 ng/L [Wooten *et al.* 2002].

Other **GC** Soil. Column: Rtx-5 fused silica capillary (30 m × 0.53 mm i.d., 1.0 µm). Carrier gas: He, 30 mL/min. Temperature programme: 100° for 2 min to 175° at 20°/min to 200° at 4°/min to 250° at 50°/min for 5 min. FPD. Limit of detection, 0.30 and 0.09 mg/kg for CVAO and phenylarsine oxide (PhAsO), respectively [Tomkins *et al.* 2001].

GC-MS Chemical Weapons. Column: DB-5 fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 100° for 5 min to 280° at 10°/min. EI ionisation at 70 eV. Limit of detection not reported [Hanaoka *et al.* 2006]. Soil. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 40° for 1 min to 280° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, tripropanethiol arsine and Clarke I propanethiol derivative 6 µg/kg, phenyldipropanethiol arsine 3 µg/kg [Tornes *et al.* 2006]. Air. Column: DB5-MS capillary (25 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 40° for 2 min to 160° at 20°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of detection, 260 µg/m^3 [Muir *et al.* 2005]. Complex Matrices: Column: DB5-MS capillary (30 m × 0.25 mm i.d., 0.33 µm). Temperature programme: 40° for 1 min to 300° at 20°/min. Electron ionisation, SIM acquisition mode. Limit of detection, butanethiol derivative of Lewisite I 0.12 ng [Muir *et al.* 2004]. Soil. Column: HP-5MS (30 m × 0.25 mm i. d., 0.25 µm). Carrier gas: He. Temperature programme: 100° for 2 min to 175° at 20°/min to 200° at 4°/min to 250° at 50°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, CVAO 0.066 mg/kg, PhAsO 0.023 mg/kg [Tomkins *et al.* 2001]. Soil and Water. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 28 cm/s. Temperature programme: 45° for 1.5 or 5 min to 165° at 20°/min to 210° at 8°/min to 300° at 50°/min for 5 min. Scan mode. Limit of detection, 2-chlorovinylarsonous acid (CVAA)–1,2-ethanedithiol 2.0 µg/L, CVAA-PDT derivative 1.0 µg/L [Szostek, Aldstadt 1998].

Note For a multicapillary chromatographic method using ion mobility increment spectrometry for the analysis of explosives, chemical warfare agents and drugs, see Buryakov [2004].

Disposition in the Body In the environment, Lewisite rapidly hydrolyses to CVAA, which is also toxic and which, in turn, slowly degrades to CVAO (CAS—3088-37-7). This is also the case in an aqueous environment, such as blood plasma [Noort *et al.* 2002].

Toxicity For a review article on the pharmacology and toxicology of lewisite, see Goldman and Dacre [1989].

Note British anti-Lewisite (2,3-dimercapto-1-propanol) was developed just before the end of World War II for the treatment of lewisite gas exposure and is still used clinically as a chelating agent in acute heavy metal poisoning, especially with arsenic, gold, mercury and lead. For a GC-MS method for the determination of British anti-Lewisite in plasma, see Byers *et al.* [2004].

Protein Binding Approximately 25 to 50% of a dose associates with globin.

Lidocaine

Antiarrhythmic, Anaesthetic (Local)

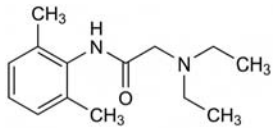
$C_{14}H_{22}N_2O$ = 234.3

CAS—137-58-6

IUPAC Name 2-(Diethylamino)-*N*-(2,6-dimethylphenyl)acetamide

Synonyms 2-Diethylaminoaceto-2′,6′-xylidide; lidokain; lignocaine.

Proprietary Names *Cuivasil*; *Dentipatch*; *ELA-Max*; *Lidoderm*; *LidoPosterine*; *Vagisil*; *Zilactin-L*. Lidocaine and lidocaine hydrochloride are ingredients of many proprietary preparations [Sweetman 2009].



Chemical Properties A white to slightly yellow crystalline powder. Mp 68° to 69° (needles from benzene or alcohol). Insoluble in water; soluble in ethanol, chloroform, benzene and ether. pK_a 7.95 (25°) [Lau *et al.* 1991], 8.01 [Sangster 1994]. Log *P* (*n*-hexane/buffer), 0.32, (octanol/buffer), 1.70, (ether/buffer) 1.77 [Lau *et al.* 1991], (octanol/water), 2.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Lidocaine Hydrochloride

$C_{14}H_{22}N_2O,HCl,H_2O$ = 288.8

CAS—73-78-9 (anhydrous); 6108-05-0 (monohydrate).

IUPAC Name 2-(Diethylamino)-*N*-(2,6-dimethylphenyl)acetamide hydrochloride

Synonym Lignocaine hydrochloride

Proprietary Names *Anestacon*; *Basicaina*; *Batixim*; *Dilocaine*; *Duo-Trach Kit*; *Dynexan*; *Heweneural*; *Laryng-O-Jet*; *Licain*; *Lidesthesin*; *Lidocard*; *Lidocation*; *Lidocaton*; *Lidocord*; *Lidofast*; *Lidoject*; *LidoPen*; *Lidosen*; *Lidrian*; *Lignostab-A*; *Nervocaine*; *Octocaine*; *Odontalg*; *Rinstead* (contact pastilles); *Sedagul*; *Ultracaine*; *Uro-Jet*; *Xylocaine*; *Xylocard*; *Xylocitin*; *Xyloneural*; *Xylotox*.

Chemical Properties A white crystalline powder. Mp 77° to 78°. Soluble 1 in 0.7 of water, 1 in 1.5 of ethanol, and 1 in 40 of chloroform; practically insoluble in ether.

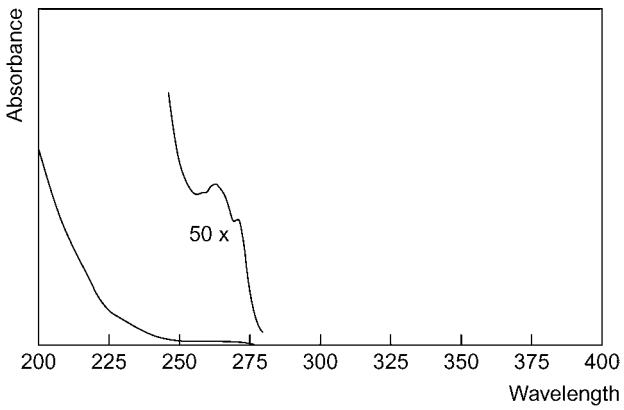
Colour Test To a 2% solution in water, add 1 mL of dilute nitric acid and 3 mL of mercuric nitrate solution and heat to boiling—yellow or yellow-green.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.35; system TC—R_f 0.71; system TE—R_f 0.80; system TL—R_f 0.63; system TAE—R_f 0.72; system TAF—R_f 0.69; system TAJ—R_f 0.55; system TAK—R_f 0.00; system TAL—R_f 0.28 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—pink).

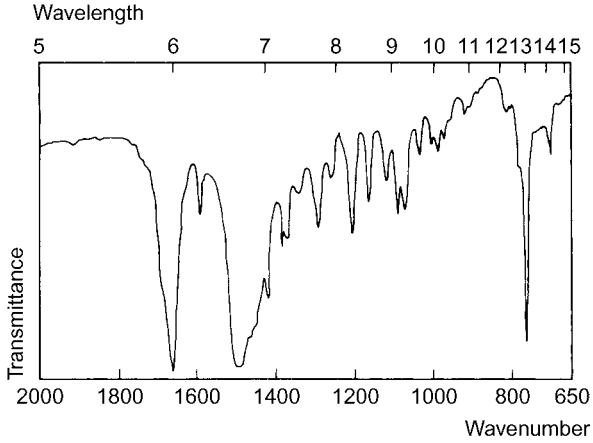
Gas Chromatography System GA—lidocaine RI 1870, M (2,6-dimethylaniline) RI 1180, M (OH-) RI 2350, M (monoethylglycinexylidide) RI 1800, M (desethyl-) RI 1790, M (dimethylhydroxyaniline) RI 1460; system GF—RI 2240; system GQ—lidocaine RT 6.0 min, M (monoethylglycinexylidide) RT 5.5 min.

High Performance Liquid Chromatography System HA—lidocaine *k* 0.6, M (monoethylglycinexylidide) *k* 1.2; system HQ—*k* 0.79; system HX—RI 288; system HY—RI 258; system HZ—RT 2.6 min; system HAA—RT 9.9 min; system HAM—lidocaine RT not detected; system HAX—RT 8.0 min; system HAY—RT 4.5 min.

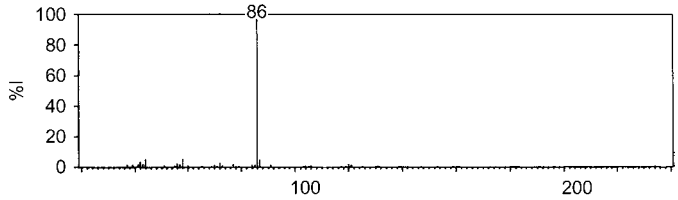
Ultraviolet Spectrum Aqueous acid—263 (A_1^1 = 19a), 272 nm.



Infrared Spectrum Principal peaks at wavenumbers 1662, 1495, 762, 1204, 1290, 1086 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 87, 58, 44, 72, 42, 120, 85.



Quantification

Blood **GC** Column: Ulbon HR-1 capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22.5 cm/s. Temperature programme: 100° to 280° at 10°/min. SID. Limit of detection, 0.5–10 µg/L [Hattori *et al.* 1991]. Column: 3% OV-101 on 80/100 Supelcoport (2 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 200°. NPD. Limit of detection, 0.1 mg/L [Levine *et al.* 1983].

GC-MS [Teatino, Barbaro 2004]. Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Temperature programme: 100° for 5 min to 280° at 20°/min. SIM acquisition mode. Limit of quantification, 0.1 µg/g, limit of detection, 0.05 µg/g [Watanabe *et al.* 1998].

Plasma **GC** Column: HP-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: N_2, 1 mL/min. Temperature programme: 80° for 3 min to 215° at 20°/min to 230° at 5°/min to 290° at 25°/min. FID. Limit of detection, 5 µg/L [Koster *et al.* 2000]. Column: HP-5 (30 m × 0.32 mm i.d.). Carrier gas: N_2, 5 mL/min. Temperature programme: 80° for 1 min to 210° at 40°/min for 3.5 min. NPD. Limit of quantification, 2.5 µg/L, limit of detection, 1 µg/L [Laroche *et al.* 1998]. UV detection [Rodovnichenko *et al.* 1998]. Column: Restek RTX-200 cross-linked trifluoropropylmethylpropylmethylpolysiloxane (30 m × 0.53 mm i.d., 0.25 µm). Carrier gas: He, 70 kPa. Temperature programme: 65° to 225° at 8°/min. NPD. Limit of quantification, 3 µg/L, limit of detection, 2 µg/L [Grouls *et al.* 1995]. Column: 2% Carbowax 20M and 0.5% potassium hydroxide on 100/120 Gas Chrom Q (0.92 m × 2.0 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 190°. NPD. Limit of detection, 300 µg/L [Hawkins *et al.* 1982]. See Blood [Levine *et al.* 1983].

GC-MS Column: DB-1 (15 m × 0.53 mm i.d., 1.5 µm). Carrier gas: He, 15 mL/min. Temperature programme: 140° to 300° at 16°/min for 10 min. Limit of quantification, 50 µg/L (lidocaine and mepivacaine) and 100 µg/L (monoethylglycinexylidide and other local anaesthetics) [Ohshima, Takayasu 1999].

HPLC Column: Zorbax Dikema C_{18} (150 × 4.6 mm, 5 µm). Mobile phase: methanol : diethylamine-acetic acid buffer (pH 4.0, 22 : 78). Limit of detection, 160 µg/L [Chen *et al.* 2007]. Column: ODS TSkgel (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.05 mol/L phosphate buffer (pH 4.0, 10 : 30 : 60), flow rate 0.6 mL/min. UV detection (λ = 210 nm). Retention time: 10 min. Limit of detection, 20 µg/L for lidocaine and metabolites [Kakiuchi *et al.* 2002]. Column: α_1-acid glycoprotein (150 × 4 mm i.d., 5 µm). Mobile phase: 8 mmol/L sodium dihydrogen phosphate and 0.1 mol/L sodium chloride containing 4% propan-2-ol and 0.6% diethylamine (pH 7.05), flow rate 0.9 mL/min. UV detection (λ = 214 nm). Limit of detection, 10 µg/L for lidocaine, 4 µg/L for bupivacaine enantiomers [Abraham *et al.* 1997]. Column: Nucleosil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L sodium dihydrogen phosphate buffer (pH 2.8, 23 : 77), flow rate 1.4 mL/min. UV detection (λ = 210 nm). Retention time: 3.6 min. Limit of quantification, 10 µg/L [Lotfi *et al.* 1997]. Column: LiChroCART Superspher 60 RP-select B (125 × 4 mm i.d., 4 µm). Mobile phase: phosphate buffer (pH 5.8) : acetonitrile (70 : 30). UV detection. Limit of quantification, 2.5 mg/L [Sattler *et al.* 1995]. See Serum [Chen *et al.* 1992a, b]. See Urine [Tam *et al.* 1987].

LC-MS Column: Supelcosil LC-Si (100 × 4.6 mm i.d.). Mobile phase: 2% formic acid in acetonitrile : water (50 : 50), flow rate 1 mL/min. TIS. Retention time: 5.1 min. Limit of quantification, 0.5 µg/L [Chik *et al.* 2006]. Mobile phase: methanol: 0.1% formic acid (1 : 1), flow rate 0.2 mL/min. ESI, positive ion mode. MRM acquisition mode. Limit of quantification, 2 nmol/L [Altun *et al.* 2004]. Column: YMC (150 × 3.0 mm i.d., 3 µm). Mobile phase: 0.1% formic acid in acetonitrile-water (0.5 : 99.5) : 0.1% formic acid in acetonitrile-water (80 : 20, 99.5 : 0.5 to 20 : 80 at 8 min for 2 min to 99.5 : 0.5 at 10.1 min), flow rate 0.35 mL/min. ESI, positive ion mode. Limit of quantification, 1.6–5 nmol/L for lidocaine and metabolites [Abdel-Rehim *et al.* 2000]. Column: C_{18}. Mobile phase : acetonitrile : 26 mmol/L ammonium acetate (pH 4.5, 70 : 30), flow rate 1 mL/min. Positive ion mode. Limit of quantification, 0.2 µg/L [Bo *et al.* 1999].

Serum **GC** Column: HP-Innowax (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2, 2 mL/min. Temperature programme: 50° for 1 min to 150° at 25°/min to 240° at 5°/min for 12 min. FID. Limit of quantification, ~50 µg/L [Baniceru *et al.* 2004]. Column: capillary. NPD. Limit of detection, for lidocaine, bupivacaine and their metabolites, 15 µg/L[Lorec *et al.* 1994]. See Plasma [Hawkins *et al.* 1982].

HPLC Column: Ultracarb ODS-30(5) (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : PBS (pH 5.0, 50 : 50), flow rate 0.8 mL/min. UV detection (λ = 238 nm). Retention time: 6.9 min. Limit of quantification, 1.5 mg/L [Perrotti *et al.* 2006]. Column: Supelcosil LC-8-DB. Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen orthophosphate (pH 3.0, 12 : 78). UV detection (λ = 205 nm). Limit of quantification, 200 µg/L for lidocaine and 10 µg/L for monoethylglycinexylidide [Piwowarska *et al.* 2004]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.05 mol/L potassium dihydrogen phosphate buffer (pH 4.0, 14 : 86), flow rate 1.3 mL/min. UV detection (λ = 205 nm). Retention time: 11.3 min. Limit of detection, 10 µg/L [Chen *et al.* 1992a, b]. UV detection. Limit of detection, 100 µg/L for lidocaine and metabolites [Lindberg *et al.* 1983].

Urine **GC** Column: Alltech EC-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 110° for 1 min to 260° at 32°/min for 5 min. NPD. Limit of detection, 0.01 µg/L [Raikos *et al.* 2009]. See Plasma [Rodovnichenko *et al.* 1998].

GC-MS See Blood [Teatino, Barbaro 2004]. See Plasma [Ohshima, Takayasu 1999].

HPLC Column: Johnsson Spherigel C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile and 11 mmol/L TEA-0.1% phosphoric acid (10 : 90) : acetonitrile and 20 mmol/L TEA-0.1% phosphoric acid (50 : 50, 100 : 0 to 30 : 70 at 15 min to 0 : 100 at 30 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, <0.05 mg/L for lidocaine, bupivacaine and tetracaine [Ma *et al.* 2006]. Column: C_{18} Novopak (115 × 8 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% phosphoric acid with 0.15% TEA (12 : 88, pH 3.0), flow rate 2 mL/min. UV detection (λ = 200 nm). Limit of detection, 0.1 mg/L [Tam *et al.* 1987].

LC-MS See Plasma [Abdel-Rehim *et al.* 2000].

Aqueous Humour **HPLC** Column: C_8. Mobile phase: methanol : 30 mmol/L sodium dihydrogen phosphate containing 10 mmol/L sodium pentane sulfonate (pH 2.5, 50 : 50). UV detection (λ = 225 nm). Limit of quantification, 2.5 mg/L, limit of detection, 0.2 mg/L [Manna *et al.* 2002].

CSF **GC** See Blood [Hattori *et al.* 1991].

HPLC Column: Zorbax Dikema C_{18} (150 × 4.6 mm, 5 µm). Mobile phase: methanol : diethylamine–acetic acid buffer (pH 4.0, 22 : 78). Limit of detection, 140 µg/L [Chen *et al.* 2007].

Milk **GC-MS** Column: 5% diphenylsiloxane 95% dimethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 20 cm/s. Temperature programme: 60° for 1 min to 140° at 10°/min to 250° at 25°/min for 1 min. MSD, SIM acquisition mode. Limit of detection, 0.2 ppb for 2,6-dimethylaniline [Puente, Josephy 2001].

Oral Fluid **GC** See Plasma [Rodovnichenko *et al.* 1998].

Hair **GC-MS** See Blood [Teatino, Barbaro 2004]. Column: Supelcowax 10 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 2 min to 250° at 20°/min to 250° at 20°/min for 7 min. MSD, SIM acquisition mode. Limit of quantification, 0.4 µg/g; limit of detection, 0.1 µg/g [Sporkert, Pragst 2000].

Tissues **GC** See Blood [Levine *et al.* 1983].

Other **GC** Biological Samples. Column: 3% W/W SP 2250 on Chromosorb W 80/100 mesh (2 m × 2 mm), Temperature programme: 210° for 5 min to 280° at 10°/min. NSD. Limit of detection, 0.1 mg/L [Lau *et al.* 1991].

Note For a review of the identification and application of up-to-date chromatographic methods for assay of local anaesthetics in blood and urine, see Stoliarov *et al.* [2009].

Disposition in the Body

Lidocaine is readily absorbed from the gastrointestinal tract, mucous membranes, damaged skin (poor absorption from intact skin) and after IM injection; oral bioavailability is low (~35%) as a result of first-pass metabolism. Metabolism in the liver is rapid, with ~90% of a dose being dealkylated to form monoethylglycinexylidide, which is 60–80% as potent as lidocaine, and glycinexylidide, which is also active. Both have longer half-lives than lidocaine. Further metabolism occurs and metabolic reactions also include hydrolysis, and ring hydroxylation. <10% of a dose is excreted in the urine as unchanged drug in 24 h, 40–70% as 4-hydroxy-2,6-xylidine, and ~4% as the active monoethylglycinexylidide; excretion of unchanged drug is increased if the urine is acid. Other metabolites include 2,6-xylidine, 3′-hydroxylignocaine, and 3′-hydroxymonoethylglycinexylidide. Glycinexylidide and the hydroxy metabolites are excreted as acid-hydrolysable conjugates. Glycinexylidide has also been detected in plasma after prolonged IV infusion. Lidocaine crosses the placenta and the blood–brain barrier and it is excreted in breast milk.

Therapeutic Concentration In plasma, usually in the range 2–5 mg/L.

Following IV infusions at rates varying between 20 and 50 µg/min/kg to 24 subjects, the following steady-state serum concentrations were reported: lidocaine 1.7–11.4 mg/L (mean, 5.7), monoethylglycinexylidide 0.2–5.2 mg/L (mean, 2.0) and glycinexylidide 0–1.4 mg/L (mean, 0.5) [Drayer *et al.* 1983].

A mean peak plasma concentration of 0.4 mg/L lidocaine was attained at 3 h in 24 subjects who received instillation of 200 mg lidocaine with adrenaline 1 : 500 000 into the intraperitoneal cavity after total abdominal hysterectomy. The highest concentration in any patient was 0.87 mg/L [Williamson *et al.* 1997].

In 15 patients with mild asthma, inhalation of lidocaine 10% (total dose: 5.0 mg/kg) produced a mean peak plasma concentration of 1.4 mg/L at ~13 min [Groeben *et al.* 2000].

In a study in 10 patients, 5 to 10 g of a cream containing lidocaine–prilocaine (EMLA) was given as a single 24 h application to leg ulcers (50–100 cm^2). Peak plasma lidocaine and prilocaine levels of 185–705 µg/L and 62–277 µg/L, respectively, occurred after 2–4 h (except in 1 patient, where they occurred at 6–8 h) [Stymne, Lillieborg 2001].

Following topical administration of lidocaine patches (four 5% patches) to 20 subjects for 18 h on each of 3 consecutive days, mean peak plasma concentrations of 0.1451, 0.153 and 0.1538 mg/L (occurring at 18, 16.5 and 16.5 h, respectively) were reported on days 1, 2 and 3, respectively [Gammaitoni, Davis 2002].

In another similar study, topical application of 4 patches every 12 or 24 h for 3 days resulted in steady-state maximum plasma levels of 0.186 mg/L and 225 mg/L, respectively [Gammaitoni *et al.* 2002].

In a study in 10 patients, 11 mL of 2% lidocaine gel (Instillagel) was inserted into the uterine cavity after thermal ablation. Plasma levels were 40.3, 66.3, 64.9 and 75 µg/L after 5, 15, 30 and 60 min, respectively [Rousseau *et al.* 2002].

Levels of free lidocaine following epidural injection of a 1.5% solution with adrenaline was increased in elderly patients [Fukuda *et al.* 2003].

In pregnant women at term given peridural anaesthesia with 200 mg lidocaine as a 2% solution, peak plasma levels of lidocaine were 1.146 and 0.879 mg/L in women with and without gestational diabetes mellitus, respectively. Peak levels of the main metabolite, monoethylglycinexylidide, were 141.4 and 82.7 µg/L, respectively. Clearance of lidocaine appears to be reduced in diabetes mellitus [Moisés *et al.* 2008].

Toxicity Toxic effects are associated with plasma concentrations >6 mg/L, and fatalities with blood concentrations >14 mg/L.

In 3 deaths involving accidental ingestion of 25 g, the following postmortem tissue concentrations were reported: blood 44, 92 and 11 mg/L; brain 17, 32 and 7 µg/g; kidney 66, – and 68 µg/g; liver 70, 96 and 20 µg/g; lung 94, 130 and 49 µg/g; and urine 59, – and – mg/L; in the first 2 cases, death occurred within a few minutes of ingestion, whereas the third subject survived for 24 h [Borkowski, Dluzneiwska, 1976].

In 33 patients with cardiac disorder and given lidocaine infusions for more than 1 day, serum levels above 8 mg/L occurred in 6 of 27 patients who had no toxicity; 5 of 6 patients with toxicity had levels below 8 mg/L [Drayer *et al.* 1983].

In a death cause by accidental IV injection of 2 g lidocaine, the following postmortem tissue concentrations were reported: blood 30 mg/L, brain 135 µg/g, heart 106 µg/g, kidney 204 µg/g, lung 87 µg/g and skeletal muscle 20 µg/g [Poklis *et al.* 1984].

In 2 deaths from deliberate self-poisoning with lidocaine, the first by oral ingestion and the second by IV injection, postmortem blood analysis revealed concentrations of 40 and 53 mg/L, respectively; urine contained 49 mg/L lidocaine in the first victim [Dawling *et al.* 1989].

In the case of a 1-month-old infant who inadvertently received an IV injection of 50 mg lidocaine, the calculated maximum level was 5.39 mg/L [Jonville *et al.* 1990].

In a 32-year-old hospital patient whose death was attributed to an overdose of lidocaine (~1500 mg) administered with homicidal intent, postmortem revealed the following lidocaine concentrations: blood, 22.2 mg/L, liver 43.6 µg/g, kidney 28.3 µg/g, brain 23.1 µg/g and heart 13.1 µg/g [Kalin, Brissie 2002].

In a fatality in a patient with paroxysmal ventricular arrhythmia given an injection of 5 mL of 10% lidocaine hydrochloride (500 mg) instead of 2.5 mL of 2% (50 mg), the following concentrations were reported in postmortem tissues that had been fixed in formalin for 40 days: parietal lobe 308 ng/g, occipital lobe 208.7 ng/g, temporal lobe 318 ng/g, frontal lobe, 223.2 ng/g, cerebellum 200.9 ng/g, pons 285.7 ng/g, liver 109.5 ng/g, kidney 109.5 ng/g and skeletal muscle 127 ng/g; formalin solution contained 8.4 µg/L. Animal studies found levels in these tissues decreased to 25–33% of the original value on storage in formalin [Kudo *et al.* 2004].

In the case of suicide by a 31-year-old woman through oral ingestion of lidocaine, the following postmortem levels were reported: blood 31 mg/L, gastric contents 2.5 g, liver 10 µg/g, kidney 12 µg/g, brain 9 µg/g, spleen 24 µg/g, lung 84 µg/g, heart 9 µg/g, urine 9 mg/L and bile 6 mg/L [Centini *et al.* 2007].

Half-life Plasma half-life, lidocaine 1–2 h, increased in subjects with liver disease or after acute myocardial infarction; monoethylglycinexylidide ~1–2 h, glycinexylidide ~10 h.

Volume of Distribution Approximately 1–2 L/kg.

Clearance Plasma clearance, ~5–20 mL/min/kg.

Protein Binding Approximately 70% at therapeutic concentrations but there is considerable intersubject variation and binding appears to be concentration-dependent

Note For a review of the pharmacokinetics of lidocaine, see Benowitz, Meister [1978]; for a review of the pharmacokinetics and pharmacodynamics of IV agents for ventricular arrhythmias, see Nolan [1997]; for a study of the pharmacokinetics of epidural lidocaine and bupivacaine during caesarean section, see Downing *et al.* [1997].

Dose For local anaesthesia, the maximum single dose of lidocaine hydrochloride by injection should not exceed 300 mg (4.5 mg/kg), unless administered with adrenaline. For ventricular arrhythmias, initially 50–100 mg IV, followed by an infusion.

Lidoflazine

Antianginal

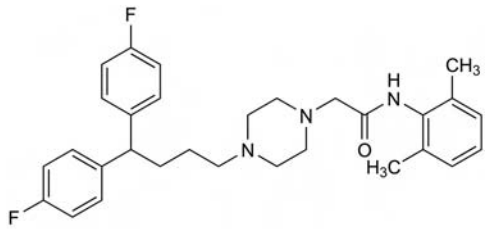
$C_{30}H_{35}F_2N_3O = 491.6$

CAS—3416-26-0

IUPAC Name 4-[4,4-Bis(4-fluorophenyl)butyl]-*N*-(2,6-dimethylphenyl)-1-piperazineacetamide

Synonyms Ordiflazine; R-7904.

Proprietary Names *Clinium*; *Corflazine*; *Klinium*.



Chemical Properties A white or slightly-yellow amorphous powder. Mp 159° to 161°. Almost insoluble in water; soluble 1 in 90 of ethanol and 1 in 220 of ether; very soluble in chloroform. Log *P* (octanol/water), 5.6.

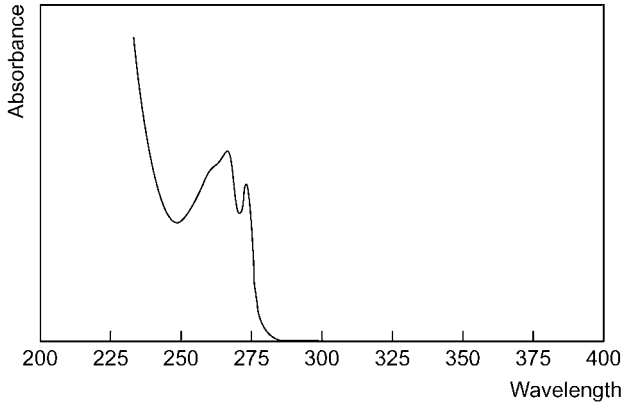
Colour Tests Mandelin's test—yellow; Marquis test—yellow.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.11; system TC—R_f 0.63; system TE—R_f 0.70; system TL—R_f 0.36; system TAE—R_f 0.70; system TAF—R_f 0.77 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—lidoflazine RI 3870, M (desaminocarboxy-) RI 2230, M (desaminocarboxy-)-Me RI 2125; system GB—lidoflazine, not eluted.

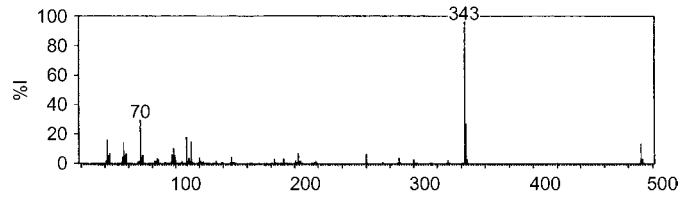
High Performance Liquid Chromatography System HA—*k* 0.6; system HX—RI 530.

Ultraviolet Spectrum Acid isopropyl alcohol—266 (A_1^1=47b), 272 nm.



Infrared Spectrum Principal peaks at wavenumbers 1505, 1645, 1220, 1155, 835, 775 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 343, 70, 344, 109, 42, 113, 491, 56.



Disposition in the Body Lidoflazine is well absorbed after oral administration. It is excreted mainly as metabolites, the major metabolites being bis(4-fluorophenyl)butyric acid and the glucuronide conjugate of bis(4-fluorophenyl)butan-1-ol. In 7 days, about 40% of an oral dose is excreted in the urine and about 40% is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 120 mg given with food, peak plasma concentrations of about 0.06 mg/L were attained in about 1 h. Following repeated oral administration of 120 mg three times a day, a mean steady-state plasma concentration of 0.12 mg/L was reported [Vanhoutte, Van Nueten 1973].

Half-life Plasma half-life, about 1 day.

Dose 120 to 360 mg daily.

Vanhoutte PM, Van Nueten JM (1973). Lidoflazine. In: Scriabine A, ed. *New Drugs Annual: Cardiovascular Drugs*. New York: Raven Press, 203–226.

Limaprost

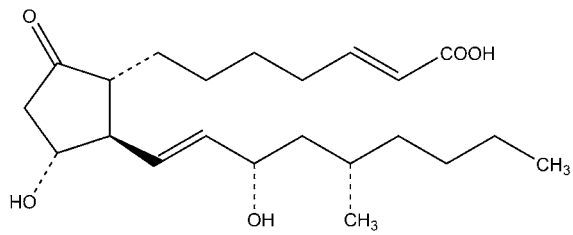
Antianginal, Prostaglandin

$C_{22}H_{36}O_5 = 380.5$

CAS—74397-12-9

IUPAC Name (*E*)-7-[(1*R*,2*R*,3*R*)-3-Hydroxy-2-[(*E*,3*S*,5*S*)-3-hydroxy-5-methylnon-1-enyl]-5-oxocyclopentyl]hept-2-enoic acid

Synonyms (2*E*,11α,13*E*,15*S*,17*S*)-11,15-Dihydroxy-17,20-dimethyl-9-oxoprosta-2,13-dien-1-oic acid; 17*S*,20-dimethyl-*trans*-2,3-didehydro-PGE1; (*E*)-7-{(1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*)-(3*S*,5*S*)-3-hydroxy-5-methyl-1-nonenyl]-5-oxocyclopentyl}-2-heptenoic acid; 17*S*-methyl-ω-homo-*trans*-Δ2-PGE1; ONO-1206; OP-1206; 9-oxo-11α,15α-dihydroxy-17S,20-dimethylprosta-*trans*-2,*trans*-13-deenoic acid.



Chemical Properties White crystals. Mp 97° to 100°. Under high humidity conditions, limaprost degrades rapidly; aqueous solutions of limaprost are most stable at pH 3 to 4 [Moribe *et al.* 2007]. Limaprost is stable in plasma for up to 73 days at –80°, after three freeze–thaw cycles, up to 4 h at room temperature, in whole blood for 4 h at 4°, and in processed samples for 96 h at 4° [Komaba *et al.*, 2007].

Limaprost Alfadex

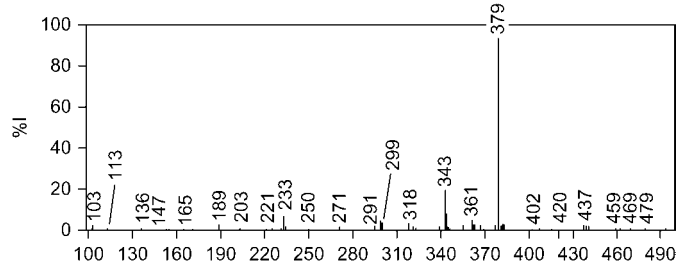
CAS—88852-12-4

Proprietary Names *Opalmon*; *Prorenal*.

Chemical Properties α-Cyclodextrin inclusion compound of limaprost.

High Performance Liquid Chromatography Column: Inertsil ODS-2 (150 × 4.6 mm i.d., 5 μm). Mobile phase: water : acetonitrile (linear gradient, not described), flow rate 1.0 mL/min. Samples derivatised with 4-(*N*,*N*-dimethylaminosulfonyl)-7-(1-piperazinyl)-2,1,3-benzoadiazole. Fluorescence detection (λ_{ex} = 440 nm, λ_{em} = 569 nm). Limit of detection, 1.7 to 5.0 fmol/L [Toyo'oka *et al.* 1992]. Column: ODS (150 × 4.6 mm i.d.). Mobile phase: 0.02 mol/L potassium dihydrogen phosphate : acetonitrile : isopropyl alcohol (9 : 5 : 2), flow rate 0.8 mL/min. UV detection (λ = 215 nm). Limit of detection not reported [Moribe *et al.* 2007].

Mass Spectrum



Quantification
Plasma **LC-MS** Column: Capcell PAK phenyl UG120 (150 × 2.0 mm, 5 μm). ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 0.1 ng/L [Komaba *et al.*, 2007]
Disposition in the Body Rapidly absorbed following oral administration, with peak plasma concentrations reached within 1 h. Studies in rats have shown that 70% of an orally administered radiolabelled dose is excreted in the faeces, with the majority of the remainder excreted in urine over a 96-h post-dose period. At the time of writing, the extent or site of metabolism and route of excretion has not yet been investigated in humans.
Therapeutic Concentration
Twenty-four healthy volunteers were administered either 5 or 10 μg limaprost orally and monitored for 4 h. Mean peak plasma concentrations for the 2 doses were 1.02 and 1.93 ng/L, respectively, reached at 1.0 h [Komaba *et al.*, 2007].
Twelve healthy adult volunteers were administered either 5 or 10 μg limaprost orally. Mean peak plasma concentrations for the 2 doses were 1.18 and 2.06 ng/L reached at 0.75 h and 0.5 h, respectively [Tsuboshima *et al.*, 1992].
Half-life Approximately 1 h.
Clearance Approximately 3110 L/h.
Dose Given by mouth as limaprost alfadex, in a dose equivalent to limaprost 15 to 30 μg daily in three divided doses.

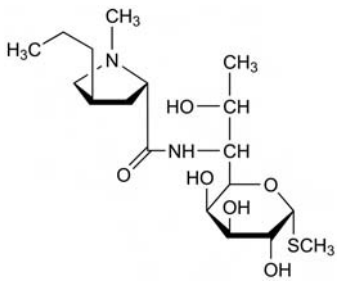
Lincomycin

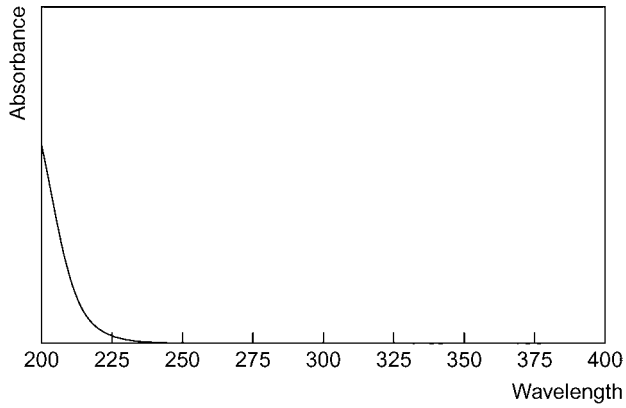
Antibiotic
$C_{18}H_{34}N_2O_6S$ = 406.5
CAS—154-21-2
IUPAC Name (2*S*,4*R*)-*N*-[(1*R*,2*R*)-2-Hydroxy-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-methylsulfanyloxan-2-yl]propyl]-1-methyl-4-propylpyrrolidine-2-carboxamide
Synonym (2*S*-*trans*)-Methyl 6,8–dideoxy-6-[[(1-methyl-4–propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*-octopyranoside; NSC-70731.



Chemical Properties Slightly soluble in water; soluble in methanol, lower alcohols, ethyl acetate, acetone and chloroform. pK_a 7.5. Log *P* (octanol/water), 0.6.

Lincomycin Hydrochloride
$C_{18}H_{34}N_2O_6S,HCl,H_2O$ = 461.0
CAS—859-18-7 (anhydrous); 7179-49-9 (monohydrate)
Proprietary Names *Albiotic*; *Anbycin*; *Cillimicina*; *Frademicina*; *Fredcina*; *Linco*; *Lincocin(e)*; *Lincocina*; *Lincogin*; *Lincolan*; *Lincomy*; *Linco-Plus*; *Lincorex*; *Lingo*; *Linmycin*; *Macrolin*; *Mycivin*; *Princol*; *Rimsalin*.
Chemical Properties A white crystalline powder. Soluble 1 in 1 of water, 1 in 40 of ethanol and 1 in 20 of dimethylformamide; soluble in methanol; practically insoluble in chloroform and ether.

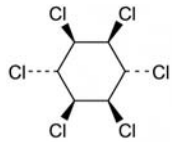
Colour Test Sodium nitroprusside (method 3)—violet.
Thin-layer Chromatography System TA—R_f 0.67; system TAE—R_f 0.75 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



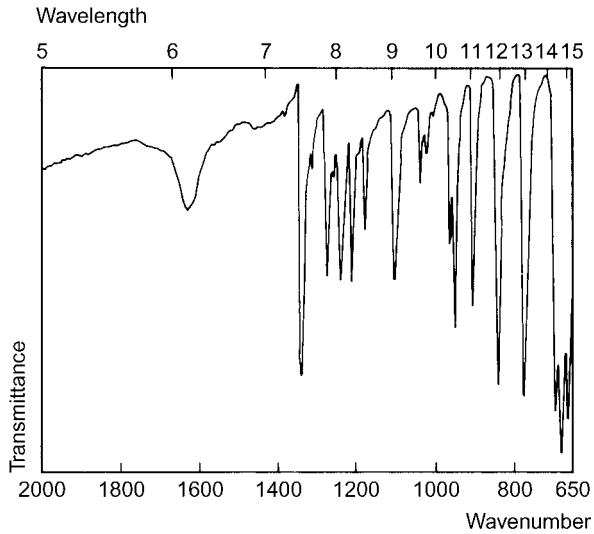
Infrared Spectrum Principal peaks at wavenumbers 1655, 1104, 1075, 1564, 1040, 1262 cm^{-1} (lincomycin hydrochloride, KBr disk).
Dose The equivalent of 1.5 to 2 g of lincomycin daily.

Lindane

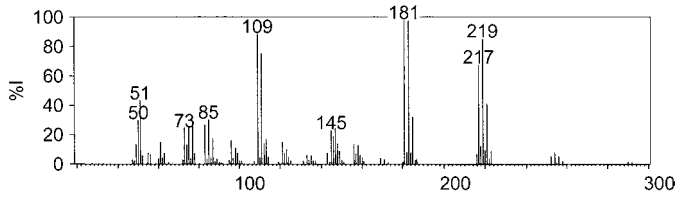
Insecticide
$C_6H_6Cl_6$ = 290.8
CAS—58-89-9
IUPAC Name (1α,2α,3β,4α,5α,6β)-1,2,3,4,5,6-Hexachlorocyclohexane
Synonyms 666; Benhexachlor; gamma benzene hexachloride; gamma-BHC; gamma-HCH; HCH; hexicide.
Proprietary Names *Aphtiria*; *Delitex N*; *Elentol*; *Escabin*; *Esoderm*; *Gambex*; *Gamene*; *GBH*; *G-Well*; *Hexicid*; *Hexit*; *Jacutin*; *Kwell*; *Kwellada*; *Lendianon*; *Lindanoxil*; *Lorexane*; *Pediletan*; *Pilensar*; *Piodrex*; *Pioletal*; *Pionax*; *Plurisan*; *Pruritrat*; *Quellada*; *Sarnapin*; *Sarpiol*; *Scabecid*; *Scabene*.



Chemical Properties A white crystalline powder. Mp 112.5°. Practically insoluble in water; soluble 1 in 19 of dehydrated alcohol, 1 in 2 of acetone, 1 in 3.5 of chloroform and 1 in 5.5 of ether. Log *P* (octanol/water), 3.7.
Thin-layer Chromatography System TE—R_f 0.86; system TF—R_f 0.75; system TX—R_f 0.51; system TY—R_f 0.92.
Gas Chromatography System GA—RI 1745; system GK—RRT 0.76(relative to caffeine).
Infrared Spectrum Principal peaks at wavenumbers 680, 665, 695, 778, 840, 950 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 181, 183, 109, 219, 111, 217, 51, 221.



Quantification

Blood **GC** ECD. Limit of detection, 1 µg/L [Radomski, Ray 1970]. ECD. For method, see Jain *et al.* [1965].

Serum **GC** ECD. Limit of detection, <7 µg/L [Saady, Poklis 1990].

Tissues **GC** See Blood [Radomski, Ray 1970].

Disposition in the Body Readily absorbed after ingestion, inhalation, or through the skin. It is stored in the body fat and adrenal glands. Metabolised by oxidation and dehydrohalogenation to a series of chlorinated phenols which are excreted mainly in the urine in free and conjugated form.

After IV administration, about 25% of the dose is excreted in the urine; after topical administration about 10% of the dose is recovered in the urine. [Feldmann, Maibach 1974.]

Blood Concentration

Blood-lindane concentrations in subjects with low occupational exposure ranged from 1 to 9 µg/L (mean, 4), and concentrations in subjects with high dermal occupational exposure ranged from 6 to 93 µg/L (mean, 31) [Milby *et al.* 1968].

Average serum concentrations of 0.07, 0.19 and 0.04 mg/L of α-benzene hexachloride (α-BHC), β-BHC and γ-BHC, respectively, were reported in 57 subjects who worked in a factory manufacturing lindane; β-BHC was the only isomer observed to accumulate on chronic exposure. A mean fat concentration of 45.6 µg/g of β-BHC was reported in 8 subjects [Baumann *et al.* 1980].

Fifteen subjects with long-term (5 to 17 years) exposure to wood-preserving chemicals containing lindane and pentachlorophenol had mean serum levels of 0.085 and 43.6 µg/L, respectively [Peper *et al.* 1999].

Toxicity Lindane is not highly toxic when applied externally in the concentrations usually employed (0.1 to 1%), but when ingested it may cause convulsions; dusts may irritate the nose and throat when used in a confined space. Blood concentrations >0.02 mg/L have been associated with toxic effects. The estimated minimum oral lethal dose is 200 mg/kg and the maximum permissible atmospheric concentration is 0.5 mg/m^3. Toxic doses or long-term exposure may cause liver necrosis. The maximum acceptable daily intake is 10 µg/kg.

A young girl who ingested about 1.6 g of lindane was found to have a serum concentration of 0.84 mg/L after 2 h, following convulsions; the concentration decreased to 0.49 mg/L after 4 h; urinary concentrations of individual free phenolic metabolites determined 5.5 h after ingestion ranged from 0.04 to 0.74 mg/L [Starr, Clifford 1972].

A fat concentration of 343 µg/g was reported in a fatality caused by lindane [Hayes, Vaughn 1977].

Half-life Derived from urinary excretion data, about 26 h.

Use Topically in concentrations of 0.1 to 1%.

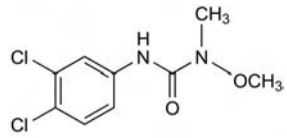
Linuron

Herbicide

$C_9H_{10}Cl_2N_2O_2$ = 249.1

CAS—330-55-2



IUPAC Name *N′*-(3,4-Dichlorophenyl)-*N*-methoxy-*N*-methylurea

Synonyms Du Pont herbicide 326; HOE-2810.

Proprietary Names *Afalon*; *Garnitan*; *Linex*; *Linorox*; *Linurex*; *Lorox*; *Premalin*; *Rotalin*; *Sarclex*; *Sinuron*; *Siolcid*.

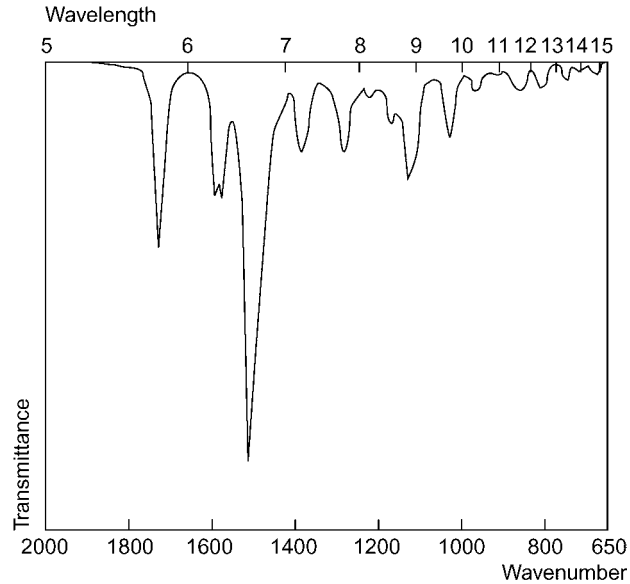
Chemical Properties A white crystalline solid (fine flakes or coarse powder). Mp 93° to 94°. Soluble in water (81 mg/L at 25°) and soluble in acetone (500 g/kg at 25°), ethanol (150 g/kg at 25°), benzene (150 g/kg at 25°), toluene, xylene (130 g/kg at 25°), and heptane (15 g/kg at 25°); readily soluble in dimethylformamide, chloroform and diethyl ether; moderately soluble in aromatic hydrocarbons; sparingly soluble in aliphatic hydrocarbons. Log *P* (octanol/water), 3.00.

Thin-layer Chromatography System TX—R_f 0.22; system TY—R_f 0.31.

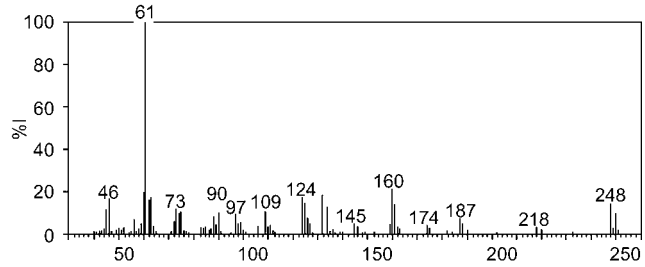
Gas Chromatography System GA—linuron RI 1927, linuron-Me RI 1785, 3,4-dichloroaniline RI 1323; system GK—linuron RRT 0.97, 3,4-dichloroaniline RRT 0.36, 3,4-dichlorophenyl-isocyanateRRT 0.13 (all relative to caffeine).

High Performance Liquid Chromatography System HY—RI 506; system HAA—retention time 21.3 min.

Infrared Spectrum Principal peaks at wavenumber 2269, 1507, 1729, 1594, 1132, 1282 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 61, 160, 132, 124, 46, 248, 73, 109.



Disposition in the Body Linuron is broken down completely after passing through the liver. It is unlikely to bioaccumulate. Metabolites include 3,4-dichloroaniline and 3,4-dichlorophenylisocyanate.

Liothyronine

Thyroid Agent

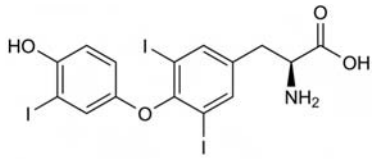
$C_{15}H_{12}I_3NO_4$ = 651.0

CAS—6893-02-3

IUPAC Name (2*S*)-2-Amino-3-[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]propanoic acid

Synonyms *O*-(4-Hydroxy-3-iodophenyl)-3,5-diiodo-L-tyrosine; L-tri-iodothyronine.

Note The abbreviation T_3 is often used for tri-iodothyronine.



Chemical Properties Crystals. Mp 236° to 237°, with decomposition. Insoluble in water, alcohol and propylene glycol; soluble in dilute alkalis. pK_a 8.5. Log *P* (octanol/water), 3.0.

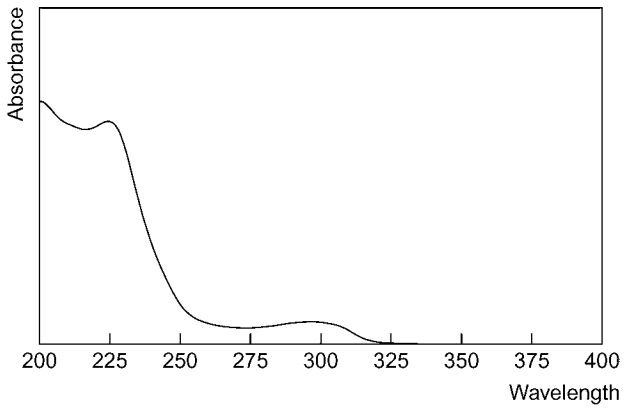
Liothyronine Hydrochloride

$C_{15}H_{12}I_3NO_4,HCl = 687.4$
CAS—6138-47-2
Proprietary Name *Thybon*
Chemical Properties Long birefringent needles. Mp 202° to 203° with decomposition.

Liothyronine Sodium

$C_{15}H_{11}I_3NNaO_4 = 673.0$
CAS—55-06-1
Synonym Sodium liothyronine
Proprietary Names *Cynomel*; *Cytomel*; *Dispon*; *Neo-Tiroimade*; *Ro-Thyronine*; *Tertroxin*; *Thybon*; *Thyrotardin*; *Ti-Tre*; *Triostat*; *Triyodisan*; *Triyotex*. It is an ingredient of *Euthroid*, *Novothyral*, and *Thyrolar*.
Chemical Properties A white to buff-coloured solid or crystalline powder. Practically insoluble in water, chloroform, ether and most other organic solvents; soluble 1 in 500 of ethanol; soluble in solutions of alkali hydroxides.

Ultraviolet Spectrum Liothyronine sodium: aqueous alkali—319 nm (A^1_1=65a).

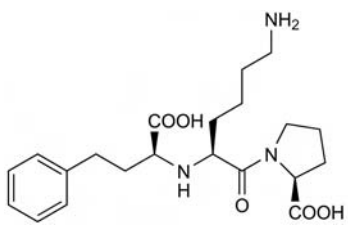


Infrared Spectrum Principal peaks at wavenumbers 1608, 1180, 1493, 1250, 1535, 1320 cm^{-1} (KBr disk).
Quantification See under Levothyroxine.
Disposition in the Body Liothyronine is absorbed after oral or IM administration. It is metabolised by conjugation with glucuronic acid or sulfate, de-iodination oxidative deamination and decarboxylation. It is excreted mainly in the bile and faeces, and is subject to enterohepatic circulation; some iodide is excreted in the urine.

Endogenous serum concentrations range from 0.0010 to 0.0016 mg/L, in normal subjects.
Half-life Plasma half-life, about 2 days.
Protein Binding >99%.
Dose Up to 100 µg of liothyronine sodium daily.

Lisinopril

Antihypertensive
$C_{21}H_{31}N_3O_5 = 405.5$
CAS—76547-98-3
IUPAC Name (2*S*)-1-[(2*S*)-6-Amino-2-[[(2*S*)-1-hydroxy-1-oxo-4-phenylbutan-2-yl]amino] hexanoyl]pyrrolidine-2-carboxylic acid
Synonyms (*S*)-1-[N^2-(1-Carboxy-3-phenylpropyl]-L-lysyl]-L-proline; L-154,826-000T; lisinoprilum; MK-521.



Chemical Properties A white to off-white crystalline powder. It is soluble in water (1 in 10), methyl alcohol (1 in 70); practically insoluble in alcohol, acetone, chloroform and in ether. pK_a 2.5, 4.0, 6.7, 10.1 (25°). Log *P* (octanol/water), −1.22; log *P* (phosphate buffer (0.1 mol/L, pH 7)/octanol), 10.2 ± 0.5 (room temperature). Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Lisinopril Dihydrate

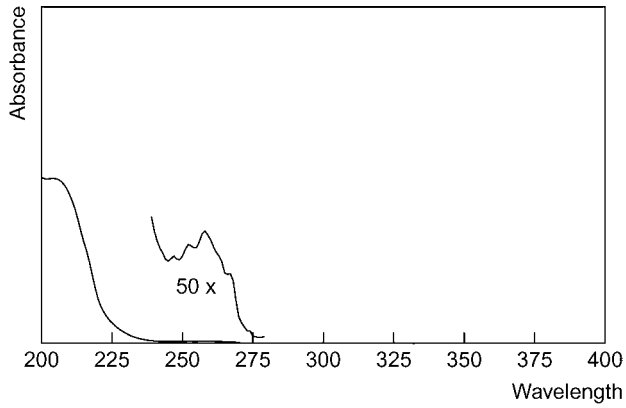
$C_{21}H_{31}N_3O_3,2H_2O = 441.5$
CAS—83915-83-7
Proprietary Names *Acemin*; *Acerbon*; *Alapril*; *Carace*; *Coric*; *Doneka*; *Prinil*; *Prinivil*; *Novatec*; *Tensopril*; *Vivatec*; *Zestril*. Also an ingredient of *Novazyd*; *Prinzide*; *Zestoretic*.
Chemical Properties An off-white crystalline powder. Solubility: water (97 g/L), methanol (14 g/L), ethanol, acetone, acetonitrile, chloroform and *N*,*N*-dimethylformamide (<0.1 g/L).

Thin-layer Liquid Chromatography System TB—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAE—R_f 0.27.
High Performance Liquid Chromatography System HX—RI 271; system HY—RI 250; system HZ—retention time 1.5 min.

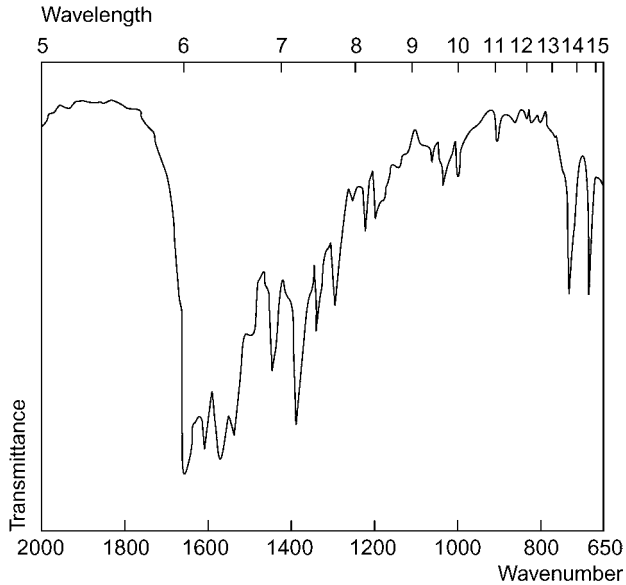
Column: ILS Hypersil (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : TEA (triethylamine) (pH 2.6, 50:50:0.1), flow rate 1 mL/min. UV detection (λ=210 nm); fluorescence detection (λ_{ex}=340 nm, λ_{em}=455 nm). Retention time: 2.9 min [El-Gindy *et al.* 2001].

Column: ODS Hypersil (250 × 4.5 mm i.d., 5 µm). Mobile phase: 20 mmol/L sodium heptanesulfonate (pH 2.5) : ACN (acetonitrile) (with 5% THF, tetrahydrofuran) (63:37), flow rate 1 mL/min. UV detection (λ= 215 nm). Retention time: 5.0 min [Bonazzi *et al.* 1997].

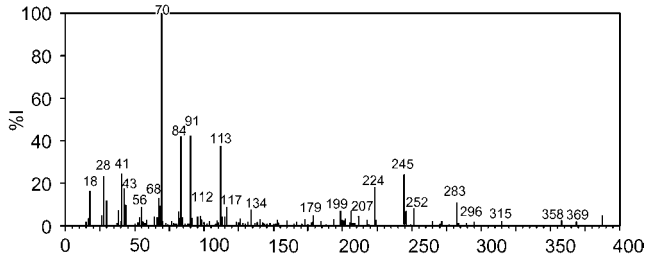
Column: C_{18} µBondapak (300 × 3.9 i.d., 10 µm). Temperature: 40°. Mobile phase: 15 mmol/L potassium dihydrogen phosphate (pH 2.9) : ACN : methanol : THF (92:6:1:1), flow rate 1.5 mL/min. Internal standard (IS): enalaprilat. UV detection (λ=206 nm). Retention time: lisinopril, 7.5 min; IS, 10.5 min [Wong, Charles 1995].
Ultraviolet Spectrum Aqueous alkali (0.1 mol/L sodium hydroxide)—246, 254, 258, 261, 267 nm; aqueous acid (0.1 mol/L hydrochloric acid)—246, 253, 258, 264, 267 nm.



Infrared Spectrum Principal peaks at wavenumbers 1655, 1570, 1388, 741, 732 cm^{-1} (broad peak around 3000 cm^{-1}) (KBr).



Mass Spectrum Principal peaks at *m/z* 70, 91, 84, 113, 245, 41, 28, 224.



Quantification

Plasma **GC–MS** Limit of detection 0.5 µg/L [Shioya *et al.* 1989].

Urine **GC–MS** Limit of detection 5 µg/L [Shioya *et al.* 1989].

Disposition in the Body Lisinopril is slowly and incompletely absorbed after oral administration. Absorption varies between 6 and 60% depending on the individual, but on average is 25% of the dose. Metabolism does not occur as it is already an active diacid (a lysine derivative of enalaprilat). The absorbed drug is excreted unchanged in urine via the kidneys and the unabsorbed drug is excreted in faeces.

Therapeutic Concentration The serum therapeutic concentration is 20 to 70 µg/L.

Twelve healthy male volunteers were administered with an oral dose of 10 mg lisinopril. Peak serum concentrations of 0.095 ± 0.055 µg/L were observed in 7 ± 1 h [Ulm *et al.* 1982].

Bioavailability 25 to 50%.

Half-life 12 h.

Volume of Distribution Mean 124 L.

Clearance 6.36 L/h (following a 10 mg oral dose in healthy subjects); reduced in renal impairment and the elderly. Clearance reduced in impaired renal function (glomerular filtration rate <30 mL/min).

Protein Binding Negligible.

Note For a review of lisinopril, see Simpson and Jarvis [2000]. For a general review of the pharmacokinetics of ACE inhibitors, see Kelly and O'Malley [1990].

Dose 2.5 to 20 mg daily with a maximum of 40 mg daily.

Lithium Carbonate

Tranquilliser

$Li_2CO_3 = 3.89$

CAS—302-27-2

IUPAC Name Dilithium carbonate

Synonyms CP-15467-61; lithii carbonas; lithium carb; NSC-16895.

Proprietary Names *Camcolit*; *Carbolit*; *Carbolith*; *Carbolithium*; *Eskalith*; *Hypnorex*; *Leukominerase*; *Li 450*; *Liskonum*; *Lithane*; *Litheum*; *Lithicarb*; *Lithizine*; *Lithobid*; *Lithonate*; *Lithosun*; *Lithotabs*; *Litiocar*; *Lito*; *Neurolepsin*; *Phasal*; *Plenur*; *Priadel*; *Quilonorm*; *Quilonum Retard*; *Teralithe*.

Chemical Properties A white granular powder. Mp ~720°. Soluble 1 in 78 of cold water and 1 in 140 of boiling water; practically insoluble in ethanol; soluble, with effervescence, in dilute mineral acids. Log *P* (octanol/water), −6.2.

Lithium Citrate

$C_6H_5Li_3O_7,4H_2O = 282.0$

CAS—919-16-4 (anhydrous); 6080-58-6 (tetrahydrate).

IUPAC Name Trilithium 2-hydroxypropane-1,2,3-tricarboxylate tetrahydrate

Synonym Lithii citras

Proprietary Names *Li-Liquid*; *Litarex*; *Lithonate-S*.

Chemical Properties A white, somewhat deliquescent, crystalline powder. Soluble 1 in 2 of water; practically insoluble in ethanol and ether.

Quantification

Blood **AAS** Varian hollow cathode lamp ($\lambda = 670.8$ nm). Limit of detection, 1 mg/L [Scott 1982].

ETAAS ($\lambda = 670.8$ nm). Limit of detection, 2 nmol/L [Robertson *et al.* 1973].

Serum **ETAAS** Lithium hollow cathode lamp ($\lambda = 668$ nm). Limit of detection, 50 nmol/L [Levy, Katz 1970].

Urine **ETAAS** See Blood. Limit of detection, 30 nmol/L. [Robertson *et al.* 1973].

Disposition in the Body Readily absorbed after oral administration. Approximately 97% of a dose is excreted unchanged in the urine in 10 days, with 50–60% in the first 24 h, and only small amounts being found in the faeces, saliva, and sweat. The urinary excretion of lithium appears to be slower in the elderly than the young and also appears to occur more slowly at night, resulting in a diurnal rhythm in excretion rate. Its excretion is also markedly influenced by sodium and, possibly, potassium status; in subjects where the sodium intake is reduced, lithium is reabsorbed by the renal tubules and in subjects who have a high sodium intake the excretion of lithium is increased. Lithium is widely distributed throughout the body and higher concentrations may be found in bones, the thyroid gland, and parts of the brain than in plasma. It crosses the placenta and is excreted in breast milk.

Therapeutic Concentration Lithium plasma concentrations should be monitored 12 h after a dose to ensure that they are within the range 0.5–1.2 mmol/L.

Administration of lithium 600 mg once daily as a slow-release capsule formulation to 18 subjects resulted in mean plasma concentrations (over 96 h) of 0.252 mmol/L, compared with 0.214 mmol/L following twice daily dosing with 300 mg of a standard-release preparation. Corresponding values for the first 24 h were 0.303 and 0.264 mmol/L, respectively [Castrogiovanni 2002].

Following a single oral dose of 600 mg to 10 subjects, peak plasma concentrations of 0.45–0.80 mmol/L (mean 0.64) were attained in ~2 h [Meinhold *et al.* 1979].

After daily oral doses of 1.5–1.7 g to 16 subjects, steady-state serum concentrations were in the range 0.7–0.9 mmol/L [Marini, Sheard 1976].

Toxicity Toxic effects may be produced by serum concentrations greater than 2 mmol/L. Blood concentrations of ~5 mmol/L or more are usually fatal, although in one instance of survival after the ingestion of 22.5 g lithium carbonate, the maximum serum concentration was 8.2 mmol/L. A fatality after acute ingestion of lithium carbonate has also been reported in which the serum concentration was 2.43 mmol/L on admission to hospital and 1.93 mmol/L at the time of death.

Acute lithium intoxication followed a suicide attempt in a 51-year-old woman on chronic lithium therapy, in which she ingested 50 slow-release 450 mg lithium carbonate tablets. Serum levels were reported to be 10.6 mmol/L 13 h after the ingestion and 5.8 mmol/L at 24 h [Nagappan *et al.* 2002].

A 29-year-old male who ingested 8 g lithium in the form of a sustained-release preparation had a plasma concentration of 2.38 mmol/L 15 h after the ingestion and 3.12 mmol/L at 25 h. Following 4 h of haemodialysis, the lithium level was 2.16 mmol/L [Astruc *et al.* 1999].

A 48-year-old woman was admitted to hospital having ingested 97 tablets of immediate-release lithium carbonate (300 mg each) 60 min earlier. Her serum lithium concentration was 4.3 mmol/L. After stabilisation and transfer to the intensive care unit, the patient's serum lithium level was 3.1 mmol/L and decreased to 1.5 mmol/L after haemodialysis. However, 9 h later the level had risen to 2.1 mmol/L. After the patient complained of a vaginal burning sensation, she admitted to having inserted 80 lithium carbonate tablets (300 mg) intravaginally. Vaginal irrigation with 3 L normal saline resulted in the lithium level dropping to 1.3 mmol/L by the next morning and to 0.5 mmol/L after 24 h [Temte *et al.* 1994].

In 3 fatalities from lithium intoxication, the following postmortem tissue concentrations were reported: blood 1.9, 3.0, and 4.6 mmol/L, brain 1.4, 5.2, and 4.2 mmol/kg, kidney 1.9, 5.9, and 9.6 mmol/kg, liver 1.9, 2.9, and 6.7 mmol/kg, urine 4.9, –, and 6.7 mmol/L [Baselt 2008].

Half-life Plasma half-life is ~20–24 h after a single dose but appears to be dependent on the duration of treatment. In patients on their first course of treatment, a plasma half-life averaging 31 h has been reported; this increased to 40 h in subjects receiving lithium for less than 1 year and 58 h in those taking the drug for longer than 1 year. Half-life is increased in the elderly and in renal impairment.

Bioavailability 80–100%.

Volume of Distribution Approximately 0.7 L/kg.

Clearance Apparent plasma clearance after a single dose is ~0.4 mL/min/kg, decreased in uraemia and in the elderly.

Distribution in Blood Lithium is taken up by erythrocytes to a variable extent, which appears to be partly genetically determined. The erythrocyte:plasma ratio was reported to range from 0.19–1.0 (mean 0.5), in 42 subjects [Smith *et al.* 1979]. The plasma : saliva ratio is ~0.4 but there is considerable intersubject variation.

Protein Binding Lithium is not bound to plasma proteins.

Note For a review of the pharmacokinetics of lithium, see Ward *et al.* [1994]; for a discussion on target serum lithium concentrations, see Sproule [2002]; for a study of the effect of acute alcohol consumption on lithium kinetics, see Anton *et al.* [1985].

Dose The dose of lithium depends on the preparation given since different preparations vary widely in bioavailability. Dosage is usually adjusted to provide a serum concentration of 0.4 to 1.0 mmol/L, with maintenance doses at lower end of the range.

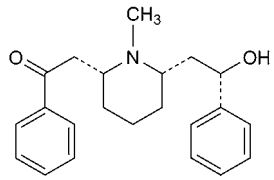
Lobeline

Respiratory Stimulant
$C_{22}H_{27}NO_2 = 37.5$
CAS—90-69-7

IUPAC Name 2-[6-(2-Hydroxy-2-phenylethyl)-1-methylpiperidin-2-yl]-1-phenylethanone
Synonyms Alpha-lobeline; [2*R*-[2α,6α(*S*)]]-2-[6-(2-hydroxy-2-phenylethyl)-1-methyl-2-piperidinyl]-1-phenylethanone.
Proprietary Name *Butt-Out*



Chemical Properties An alkaloid obtained from *Lobelia inflata* (Lobeliaceae). Crystals. Mp 130° to 131°. Very slightly soluble in water and petroleum ether; soluble in hot ethanol, benzene, chloroform and ether. Log *P* (octanol/water), 3.7.

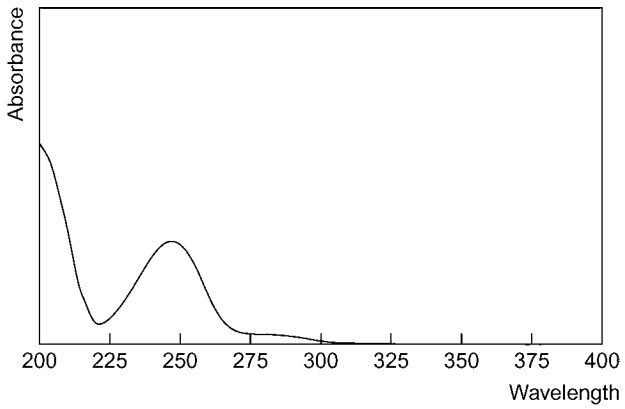
Lobeline Hydrochloride

$C_{22}H_{27}NO_2,HCl = 373.9$
CAS—134-63-4
Proprietary Names *Cig-Ridettes*; *Lobron*; *Zoolobelin*.
Chemical Properties A white crystalline or granular powder. Mp not lower than 180°. Soluble 1 in 40 of water and 1 in 12 of ethanol; very soluble in chloroform; very slightly soluble in ether.

Lobeline Sulfate

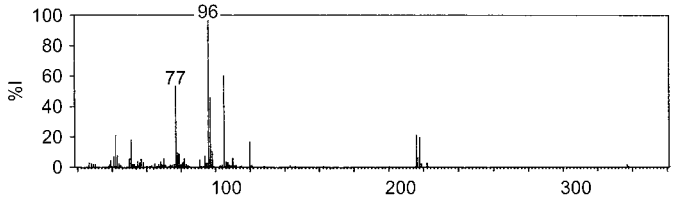
$(C_{22}H_{27}NO_2)_2,H_2SO_4 = 73.0$
CAS—134-64-5
Proprietary Names *Bantron*; *Lobatox*; *Lobeton*; *Lobidan*; *Nikoban*; *Nofum*; *Smokeless*; *Toban*; *Unilobin*.
Chemical Properties Soluble 1 in ~30 of water; slightly soluble in alcohol.

Colour Tests Mandelin's test—grey; Marquis test—red-violet.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.17; system TC—R_f 0.35; system TE—R_f 0.75 (acidified iodoplatinate solution, positive); system TAE—R_f 0.23; system TAG—R_f 0.29.
Gas Chromatography System GA—RI 1820.
High Performance Liquid Chromatography System HAA—RT 14.6 min.
Ultraviolet Spectrum Aqueous acid—248 nm ($A^1_1 = 416$a).



Infrared Spectrum Principal peaks at wavenumbers 1687, 700, 1211, 1115, 1052, 769 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z*96, 105, 77, 97, 216, 42, 218, .

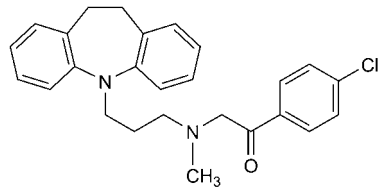


Dose Lobeline hydrochloride was formerly given IM in doses of 3 to 10 mg.

Lofepramine

Tricyclic Antidepressant
$C_{26}H_{27}ClN_2O = 419.0$
CAS—23047-25-8

IUPAC Name 1-(4-Chlorophenyl)-2-[3-(5,6-dihydrobenzo[*b*][1]benzazepin-11-yl)propyl-methylamino]ethanone
Synonyms 1-(4-Chlorophenyl)-2-[[3-(10,11-dihydro-5*H*-dibenz[*b*,*f*]azepin-5-yl)propyl]methylamino]ethanone; lopramine.

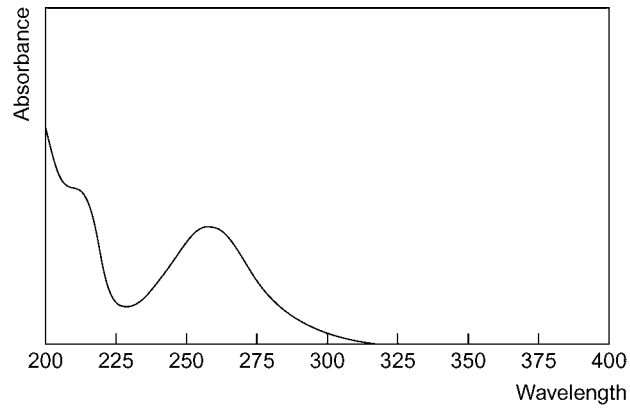


Chemical Properties Colourless crystals, which become discoloured in air. Mp 106°. Practically insoluble in water; slightly soluble in ethanol; soluble in chloroform. Log *P* (octanol/water), 7.3. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

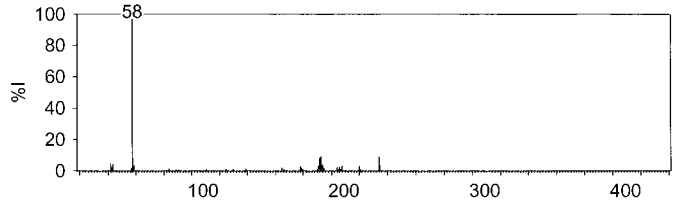
Lofepramine Hydrochloride

$C_{26}H_{27}ClN_2O,HCl = 455.4$
CAS—26786-32-3
Proprietary Names *Deprimil*; *Feprapax*; *Gamanil*; *Gamonil*; *Lomont*; *Timelit*; *Tymelyt*.
Chemical Properties Colourless crystals or yellowish-white microcrystalline powder. Mp 152° to 154°. Practically insoluble in water; soluble in ethanol, methanol and chloroform.

Thin-layer Chromatography System TE—R_f 0.90; system TAE—R_f 0.82.
Gas Chromatography System GA—lofepramine, not eluted (metabolised to desipramine).
High Performance Liquid Chromatography System HA—iofepramine *k* 0.6, desipramine *k* 2.1, 2-hydroxydesipramine *k* 1.2.
Ultraviolet Spectrum Methanol—255 nm ($A^1_1 = 596$a).



Infrared Spectrum Principal peaks at wavenumbers 1700, 1235, 1495, 1590, 1100, 763 cm^{-1} (lofepramine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 234, 193, 192, 42, 235, 194, 59; desipramine235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxydesipramine44, 209, 211, 250, 210, 224, 42, 251.



Quantification

Plasma **GC** Column: 3% Hi-Eff 8BP (5′ × 1/8" i.d. [150 cm × 3 mm i.d.]). Carrier gas: N_2, 3.9×10^5 N/m^2. FID. Limit of detection, 1 µg/mL [Lundgren *et al.* 1977].

GC-MS Column: 2% PEG-20M on Gas Chrom Q 80/100 mesh (2 m × 3 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 220°. Multiple ion detection. Limit of detection, lofepramine and desipramine 2 µg/mL, 2-hydroxydesipramine 20 µg/mL [Matsubayashi *et al.* 1977].

HPLC Column: Supelcosil LC-PCN (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.015 mol/L phosphate buffer (120 : 35 : 100), flow rate 2.5 mL/min. UV detection (λ = 254 nm). Retention time: ~8 min. Limit of quantification, 5 nmol/L, limit of detection, 3 nmol/L [Elm, Hansen 1995].

Urine **GC-MS** See Plasma [Matsubayashi *et al.* 1977].

Disposition in the Body Readily absorbed after oral administration but undergoes extensive first-pass demethylation to desipramine, which is the principal active metabolite. It is also metabolised by *N*-oxidation, hydroxylation, and conjugation and is excreted in the urine mainly as metabolites; a second active metabolite, 2-hydroxydesipramine, has been reported to be the major unconjugated urinary metabolite.

Therapeutic Concentration After a single oral dose of 2 mg/kg given to six subjects, peak plasma lofepramine concentrations of 0.04 to 0.14 mg/L (mean 0.09) were attained in ~1 h; peak plasma desipramine concentrations of 0.01–0.02 mg/L were attained in 3–8 h in 4 subjects. When a similar dose was given to the same subjects on a second occasion some weeks later, peak plasma lofepramine concentrations of 0.05–0.27 mg/L (mean 0.13) were reported. Following oral doses of 70 mg three times a day for 10 days to 3 subjects, plasma concentrations of ~0.003 mg/L of lofepramine and 0.01–0.05 mg/L (mean 0.025) of desipramine were reported, determined immediately prior to a dose [Forshell *et al.* 1976].

Protein Binding In plasma, approximately 99%.

Note For a review of the pharmacokinetics of lofepramine and its efficacy in depression, see Lancaster and Gonzalez [1989].

Dose 70 to 210 mg daily.

Lofexidine

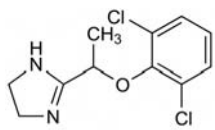
Antihypertensive

$C_{11}H_{12}Cl_2N_2O$ = 259.1

CAS—31036-80-3

IUPAC Name 2-[1-(2,6-Dichlorophenoxy)ethyl]-4,5-dihydro-1*H*-imidazole

Proprietary Names *Almide*; *BritLofex*.



Chemical Properties A colourless, crystalline substance with mp 126° to 128°. Log *P* (water/octanol), 3.58.

Lofexidine Hydrochloride

$C_{11}H_{12}Cl_2N_2O$,HCl = 295.6

CAS—21498-08-8

Synonyms Ba-168; MDL-14042A; RMI-14042A.

Proprietary Names *BritLofex*; *Lofetensin*; *Loxacor*.

Chemical Properties Crystals from ethanol/ether or propan-2-ol, mp 221° to 223°; also reported as 230° to 232°. Very soluble in water and ethanol; slightly soluble in 2-propanol; poorly soluble in chloroform; practically insoluble in ether.

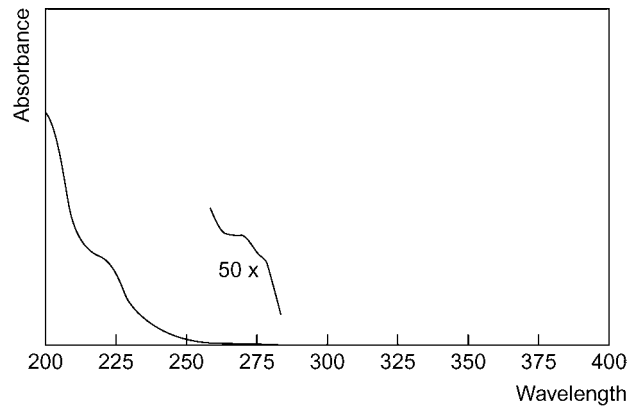
Thin-layer Chromatography System TE—R_f 0.53; system TAE—R_f 0.17.

Plate: silica gel plates 60 F_{254}. Mobile phase: chloroform : methanol : ammonia (25%) (70:26:4). Spray reagent bromocresol green (0.05%). Rf 0.85.

Plate: silica gel plates 60 F_{254}. Mobile phase: butan-1-ol:acetic acid : water (80:20:20). Spray reagent bromocresol green (0.05%). Rf 0.49 [Betzing *et al.* 1982].

High Performance Liquid Chromatography Column: C_{18} µBondapak (300 × 4 mm i.d., 10 µm). Mobile phase: (A:B) methanol : 0.05 mol/L aqueous potassium dihydrogen phosphate (pH 2.5). Elution programme: (A:B) (30:70) to (70:30) in 20 min and back to initial conditions over 5 min, flow rate 2 mL/min. UV detection (λ=254 nm). Retention time: lofexidine, 11.2 min; glucuronide conjugate metabolites, 3.5 and 6.3 min [Midgley *et al.* 1983].

Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumber 1610, 1445, 1240, 1095, 780 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 258, 260, 262.

Disposition in the Body Lofexidine is rapidly absorbed after administration, extensively biotransformed and excreted mainly in urine (87%) and faeces (5%). The principal metabolite is 2,6-dichlorophenol, and minor metabolites have been detected including glucuronic acid conjugates. Renal excretion is rapid and is the most important route of elimination. 73 to 94.4% (mean, 85%) of the drug is excreted in urine and 0.4 to 4.2% (mean, 1.5%) in faeces. Peak plasma concentration occurs 2 to 5 h after administration. The rate of bioavailability is rapid and subject dependent.

Toxicity Overdosage may cause hypotension, bradycardia and sedation.

Half-life Lofexidine undergoes biphasic elimination with half-lives 1.3 to 3.7 h and 9.0 to 18.3 h; also reported as 11 h.

Protein Binding Approximately 40% at nominal concentration (2 and 4 µg/L) and 80 to 90% at peak concentration.

Dose An initial oral dose of 200 µg is administered twice daily which may increase in steps of 200 to 400 µg daily to a maximum of 2.4 mg daily for a duration of 7 to 10 days.

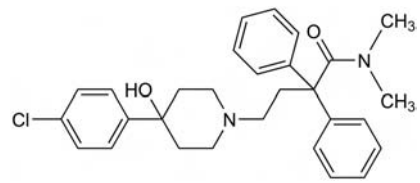
Loperamide

Antidiarrhoeal

$C_{29}H_{33}ClN_2O_2$ = 477.0

CAS—53179-11-6

IUPAC Name 4-(4-Chlorophenyl)-4-hydroxy-*N*,*N*-dimethyl-α,α-diphenyl-1-piperidinebutanamide



Chemical Properties Log *P* (octanol/water), 5.2.

Loperamide Hydrochloride

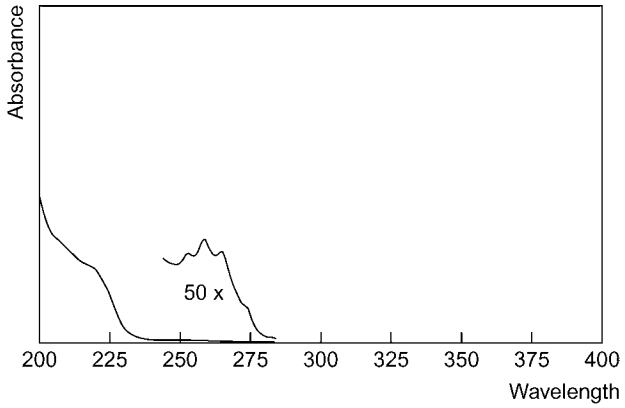
$C_{29}H_{33}ClN_2O_2$,HCl = 513.5

CAS—34552-83-5

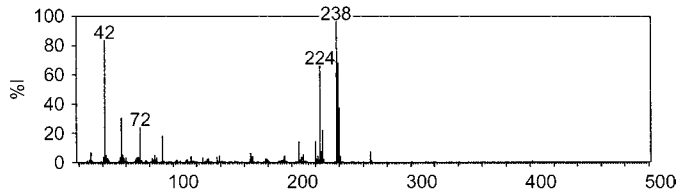
Proprietary Names *Altocel*; *Arestal*; *Arret*; *Blox*; *Celkalm*; *Diar-Limit*; *Diareze*; *Diasorb*; *Diocalm Ultra*; *Diocaps*; *Endiaron*; *Entrocalm*; *Imodium*; *Kaopectate II*; *Lodiar*; *Lopemid*; *LoperaGen*; *Maalox Anti-Diarrheal*; *Neo-Diarel*; *Norimode*; *Normaloe*; *Pepto Diarrhea Control*.

Chemical Properties A white or yellowish-white, amorphous or microcrystalline powder. Mp about 225°, with some decomposition. Slightly soluble in water; freely soluble in chloroform and methanol.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.09; system TC—R_f 0.32; system TE—R_f 0.74; system TL—R_f 0.22; system TAE—R_f 0.52; system TAF—R_f 0.81 (Dragendorff spray).
High Performance Liquid Chromatography System HX—RI 510; system HZ—retention time 14.0 min.
Ultraviolet Spectrum Acid isopropyl alcohol—254, 260 (A_1^1=14b), 266 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 700, 830, 765, 964, 986 cm^{-1} (loperamide hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 238, 42, 239, 224, 240, 56, 72, 226.



Quantification
Plasma **HPLC–MS** Selected-ion monitoring. Limit of detection, <0.12 µg/L for loperamide and *N*-demethylloperamide [He *et al.* 2000].
Serum **Radioimmunoassay** For method, see Weintraub *et al.* [1977].
Urine **Radioimmunoassay** For method, see Weintraub *et al.* [1977].
Disposition in the Body Loperamide is poorly absorbed after oral administration. About 1 to 2% of a dose is excreted in the urine as free or conjugated loperamide in 48 h. Up to 10% of a dose may be excreted in the urine in 8 days and about 40% is eliminated in the faeces over the same period.
Therapeutic Concentration
Following oral administration of capsules containing 8 mg of loperamide hydrochloride to 6 subjects, peak serum concentrations of about 0.002 mg/L were attained in about 4 to 5 h [Killinger *et al.* 1979].
Twenty–four subjects in a cross-over study received a single 16 mg dose of loperamide, either as tablets or in capsules, on two days. A mean peak plasma concentration of 3.35 µg/L occurred at 4.08 h after the tablets and 3.98 µg/L at 4.38 h after the capsules [Doser *et al.* 1995].
Half-life Plasma half-life, 7 to 15 (mean 11) h.
Protein Binding About 97%.
Note For a review of the pharmacokinetics of loperamide, see Heel *et al.* [1978].
Dose Up to 16 mg of loperamide hydrochloride daily.

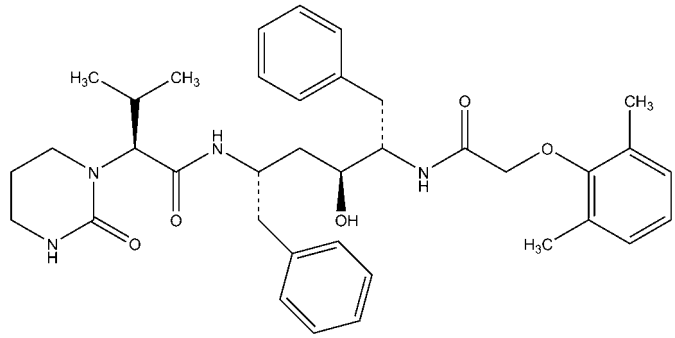
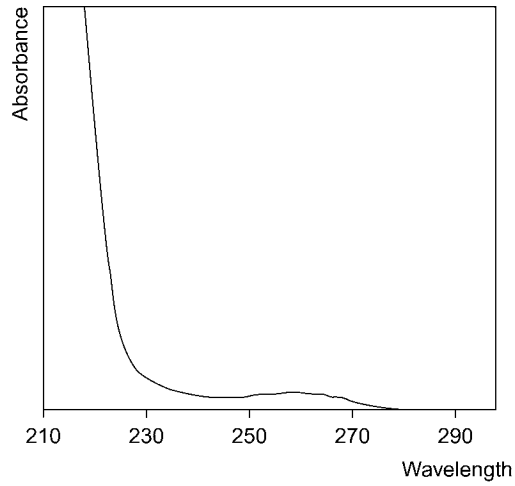
Lopinavir

Antiretroviral, Protease Inhibitor
$C_{37}H_{48}N_4O_5$ = 628.8
CAS—192725-17-0

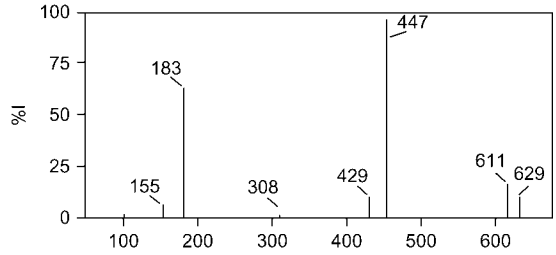
IUPAC Name (2*S*)-*N*-[(2*S*,4*S*,5*S*)-5-[[2-(2,6-Dimethylphenoxy)acetyl]amino]-4-hydroxy-1,6-di(phenyl)hexan-2-yl]-3-methyl-2-(2-oxo-1,3-diazinan-1-yl) butanamide
Synonyms A-157378; ABT-378; (α*S*)-*N*-[1*S*,3*S*,4*S*)-4-[[(2,6-dimethylphenoxy) acetyl]amino]-3-hydroxy-5-phenyl-1-(phenylmethyl)pentyl]tetrahydro-α-(1-methylethyl)-2-oxo-1(2*H*)-pyrimidineacetamide; [1*S*-[1*R*,(*R*),3*R*,4*R*]]-*N*-[4-[[(2,6-dimethyl phenoxy)acetyl]amino]-3-hydroxy-5-phenyl-1-(phenylmethyl)pentyl]tetrahydro-α-(1-methylethyl)-2-oxo-1(2*H*)-pyramidine acetamide; (2*S*,3*S*,5*S*)-2-(2,6-dimethylphenoxyacetyl)amino-3-hydroxy-5-[2*S*-(1-tetrahydro-pyrimid-2-only)-3-methylbutanoyl]amino-1,6-diphenylhexane; (α*S*)-tetrahydro-*N*-[(α*S*)-α-[(2*S*,3*S*)-2-hydroxy-4-phenyl-3-[2-(2,6-xylyloxy)acetamido]butyl]phenethyl]-α-isopropyl-2-oxo-1(2*H*)-pyrimidineacetamide.
Proprietary Names *Aluvia*; *Kaletra* (co-formulation with ritonavir).



Chemical Properties White to light tan solid. Mp 124° to 127°. Freely soluble in methanol and ethanol, soluble in isopropanol and practically insoluble in water. Stability was established in plasma after 3 freeze–thaw cycles [Gehrig *et al.* 2007]. Sample stability was verified in plasma at room temperature for 24 h, after 3 freeze–thaw cycles and at 4° for 7 days [Rezk *et al.* 2006]. Lopinavir was stable in human plasma for at least 184 days at –20° [Wang *et al.* 2006]. Stability of standard solutions was established up to 72 h and there was no significant loss of drug after 3 freeze–thaw cycles [Colombo *et al.* 2005].
Ultraviolet Spectrum 260 nm Rebiere *et al.* [2007].



Mass Spectrum Principal ions at *m/z* 447, 183, 611, 429, 629, 155 and 308 .



Quantification
Blood **LC-MS** Column: SymmetryShield RP_{18} (30 × 2.1 mm i.d., 3.5 µm). Mobile phase: 2 mmol/L ammonium acetate containing 0.1% formic acid : acetonitrile containing 0.1% formic acid (98 : 2 to 75 : 25 at 2 min to 0 : 100 at 10 min), flow rate 0.3 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, <0.5 µg/L [Colombo *et al.* 2005]. Column: Supelcosil ABZ (150 × 4.6 mm i.d., 3 µm). Mobile phase: monobasic potassium phosphate : methanol : acetonitrile with 0.02 mol/L heptane sulfonic acid (44.5 : 32.5 : 23), flow rate 1 mL/min. UV detection (λ = 240 nm). Limit of quantification, 42 µg/L [Antoniou *et al.* 2005]. Column: X-Terra MS C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.4% formic acid (pH 3; 50 : 50), flow rate 1.0 mL/min. APCI, positive ion mode, SIM acquisition mode. Limit of quantification, 2.0 ng/3 × 10^6 mononuclear cells; limit of detection, 0.49 ng/3 × 10^6 mononuclear cells [Rouzes *et al.* 2004].
Plasma **HPLC** Column: Allsphere hexyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 15 mmol/L sodium dihydrogen phosphate buffer (pH 4.5,

35 : 20 : 45), flow rate 1.0 mL/min. UV detection ($\lambda = 215$ nm). Fluorescence detection ($\lambda_{ex} = 280$ nm, $\lambda_{em} = 340$ nm). Limit of quantification, 25 μg/L [Verbesselt *et al.* 2007]. Column: reversed phase S-3 (150 × 3.0 mm i.d., 0.5 μm). Mobile phase: 25 mmol/L monobasic potassium (pH 4.9) : acetonitrile (52 : 48), flow rate 0.4mL/min. UV detection ($\lambda = 212$ nm). Limit of detection, 50 μg/L [Weller *et al.* 2007]. Column: YMC C_8 reversed phase (100 × 4.6 mm i.d., 3 μm). Mobile phase: 20 mmol/L sodium acetate : acetonitrile (55 : 45). UV detection ($\lambda = 212$ nm). Limit of detection, 25 μg/L [Ofotokun *et al.* 2007]. Column: Symmetry C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate : acetonitrile (94 : 6 to 0 : 100 in 35 min), flow rate 1.0 mL/min. UV detection ($\lambda = 240$ and 260 nm). Limit of detection not reported [Notari *et al.* 2006]. Column: Develosil Ph-UG-3 (150 × 2.0 mm i.d., 3 μm). Mobile phase: acetonitrile–25 mmol/L sodium dihydrogen phosphate containing 6 mmol/L sodium 1-hexanesulfonate (pH 5.1, 34 : 66) : acetonitrile–25 mmol/L sodium dihydrogen phosphate containing 6 mmol/L sodium 1-hexanesulfonate (pH 5.3; 64 : 36; 100 : 0 for 14.6 min to 70 : 30 at 16.6 min until 35.5 min), flow rate 200 μL/min. UV detection ($\lambda = 212$ nm). Limit of quantification, 50 μg/L [Hirabayashi *et al.* 2006]. See also Rezk *et al.* [2006], Takahashi *et al.* [2005].

LC-MS Column: Nucleosil C_{18}-100 Nautilus (125 × 3.0 mm, 3 μm). Mobile phase: 20 mmol/L ammonium acetate containing 1% aqueous acetic acid : acetonitrile (95 : 5 for 0.5 min to 5 : 95 at 5 min for 10 min), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 10 μg/L [Gehrig *et al.* 2007]. Column: Waters Symmetry C_{18} (150 × 3.9 mm i.d., 5 μm). Mobile phase: acetonitrile : 2mmol/L ammonium acetate containing 0.01% formic acid (70 : 30), flow rate 1.0 mL/min. APCI, MRM acquisition mode. Limit of quantification, 19 μg/L [Wang *et al.* 2006]. Column: Vydac C_{18} (250 × 1 mm i.d., 3.0 μm). Mobile phase: acetonitrile with 0.2% formic acid : water with 0.2% formic acid (5 : 95 to 100 : 0 in 16 min), flow rate 70 μL/min. MALDI-TOF, positive ion mode. Limit of detection, 1.57 μg/L [Notari *et al.* 2006].

***CSF* LC-MS** Column: Nucleosil C_{18}-100 Nautilus. Mobile phase: 20 mmol/L ammonium acetate containing 1% aqueous acetic acid : acetonitrile. ESI, positive ion mode. Limit of detection, 10 μg/L [Gehrig *et al.* 2007].

***Liver* HPLC** Column: Beckman Ultrasphere C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 25 mmol/L ammonium acetate (pH 4.8; 25 : 75 to 55 : 45 at 57 min), flow rate 1 mL/min. DAD ($\lambda = 220$ nm). Limit of detection, not reported [Kumar *et al.* 1999].

LC-MS Column: Beckman Ultrasphere C_{18} (250 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (pH 4.8; 30 : 70 to 80 : 20 at 15 min for 5 min), flow rate 200 μL/min. ESI at 90 eV, positive ion mode. Limit of detection, not reported [Kumar *et al.* 1999].

***Other* HPLC** Pharmaceutical Products. Column: Symmetry C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L potassium phosphate buffer (pH 5.65) : acetonitrile (60 : 40 for 5 min to 40 : 60 in 35 min for 5 min to 60 : 40 in 1 min), flow rate 1.5 mL/min. DAD ($\lambda = 260$ nm). Limit of detection, 10 mg/L [Rebiere *et al.* 2007].

Disposition in the Body Lopinavir is metabolised by the hepatic enzymes CYP3A4 and CYP3A5 to 12 metabolites in liver microsomes, of which M1, M3 and M4 are predominant. M3 and M4 are the epimeric C-4 hydroxy products of oxidation in the cyclic urea moiety and M1 is the C-4 oxo product.

Therapeutic Concentration

A group of 9 men and 11 women were administered lopinavir/ritonavir 400/100 mg twice daily for 15 days followed by 800/200 mg once daily for the next 15 days. There were no sex differences in the pharmacokinetic profiles. The mean maximum plasma concentrations for men and women were 12.4 and 12.3 mg/L, respectively, attained at 4.00 and 4.03 h, respectively [Ofotokun *et al.* 2007].

Pharmacokinetics of lopinavir/ritonavir in patients infected with HIV and hepatitis C has been investigated; all pharmacokinetic parameters were comparable apart from the volume of distribution of lopinavir, which was 125% higher in hepatitis C-positive patients with hepatic fibrosis [Molto *et al.* 2007].

A study including 542 HIV-infected patients showed that the minimum plasma concentrations of ritonavir were significantly lower when it was given in combination with lopinavir [Guiard-Schmid *et al.* 2003].

Five severely immunocompromised HIV-infected patients were treated with lopinavir or amprenavir and nevirapine. Lopinavir concentrations varied widely, with a mean peak plasma concentrations ranging from 2.71 to 12.6 mg/L, attained at 1.9 to 12.8 h [Fatkenheuer *et al.* 2001].

Note For a study of the weight, age and sex differences in the pharmacokinetics of lopinavir in children from birth to 18 years old, see Jullien *et al.* [2006]; for a study of the effect of pregnancy on lopinavir pharmacokinetics, see Stek *et al.* [2006].

Volume of Distribution 24.6 L in children; 44.0 L in hepatitis C virus-negative adults.

Clearance Men, 4.37 L/h, women 4.76 L/h, children 2.58 L/h.

Protein Binding More than 98% bound, mainly to α_1-acid-glycoprotein and albumin.

Dose 400 mg (with ritonavir 100 mg) twice daily with food.

Loprazolam

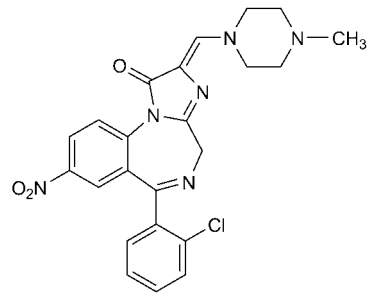
Benzodiazepine, Hypnotic, Sedative

$C_{23}H_{21}ClN_6O_3 = 64.9$

CAS—61197-73-7

IUPAC Name (2*Z*)-6-(2-Chlorophenyl)-2-[(4-methylpiperazin-1-yl)methylidene]-8-nitro-4*H*-imidazo[1,2*a*][1,4]benzodiazepin-1-one

Synonym (*Z*)-6-(2-Chlorophenyl)-2,4-dihydro-2-[(4-methyl-1-piperazinyl)methylene]-8-nitro-1*H*-imidazo[1,2-*a*][1,4]benzodiazepin-1-one



Chemical Properties Crystals. Mp 214° to 215°. pK_a 6.0 (24°). Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Limited stability at room temperature in buffer, urine or bile; consequently samples are stored at –2 0°. [^{14}C]-Loprazolam degrades rapidly (95% within 1 h) at room temperature in 0.1 mol/L HCl or NaOH but is relatively stable between pH 6 and 9 [Illing *et al.* 1983].

Loprazolam Mesilate

$C_{23}H_{21}ClN_6O_3,CH_4SO_3,H_2O = 579.0$

CAS—70111-54-5 (anhydrous)

Proprietary Names *Dormonoct*; *Havlane*; *Somnovit*; *Sonin*.

Chemical Properties A yellow powder. Mp 242° to 245°, with decomposition. Soluble 1 in ~100 water, 1 in ~200 ethanol and 1 in ~500 chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.1; system TC—R_f 0.48; system TD—R_f 0.03; system TE—R_f 0.40; system TF—R_f 0.01; system TAD—R_f 0.36; system TAE—R_f 0.26; system TAF—R_f 0.15; system TAG—R_f 0.05.

Gas Chromatography System GA—not eluted; system GB—not eluted.

High Performance Liquid Chromatography System HAA—RT 13.4 min; system HX—RI 388.

	0.5 mg dose		*1.0 mg dose*

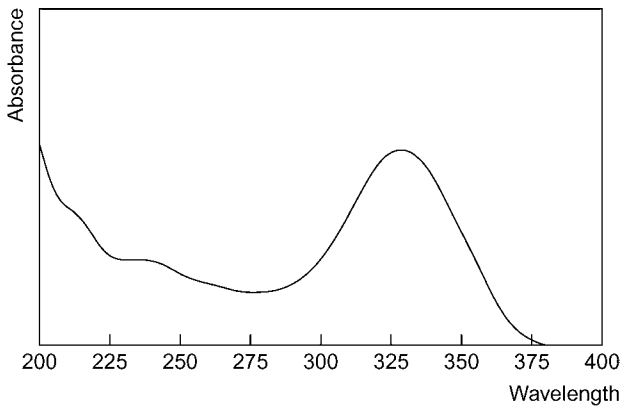
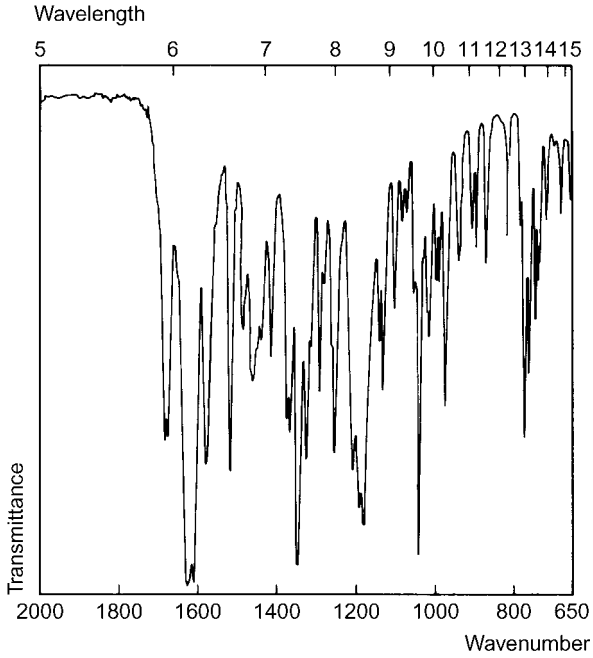
[Ford *et al.* 1987].

Ultraviolet Spectrum Ethanol—330 nm ($A_1^1 = 884$b).



Infrared Spectrum Principal peaks at wavenumbers 1628, 1610, 1045, 1182, 1192, 1518 cm^{-1} (loprazolam mesilate, KBr disk).



Quantification

Plasma **GC** Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh. Carrier gas: Ar : CH_4 (95 : 5), 60 mL/min. Temperature programme: 260°. ECD. Retention time: 9.0 min. Limit of detection, 1 μg/L [Levasseur *et al.* 1985].

Urine **LC-MS** Column: 5% OV-101 Chromosorb G HP 100/120 mesh (600 × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Disposition in the Body A single oral dose of loprazolam is eliminated in urine (39%) and faeces (53%) over a 2 week period. The drug is extensively biotransformed. Urinary elimination products include unchanged drug (<1%), loprazolam *N*-oxide (17%), acetamidoloprazolam (4%), hydroxyloprazolam (3%), and unidentified polar metabolites (25%). Loprazolam *N*-oxide is thought to be pharmacologically active [Baselt 2008; Illing *et al.* 1983].

Therapeutic Concentration

The pharmacokinetics of loprazolam and its *N*-oxide were investigated in young subjects (aged 21 to 25 years) and elderly patients (aged 63 to 86 years) following a single oral evening dose of 0.5 or 1 mg loprazolam. The pharmacokinetic parameters were measured: As per the table above.

Nine healthy male volunteers (aged 22 to 38 years) were administered a single oral dose of 2 mg loprazolam. A mean maximum plasma concentration of 6.10 ± 0.6 μg/L was reached between 1.5 and 2 h [Levasseur *et al.* 1985].

Following single and repeated doses of loprazolam 1 mg to 6 healthy subjects, mean peak plasma concentrations were 4.1 ± 2.19 and 4.6 ± 2.07 μg/L, respectively, reached at 5.0 ± 3.63 and 5.5 ± 2.66 h, respectively [McInnes *et al.* 1985].

Following a single oral dose of 2 mg to 8 subjects, a mean peak serum concentration of 0.0097 mg/L was attained in 2.4 h. Following repeated oral doses of 2 mg daily for 8 days, a mean peak serum concentration of 0.012 mg/L was reported 2.2 h after the last dose [Stevens *et al.* 1983].

Toxicity Adverse effects include drowsiness, lethargy, confusion and ataxia [Baselt 2008].

Volume of Distribution 3.2–6.3 L/kg [Baselt 2008].

Protein Binding Approximately 80% [Illing *et al.* 1983].

Half-life Plasma half-life, 6–23 h [Baselt 2008].

Note For a review of the pharmacokinetics of the newer benzodiazepines, see Garzone and Kroboth [1989].

Dose The equivalent of 1 to 2 mg loprazolam, as a hypnotic.

Loratadine

Antihistamine (Non-Sedating)

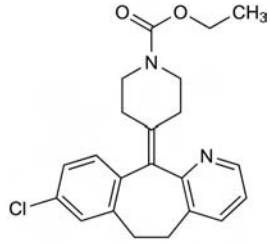
$C_{22}H_{23}ClN_2O_2 = 382.9$

CAS—79794-75-5

IUPAC Name 4-(8-Chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene)-1-piperidinecarboxylic acid ethyl ester

Synonym SCH-29851

Proprietary Names *Allerfre*; *Civeran*; *Claritin*; *Clarityn*; *Fristamin*; *Lisino*; *Lorastyne*; *Optimin*; *Polaratyne*; *Sanelor*; *Velodan*; *Versal*; *Viatin*. It is also an ingredient of *Loractin*.



Chemical Properties Crystals from acetonitrile. Mp 134° to 136°. Soluble in alcohol (1 in 10); insoluble in water. pK_a 5.0. Log *P* (octanol/water), 5.20.

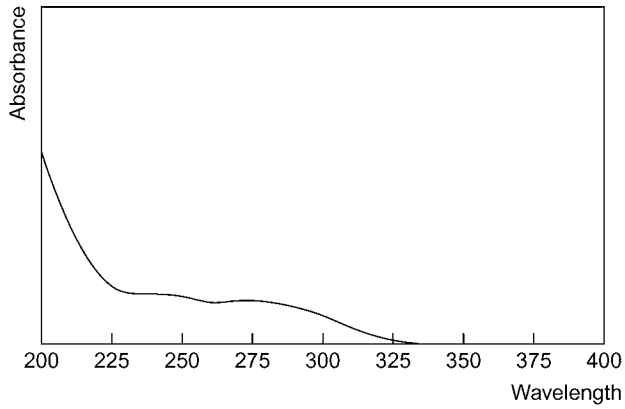
Thin-layer Chromatography System TB—R_f 0.20; system TE—R_f 0.78; system TF—R_f 0.29; system TAE—R_f 0.86.

Gas Chromatography System GB—RI 3236.

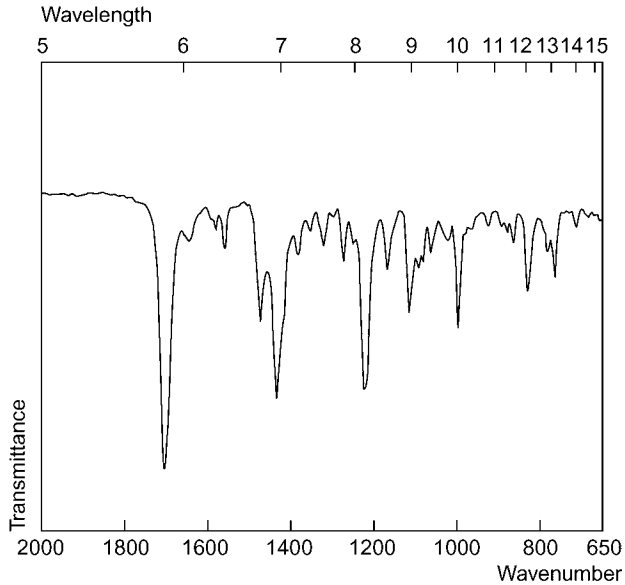
High Performance Liquid Chromatography System HX—RI 523; system HY—RI 362; system HZ—retention time 14.6 min; system HAA—retention time 22.9 min; system HAX—retention time 10.9 min; system HAY—retention time 13.3 min.

Column: LC-18-DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 0.5 M potassium dihydrogen phosphate : orthophosphoric acid (pH 3.0, 440:480:80:1), flow rate 1.8 mL/min. IS: diazepam. UV detection (λ=200 nm). Retention time: loratadine, 4.1 min; IS, 4.7 min [Kunicki 2001].

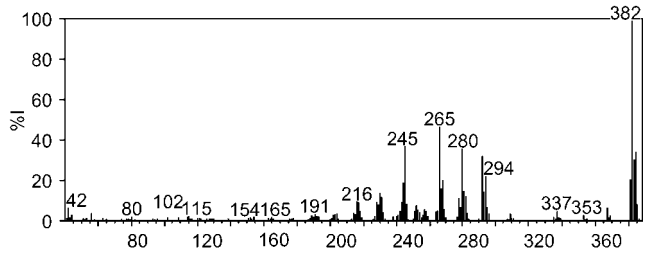
Ultraviolet Spectrum Aqueous acid—280 nm; aqueous base—252 nm.



Infrared Spectrum Principal peaks at wavenumbers 1709, 1435, 1226, 997 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 382, 266, 245, 280, 292, 384, 383, 294.



Quantification

Plasma **GC** NPD (nitrogen–phosphorus detection). Limit of quantification, 0.1 µg/L for loratadine and its metabolite [Johnson *et al.* 1994].

HPLC MS detection (ESI, MRM (multiple reaction monitoring) mode). Limit of detection, 0.1 µg/L for loratadine and metabolite [Sutherland *et al.* 2001]. Limit of quantification, 0.6 µg/L [Radwanski *et al.* 1987].

Serum **GC–MS** Column: HP-Ultra 1 capillary (25 m × 0.2 mm i.d.). Temperature programme: held at 100° for 2 min, increased to 310° at 15°/min, held for 2.5 min. Carrier gas: He, flow rate 1 mL/min. Internal standard (IS): etoloxamine. Detection: mass spectrometer (EI, SIM mode, *m/z*: 382.1 for loratadine; *m/z*: 86.2, 283.2 for IS). Retention time: loratadine, 17.2 min; IS, 11.9 min. Limit of quantification, 1.5 µg/L, limit of detection, 0.5 µg/L [Martens 1995].

Disposition in the Body Loratadine is rapidly absorbed after oral administration and undergoes extensive metabolism. Peak plasma concentrations are observed 1 to 1.5 h after administration. Steady-state concentrations are achieved after 5 days. The major metabolite desloratadine (descarboethoxyloratadine) is rapidly formed and has antihistamine activity. It undergoes further oxidation and hydroxylation to several products. Excretion, in the form of metabolites, is via urine and faeces. Twenty-seven percent of a dose is excreted in urine within 24 h and 40% is excreted in urine and 42% in faeces over 10 days. Loratadine and its metabolites are also distributed in breast milk but do not appear to cross the blood–brain barrier to a significant extent.

Therapeutic Concentration The serum therapeutic concentration is 15 to 27 µg/L and descarboethoxyloratadine, 7 to 28 µg/L.

Eighteen men and women, aged between 29 and 60 years (mean, 22-years-old), selected with a creatinine clearance >80 mL/min (group 1), ≤30 mL/min (group 2) and with end-stage renal disease (group 3) (6 volunteers in each group) were administered a single 40 mg dose in the fasted state. Mean peak plasma concentrations of 24.3 (range, 6.2 to 44.7) µg/L, 35.8 (10.7 to 61.9) µg/L and 42.2 (12.6 to 81.7) µg/L were reached for the three groups, respectively, between 1 and 2 h. Mean peak plasma concentrations of the metabolite desloratidine were 14.8 (11.3 to 19.0), 32.2 (19.7 to 56.6) and 26.3 (18.6 to 43.4) µg/L for groups 1, 2 and 3, respectively. These levels were observed between 1 and 10 h with a mean of 2.6 h for each group [Matzke *et al.* 1990].

Half-life Loratadine, 8 to 11 h; desloratadine, 17 to 28 h (37 h for patients with chronic alcohol liver disease).

Volume of Distribution 119 L/kg (range, 32 to 261) for patients with creatinine clearance >80 mL/min; 50 (27 to 64) L/kg for patients with ≤30 mL/min creatinine clearance; 92 L/kg (range 36 to 190) for patients with end stage renal disease.

Clearance 239 mL/kg/min (range 88 to 585) for patients with creatinine clearance >80 mL/min; 109 (36 to 164) mL/kg/min for patients with ≤30 mL/min creatinine clearance; 137 mL/kg/min (range, 48 to 339) for patients with end-stage renal disease.

Protein Binding Loratadine, 97 to 99%; desloratadine, 73 to 76%.

Dose 10 mg daily. Children (2 to 5 years): 5 mg daily.

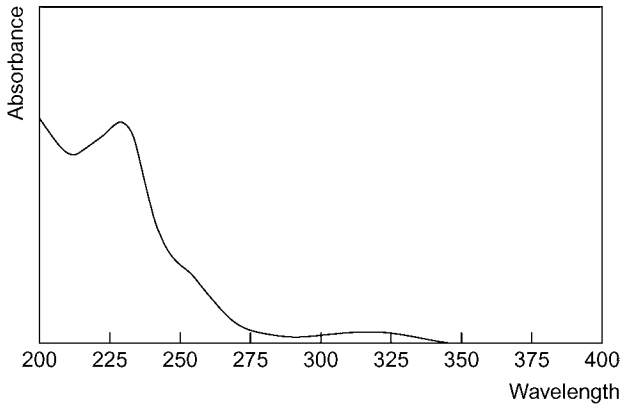
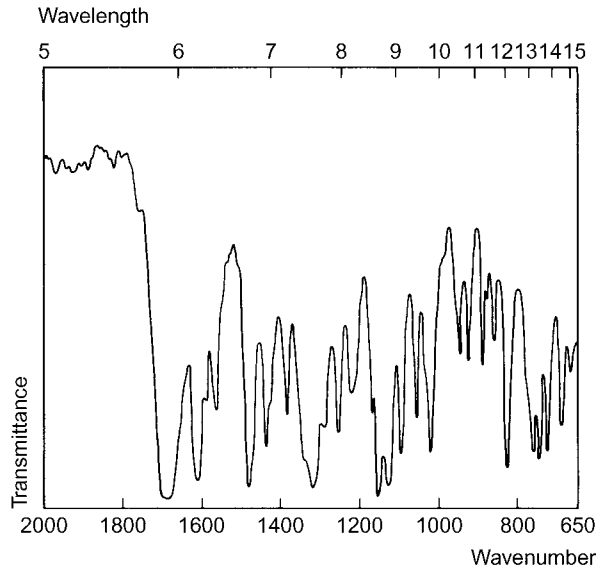
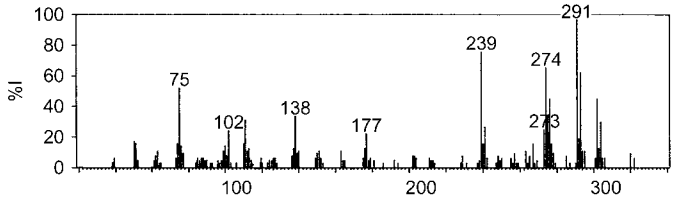
Ultraviolet Spectrum Ethanol—230 (A_1^1= 1100b), 316 nm.



Infrared Spectrum Principal peaks at wavenumbers 1685, 1149, 1317, 1120, 1605, 826 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 291, 239, 274, 293, 75, 302, 276, 138.



Quantification

Blood **GC** Column: fused silica SE-54. ECD and NPD. Lorazepam and other benzodiazepines [Lillsunde, Seppälä 1990].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 295° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 21.4 min. Limit of quantification, 11.8 µg/L, limit of detection, 3.89 µg/L [Papoutsis *et al.* 2010]. Column: 100% methylsiloxane or 5% phenylsiloxane-95% methylsiloxane. Carrier gas: 1.0 mL/min. Temperature programme: 140° for 0.5 min to 320° at 25°/min. SIM acquisition mode. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: 5% diphenyldimethylsiloxane DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 150° for 0.6 min to 230° at 40°/min to 310° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 50 µg/L, limit of detection, 5 µg/L [Tiscione *et al.* 2008].

HPLC Column: Chromolith Performance P-18e (100 × 4.0 mm). Mobile phase: 35 mmol/L phosphate buffer (pH 2.1) : acetonitrile (70 : 30), flow rate 2 mL/min. Lorazepam and other benzodiazepines [Bugey, Staub 2004].

LC-MS Column: Acquity BEH Phenyl (100 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.1% formic acid in water : 0.1% formic acid in acetonitrile (80 : 20 for 0.25 min to 65 : 35 over 2.25 min for 2.5 min to 20 : 80 over 1 min to 80 : 20 over 0.01 min for 1.4 min), flow rate 0.5 mL/min. ESI, MRM acquisition mode [Gunn *et al.* 2010]. Lorazepam and related drugs [Deveaux *et al.* 2008]. Limit of quantification, 2–3 µg/L for lorazepam and some other benzodiazepines, 5 µg/L for lormetazepam and 6 µg/L for bromazepam [Dussy *et al.* 2006].

Plasma **GC** Column: C_8 reversed-phase sorbent. NP and ECD. Lorazepam and related drugs [Gaillard *et al.* 1993]. Column: 3% OV-17 on 80/100 mesh Chromosorb W HP (1.8 m (6 ft) × 4 mm i.d.). Carrier gas: He, 50 mL/min. Temperature: 280°. ECD. Limit of detection, 1–3 µg/L for lorazepam and lorazepam glucuronide [Greenblatt *et al.* 1978]. See Blood [Lillsunde, Seppälä 1990].

GC-MS Column: Restek Rtx-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 1 min to 295° at 30°/min for 5 min. CID. Limit of quantification, 0.1 µg/L [Pichini *et al.* 1999]. Column: 3% OV-1 on Chromosorb W AW DMCS 80/100 mesh (1 m × 3 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 210°. Limit of detection, 2 µg/L for lorazepam and lorazepam glucuronide [Higuchi *et al.* 1979].

HPLC Column: LC-18DB (250 × 4.6 mm, 5 µm). Mobile phase: 5 mmol/L potassium dihydrogen phosphate buffer (pH 6.0) : methanol : diethyl ether (55 : 40 : 5), flow rate 0.8 mL/min. UV detection (245 nm). Limit of quantification, 30 to 50 µg/L for lorazepam and other benzodiazepines [Borges *et al.* 2009]. Column: Kromasil C(8) (250 × 5 mm, 5 µm). Mobile phase: methanol, acetonitrile and 0.05 mol/L ammonium acetate. Limit of quantification, 0.07–1.57 mg/L for lorazepam and other benzodiazepines; limit of detection, 0.02–0.47 mg/L for lorazepam and other benzodiazepines [Uddin *et al.* 2008]. Column: Synergi Max RP (150 × 4.6 mm, 4 µm). Mobile phase: 10 mM potassium dihydrogen phosphate buffer (pH 2.4) : acetonitrile (65 : 35), flow rate 2.5 mL/min. UV detection. Limit of quantification, 10 µg/L, limit of detection, 2.5 µg/L [Muchohi *et al.* 2005]. Column: Hisep. Mobile phase: acetonitrile: 0.18 mol/L ammonium acetate (pH 2.5). Limit of quantification, 0.5 mg/L for lorazepam, clobazam, nitrazepam and oxazepam, limit of detection, 0.16 mg/L for lorazepam, clobazam, nitrazepam and oxazepam [Pistos, Stewart 2003]. Column: octadecyl or select B. Limits of detection, 5–10 µg/L for lorazepam glucuronide and other benzodiazepine glucuronides [Franzelius, Besserer 1993]. See also Kondo *et al.* [1993].

LC-MS Column: Xterra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water : 100 mmol/L ammonium formate (pH 3.0, 55 : 40 : 5), flow rate 0.125 mL/min. ESI, MRM acquisition mode. Reteention time: 5.03 min. Limit of quantification, 20 µg/L, limit of detection, 10 µg/L [Marin, McMillin 2010; Marin *et al.* 2008]. Column: Chiralpak OD-R (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : water : acetic acid (80 : 20 : 0.1), flow rate 1.0 mL/min. ESI. Limit of quantification, 1 µg/L [Papini *et al.* 2006a, 2006b]. Column: Zorbax C_{18}(100 × 2.1 mm). Mobile phase: acetonitrile : 10 mmol/L aqueous formic acid (65 : 35). SIM mode. Limit of detection, 0.10 µg/L [Zhu, Luo 2005]. Column: Merck LiChroCART with Superspher 60 RP Select B stationary phase. Mobile phase: aqueous ammonium formate and acetonitrile. SIM acquisition mode. Lorazepam and related compounds [Kratzsch *et al.* 2004]. Column: CAPCELL PAK ODS. UG 120 (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.1 mol/L phosphate buffer (3 : 7), flow rate 1.0 mL/min. SIM acquisition mode [Kanazawa *et al.* 1998].

Serum **HPLC** Column: reversed phase with stationary phase with low silanol activity. Limit of quantification, 2.5 µg/L [Kazemifard *et al.* 2006]. Column C_{18} reversed phase: condition 1 (100 × 4.6 mm i.d., 2 µm), TS gel Super-ODS; condition 2 (100 × 4.6 mm i.d., 5 µm), Hypersil ODS-C_{18}). Mobile phase: methanol : 5 mmol/L sodium dihydrogen phosphate (pH 6, 45 : 55), flow rate 0.65 mL/min. UV detection (λ= 254 nm). Limits of quantification, 4–10 times better under condition 1 than condition 2 for lorazepam and other benzodiazepines [Tanaka *et al.* 1996, 1998].

LC-MS Column: Unison UK-C_{18} ODS (150 × 2 mm i.d., 3 µm) or Cadenza CD-C_{18} ODS (150 × 2.0 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 to 20 : 80 at 20 min for 5 min), flow rate 0.25 mL/min. ESI. Limit of detection, 0.3–11.4 µg/L [Nakamura *et al.* 2009]. See Plasma [Marin, McMillin 2010; Marin *et al.* 2008]. See Blood [Dussy *et al.* 2006].

Urine **GC** Column: HP-5 capillary. NPD. Limit of detection, 5 µg/L [Jiang *et al.* 2001]. See Plasma [Greenblatt *et al.* 1978].

GC-MS Column: polydimethylsiloxane. Scan and SIM acquisition mode. Limit of quantification, 2.5–5 µg/L (scan mode), 0.1–0.5 µg/L (SIM) for lorazepam and other benzodiazepines [Borrey *et al.* 2001a]. Column: polydimethylsiloxane. Scan mode and SIM. Limits of detection, 13–30 µg/L (scan mode) and 1.0–1.7 µg/L (SIM) for lorazepam and other benzodiazepines [Borrey *et al.* 2001b]. Column: 5% phenylmethylsiloxane (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.5 mL/min. Temperature programme: 240° to 260° at 25°/min to 300° at 30°/min. SIM acquisition mode. Limit of detection, 0.1 mg/L [Black *et al.* 1994; Hagan 1995]. Column: DB-1 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature

programme: 160° for 1 min to 280° at 20°/min for 3 min. NCI. Limit of quantification, <10 µg/L [Fitzgerald *et al.* 1993]. Column: DB-5 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 66 cm/s. Temperature programme: 210° to 300° at 20°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification <10 µg/L, limit of detection, <10 µg/L [Dickson *et al.* 1992]. See Blood [Goldberger *et al.* 2010; Higuchi *et al.* 1979; Pichini *et al.* 1999].

HPLC See Plasma [Uddin *et al.* 2008] and [Franzelius, Besserer 1993].

LC-MS Limit of detection, <0.5 µg/L for lorazepam and related drugs [Deveaux *et al.* 2008]. See Plasma [Marin, McMillin 2010; Marin *et al.* 2008; Papini *et al.* 2006a; Papini *et al.* 2006b]. Column: XTerra C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate (pH 3.6, 5 : 95 to 80 : 20 at 10 min), flow rate 200 µL/min. ESI, MRM acquisition mode. Limit of detection, 0.02 µg/L [Kintz *et al.* 2004].

CE-MS Running buffer: methanol : water (50 : 50) containing 0.1% formic acid, flow rate 0.5 mL/min. ESI, TOF. Limit of quantification, 1 µg/L, limit of detection, 50 µg/L [Blas, McCord 2008].

Meconium **LC-MS** See Plasma [Marin, McMillin 2010; Marin *et al.* 2008].

Oral Fluid **HPLC** See Plasma [Uddin *et al.* 2008].

LC-MS See Urine. Limit of detection, 0.05 µg/L [Kintz *et al.* 2004].

Hair **GC-MS** Column: XTerra C_{18}. Limit of detection, 0.5 ng/g [Kintz *et al.* 2004]. Column: HP-Ultra 2 capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 70° for 2 min to 220° at 25°/min to 255° at 5°/min to 300° for 7 min. EI ionisation at 70 eV. Retention time: 10.4 min. Limit of detection, 1 ng/mg. [Yegles *et al.* 1997]. Column: HP-5MS 5% phenyl-95% methylsiloxane (30 m × 0.25 mm i.d.). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 1 min to 295° at 30°/min for 5 min. NCI, SIM acquisition mode. Retention time: 9.96 min. Limit of detection, 2 pg/mg [Cirimele *et al.* 1996].

Note For an ELISA for the detection of lorazepam, see Miller *et al.* [2006].

Disposition in the Body Lorazepam is readily absorbed after oral administration; bioavailability is ~95%. Lorazepam crosses the blood–brain barrier and the placenta. It is found in breast milk. Approximately 75% of a dose is excreted in the urine as the inactive glucuronide conjugate within 5 days (up to ~50% in the first 24 h) and 14% is excreted as conjugates of minor metabolites, which include ring-hydroxylation products and quinazoline derivatives; only negligible amounts are excreted as free lorazepam; ~7% of a dose is eliminated in the faeces. Lorazepam is a metabolite of lormetazepam.

Therapeutic Concentration In plasma, the usual therapeutic range is 0.05–0.24 mg/L. Lorazepam glucuronide accumulates in plasma, achieving concentrations greater than those of unchanged drug.

Peak plasma levels of 16.9 µg/L lorazepam were reported 2 h after single 2 mg oral doses of lorazepam. The apparent elimination half-life was 12 h [Greenblatt *et al.* 1976].

Following daily oral doses of 6 mg in 8 subjects, mean steady-state plasma concentrations of 0.09 mg/L lorazepam and 0.17 mg/L lorazepam glucuronide were reported; in 7 subjects receiving 10 mg daily, the mean steady-state plasma concentrations were 0.16 and 0.27 mg/L, respectively [Greenblatt *et al.* 1977a].

After a single oral dose of 0.05 mg/kg given to 9 subjects, peak plasma concentrations of 0.04–0.06 mg/L (mean, 0.05) were attained in ~0.5–1.5 h; the maximum therapeutic effect was associated with plasma concentrations of 0.03–0.05 mg/L and concentrations below 0.01 mg/L were ineffective [Bradshaw *et al.* 1981].

Administration of lorazepam 288 mg as continuous IV infusions in 2 patients or as 55 mg IV injections in 11 patients resulted in plasma levels of 629 and 49 µg/L, respectively. The median plasma level was 59 µg/L and clearance was maintained at 92 mL/min [de Wit *et al.* 2006].

For the pharmacokinetics of lorazepam after IV and IM injections, see Greenblatt *et al.* [1977b], Greenblatt *et al.* [1977c].

Toxicity

Plasma concentrations of 0.3–0.6 mg/L were reported in 3 subjects suffering toxic effects after the ingestion of overdoses of lorazepam; the estimated amounts ingested were 100 and 120 mg in 2 of these cases. The subjects recovered within 24–30 h [Allen *et al.* 1980].

In a review of 170 drug-impaired driving cases involving lorazepam and submitted to Washington DC State Toxicological Laboratory between 1998 and 2003, the mean blood level of lorazepam was 0.048 mg/L (range, <0.005–0.39 mg/L). In 86% of these drivers other drugs were found that may have contributed to driving impairment. In 23 cases where lorazepam was the only drug detected, mean blood levels were 0.051 mg/L (range, <0.01–0.38 mg/L) [Clarkson *et al.* 2004].

Half-life Plasma half-life: lorazepam 9–24 h (mean, 14), lorazepam glucuronide ~16 h.

Volume of Distribution ~1–2 L/kg.

Clearance Plasma clearance, ~1 mL/min/kg.

Protein Binding ~90%; decreased in patients with cirrhosis.

Note For reviews of the clinical pharmacokinetics of lorazepam, see Kyriakopoulos *et al.* [1978], and Greenblatt [1981].

Dose For anxiety disorders, 1 to 10 mg in divided doses, orally daily.

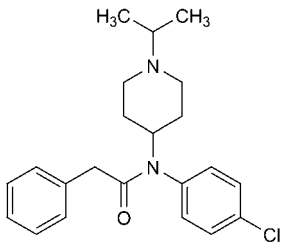
Lorcainide

Antiarrhythmic
$C_{22}H_{27}ClN_2O = 370.9$
CAS—59729-31-6

IUPAC Name *N*-(4-Chlorophenyl)-*N*-(1-propan-2-ylpiperidin-4-yl)acetamide
Synonyms *N*-(4-Chlorophenyl)-*N*-[1-(1-methylethyl)-4-piperidinyl]benzeneacetamide; isocainide; socainide.



Lorcainide Hydrochloride

$C_{22}H_{27}ClN_2O,HCl = 407.4$
CAS—58934-46-6
Proprietary Name *Remivox*
Chemical Properties Crystals. Mp 263°. Freely soluble in water, ethanol, chloroform, and methanol. Log *P* (octanol/water), 4.9.

Thin-layer Chromatography System TB—R_f 0.48; system TE—R_f 0.80; system TAE—R_f 0.41.
Gas Chromatography System GA—lorcainide RI 2810, M (nor-) RI 2660, M (OH-)-AC RI 2880, M (OH-dimethoxy-)-AC RI 3010, M (OH-methoxy-)-AC RI 2940, M (*N*-desalkyl-desacyl-)-AC_2 RI 2490, M (desacyl-) RI 2100, M (desacyl-)-AC RI 2200; system GB—lorcainide RI 2923, M (nor-) RI 2789.
High Performance Liquid Chromatography System HA—*k* 1.8; system HX—RI 425; system HZ—RT 6.6 min.
Ultraviolet Spectrum Water—257 ($A_1^1 = 14.3$b), 263 nm ($A_1^1 = 12.1$b).
Infrared Spectrum Principal peaks at wavenumbers 1649, 716, 1094, 1298, 1153, 1016 cm^{-1} (lorcainide hydrochloride, KBr disk).
Quantification
Plasma **GC** Column: 3% OV-22 on 80/100 Supelcoport (200 × 0.2 cm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 260°. ECD. Limit of detection, lorcainide 5 µg/L, norlorcainide 10 µg/L, hydroxylated metabolites 10 to 15 µg/L [Woestenborghs *et al.* 1979]. Column: 3% OV-17 glass (2 m). Carrier gas: N_2, 60 mL/min. ECD. Limit of detection, lorcainide and norlorcainide 10 µg/L [Klotz *et al.* 1978]

HPLC Column: µBondapak phenyl reversed phase (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : phosphate buffer (2 : 3), flow rate 80 mL/h. UV detection (λ = 196 nm). Retention time: 6.0 min. Limit of detection, lorcainide and norlorcainide 5 µg/L [Yee, Kates 1981]. Column: Spherisorb hexyl (150 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen phosphate (pH 3.0; 60 : 40), flow rate 1.5 mL/min. UV detection (λ = 230 nm). Limit of detection, 0.025 mg/L [Verbesselt *et al.* 1991]. Column: µBondapak phenyl reversed phase (300 × 3.9 mm i.d., 10 µm). Mobile phase: potassium dihydrogen phosphate : acetonitrile (pH 2.3; 750 : 1250), flow rate 1 mL/min. UV detection (λ = 254 nm). Retention time: 9.8 min. Limit of detection, 0.06 mg/L [Simon, Somani 1982].
Serum **HPLC** Column: YWG C_{18} H37 (200 × 5.0 mm i.d., 5 µm). Mobile phase: methanol : water: 0.625 mol/L ammonium acetate (pH 8.0; 86 : 13 : 1), flow rate 1.0 mL/min. UV detection (λ = 226 nm). Limit of detection, 5 µg/L [Luo, Zeng 1995].
Urine **GC** See Plasma [Klotz *et al.* 1978; Woestenborghs *et al.* 1979].

GC-MS Column: HP cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. FID. Limit of detection not reported [Maurer 1990].
Tissues **GC** See Plasma [Woestenborghs *et al.* 1979].

Disposition in the Body Well absorbed after oral administration but undergoes extensive, saturable first-pass metabolism. The principal active metabolite, norlorcainide, is found in high concentrations in plasma during chronic oral dosing. Other major metabolites include a 4-hydroxyphenyl derivative and a 4-hydroxy-3-methoxyphenyl compound. After IV administration, less than 2% of a dose is excreted in the urine as unchanged drug in 48 h; a total of ~60% of a dose is excreted in the urine as metabolites in 4 days and 35% is eliminated in the faeces [Lauwers *et al.* 1983].
Therapeutic Concentration
Following oral doses of 100 mg twice a day to eight subjects for 2 weeks, mean steady-state plasma concentrations were 0.05–0.50 mg/L (mean 0.19) for lorcainide and 0.16–0.68 mg/L (mean 0.32) for norlorcainide [Kates *et al.* 1983].
Toxicity
A 15-year-old girl died 3 h after ingesting at least 2.5 g lorcainide; the lorcainide concentration in a blood sample taken 30 to 60 min post-ingestion was 1.82 mg/L [Evers, Buttner-Belz 1995].
Bioavailability Approximately 30% after a single dose of 150 mg but almost 100% during chronic oral dosing.
Half-life Plasma half-life, lorcainide 3–15 h (mean 8), increased in subjects with cirrhosis of the liver and during chronic oral dosing; norlorcainide 20–40 h (mean 27).
Volume of Distribution Approximately 8 L/kg but there is considerable inter-subject variation.
Clearance Plasma clearance, 10–25 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, approximately 1.3.
Protein Binding 80–85% [Klotz *et al.* 1978].
Note For reviews of lorcainide, see Eiriksson and Brogden [1984]; Klotz *et al.* [1978].
Dose The equivalent of 200 to 300 mg of lorcainide daily.

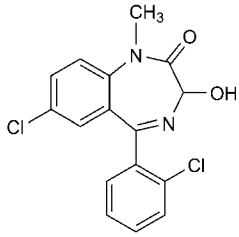
Lormetazepam

Benzodiazepine, Hypnotic
$C_{16}H_{12}Cl_2N_2O_2 = 35.2$
CAS—848-75-9

IUPAC Name 7-Chloro-5-(2-chlorophenyl)-1,3-dihydro-3-hydroxy-1-methyl-2*H*-1,4-benzodiazepin-2-one
Synonym Wy-4082
Proprietary Names *Aldosomnil*; *Ergocalm*; *Loramet*; *Loretam*; *Minias*; *Noctamid(e)*; *Octonox*; *Pronoctan*; *Stilaze*.



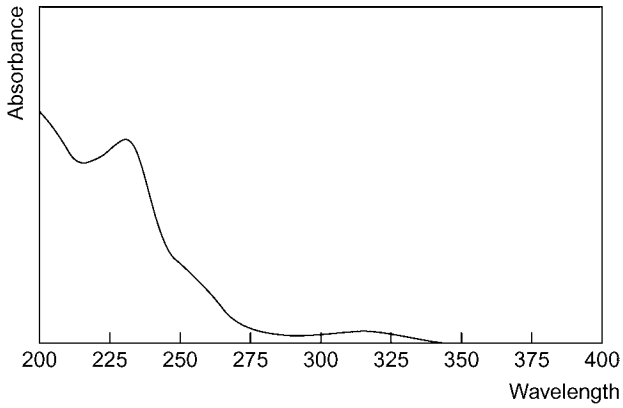
Chemical Properties A white crystalline powder. Mp 209° to 211°, with decomposition. Practically insoluble in water; slightly soluble in ethanol and methanol; freely soluble in chloroform. Log *P* (octanol/water), 2.2. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Test Formaldehyde–sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.06; system TC—R_f 0.61; system TD—R_f 0.46; system TE—R_f 0.59; system TF—R_f 0.45; system TL—R_f 0.50; system TAD—R_f 0.60; system TAE—R_f 0.82; system TAF—R_f

0.82 (acidified potassium permanganate—positive; Dragendorff spray—positive; FPN reagent—pale yellow; Marquis reagent—very weak pale yellow; mercuric chloride–diphenylcarbazone reagent—blue, on heating turns pale pink).

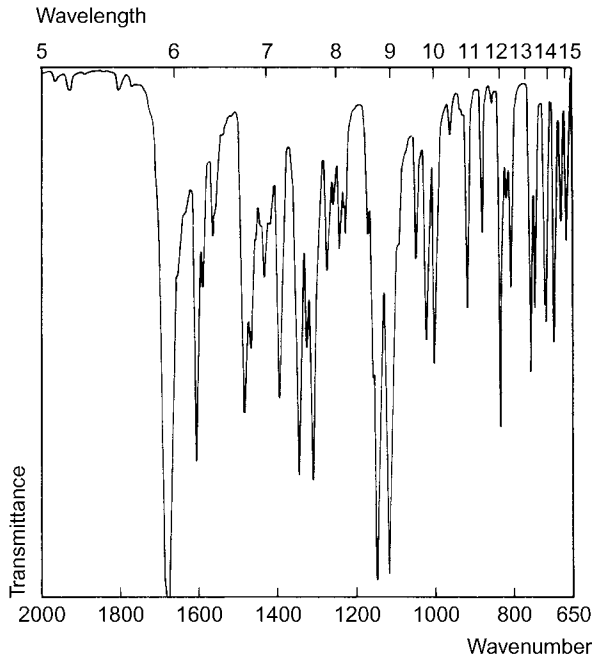
Gas Chromatography System GA—lormetazepam RI 2660, lorazepam RI 2410, decomposition product RI 2727; system GB—lormetazepam RI 2770; lorazepam RI 2528, lormetazepam-TMS_2 RI 2799; lorazepam-TMS_2 RI 2566.

High Performance Liquid Chromatography System HI—*k* 6.32; system HK—*k* 0.08; system HX—RI 487; system HY—RI 463; system HZ—RT 6.2 min; system HBH—*k* 7.19; system HBI—*k* 1.46.

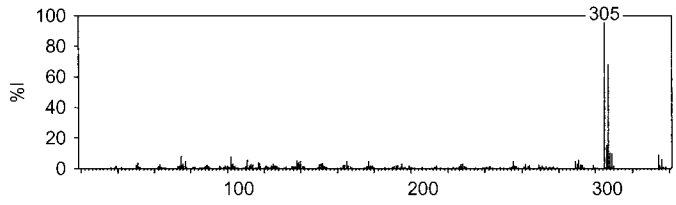
Ultraviolet Spectrum Aqueous acid—231 ($A_1^1 = 1030$b), 311 nm ($A_1^1 = 59$b).



Infrared Spectrum Principal peaks at wavenumbers 1682, 1153, 1121, 1315, 1610, 843 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 305, 307, 306, 309, 308, 334, 102, 75; lorazepam 291, 239, 274, 293, 75, 302, 276, 138.



Quantification

Plasma **GC** Column: 3% OV-17 on Chromsorb W HP 100/120 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature programme: 280°. ECD. Retention time: 4.2 min. Limit of detection, 200 ng/L [Pierce *et al.* 1984].

Note For a radioimmunoassay method, see Hümpel *et al.* [1980].

Urine **GC-MS** Column: SGE BP1 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 65° for 1 min to 250° at 15°/min for 8 min to 300° at 10°/min for 2 min. EI ionisation, scan or SIM acquisition mode. Limit of detection, 18 µg/L (scan mode) and 1.1 µg/L (SIM) [Borrey *et al.* 2001].

LC-MS Column: 5% OV-101 Chromosorb G HP 100/120 mesh (600 × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Disposition in the Body Well absorbed after oral administration. Metabolised to some extent by *N*-demethylation to lorazepam. Approximately 80% of a dose is excreted in the urine as lormetazepam glucuronide in 72 h, and ~6% as lorazepam glucuronide.

Therapeutic Concentration

Six subjects were given single oral doses of 1 mg and 3 mg. Mean peak plasma concentrations were 0.006 and 0.016 mg/L, respectively, attained at 2–3 h [Hümpel *et al.* 1980].

Bioavailability Approximately 80%

Half-life Plasma half-life, lormetazepam ~10 h, appears to be increased in elderly subjects; lormetazepam glucuronide ~13 h.

Volume of Distribution Approximately 5 L/kg.

Clearance Plasma clearance, approximately 4 mL/min/kg.

Protein Binding Approximately 90%.

Dose 0.5 to 1.5 mg, as a hypnotic.

Lornoxicam

Analgesic, COX Inhibitor, NSAID

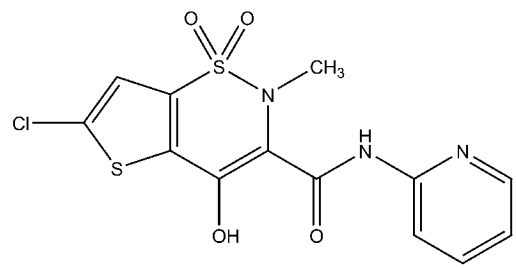
$C_{13}H_{10}ClN_3O_4S_2 = 371.8$

CAS—70374-39-9

IUPAC Name (3*E*)-6-Chloro-3-[hydroxy-(pyridin-2-ylamino)methylidene]-2-methyl-1,1-dioxothieno[2,3-e]thiazin-4-one

Synonyms 6-Chloro-4-hydroxy-2-methyl-3-(2-pyridylcarbamoyl)-2*H*-thieno[2,3-e]-1,2-thiazine-1,1-dioxide; 6-chloro-4-hydroxy-2-methyl-*N*-2-pyridinyl-2*H*-thieno[2,3-e][1,2]-thiazine-3-carboxamide 1,1-dioxide; chlortenoxican; CTX; Ro-13-9297; TS-110.

Proprietary Names *Acabel*; *Artok*; *Bosporon*; *Hypodol*; *Lorcam*; *Lornox*; *Noxon*; *Taigalor*; *Telos*; *Xefo*.

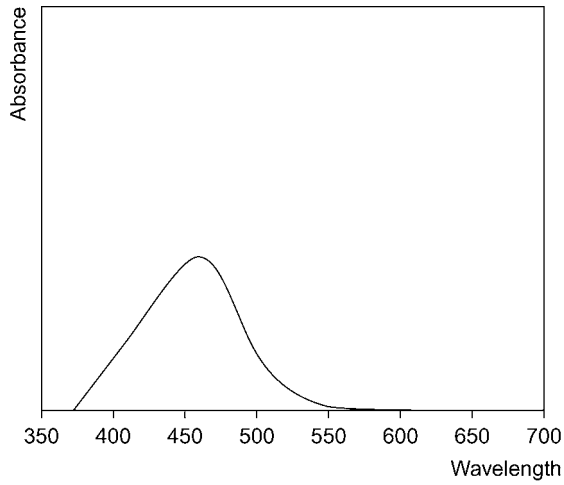


Chemical Properties Orange to yellow crystals. Mp 225° to 230°. pK_a 4.7 [O'Neil *et al.* 2006]. Log *P* (octanol/pH 7.4 buffer), 1.8 [O'Neil *et al.* 2006]. Stability of blank plasma was established after storage at –20° for 5 months [Radhofer-Welte, Dittrich 1998].

Thin-layer Chromatography Plates: aluminium precoated with silica gel F_{254} (20 × 20 cm, 0.25 mm). Solvent system: ethyl acetate : methanol : 26% ammonia (17 : 3 : 0.35). Limit of quantification, 0.26 µg/spot; limit of detection, 0.08 µg/spot [Taha *et al.* 2004].

High Performance Liquid Chromatography Column: Nova-Pak reversed phase C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: methanol : acetonitrile : acetate buffer (pH 4.6, 45 : 5 : 50), flow rate 0.8 mL/min. UV detection (λ = 280 nm). Limit of quantification, 0.04 mg/L; limit of detection, 0.01 mg/L [Taha *et al.* 2004].

Ultraviolet Spectrum 371 nm [Nemutlu *et al.* 2005].



Quantification

Plasma **HPLC** Column: Hypersil ODS C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L sodium dihydrogen phosphate buffer (pH 6) : methanol (50 : 50), flow rate 1.5 mL/min. UV detection (λ = 372 nm). Limit of detection, 10 μg/L [Radhofer-Welte, Dittrich 1998]. Column: Hypersil ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L phosphate buffer (pH 6) : methanol (50 : 50), flow rate 1.3 mL/min. UV detection (λ = 371 nm). Limit of detection, 10 μg/L [Bareggi *et al.* 1997]. Column: Sumipax ODS A-212 C_{18} (150 × 6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate : acetonitrile : methanol (60 : 23 : 17), flow rate 1.5 mL/min. Electrochemical detection. Limit of detection, 5 and 10 μg/L for lornoxicam and 5′-hydroxylornoxicam, respectively [Suwa *et al.* 1993]. Column: Perkin Elmer. Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 6; 55 : 45), flow rate 1.0 mL/min. UV-vis detection (λ = 370 nm). Limit of detection, 3 μg/L [Dittrich *et al.* 1990].

LC-MS Column: Sunfire C_{18}. Mobile phase: methanol : 10 mmol/L ammonium formate (70 : 30). ESI, MRM acquisition mode. Limit of quantification, 0.5 μg/L [Kim *et al.* 2007]. Column: Zorbax XDB-C_8. Mobile phase: methanol : water : formic acid (80 : 20 : 0.5), flow rate 0.7 mL/min. APCI, SRM acquisition mode. Limit of quantification, 2 μg/L [Zeng *et al.* 2004].

Synovial Fluid **HPLC** Column: Hypersil ODS C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L sodium dihydrogen phosphate buffer (pH 6) : methanol (50 : 50), flow rate 1.5 mL/min. UV detection (λ = 372 nm). Limit of detection, 10 μg/L [Radhofer-Welte, Dittrich 1998].

Note For a UV spectrophotometric method for the detection of lornoxicam, see Nemutlu *et al.* [2005].

Disposition in the Body Following oral administration, lornoxicam is completely absorbed. Maximum plasma concentrations are reached within an average of 1 to 3 h. The major inactive metabolite, 5′-hydroxylornoxicam, is formed in the liver by CYP2C9. This pathway accounts for 95% of lornoxicam clearance, with no unchanged drug being found in urine. The presence of food reduces the peak plasma concentration by approx. 30% and delays time to the maximum slightly.

Therapeutic Concentration

A study in 18 healthy Chinese volunteers revealed that the pharmacokinetics of lornoxicam are dependent on CYP2C9 polymorphism, with the presence of the *CYP2C9*3* allele impairing oral clearance [Zhang *et al.* 2005]. An allele designated *CYP2C9*13* occurs in 2% of the Chinese population and is also associated with decreased clearance of lornoxicam. After a single oral dose of lornoxicam in healthy volunteers with *CYPC9*1/*1*, *CYP2C9*1/*3,* and *CYP2C9*1/*13* genotypes, mean peak plasma concentrations were 1.28, 1.62, and 1.83 mg/L, attained at 2.2, 7.98 and 7.97 h, respectively [Guo *et al.* 2005].

A study in 18 healthy volunteers compared the pharmacokinetics of a granular formulation of lornoxicam with standard tablets. The study showed that the granular formation had a faster absorption rate. Mean peak plasma concentrations were 783 ± 56.5 and 682 ± 33.3 μg/L, reached at 1.4 ± 0.2 and 1.8 ± 0.1 h, for granules and tablets, respectively [Bareggi *et al.* 1997]. Mean peak plasma concentration was 299 ± 63 μg/L at 3.0 h in young volunteers after a single oral dose of 4 mg lornoxicam compared with 353 ± 127 μg/L at 2.0 h in healthy elderly volunteers [Turner, Johnston 1990].

Note For an overview of the pharmacokinetics of lornoxicam, see Skjodt and Davies [1998]. For studies on the effects of antacids on the pharmacokinetics of lornoxicam, see Ravic *et al.* [1993] or Dittrich *et al.* [1990].

Bioavailability Approximately 100%.

Half-Life 3 to 5 h.

Volume of Distribution 0.1 to 0.2 L/kg.

Clearance 1.5 to 3.4 L/h in healthy volunteers.

Protein Binding 99.7% bound, mainly to albumin.

Dose For osteoarthritis and rheumatoid arthritis, an oral daily dose of 12 mg in two or three separate doses. For pain 8 to 16 mg orally.

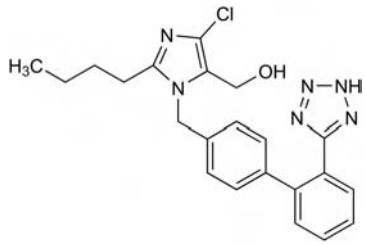
Losartan

Angiotensin II Receptor Antagonist

$C_{22}H_{23}ClN_6O$ = 422.9

CAS—114798-26-4

IUPAC Name 2-Butyl-4-chloro-1-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl] methyl]-1*H*-imidazole-5-methanol



Chemical Properties A light-yellow solid. Mp 183.5° to 184.5°. pK_a 5 to 6. Log *P* (octanol/water), 4.01.

Losartan Potassium

$C_{22}H_{22}ClKN_6O$ = 461.0

CAS—124750-99-8

Synonyms DUP-753; E-3340; MK-954.

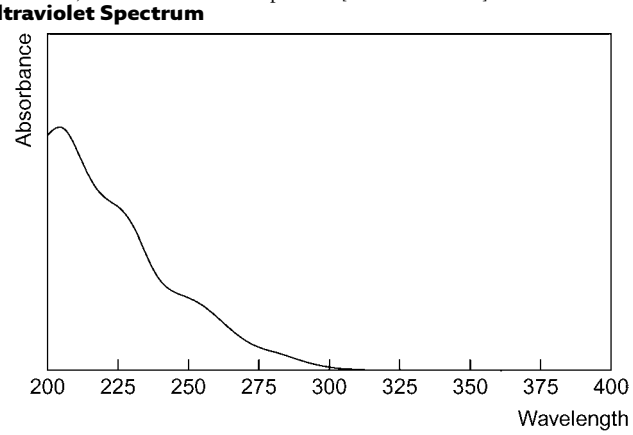
Proprietary Names *Cozaar*; *Lortaan*; *Losaprex*; *Neo-Lotan*; *Oscaar*. It is also an ingredient of *Hyzaar* and *Losazid*.

Gas Chromatography System GP—RI 3555(losartan-2ME).

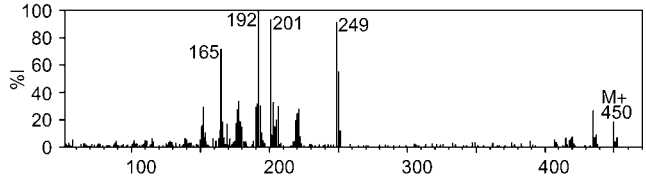
High Performance Liquid Chromatography Column: RP C_{18} (250 × 2.0 mm i.d., 5 μm). Mobile phase: 10 mmol/L ammonium phosphate (with 0.02% sodium azide) : acetonitrile : methanol : TEA (pH 3.2, 60:30:10:0.04), flow rate 0.3 mL/min. Internal standard (IS): L-158809. UV detection (λ=254 nm). Retention time: losartan, 12.0 min; E-3174, 20.0 min; IS, 8.4 min [Yeung *et al.* 2000].

Column: RP C_8 Spherisorb (250 × 4.6 mm i.d.). Temperature: 40°. Mobile phase: (A:B) acetonitrile : 1 mmol/L phosphate buffer (pH 2.3). Elution programme: (40:60) to (75:25) in 25 min, hold for 5 min, flow rate 1.5 mL/min. UV detection (λ=230 nm). Retention time: not specified [Zhao *et al.* 1999].

Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 192, 201, 249, 165, 450 (losartan-2ME).



Quantification

***Plasma* HPLC** Fluorescence detection (λ_{ex}=250 nm, λ_{em}=375 nm). Limit of detection, 1 µg/L [Farthing *et al.* 1997]. UV detection (λ=254 nm). Limit of quantification, 0.01 mg/L for losartan, 0.02 mg/L, for the metabolite [Ohtawa *et al.* 1993]. UV detection (λ=254 nm). Limit of quantification, 0.02 mg/L for losartan, 0.017 mg/L for the metabolite, E-3174 [Munafo *et al.* 1992].

***Urine* HPLC** Fluorescence detection (λ_{ex}=250 nm, λ_{em}=375 nm). Limit of detection, 1 µg/L [Farthing *et al.* 1997]. UV detection (λ=254 nm). Limit of quantification, 0.01 mg/L for losartan, 0.02 mg/L, for the metabolite [Ohtawa *et al.* 1993].

***Dialysate* HPLC** Fluorescence detection (λ_{ex}=250 nm, λ_{em}=375 nm). Limit of detection, 1 µg/L [Farthing *et al.* 1997].

Disposition in the Body Losartan is readily absorbed after oral administration. The drug undergoes extensive first-pass metabolism to form the active carboxylic acid metabolite, E-3174, as well as a number of inactive metabolites. After administration, peak plasma concentrations of losartan and E-3174 occur at about 1 h and 3 to 4 h, respectively. It is excreted in urine (35%) and in faeces (60%) via bile as the unchanged drug and as its metabolites. There is no evidence for accumulation of the drug.

Therapeutic Concentration

Six young, healthy male volunteers, aged 20 to 30 years (mean, 26 years) were administered single doses of 40, 80 and 120 mg. The peak plasma concentrations of the parent drug, losartan, were 0.104, 0.244 and 0.544 mg/L, respectively, and were reached about 1 h after administration. The peak concentrations for the metabolite, E-3174, were 0.164, 0.504 and 0.821 mg/L for the doses, respectively, and were observed at 3.7, 3.0 and 2.3 h after dosing [Munafo *et al.* 1992].

Healthy males (23 to 48 years old) were administered either 25, 50, 100 or 200 mg after an overnight fast. Mean peak plasma concentrations were 84.5, 197.6, 800.5 and 1394.9 µg/L for losartan and 188.9, 462.5, 1210.8 and 2219.0 µg/L for the metabolite, respectively. These concentrations were observed 0.7 and 1.3 h for the drug and 2 to 4 h for the metabolite [Ohtawa *et al.* 1993].

Toxicity Generally well tolerated, but fetal toxicity has been observed.

Bioavailability Around 33%.

Half-life Losartan: 1.5 to 2.5 h; active metabolite: 3 to 9 h.

Volume of Distribution 34 L; active metabolite: 12 L.

Clearance Plasma clearance: losartan, 600 mL/min; active metabolite, 50 mL/min.

Protein Binding ≥98%, mainly to albumin (both losartan and active metabolite).

Dose 50 to100 mg daily.

Farthing D *et al.* (1997). Simple high-performance liquid chromatographic method for determination of losartan and E-3174 metabolite in human plasma, urine and dialysate. *J Chromatogr B Biomed Sci Appl* 704: 374–378.

Losigamone

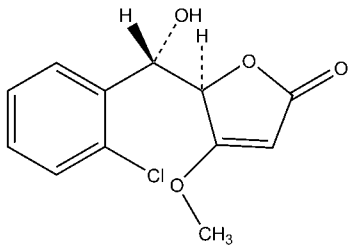
Antiepileptic, β-Methoxybutenolide

$C_{12}H_{11}ClO_4$ = 254.7

CAS—112856-44-7

IUPAC Name (5*R*)-5-[(*S*)-(2-Chlorophenyl)-hydroxymethyl]-4-methoxy-5*H*-furan-2-one

Synonyms ADD137022; AO-33; (5*R**)-5-[(α*S**)-*o*-chloro-α-hydroxybenzyl]-4-methoxy-2-(5*H*)-furanone; LSG.



Quantification

***Plasma* HPLC** Column: LiChroCart (250 × 4.0 mm i.d., 5 µm). Mobile phase: 0.01 mol/L sodium dihydrogen phosphate (pH 4.2) : methanol : acetonitrile (89 : 7 : 4), flow rate 0.7 mL/min. UV detection (λ = 230 nm). Retention times: (+)-losigamone, 8.5 min; (−)-losigamone, 9.5 min. Limit of quantification, 30 µg/L; limit of detection, 7.8 µg/L [Torchin *et al.* 1999]. Column: LiChrospher 60 RP select-B (125 × 4.6 mm i.d., 5 µm). Mobile phase: 18 mmol/L ammonium dihydrogen phosphate (pH 5.5) : acetonitrile (70 : 30), flow rate 0.8 mL/min. UV detection (λ = 220 nm). Limit of quantification, 100 µg/L. Column: Chiraspher (250 × 4.0 mm i.d., 5 µm). Mobile phase: hexane : methanol : propan-2-ol (850 : 300 : 20), flow rate 1 mL/min. UV detection (λ = 220 nm). Limit of detection not reported [Peeters *et al.* 1998]. Column: Nucleosil C_{18} (150 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 8 mmol/L ammonium dihydrogen phosphate (30 : 70), flow rate 1.2 mL/min. UV detection (λ = 220 nm). Limit of quantification, 50 µg/L [Biber, Dienel 1996].

Disposition in the Body Rapidly absorbed with peak plasma concentrations achieved within 3 h. It is primarily eliminated by oxidation and conjugation via CYP2A6, with less than 1% of the administered dose being found unchanged in urine and ~15% being excreted as the glucuronide conjugate. Stereoselective metabolism has been demonstrated with (+)-losigamone being primarily metabolised to a single hydroxyl metabolite whereas the (−)-form is metabolised to 3 distinctly different metabolites. It appears that (−)-losigamone has considerably greater affinity for CYP2A6 than does (+)-losigamone. There is evidence that losigamone elimination is accelerated by concomitant treatment with phenytoin.

Therapeutic Concentration

Five healthy volunteers was administered 100 mg of either (+)- or (−)-losigamone after a 10 h fast. Mean peak concentrations were 0.44 mg/L after 0.35 h for the (−)-enantiomer and 1.69 mg/L after 0.55 h for the (+)-enantiomer. It is thought that these differences are caused by a different affinity of the 2 enantiomers for CYP2A6. In a separate study, 5 healthy volunteers were administered 200 mg [^{14}C]losigamone. A mean peak plasma concentration of 1.99 mg/L was reached after 0.7 h. Radioactivity recovered in urine and faeces was 84.8 and 12.3%, respectively [Peeters *et al.* 1998].

Nine healthy male subjects were administered single 100, 300 and 700 mg doses of fast-releasing losigamone after breakfast. Mean peak plasma concentrations of 0.70, 1.69 and 4.36 mg/L were reached within 3.21, 2.34 and 2.56 h, respectively [Biber, Dienel 1996].

Nine healthy volunteers were administered a fast-release formulation of 500 mg losigamone 3 times daily on days 3 and 10. The peak concentration on day 3 was 3.36 mg/L after 1.69 h and on day 10 the steady-state concentration was 3.86 mg/L after 1.92 h [Biber, Dienel 1996].

Twenty healthy men were administered 500 mg (film-coated formulation) losigamone on days 1 and 8 after an 8 h fast and on the remaining days after a 2 h fast. The mean peak concentration on day 3 was 3.39 mg/L after 2.03 h; on day 10, the steady-state concentration was 3.94 mg/L after 1.67 h [Biber, Dienel 1996].

Twenty-four volunteers were administered 200, 400 and 600 mg losigamone 3 times daily for 28 days. Steady-state concentrations were 1.44, 3.02 and 5.31 mg/L for the 3 doses, respectively, and observed at 1.42, 2.25 and 0.87 h, respectively [Biber, Dienel 1996].

Note For a study of the stereoselective metabolism of losigamone, see Torchin *et al.* [1996].

Half-life Between 3.2 to 4.5 h.

Clearance Approximately 0.35 L/min.

Protein Binding Approximately 40 to 55%.

Dose Has been investigated in different doses as adjunctive therapy in the treatment of partial seizures.

Lovastatin

HMG-CoA Reductase Inhibitor, Antihyperlipoproteinaemic

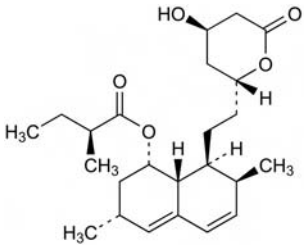
$C_{24}H_{36}O_5$ = 404.5

CAS—75330-75-5

IUPAC Name (2*S*)-2-Methylbutanoic acid (1*S*,3*R*,7*S*,8*S*,8a*R*)-1,2,3,7,8,8a-hexahydro-3,7-dimethyl-8-[2-[(2*R*,4*R*)-tetrahydro-4-hydroxy-6-oxo-2*H*-pyran-2-yl]ethyl]-1-naphthalenyl ester

Synonyms L-154803; MB-530B; MK-803; MSD-803; monacolin K; 6α-methylcompactin; mevinolin.

Proprietary Names *Lipofren*; *Lovalip*; *Mevacor*; *Mevinacor*; *Mevlor*; *Nergadan*; *Sivlor*; *Taucor.*

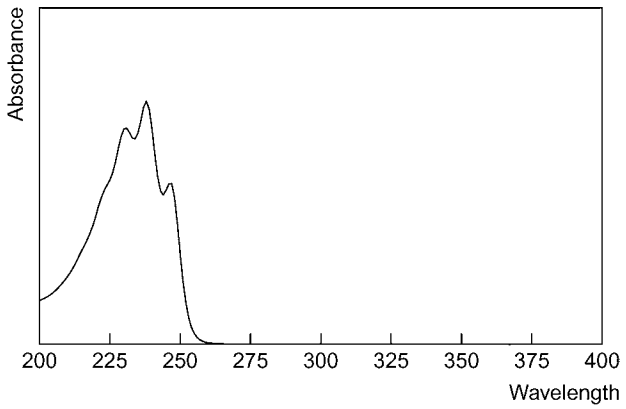


Chemical Properties A white crystalline powder. Mp 174.5°. It is practically insoluble in water (0.4×10^{-3}g/L) and petroleum spirit; sparingly soluble in low molecular weight alcohols (methanol, 28 g/L, ethanol, 16 g/L, isopropanol 20 g/L); soluble in acetone and acetonitrile; freely soluble in chloroform. Log *P* (octanol/water), 4.26; hydroxyacid derivative, 1.2×10^4; Log *P* (octanol/phosphate buffer pH 7.4), hydroxyacid derivative, 14.1.

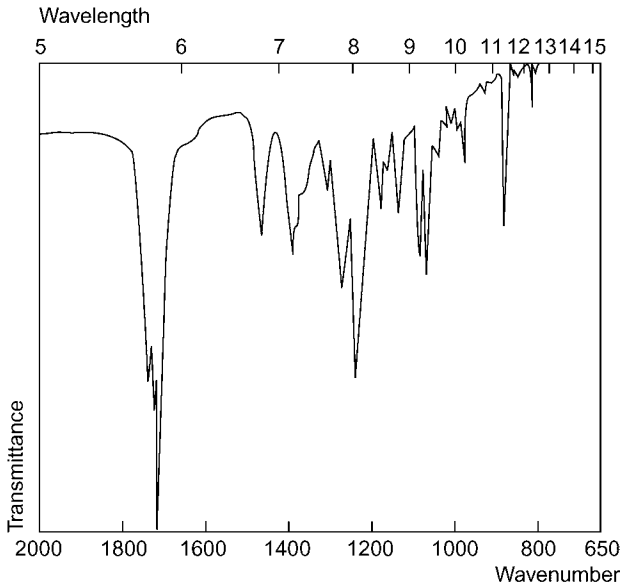
High Performance Liquid Chromatography System HAX—retention time 13.8 min; system HAY—retention time 14.8 min.

Column: RP C_{18} (250 × 4.6 i.d., 5 µm). Mobile phase: methanol : 25 mmol/L sodium dihydrogen phosphate (pH 4.5, 82:18), flow rate 1 mL/min. IS: Bay W 62230. UV detection (λ=236 nm). Retention time: lovastatin, 8.9 min; lovastatin acid, 6.4 min; IS, 5.6 min [Ye *et al.* 2000].

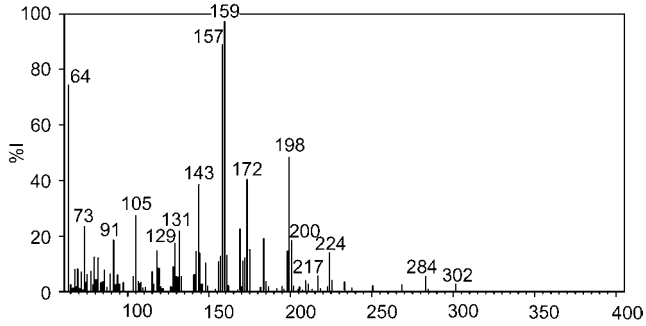
Ultraviolet Spectrum Aqueous acid—231, 238, 247 nm.



Infrared Spectrum Principal peaks at wavenumbers 1725, 1260, 1072, 1460 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 159, 157, 64, 198, 172, 143, 105, 73.



Quantification

***Plasma* HPLC** UV detection (λ=238 nm). Limit of detection, 25 µg/L [Stubbs *et al.* 1986].

***Serum* GC–MS** Column: DB-1701 (10 m × 0.25 mm i.d., 0.15 µm). Temperature programme: 210° for 0.75 min, to 290° at 30°/min, for 2 min. Carrier gas: He. Internal standard (IS): compactin. (NICI, SIM acquisition mode at *m/z* 565 for lovastatin and m/z 551 for IS). Retention time: lovastatin, 3.3 min; IS, 3.2 min. Limit of detection, 0.5 µg/L [Wang-Iverson *et al.* 1989].

Disposition in the Body Lovastatin is absorbed after oral administration (30%) and is hydrolysed in the liver to the active β-hydroxyacid form. Three other metabolites have also been detected: 3-hydroxy, 3-hydroxymethyl and 3-exomethylene derivatives. The drug undergoes extensive first-pass metabolism with <5% of a dose reaching circulation. Peak plasma concentrations are reached within 2 to 4 h and steady state within 2 to 3 days. Lovastatin is mainly excreted in faeces (85% of an administered dose) and 10% in urine over 72 h. It crosses the blood–brain and placental barriers.

Therapeutic Concentration

Seventeen healthy male volunteers, aged between 19 and 27 years, were administered a 20 mg single dose of lovastatin. The peak plasma concentration of the active inhibitors was 14.5 µg (equivalent)/L which was reached in 2.4 h. The peak concentration for the total inhibitors was 27.1 µg (equivalent)/L in 2.1 h [Pan *et al.* 1991].

Twelve healthy males, aged between 22 and 29 years, were administered a single 40 mg dose. The peak plasma concentration of the active inhibitors was 9.5 µg (equivalent)/L and total inhibitors 19.9 µg (equivalent)/L, reached in 2.9 and 2.6 h, respectively [Pentikainen *et al.* 1992].

Half-life 1 to 2 h (active metabolite).

Clearance Has been quoted as 30 to 1248 mL/min.

Protein Binding Both the parent drug and metabolite are >95% bound to plasma proteins.

Note For a general review of statins, see Hsu [1995].

Dose An initial dose of 10 to 20 mg daily is administered and increased to 80 mg daily if necessary over a period of 4 weeks. In patients taking immunosuppressants the initial daily dose is 10 mg and the overall dose should not exceed 20 mg daily.

Loxapine

Antipsychotic, Tranquilliser, Tricyclic Dibenzoxazepine

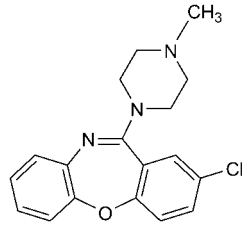
$C_{18}H_{18}ClN_3O = 327.8$

CAS—1977-10-2

IUPAC Name 2-Chloro-11-(4-methyl-1-piperazinyl)dibenz[*b,f*][1,4]oxazepine

Synonym Oxilapine

Proprietary Name *Loxapac* (solution)



Chemical Properties Pale yellowish crystals. Mp 109° to 110°. pK_a 6.6 [Mazzola *et al.* 2000]. Log *P* (octanol/water), 3.6. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Samples were stable for 4 weeks at –20°, for 48 h at 4°, and for 24 h at >20° [Garay Garcia *et al.* 2003].

Loxapine Succinate

$C_{18}H_{18}ClN_3O,C_4H_6O_4 = 45.9$
CAS—27833-64-3
Proprietary Names *Loxapac* (capsules); *Loxitane* (capsules).
Chemical Properties A white crystalline solid.

Loxapine Hydrochloride

$C_{18}H_{18}ClN_3O,HCl = 364.3$
Proprietary Names *Laxapac*; *Loxitane (oral solution; injection)*.

Colour Test Liebermann's reagent (50 to 60°)—orange; heat with nitric acid for 3 min at 100° and then dilute tenfold with water—yellow precipitate.

Lung **GC** See Blood [Cooper *et al.* 1981].
Spleen **GC** See Blood [Cooper *et al.* 1981].
Disposition in the Body Readily absorbed after oral administration. The major urinary metabolite appears to be 8-hydroxyloxapine; other metabolites that have been identified include 7-hydroxyloxapine, desmethylloxapine (amoxapine) and its 7-hydroxy and 8-hydroxy derivatives, loxapine *N*-oxide and 8-methoxyloxapine. Some unchanged drug is also excreted in the urine. Loxapine metabolism *in vitro* is inhibited by alimemazine, cyamemazine, daunorubicin, fluvoxamine, ketoconozole, levomepromazine, miconazole, nefopam, pirarubicin, prazepam, quercetin and verapamil [Bun *et al.* 2003].
Therapeutic Concentration There is considerable intersubject variation in plasma concentrations.

After a single oral dose of 25 mg to 25 subjects, mean peak serum concentrations were 0.02 mg/L loxapine, 0.05 mg/L 8-hydroxyloxapine, and 0.006 mg/L 8-hydroxyamoxapine, attained in 1–2 h [Khan *et al.* 1980].

Two subjects receiving 100 mg daily were found to have serum concentrations, respectively, of 0.031 and 0.006 mg/L loxapine, 0.072 and 0.041 mg/L 8-hydroxyloxapine, and 0.064 and 0.031 mg/L 8-hydroxyamoxapine immediately prior to a morning dose [Cooper, Kelly 1979].

Toxicity

In a fatality attributed to loxapine overdose, the following postmortem tissue concentrations (mg/L or µg/g) were reported:

	Blood	*Brain*	*Liver*	*Lung*	*Spleen*
Loxapine	1.22	4.46	11.88	4.98	3.96
8-Hydroxyloxapine (conjugated)	1.51	–	7.98	1.59	0.93
8-Hydroxyloxapine (unconjugated)	0.76	3.80	4.38	3.28	3.26
Amoxapine	1.01	4.84	10.00	3.80	6.30
8-Hydroxyamoxapine (conjugated)	1.92	–	1.89	1.32	–
8-Hydroxyamoxapine (unconjugated)	1.98	3.71	25.47	9.44	14.17

[Cooper *et al.* 1981].

A 22-year-old female ingested approximately 2.5 g loxapine and died after 12 days in a coma. Concentrations on admission to hospital were: 1.9 mg/L in blood and 0.4 mg/L in urine; 24 h later, the urine concentration was 8 mg/L [Reynolds *et al.* 1979].

In a second fatality, postmortem blood and liver concentrations of 7.7 mg/L and 150 µg/g, respectively, were reported [Reynolds *et al.* 1979].

A 69-year-old female died after ingesting loxapine tablets; loxapine and amoxapine concentrations, respectively, in postmortem tissues were 9.5 and 0.6 mg/L in heart blood, 28.8 and 4.7 mg/L in bile, 278 mg/L and none in gastric contents, and 1.5 mg/L and negative in vitreous humour [Mazzola *et al.* 2000].

A 19-year-old man ingested 20 mg fluoxetine and 10 mg loxapine in a suicide attempt. On admission, his serum loxapine concentration was 40 µg/L. He developed atrial flutter shortly after ingestion. A repeat serum

loxapine 16 h after ingestion contained less than 20 μg/L. Concentrations of metabolites were 28 μg/L for 8-hydroxyloxapine, less than 20 μg/L for amoxapine, and less than 10 μg/L for 8-hydroxyamoxapine. He recovered with no sequelae [Roberge, Martin 1994].

A 20-month-old girl ingested an unknown quantity of loxapine succinate tablets. Her blood concentration of loxapine was 0.72 mg/L. She made a full recovery [Hepler *et al.* 1982].

Note

For overdose in an 8-year-old boy, see Tarricone [1998]; for neuroleptic malignant syndrome secondary to loxapine, see Chong and Abbott [1991]; for seizures induced by overdose, see Peterson [1981]; for rhabdomyelosis and renal failure secondary to loxapine, see Tam *et al.* [1980].

Half-life Plasma half-life, loxapine 1–4 h; 8-hydroxyloxapine ~8 h; 8-hydroxyamoxapine ~36–48 h.

Dose Usually the equivalent of 20 to 100 mg loxapine daily; maximum 250 mg daily.

Loxoprofen

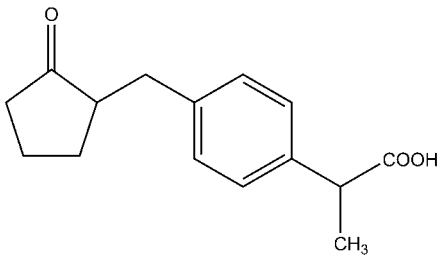
Analgesic, NSAID

$C_{15}H_{18}O_3 = 246.3$

CAS—68767-14-6

IUPAC Name 2-[4-[(2-Oxocyclopentyl)methyl]phenyl]propanoic acid

Synonyms α-Methyl-4-[(2-oxocyclopentyl)methyl]benzeneacetic acid; (±)-*p*-[(2-oxocyclopentyl)methyl]hydratropic acid.



Chemical Properties Colourless oil. Mp 108.5° to 111°. Bp 190° to 195°. Stock solutions were stable for at least a month when stored at –20° [Hirai *et al.* 1997].

Sodium Loxoprofen

$C_{15}H_{17}NaO_3,2H_2O = 304.3$

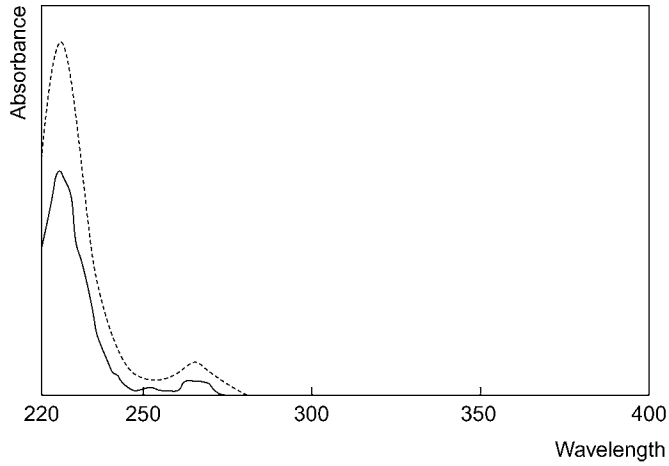
CAS—80382-23-6

IUPAC Name Sodium 2-[4-[(2-oxocyclopentyl)methyl]phenyl]propanoate

Synonyms CS-600; Sodium (±)-*p*-[(2-oxocyclopentyl)methyl]hydratropate dihydrate.

Proprietary Names *Loxonin*; *Oxeno*.

Ultraviolet Spectrum Methanol—226 nm [Kanazawa *et al.* 2002].



Quantification

Plasma **HPLC** Column: Chiralcel OJ (250 × 4.6 mm i.d.). Mobile phase: propan-2-ol : hexane : trifluoroacetic acid (5 : 95 : 0.1), flow rate 1.0 mL/min. UV and CD detection (λ = 225 nm). Retention time: 22.6, 25.6, 30.1 and 35.5 min for (1′*R*,2*R*)-, (1′*S*,2*R*)-, (1′*R*,2*S*), and (1′*S*,2*S*)-loxoprofen, respectively. Limit of detection not reported [Kanazawa *et al.* 2002]. Column: ODS (250 × 4.5 mm i.d., 5 μm). Mobile phase: acetonitrile : water (pH 3.0; 35 : 65), flow rate 1.2 mL/min. Spectrophotometric detection (λ = 220 nm). Limit of detection, 200 μg/L [Kim *et al.* 2002]. Column: Luna Phenomenex ODS (250 × 4.5 mm i.d., 5 μm). Mobile phase: acetonitrile : water (pH 3.0; 35 : 65), flow rate 1.2 mL/min. UV detection (λ = 220 nm). Limit of detection, 200 μg/L [Choo *et al.* 2001]. Column: Zorbax ODS (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid (55 : 45 : 1), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 355 nm, λ_{em} = 435 nm). Limit of quantification, 10 μg/L [Naganuma, Kawahara 1990].

Urine **HPLC** Column: Luna Phenomenex ODS (250 × 4.5 mm i.d., 5 μm). Mobile phase: acetonitrile : water (pH 3.0, 35 : 65), flow rate 1.2 mL/min. UV detection (λ = 220 nm). Limit of detection, 500 μg/L [Choo *et al.* 2001]. Column: Inertsil reversed phase ODS-2 (150 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L phosphate buffer: acetonitrile (pH 5.0; 58 : 42), flow rate 0.9 mL/min. UV detection (λ= 230 nm). Limit of detection, 50 μg/L [Hirai *et al.* 1997]. Column: μPorasil (30 cm × 3.9 mm i.d., 10 μm). Mobile phase: *n*-hexane : ethylacetate (68 : 32), flow rate 1.7 mL/min. Fluorescence detection (λ_{ex} = 313 nm, λ_{em} = 420 nm). Limit of quantification, ~5 ng on the column [Nagashima *et al.* 1985]. Column: Zorbax ODS (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid (55 : 45 : 1), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 355 nm, λ_{em} = 435 nm). Limit of quantification, 0.05 mg/L [Naganuma, Kawahara 1990].

Disposition in the Body An aldehyde–ketone reductase metabolises the parent compound to the reactive metabolites, followed by subsequent phase II metabolism (i.e. conjugation with glucuoronic acid or taurine). The alcohol metabolites and their conjugates comprise >95% of the metabolites excreted by dogs [Kim *et al.* 2002].

Therapeutic Concentration

Six healthy Korean volunteers (aged 24 to 28 years; weight 58 to 70 kg) were administered 60 mg loxoprofen as the anhydrous form daily for 3 days. On day 10, the volunteers were given an additional dose. The oral bioavailability was decreased in some of the patients on the second administration [Kim *et al.* 2002].

Sixteen healthy male volunteers (aged 46.8 ± 3.7 years; weight 63.9 ± 3.7 kg) were administered single oral doses of 60 mg loxoprofen. The drug was rapidly absorbed and a mean maximum plasma concentration of 4.92 mg/L was achieved after 31 min. [Naganuma, Kawahara 1990].

Half-life 1.15 h.

Dose Anhydrous form: 60 mg orally three times daily.

Nagashima H *et al.* (1985). Column liquid chromatography for the simultaneous determination of the enantiomers of loxoprofen sodium and its metabolites in human urine. *J Chromatogr* 345: 373–379.

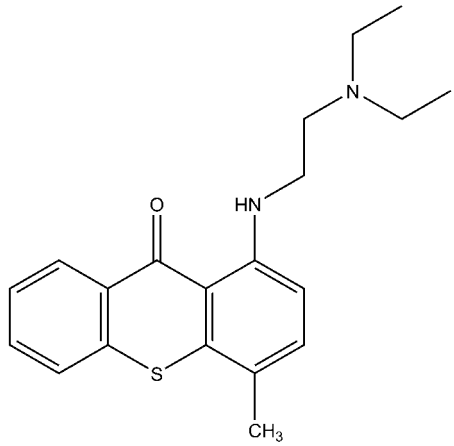
Lucanthone

Filaricide

$C_{20}H_{24}N_2OS = 340.5$

IUPAC Name 1-(2-Diethylaminoethylamino)-4-methyl-thiaxanthen-9-one

Synonyms BW 57-233; NSC 14574.



Chemical Properties Lucanthone melts at 66°. Lucanthone is extracted by organic solvents from aqueous alkaline solutions.

Lucanthone Hydrochloride

Proprietary Names *Miracil D*; *Nilodin*.

Chemical Properties A yellowish-orange crystalline powder. Mp 195° to 198°. Soluble 1 in 110 of water, 1 in 85 of ethanol, and 1 in 20 of chloroform; readily soluble in warm water and warm ethanol; insoluble in ether.

Colour Tests Sulfuric acid–formaldehyde test—(yellow)orange→purple→blue (limit of detection, 0.1 µg); Vitali's test—(yellow) yellow/yellow/red (limit of detection, 1 in 1000).

Thin-layer Chromatography System T1—R_f 0.53 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Lucanthone in 0.1 N sulfuric acid, maxima at 223 (E1%, 1 cm 566), 257 (E1%, 1 cm 1325) and 331 nm (E1%, 1 cm 236) and an inflexion at 280 nm.

Infrared Spectrum Principal peaks at A 1616, B 1224, 1512 or 1591 (base) (KBr disk).

Disposition in the Body

Metabolism Lucanthone hydrochloride is readily absorbed from the gastrointestinal tract. Most of it is metabolised by the body, only 7% to 10% appearing unchanged in the urine.

Toxicity Lucanthone is more toxic when given by injection than when given by mouth. The skin may turn yellow or orange and remain so for about 4 weeks. Heptic or renal damage has resulted from chronic poisoning.

LD_{50} (oral): mice 140 mg/kg.

Dose Usually 1 g twice daily for 3 days.

Lymecycline

Antibacterial

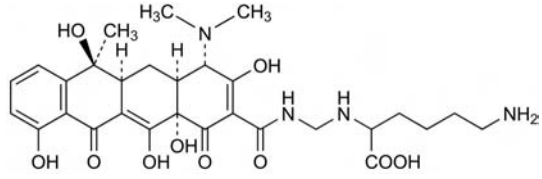
$C_{29}H_{38}N_4O_{10} = 602.6$

CAS—992-21-2

IUPAC Name [4S-(4a,4aα,5aα,6β,12aα)]-N^6-[[[[4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenyl]-carbonyl]amino]methyl]-L-lysine

Synonyms Limeciclina; Tetracycline-L-methylenelysine.

Proprietary Names *Armyl*; *Ciclolysal*; *Mucomycin*; *Tetralysal*; *Tetramyl*.

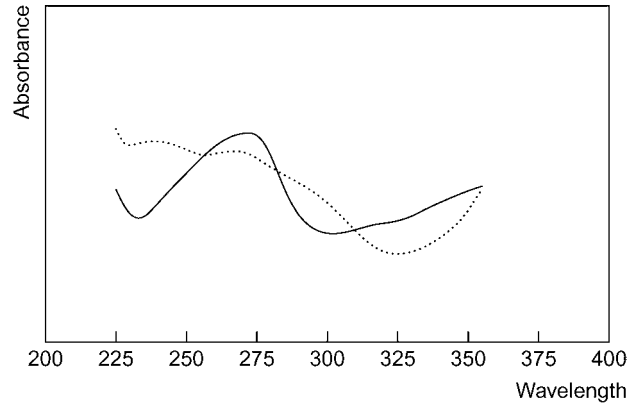


Chemical Properties A water-soluble combination of tetracycline, lysine and formaldehyde with a molecular weight of ~603. A yellow, very hygroscopic powder which darkens on exposure to light and air. Mp above 200°, with slow decomposition. Soluble 1 in <1 of water; slightly soluble in ethanol and methanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), −3.2.

Colour Tests Benedict's reagent—red; formaldehyde-sulfuric acid—brown-red; Mandelin's test—violet-brown→yellow; Marquis test—orange; sulfuric acid—red-brown.

Thin-layer Chromatography System TA—R_f 0.05, streaking (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—269 (A_1^1=292a), 356 nm; aqueous alkali—239, 267 nm.



Dose Usually 816 mg (the equivalent of 600 mg of tetracycline) daily.

Lynestrenol

Progestational Steroid

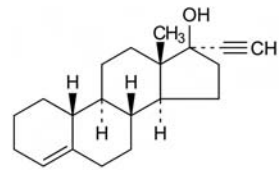
$C_{20}H_{28}O = 284.4$

CAS—52-76-6

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Ethynyl-13-methyl-2,3,6,7,8,9,10,11,12,14,15,16-dodecahydro-1*H*-cyclopenta[a]phenanthren-17-ol

Synonyms Lynenol; lynoestrenol; (17α)-19-norpregn-4-en-20-yn-17-ol.

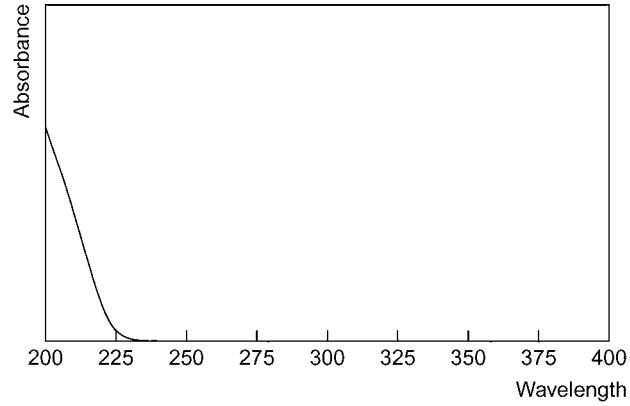
Proprietary Names *Exlutena*; *Exluton(a)*; *Orgametil*; *Orgametril*.



Chemical Properties It is an ingredient of many oral contraceptives, see Sweetman [2009]. A white crystalline powder. Mp 158° to 160°. Practically insoluble in water; soluble 1 in 15 of ethanol, 1 in 8 of chloroform and 1 in 12 of ether. Log *P* (octanol/water), 4.8.

Thin-layer Chromatography System TP—R_f 0.77; system TQ—R_f 0.55; system TR—R_f 0.99; system TS—R_f 0.97.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 683, 1040, 1014, 1053, 813, 1266 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 91, 79, 67, 201, 77, 105, 93, 120.

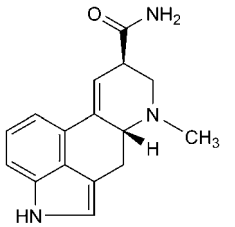
Dose 2.5 mg daily, for courses of 22 days.

Sweetman SC (2009). *Martindale: The complete drug reference*, 36 edn. London: Pharmaceutical Press.

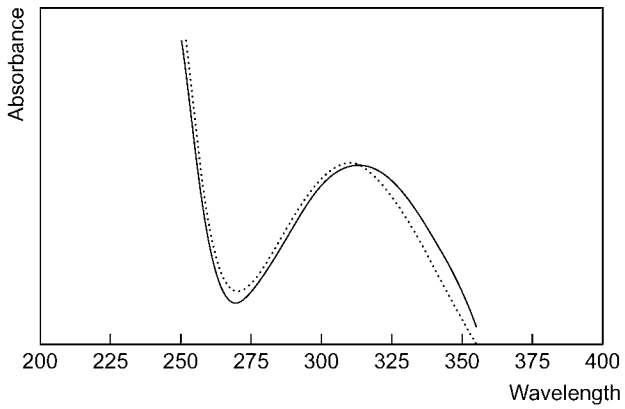
Lysergamide

Hallucinogen
$C_{16}H_{17}N_3O$=267.3
CAS—478-94-4

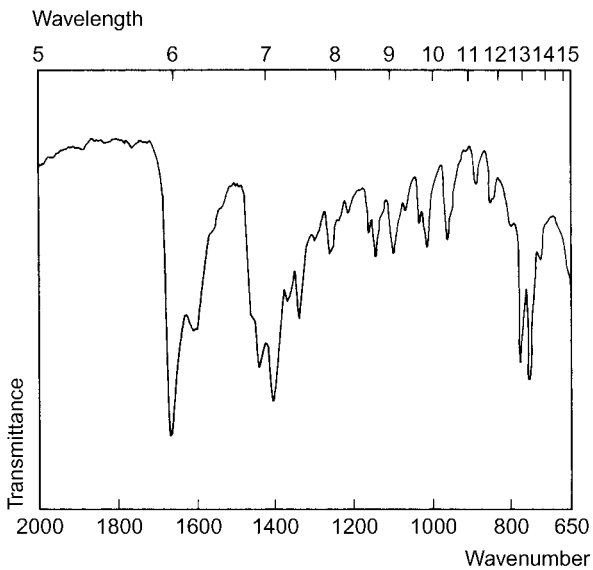
Synonyms 9,10-Didehydro-6-methylergoline-8β-carboxamide; ergine; lysergic acid amide.



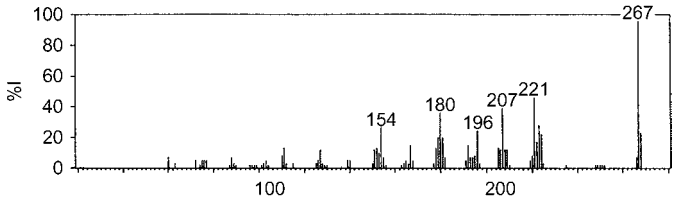
Chemical Properties Lysergamide is found in *Rivea corymbosa*, *Ipomoea* spp. (Convolvulaceae), and ergot. Crystals. It decomposes at 242°.
Colour Test Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.00; system TC—R_f 0.19; system TE—R_f 0.36; system TL—R_f 0.06; system TM—R_f 0.27; system TAE—R_f 0.57; system TAF—R_f 0.51; system TAG—R_f 0.07 (Van Urk reagent, blue).
High Performance Liquid Chromatography System HA—*k* 0.5; system HP—*k* 0.33.
Ultraviolet Spectrum Aqueous acid—313 nm; aqueous alkali—309 nm.



Infrared Spectrum Principal peaks at wavenumbers 1670, 760, 783, 1618, 1158, 1270 cm^{-1} (KBr disk).



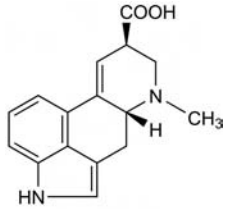
Mass Spectrum Principal ions at *m/z* 267, 221, 207, 180, 223, 154, 196, 268.



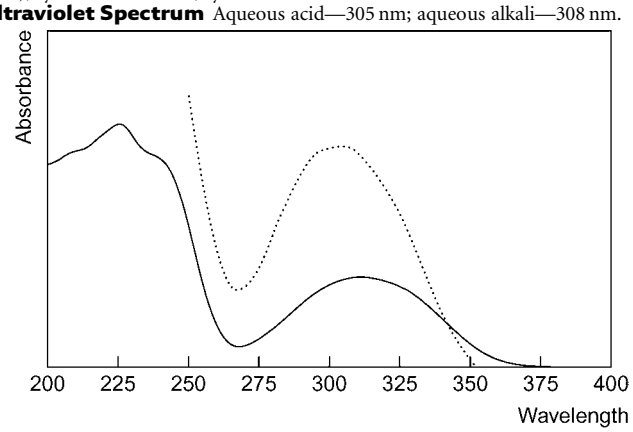
Lysergic Acid

Hallucinogen
$C_{16}H_{16}N_2O_2$ = 268.3
CAS—82-58-6

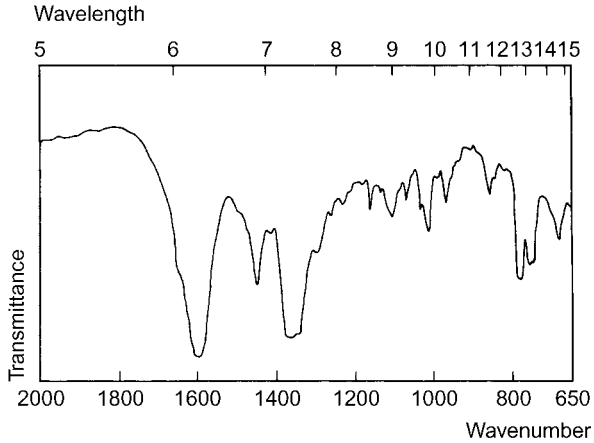
IUPAC Name 7-Methyl-4,6,6*a*,7,8,9-hexahydro-indolo [4,3-*fg*] quinoline-9-carboxylic acid
Synonym 9,10-Didehydro-6-methylergoline-8-carboxylic acid



Chemical Properties A white crystalline powder. Mp 240°, with decomposition. Sparingly soluble in water; soluble in dilute acids and alkalis; moderately soluble in pyridine. pK_a 3.4, 6.3.
Colour Tests Mandelin's test—green-brown; Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.00; system TC—R_f 0.00; system TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TL—R_f 0.00; system TM—R_f 0.00; system TAD—R_f 0.00; system TAE—R_f 0.70; system TAF—R_f 0.16; system TAJ—R_f 0.48; system TAK—R_f 0.07; system TAL—R_f 0.79 (acidified potassium permanganate solution, positive; location under UV light, violet fluorescence; mercuric chloride–diphenylcarbazone reagent, blue; Van Urk reagent, blue).
High Performance Liquid Chromatography System HA—*k* 0.8 (tailing peak); system HP—*k* 0.00; system HY—RI 236.
Ultraviolet Spectrum Aqueous acid—305 nm; aqueous alkali—308 nm.

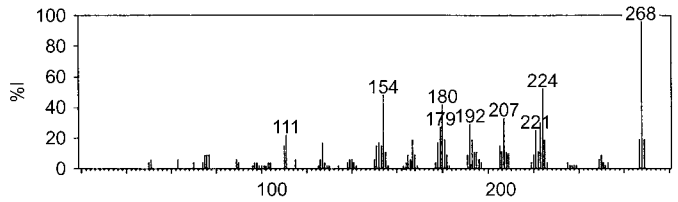


Infrared Spectrum Principal peaks at wavenumbers 1592, 787, 758, 1308, 691, 1015 cm^{-1} (KBr disk).



L

Mass Spectrum Principal ions at *m/z* 268, 224, 154, 180, 207, 223, 192, 179.



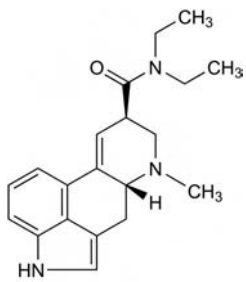
Lysergide

Hallucinogen

$C_{20}H_{25}N_3O$ = 323.4

CAS—50-37-3

Synonyms 9,10-Didehydro-*N*,*N*-diethyl-6-methylergoline-8β-carboxamide; *N*,*N*-diethyl-*d*-lysergamide; LSD; LSD-25; lysergic acid diethylamide.



Chemical Properties A colourless crystalline substance. Mp 80° to 85°. Soluble in water. pK_a 7.5. Log *P* (octanol/water), 2.9. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005]. There is evidence that LSD degrades readily in biological specimens when exposed to light or elevated temperatures. It may also bind to glass containers in acidic solutions.

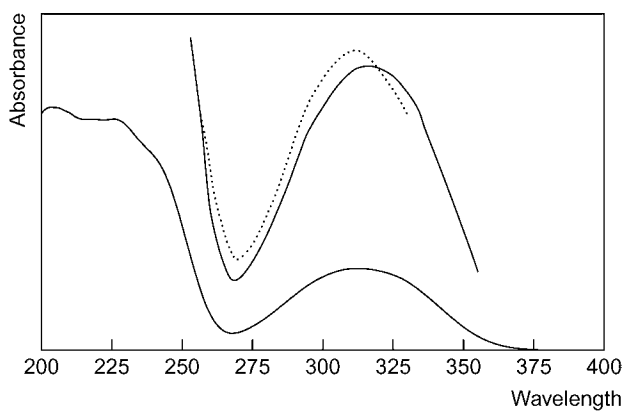
Colour Tests *p*-Dimethylaminobenzaldehyde—violet; Mandelin's test—grey; Marquis test—grey.

Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.03; system TC—R_f 0.39; system TD—R_f 0.30; system TE—R_f 0.56; system TL—R_f 0.24; system TM—R_f 0.70; system TAE—R_f 0.60; system TAF—R_f 0.59; system TAJ—R_f 0.33; system TAK—R_f 0.02; system TAL—R_f 0.59 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—grey; van Urk reagent—blue).

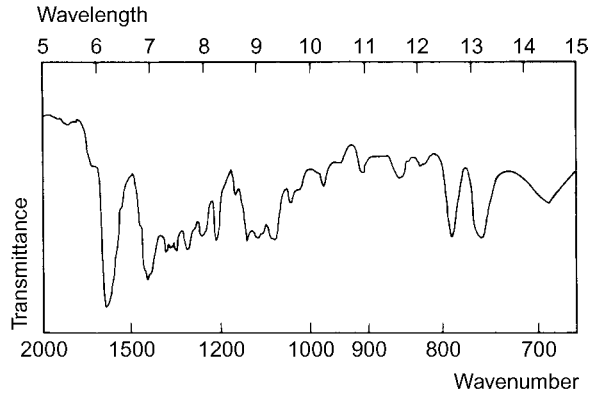
Gas Chromatography System GA—LSD RI 3445, LSD-TMS RI 3595, iso-LSD-TMS RI 3515, M (nor-)-TMS RI 3705, M (nor-)-TMS_2 RI 3515, M (2-oxo-3-OH-)-TMS_2 RI 3430; system GB—RI 3332; system GAL—RT 7.3 min.

High Performance Liquid Chromatography System HA—*k* 0.7; system HP—LSD *k* 1.83, M (2-oxy-) *k* 0.92; system HX—RI 362; system HAA—RT 12.0; system HBE—RT 5.3 min.

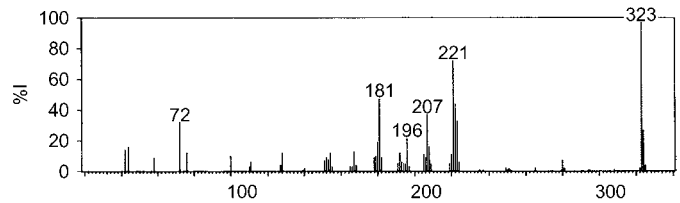
Ultraviolet Spectrum Aqueous acid—315 nm (A_1^1 = 225a); aqueous alkali—310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1626, 1307, 1136, 1066, 1212, 749 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 323, 221, 181, 222, 207, 72, 223, 324.



Quantification

Blood **GC-MS** Column: CP-Sil 8CB-MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.4 mL/min. Temperature programme: 200° for 1.5 min to 220° at 30°/min to 280° at 20°/min to 300° at 2°/min for 4.83 min. CI and EI modes. Limit of detection, 0.02 μg/L [Libong *et al.* 2003]. Column: Ultra-2 (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: H_2, 67 cm/s. Temperature programme: 175° for 0.8 min to 298° at 19°/min for 3–5 min. Desorption CI. Limit of quantification, 20 ng/L [Nelson, Foltz 1992].

HPLC Column: LiChroSphere 60 RP-Select B (5 μm). Fluorescence detection (λ_{ex}=320 nm, λ_{em}= 420 nm). Limit of detection, 0.05 μg/L [Bergemann *et al.* 1999].

LC-MS Column: BEH C_{18} (50 × 2.5 mm i.d., 1.7 μm). Mobile phase: 20 mmol/L ammonium acetate buffer (pH 4.0) : acetonitrile (90 : 10 for 1 min to 75 : 25 in 10 min for 1 min), flow rate 0.2 mL/min. API, ESI, MRM acquisition mode. Limit of quantification, 20 ng/L for LSD and iso-LSD, and 50 ng/L for nor-LSD and 2-oxo-3-OH-LSD, limit of detection, 5 ng/L for LSD and iso-LSD, and 10 ng/L for nor-LSD and 2-oxo-3OH-LSD [Chung *et al.* 2009]. Column: Luna CN (150 × 2 mm i.d., 5 μm). Mobile phase: water-0.1% formic acid-2 mmol/L ammonium formate (pH 3.0): acetonitrile-0.1% formic acid-2 mmol/L ammonium formate (80 : 20 to 20 : 80 in 8 min for 4 min), flow rate 0.3 mL/min. ESI. Limit of quantification, 20 ng/L for LSD and nor-LSD, 10 ng/L for iso-LSD, limit of detection, 10 ng/L for LSD and nor-LSD [Favretto *et al.* 2007]. Column: Zorbax SB-C_{18} (30 × 2.1 mm i.d., 3.5 μm). Mobile phase: 5% acetonitrile in 0.05% formic acid : 100% acetonitrile with 0.05% formic acid (5 : 95 for 2 min to 40 : 60 over 10 min), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.01 μg/kg for LD and iso-LSD [Johansen, Jensen 2005]. Column: Spherisorb 5 RP 8S (100 × 2.1 mm i.d., 5 μm). Mobile phase: water : acetonitrile (40 : 60) containing 0.1% formic acid and 2 mmol/L ammonium formate, flow rate 400 μL/min. ESI, MRM acquisition mode. Retention time: 4.3 min. Limit of quantification, 0.02 μg/L for LSD and iso-LSD [Canezin *et al.* 2001]. Column: Eclipse XDB-C_{18} (75 × 4.6 mm i.d., 3.5 μm). Mobile phase: 20 mmol/L ammonium formate (pH 4.3) : methanol (70 : 30 for 5 min to 66 : 44 over 5.5 min for 11 min in total) flow rate 0.7 mL/min. ESI. SIM acquisition mode. Limit of detection, 100 ng/L for LSD and 400 ng/L for OH-LSD [Sklerov *et al.* 2000]. See also de Kanel *et al.* [1998] and Bogusz *et al.* [1998].

Plasma **GC-MS** Column: Ultra-1 dimethylsilicone (12.5 m × 0.2 mm i.d., 0.33 μm) or DB-5 (10 m × 0.25 mm i.d., 1.0 μm). Carrier gas: H_2, 90 cm/s. Temperature programme: 180° for 1 min to 300° at 20°/min for 1 min. ECD. Limit of detection, 0.1 μg/L [Papac, Foltz 1990].

LC-MS Column: Zorbax SB-phenyl (75 × 4.6 mm i.d., 3.5 μm). Mobile phase: ammonium acetate buffer (pH 4.0) : acetonitrile-propan-1-ol (35 : 65), flow rate 250 μL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.05 μg/L for LSD, limit of detection, 0.025 μg/L for LSD and *N*-demethyl-LSD [de Kanel *et al.* 1998].

Serum **GC-MS** Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 150° for 2 min to 290° at 30°/min for 25 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.1 μg/L [Musshoff, Daldrup 1997].

HPLC Column: LiChrospher 60 RP Select B HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Mobile phase: 0.05 mol/L phosphate buffer (pH 2.3) : acetonitrile (75 : 25), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}= 231 nm, λ_{em}= 420 nm). Retention time: 14.4 min for LSD, 15.3 min for LAMPA. Limit of detection, 50 pg [Röhrich *et al.* 2000]. Comparison with radioimmunoassay, limit of detection, 0.5 μg/L [McCarron *et al.* 1990].

LC-MS Column: Superspher RP-18 (125 × 3 mm i.d., 4 μm) Mobile phase: acetonitrile : 50 mmol/L ammonium formate (pH 3.0, 25 : 75), flow rate 0.5 mL/min.

APCI, SIM acquisition mode. Limit of detection, 0.5 μg/L [Bogusz *et al.* 1998]. See Plasma [de Kanel *et al.* 1998].

Urine **GC-MS** Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 200° for 1 min to 260° at 50°/min to 290° at 10°/min to 320° at 50°/min for 5 min. SIM acquisition mode. Limit of quantification, 1.0 μg/L for 2-oxo-3-OH-LSD; limit of detection, 0.5 μg/L for 2-oxo-3-OH-LSD) [Burnley, George 2003]. Column: Eclipse XDB-C_{18} (150 × 4.6 mm i.d., 3.5 μm). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 8.0) : acetonitrile (80 : 20) with 0.02% TEA. APCI, positive ion mode. Limit of quantification, 400 ng/L for OH-LSD, limit of detection, 200 ng/L for OH-LSD [Poch *et al.* 1999]. Column: ZB-5 (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H_2, 20 psi (137.9 kPa). Temperature programme: 175° for 0.8 min to 298° at 20°/min. PICI, SRM acquisition mode. Limit of detection, 10 ng/L for LSD and 2-oxo-3-OH-LSD [Reuschel *et al.* 1999a]. Column: ZB-5 (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.4 mL/min. Temperature programme: 150° for 1.5 min to 220° at 30°/min to 280° at 20°/min to 300° at 10°/min for 1.5 min. EI ionisation, CID. Limit of quantification, 80 ng/L, limit of detection, 20 ng/L, [Sklerov *et al.* 1999]. See Blood [Nelson, Foltz 1992]. See also Clarkson *et al.* [1998], Francom *et al.* [1988], Lim *et al.* [1988], Paul *et al.* [1990].

HPLC See Blood [Bergemann *et al.* 1999]. Limit of detection, <1 μg/L [Blum *et al.* 1990]. See Serum [McCarron *et al.* 1990].

LC-MS See Blood. Limit of quantification, 20 ng/L for LSD and iso-LSD, and 50 ng/L for nor-LSD, 2-oxo-3-OH-LSD; limit of detection, 10 ng/L for LSD, iso-LSD, nor-LSD and 2-oxo-3OH-LSD [Chung *et al.* 2009]. Column: RP C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: water : acetonitrile (80 : 20) with 0.1% formic acid, flow rate 200 μL/min. ESi. Limit of quantification, 0.2 ng/L [Chapuis-Hugon *et al.* 2009]. See Blood [Favretto *et al.* 2007]. Column: Atlantis dC_{18} (100 × 2.1 mm i.d., 3 μm). Mobile phase: acetonitrile : ammonium formate buffer (pH 3.0, 0 : 100 for 1 min to 50 : 50 in 10 min for 2.5 min to 0 : 100 in 0.5 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 10.4 min. Limit of quantification, 0.2 μg/L, limit of detection, 0.1 μg/L, [Concheiro *et al.* 2007]. Column; Zorbax Eclipse XDB C_8 (150 × 4.6 mm i.d., 5 μm). Mobile phase: 2 mmol/L ammonium acetate in acetonitrile : water (70 : 30), flow rate 0.8 mL/min. ESI, SRM acquisition mode. Limit of quantification, 1 μg/L [Cui *et al.* 2004]. Mobile phase: buffer : acetonitrile (79 : 21 for 2 min to 63 : 37 over 9 min), flow rate 0.8 mL/min. SIM acquisition mode. Limit of quantification, 250 ng/L for LSD and 2-oxo-3-OH-LSD, limit of detection, 250 ng/L for LSD and 2-oxo-3-OH-LSD [Horn *et al.* 2003]. Column; Luna C_{18} (100 × 2.0 mm i.d., 3 μm). Mobile phase: 20 mmol/L acetic acid-5 mmol/L ammonia : acetonitrile (pH 4.5, 80 : 20), flow rate 0.3 mL/min. API, ESI. Limit of detection, 0.02 μg/L [Bodin, Svensson 2001]. See Blood [Canezin *et al.* 2001; Johansen, Jensen 2005; Sklerov *et al.* 2000]. See Plasma [de Kanel *et al.* 1998]. See Serum [Bogusz *et al.* 1998]. See also Hoja *et al.* [1997], Klette *et al.* [2002], Poch *et al.* [2000], Webb *et al.* [1996], White *et al.* [1997] and White *et al.* [1999].

CE Capillary: fused silica (65/60 cm total/effective length, 50 μm i.d.). Running buffer: acetonitrile : methanol : water (5 : 35 : 60) containing 100 mmol/L SDS, 3 mmol/L Brij-30 and 50 mmol/L hydrogen phosphate. LTFS detection. Limit of detection, 20 ppt (with sweeping-MEKC) and 60 ppt (with CSEI-sweep-MEKC) [Fang *et al.* 2002].

Note For a comparison of EMIT and CEDIA photometric immunoassays with DPC radioimmunoassay, see Wiegand *et al.* [2002].

Body Fluids **HPLC-radioimmunoassay** Fluorescence detection. Limit of detection, 0.5 μg/L [Twitchett *et al.* 1978].

Fluoroimmunoassay Limit of detection, 4 μg/L [Hubbard *et al.* 1983].

Vitreous Humour **LC-MS** See Blood [Favretto *et al.* 2007].

Hair **HPLC** See Serum [Röhrich *et al.* 2000].

LC-MS See Urine. Limit of detection, 0.1 μg/g [Chapuis-Hugon *et al.* 2009].

Other **HPTLC** Illicit dosage forms. Limit of detection, 2 ng [Kraus *et al.* 1980].

Note For reviews of methods for determination of LSD and other drugs of abuse for investigation of drug-related driving, see Moeller, Kraemer [2002]; for methods for the determination of LSD in body fluids, see Reuschel *et al.* [1999b], Schneider *et al.* [1998] and Smith, Robinson [1985].

Note Known interferences to LSD detection include ergometrine, ergonovine, methylergometrine, dihydroergotamine, ergocornine, ergocristine, methysergide and ergotamine. Several of these agents are used clinically for various medical conditions.

Disposition in the Body LSD is readily absorbed from all mucous membranes. It can be administered through inhalation and topical application, although oral ingestion is more common. LSD-paper can be placed on skin or in the conjunctival sac for absorption of the drug. It is believed to undergo extensive biotransformation in the liver (hydroxylation and glucuronide conjugation) to inactive metabolites. A very small percentage crosses the blood–brain barrier and it is extensively bound to plasma proteins. Approximately 1% of a dose is excreted unchanged in the urine in 24 h. 2-Oxy-LSD is a major metabolite although 13-OH-LSD and 14-OH-LSD also appear.

As little as 0.5–1.5 μg/kg bodyweight is known to produce hallucinations. LSD is thought to produce its effects by binding to and activating the 5-hydroxytryptamine receptor subtype 2 (5-HT_2).

Single doses of 200–400 μg were administered to 8 subjects; the urinary concentration of LSD or a closely related metabolite ranged from 0.001–0.055 mg/L in the 24 h after ingestion [Taunton-Rigby *et al.* 1973].

Blood Concentration

A single oral dose of 160 μg was administered to 13 subjects; plasma concentrations measured at intervals over a period of 2.5 h varied considerably but were in the range 0–0.009 mg/L [Upshall, Wailling 1972].

A peak plasma concentration of 1.9 μg/L LSD was found 3 h after the administration of an oral dose of 1 μg/kg to a healthy subject. Apparent plasma half-life was 5.1 h [Papac, Foltz 1990].

Toxicity Hallucinatory effects are produced with doses of 200–400 μg but recovery has occurred after much larger doses (up to 10 mg). Plasma concentrations >0.001 mg/L have been associated with toxic effects.

Following a dinner party, 4 men and 4 women (age range 19–39 years) were admitted to hospital after 'snorting' 2 lines of white powder believed to be cocaine. Analysis of the white powder identified it as almost pure (80–90%) LSD tartrate. Emesis and collapse occurred along with sign of sympathetic overactivity, hyperthermia, coma and respiratory arrest. Concentrations of LSD tartrate ranged from 2.1–26 μg/L in serum and 1000–7000 μg/100 mL in gastric fluid. All patients recovered with supportive care [Klock *et al.* 1975].

A 25-year-old man died 16 h after being admitted to hospital. Postmortem toxicological analysis by radioimmunoassay (RIA) and HPLC revealed the following LSD concentrations (μg/L):

Sample	*RIA*	*HPLC*
Antemortem serum	14.4	–
Antemortem plasma	14.8	8
Postmortem blood	4.8	–
Stomach contents	55.2	60
Liver blood	7.2	–

[Fysh *et al.* 1985].

An 8-month-old baby was brought to the emergency department by his father after the baby had ingested 5 blotters of LSD. Charcoal and magnesium sulfate were administered. Both urine and gastric acid tested positive for LSD. The baby was admitted to the paediatric intensive care unit for observation but no further treatment was necessary [Maslanka, Scott 1992].

For a report of the clinical findings in 5 patients with suspected LSD intoxication, see [Blaho *et al.* 1997].

Half-life Plasma half-life, ~2.5 h.

Volume of Distribution ~0.3 L/kg.

Protein Binding Approximately 90%, decreasing to ~65% in overdose subjects.

Dose In psychotherapy, doses of 100 to 750 μg have been given.

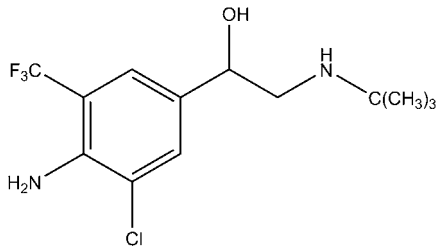
Mabuterol

β_2-*Adrenoceptor Agonist, Bronchodilator, Sympathomimetic*
$C_{13}H_{18}ClF_3N_2O = 310.7$
CAS—56341-08-3

IUPAC Name 1-(4′-Amino-3′-chloro-5′-trifluoromethylphenyl)-2-*tert*-butylaminoethanol

Synonyms Ambuterol; 4-amino-3-chloro-α-[[(1,1-dimethylethyl)amino]methyl]-5-(trifluoromethyl)benzene-methanol; 4-amino-α-[(*tert*-butylamino)methyl]-3-chloro-5-(trifluoromethyl)benzyl alcohol; 1-(4′-amino-3′-chloro-5′-trifluoromethylphenyl)-2-tert-butylaminoethanol.



Chemical Properties Mabuterol is stable in plasma after 3 freeze–thaw cycles and after storage at 4° [Lu *et al.* 2005].

dl-Mabuterol Hydrochloride

$C_{13}H_{18}ClF_3N_2O,HCl = 347.2$
CAS—95656-48-7
Synonyms KF-868; PB-868Cl.
Proprietary Name *Broncholin*
Chemical Properties Crystals. Mp 205° to 206°. Fairly soluble in water.

d-Mabuterol Hydrochloride

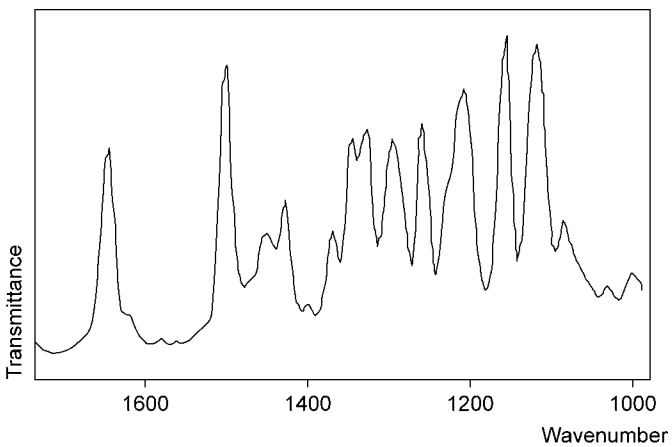
CAS—95656-54-5
Chemical Properties Mp >194°.

l-Mabuterol Hydrochloride

CAS—95656-55-6
Chemical Properties Mp >194°.

Gas Chromatography Column: CpSil-5 CB (TMS derivative; 25 m × 0.25 mm i.d.) DB-5 capillary (MBA derivative, 30 m × 0.25 mm i.d.). Carrier gas: He, 0.9 mL/min. Temperature programme: 80° for 1 min to 180° at 20°/min to 290° at 10°/min for 5 min. FTIR interface. Retention time: 13.5 min. Limit of detection, 1 mg/L [Visser *et al.* 1994].

Infrared Spectrum Principal peaks at wavenumbers 1637, 1494, 1422, 1341, 1323, 1287 cm^{-1} (MBA derivative) [Visser *et al.* 1994].



Quantification

Other **TLC** Rat Urine. Plates: silica gel 60 F_{254} (2 mm). Solent system: (1) benzene : isopropanol : ammonia (80 : 20 : 1); (2) chloroform : ethylacetate : formic acid (50 : 50 : 1); (3) chloroform : ethylacetate : methanol : acetic acid : water (50 : 50 : 35 : 1 : 1). Autoradiographic detection. Limit of detection not reported [Horiba *et al.* 1984].

GC-MS Bovine Urine. Column: HP-5 fused silica (24 m × 0.2 mm i.d., 0.11 μm). Carrier gas: He. Temperature programme: 120° to 300° at 11°/min for 5 min. EI ionisation at 70 eV. Limit of quantification, 1.54 μg/L; limit of detection, 0.5 μg/L [Spisso *et al.* 2000]. Bovine hair. Column: CP-Sil 5CB-MS capillary (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 90° for 2 min to 210° at 12.5°/min for 5 min to 300° at 15°/min. EI ionisation or chemical ionisation. Limit of quantification, 5.0 and 1.7 μg/kg for black and white hair, respectively; limit of detection, 2.9 and 1.1 μg/kg for black and white hair, respectively [Haasnoot *et al.* 1998]. Bovine Urine. Column: HP 1 (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 0.1 min to 245° at 15°/min to 300° at 30°/min for 4.0 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.7 and 0.3 μg/L for the MBA and BBA derivatives, respectively [Ramos *et al.* 1998]. Bovine Urine and Lliver. Column: DB-5 Permabond SE-52 fused silica (25 m × 0.32 mm i.d., 0.5 μm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 310° at 10°/min. EI ionisation at 70 eV, positive ion mode, MRM acquisition mode. Limit of detection, 0.05 and 0.1 μg/kg for urine and liver, respectively [van Vyncht *et al.* 1996].

HPLC Rat Plasma. Column: Agilent C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: 20 mmol/L sodium dihydrogen phosphate (pH 6.6) : acetonitrile (80 : 20), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of quantification, 10 μg/L [Lu *et al.* 2005]. Equine Plasma. Column: LiChrosorb (select B) C_{18} (125 × 4.0 mm i.d., 7.0 μm). Mobile phase: phosphate buffer (pH 4.0 to 4.1) : acetonitrile with 0.2 mmol/L sodium 1-heptanesulfonate (77 : 23). Electrochemical detection. Limit of detection, 2 μg/L [Qureshi, Eriksson 1988].

LC-MS Bovine Urine. Column: Inertsil C_8 (150 × 2.1 mm i.d., 5 μm). Mobile phase: 0.06 mol/L ammonium formate buffer (pH 3.2) : acetonitrile (93 : 7 to 40 : 60 at 20 min to 93 : 7 at 30 min for 5 min), flow rate 0.3 mL/min. APCI, positive ion mode, MRM acquisition mode. Limit of detection, 0.73 μg/L [Dickson *et al.* 2005]. Bovine Liver and Retina. Column: Inertsil C_8 (150 × 2.1 mm i.d., 5 μm). Mobile phase: ammonium formate buffer (pH 3.2) : acetonitrile (93 : 7 to 50 : 50 at 16 min to 93 : 7 at 17 min for 12 min), flow rate 0.3 mL/min. APCI, positive ion mode. Limit of detection, 0.2 and 2 μg/kg for liver and retina, respectively [Fesser *et al.* 2005]. Bovine Liver. Column: Symmetry C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: methanol : 0.032% trifluoroacetic acid (22 : 78), flow rate 0.3 mL/min. ESI, positive ion mode, full scan mode. Limit of detection, 0.1 μg/kg [De Wasch *et al.* 1998]. Bovine Urine and Liver. Column: α-chrom C_{18} (25 cm × 3 mm i.d., 5 μm). Mobile phase: acetonitrile–10 mmol/L ammonium acetate (pH 7.0)–water (77 : 12 : 11) : acetonitrile–25 mmol/L ammonium acetate (pH 3.5, 65 : 36; 100 : 0 for 5.5 min to 0 : 100 at 5.6 min to 15 min), flow rate 0.5 mL/min. EI ionisation at 70 eV, positive ion mode, MRM acquisition mode. Limit of detection, 0.05 μg/kg [van Vyncht *et al.* 1996].

Disposition in the Body Mainly metabolised by oxidative deamination to 6 metabolites.

Therapeutic Concentration

Six healthy male volunteers were administered a single oral dose of 40 μg radiolabelled mabuterol. Peak concentrations of 96 to 160 ng/L were reached between 1.5 and 3.2 h [Guentert *et al.* 1984].

Toxicity Oral LD_{50} values were between 200 and 319 mg/kg when malbuterol was studied in mouse, rat, rabbit and dog [Amemiya *et al.* 1984].

Volume of Distribution 5.8 L/kg.

Clearance 3.0 mL/min/kg.

Distribution in Blood Blood : plasma ratio 0.92 to 1.14.

Dose 50 μg twice a day.

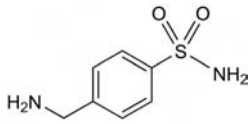
Mafenide

Sulfonamide, Antibacterial
$C_7H_{10}N_2O_2S$ = 186.2
CAS—138-39-6

IUPAC Name 4-(Aminomethyl)benzenesulfonamide
Synonyms Bensulfamide; benzamsulfonamide; 4-homosulfanilamide; sulfa benzamine.



Chemical Properties A white powder. Mp 151° to 154°. Sparingly soluble in water; soluble in methanol and in dilute acids and alkalis. Log *P* (octanol/water), −0.6.

Mafenide Acetate

$C_7H_{10}N_2O_2S,C_2H_4O_2$ = 246.3
CAS—13009-99-9
Proprietary Names *Mafatate*; *Sulfamylon*.
Chemical Properties A white crystalline powder. Mp 151° to 152°. Freely soluble in water and methanol; sparingly soluble in ethanol.

Mafenide Hydrochloride

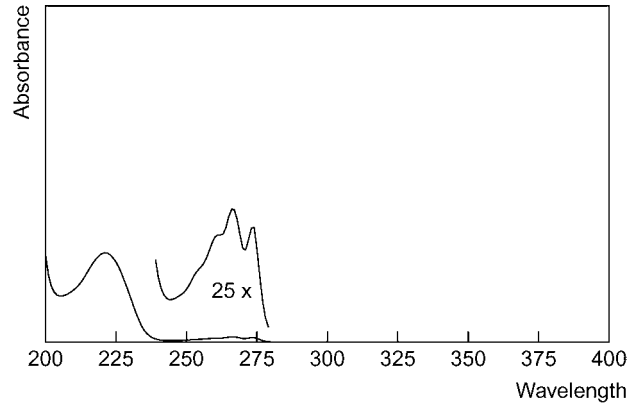
$C_7H_{10}N_2O_2S$,HCl = 222.7
CAS—138-37-4
Synonyms Homosulfaminum; maphenide.
Chemical Properties A colourless or white crystalline powder. Mp about 260°. Soluble 1 in 1.7 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Mafenide Propionate

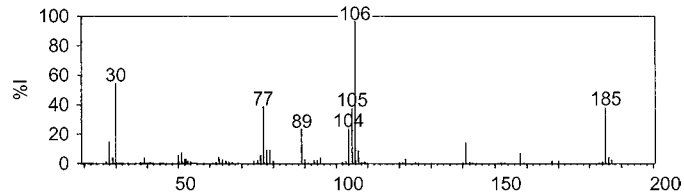
$C_7H_{10}N_2O_2S,C_3H_6O_2$ = 260.3
CAS—12001-72-8
Proprietary Name *Sulfomyl*
Chemical Properties Colourless crystals. Mp 158°. Readily soluble in water.

Colour Test Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.49; system TD—R_f 0.01; system TE—R_f 0.27; system TF—R_f 0.01; system TAD—R_f 0.02; system TAE—R_f 0.22; system TAJ—R_f 0.00; system TAK—R_f 0.72; system TAL—R_f 0.93 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—mafenide RI 2340, mafenide-Me_2 RI 1920, mafenide-Me_3 RI 1900, mafenide-Me_4 RI 1870, M (acetyl-) RI 2425, M (acetyl-)-Me RI 2300.
Ultraviolet Spectrum Aqueous acid—267 (A_1^1=41a), 274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1151, 1316, 1299, 897, 1089, 1592 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 106, 30, 77, 185, 105, 104, 89, 141.

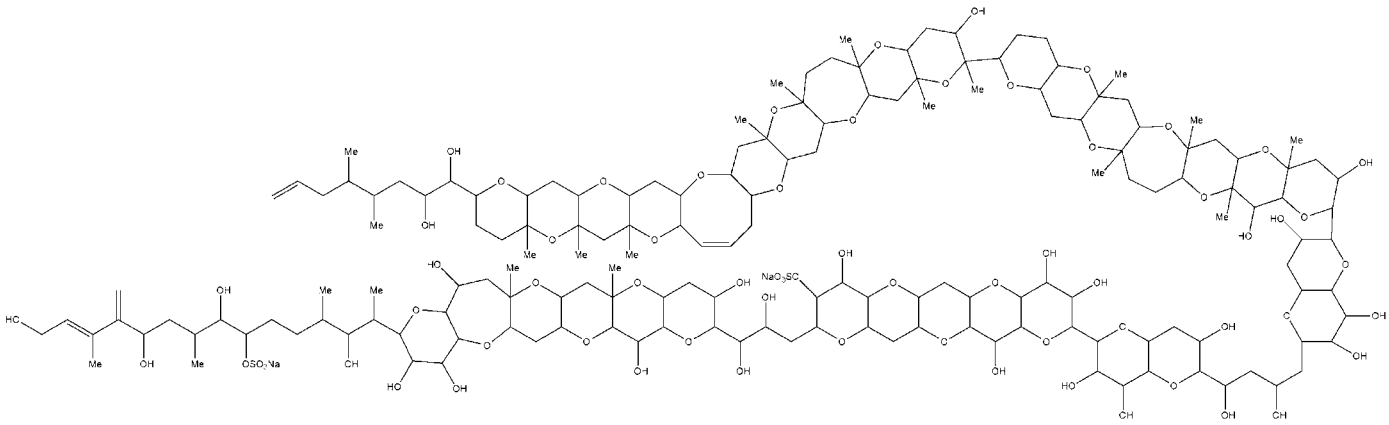


Quantification
Serum **TLC** Limit of detection, 1 mg/L [Steyn 1977].
Disposition in the Body Mafenide is absorbed from wounds into the circulation and metabolised to *p*-carboxybenzenesulfonamide which is excreted in the urine.
Use Topically as a cream containing 8.5% mafenide (as the acetate).

Steyn JM (1977). Thin-layer chromatographic determination of mafenide [(p-aminomethyl) benzenesulphonamide] in human serum. *J Chromatogr* 143: 210–213.

Maitotoxin

Marine Neurotoxin
Synonym MTX



Structure of maitotoxin

Chemical Properties Family of lipid-soluble polyether toxins responsible for ciguatera food poisoning common in tropical and subtropical regions. Maitotoxin was first detected in the gut of the surgeon fish *Ctenochaetus striatus* ('maito' is the Tahitian name for surgeon fish) and later in the dinoflagellate *Gambierdiscus toxicus* [Terao *et al.* 1988]. It is the largest secondary metabolite as yet isolated from any living creature [Nicolaou *et al.* 2008]. Three strains can be purified to homogeneity: maitotoxin-1 (M_r 3422 for the sodium salt), maitotoxin-2 (M_r 3298 for the sodium salt) and maitotoxin-3 (M_r 1060 for the sodium salt) [Holmes, Lewis 1994].

Maitotoxin-1

$C_{164}H_{256}O_{68}S_2Na_2 = 3422$
CAS—59392-53-9
Synonym MTX-1
Chemical Properties Colourless amorphous solid [Escobar *et al.* 1998].

Maitotoxin-2

MW=3298
Synonym MTX-2
Chemical Properties White powder.

Maitotoxin-3

MW=1060
Synonym MTX-3
Chemical Properties White amorphous solid.

Capillary Electrophoresis Column: Polyvinylalcohol-coated fused silica capillary (50.5/42 cm total/effective length, 50 µm i.d.). Running buffer: 40 mmol/L phosphate buffer (pH 6.8). DAD (λ= 195 nm). Retention time: 10.4 min. Limit of detection, 50 pg [Bouaicha *et al.* 1997].
Ultraviolet Spectrum Methanol—230 nm [Holmes, Lewis 1994; Yokoyama *et al.* 1988].
Toxicity The primary action of MTX in the BC_3H_1 muscle line was a pore- or channel-forming activity of a non-classical type, resulting in a massive uptake of Ca^{2+} [Sladeczek *et al.* 1988]. Ingestion of toxic surgeon fish causes neurological disturbances, gastrointestinal afflictions, and cardiovascular disorders in humans [Bagnis 1968].

LD_{50} in mice (IP), 0.05 µg/kg for MTX-1, 0.08 µg/kg for MTX-2 [Holmes, Lewis 1994]. LD_{50} in mice (IP), 0.06 µg/kg for monodesulfo-MTX, 15 µg/kg for didesulfo-MTX, 0.13 µg/kg for MTX [Murata *et al.* 1991].
Use It is used as a pharmacological research tool [Gusovsky, Daly 1990].

Bagnis R (1968). Clinical aspects of ciguatera (fish poisoning) in French Polynesia. *Hawaii Med J* 28: 25–28.

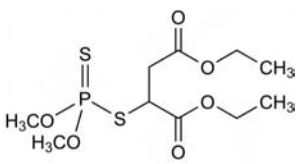
Malathion

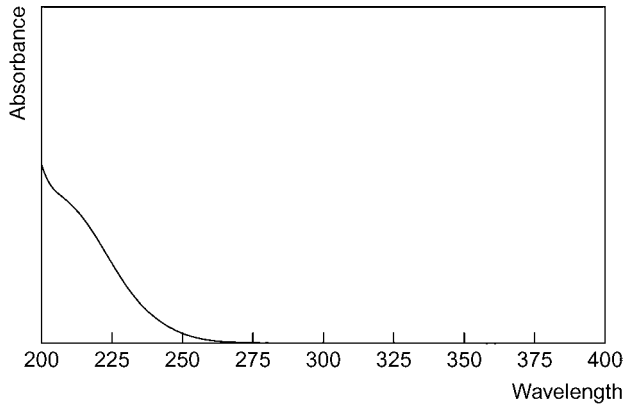
Insecticide, Organophosphate
$C_{10}H_{19}O_6PS_2 = 330.4$
CAS—121-75-5

IUPAC Name Diethyl 2-dimethoxyphosphinothioylsulfanylbutanedioate
Synonyms Carbofos; carbophos; compound 4047; diethyl[(dimethoxyphosphinothioyl)thio]butanedioate; OMS-1.
Proprietary Names *Derbac-M*; *Ovide*; *Prioderm*; *Quellada M*; *Suleo-M*.

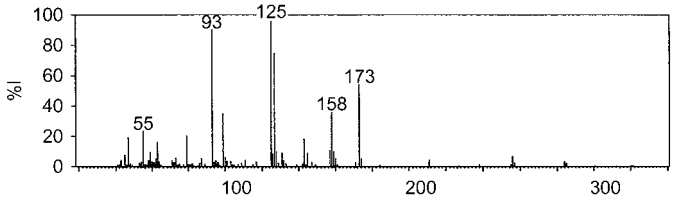


Chemical Properties A colourless to light amber liquid that decomposes in strong acid or high humidity. Although stable in light, it decomposes at high temperatures. Fp 2.85°. Refractive index 1.4985. Slightly soluble in water; miscible with many organic solvents. Log *P* (octanol/water), 2.4.
Colour Tests Palladium chloride—brown; phosphorus test—yellow; sodium nitroprusside (method 2)—violet.

Thin-layer Chromatography System TE—R_f 0.99; system TW—R_f 0.74; system TX—R_f 0.31; system TY—R_f 0.53; system TZ—R_f 0.82; system TAA—R_f 0.33; system TAB—R_f 0.24; system TAC—R_f 0.14; system TAE—R_f 0.84.
Gas Chromatography System GA—malathion RI 1925, M (malaoxon) RI 1890; system GK—RRT 1.03 (relative to caffeine).
High Performance Liquid Chromatography System HZ—RT 5.4 min.
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1018, 1748, 1174, 1209, 824, 1250 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 125, 93, 127, 173, 158, 99, 55, 79.



Quantification

Blood **Colorimetry** [Faragó 1967].

GC Column: Alltech EC-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 120° for 3 min to 230° at 10°/min for 4 min. NPD. Limit of detection, 45 µg/L [Tsoukali *et al.* 2005]. NPD and ECD. Limit of detection, malathion and other pesticides [Garcia-Repetto *et al.* 2001].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 1 min to 290° at 20°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.17 mg/L, limit of detection, 0.09 mg/L [Park *et al.* 2009]. Limit of detection, malathion and other pesticides and their metabolites [Ostrea *et al.* 2009]. Column: Rtx-CL (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 100 kPa. EI ionisation, SIM acquisition mode. Retention time: 26.9 min. Limit of detection, 2–5 µg/L [Liu, Pleil 2002]. Column: HP-5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 1 min to 290° at 10°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.05 µg/g [Musshoff *et al.* 2002]. Column: Ultra-1 (25 m × 0.33 mm i.d., 200 µm). Carrier gas: He, 1.7 mL/min. Temperature programme: 60° for 3 min to 290° at 12°/min for 10 min. EI ionisation. Limit of quantification, 1.52 µg/L, limit of detection, 0.45 µg/L [Garcia-Repetto *et al.* 2001]. See also [Namera *et al.* 1997]

HPLC Limit of detection, for malathion and other pesticides, 100 ng [Sharma *et al.* 1990].

Plasma **GC** See Blood. [Tsoukali *et al.* 2005].

Serum **TLC** High performance. UV detection. Limit of detection, 0.12 mg/L [Futagami *et al.* 1997].

HPLC DAD (λ= 230 nm). Limit of detection, for malathion and other pesticides, 0.05–6.8 mg/L [Cho *et al.* 1997].

LC-MS Column: C(18). Mobile phase: 10 mmol/L ammonium formate-methanol. Limit of quantification, 0.25–1.25 mg/L for malathion and other pesticides, limit of detection, 0.125–1 mg/L for malathion and other pesticides [Inoue *et al.* 2007].

Urine **GC** FID. Limit of detection, 40–130 µg/L (dialkyl phosphate residues) [Reid, Watts 1981]. FID. Limit of detection, 2 µg/L for malathion dicarboxylic acid metabolite and 5 µg/L for malathion α-monocarboxylic acid metabolite [Bradway, Shafik 1977]. See Blood [Tsoukali *et al.* 2005].

GC-MS Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 60° for 1.75 min to 270° at 20°/min for 20 min. EI ionisation at 70 eV. Limit of quantification, 0.24 ng/L, limit of detection, 0.07 ng/L [Cruz-Márquez *et al.* 2001].

HPLC See Serum [Cho *et al.* 1997].

LC-MS ESI. Limit of quantification, 0.1–1 µg/L for malathion and other pesticides [Olsson *et al.* 2003]. APCI. Limit of detection, 20–500 ng/L for malathion and metabolites [Baker *et al.* 2000]. Column: Partisil 5 ODS-3 (250 × 4.6 mm i.d.).

M

Mobile phase: acetonitrile : 0.2% glacial acetic acid (60 : 40), flow rate 1.0 mL/min. APCI, positive ion mode. Limit of detection, 0.5 μg/L (malathion metabolites) [Beeson *et al.* 1999].

CSF **GC** See Blood. Limit of detection, 40 μg/L [Tsoukali *et al.* 2005].

Meconium **GC-MS** See Blood [Ostrea *et al.* 2009].

Hair **GC-MS** See Blood [Ostrea *et al.* 2009].

Kidney **GC** See Blood. Limit of detection, 50 μg/L [Tsoukali *et al.* 2005].

Liver **GC** See Blood. Limit of detection, 50 μg/L [Tsoukali *et al.* 2005].

HPLC See Blood [Sharma *et al.* 1990].

Lung **HPLC** See Blood [Sharma *et al.* 1990].

Tissues **Colorimetry** See Blood [Faragó 1967].

Other **GC-MS** Environmental Media (soil, dog hair). See Blood [Liu, Pleil 2002].

Disposition in the Body Malathion is absorbed after oral ingestion but absorbed only slowly and to a small extent through intact skin. It is metabolised by conversion to malaoxon, the toxic keto analogue, and by hydrolysis to malathion α-mono- and dicarboxylic acids, which are the major metabolites. Other hydrolysis products include dimethylthiophosphoric acid and dimethyldithiophosphoric acid, which have been detected in the urine of subjects exposed to malathion. After ingestion, up to 25% is excreted in the 24 h urine as ether-extractable phosphates, mostly in the first 8 h.

Toxicity Malathion is less toxic than most other organophosphorus pesticides; the estimated minimum lethal dose is 25 g; the maximum permissible atmospheric concentration is 10 mg/m^3 and the maximum acceptable daily intake is 20 μg/kg.

In 6 cases of suspected poisoning caused by malathion, postmortem tissue concentrations were as follows: blood 175–517 mg/L, lungs 77–330 μg/g, liver 198–383 μg/g, kidneys 280–616 μg/g, spleen 175–475 μg/g, brain 84–387 μg/g, heart 160–315 μg/g, muscles 8–40 μg/g, urine 33–189 mg/L and gastric contents 452–989 mg/L [Jadhav *et al.* 1992].

An 80-year-old woman who committed suicide by ingesting malathion mixed with a fruit drink had an antemortem blood concentration of 23.9 mg/L [Zivot *et al.* 1993].

In a fatality involving a 40-year-old woman who ingested a malathion pesticide (350–400 mL), postmortem tissue concentrations were as follows: blood 1.7–1.9 mg/L, gastric contents 975–981 mg/L and liver not detected [Thompson *et al.* 1998].

Half-life Derived from urinary excretion data, ~3 h.

Dose Topically in concentrations of 0.5 or 1% in the treatment of pediculosis.

Mandelic Acid

Antibacterial (Urinary)

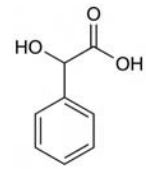
$C_8H_8O_3$ = 152.1

CAS—90-64-2; 611-72-3 (±)

IUPAC Name α-Hydroxybenzeneacetic acid

Synonyms Amygdalic acid; phenylglycollic acid; racemic mandelic acid.

Proprietary Name *Uromaline*



Chemical Properties White crystals, which turn yellow on exposure to light. Mp 119° to 121°. Soluble 1 in 6 of water, 1 in 1 of ethanol, 1 in 45 of chloroform and 1 in 6 of ether. pK_a 3.4 (25°). Log *P* (octanol/water), 0.6.

Ammonium Mandelate

$C_8H_7O_3NH_4$ = 169.2

CAS—530-31-4

Chemical Properties A white, very hygroscopic, crystalline powder, which discolours on exposure to light. Very soluble in water; sparingly soluble in ethanol.

Calcium Mandelate

$(C_8H_7O_3)_2Ca$ = 342.4

CAS—134-95-2

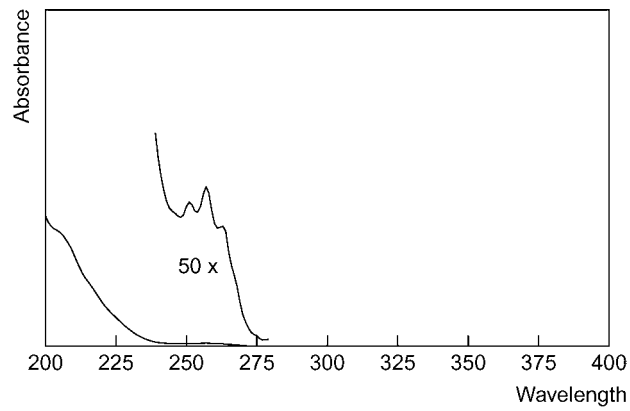
Synonym Calcium amygdalate

Chemical Properties A white crystalline powder. Soluble 1 in 100 of water and 1 in 4500 of ethanol (90%).

Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.

Gas Chromatography System GA—RI 1487.

Ultraviolet Spectrum Aqueous acid—251 (A^1_1=10.9b), 257 (A^1_1=13.7b), 262 nm (A^1_1=11.2b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1710, 1060, 1245, 1185, 690, 720 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 107, 79, 77, 51, 152, 105, 50, 78.

Quantification

Urine **GC** ECD or FID. Limit of detection, 1 mg/L and 5 to 8 mg/L, respectively, for mandelic acid enantiomers [Kezic *et al.* 2000]. Limit of detection, 30 mg/L for mandelic and phenylglycoxylic acids [Lanchote *et al.* 1994]. Limit of detection, 1 mg/L for mandelic and phenylglycoxylic acids [Dills *et al.* 1991].

HPLC For method of quantification for mandelic acid and other aromatic hydrocarbon metabolites, see Burrini [1998]. UV detection. Limit of detection, 5 mg/L for mandelic and phenylglycoxylic acids [Chua *et al.* 1993].

Disposition in the Body Mandelic acid is a urinary metabolite of several drugs and toxic chemicals, and is also found endogenously in normal urine at concentrations of up to 5 mg/L.

Dose Mandelic acid has been given in doses of 12 g daily, usually as the calcium or ammonium salt.

Burrini C (1998). The simultaneous determination of hippuric acid, o-, m-, p-methylhippuric acids, mandelic acid and phenylglyoxylic acid in urine by HPLC. *Med Lav* 89: 404–411.

Chua SC *et al.* (1993). Determination of mandelic acid and phenylglyoxylic acid in the urine and its use in monitoring of styrene exposure. *J Anal Toxicol* 17: 129–132.

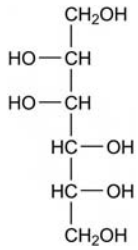
Dills RL *et al.* (1991). Capillary gas chromatographic method for mandelic and phenylglyoxylic acids in urine. *Int Arch Occup Environ Health* 62: 603–606.

Kezic S *et al.* (2000). Determination of mandelic acid enantiomers in urine by gas chromatography and electron-capture or flame ionisation detection. *J Chromatogr B Biomed Sci Appl* 738: 39–46.
Lanchote VL *et al.* (1994). An improved method for the simultaneous determination of mandelic and phenylglyoxylic acids by gas chromatography. *J Anal Toxicol* 18: 143–146.

Mannitol

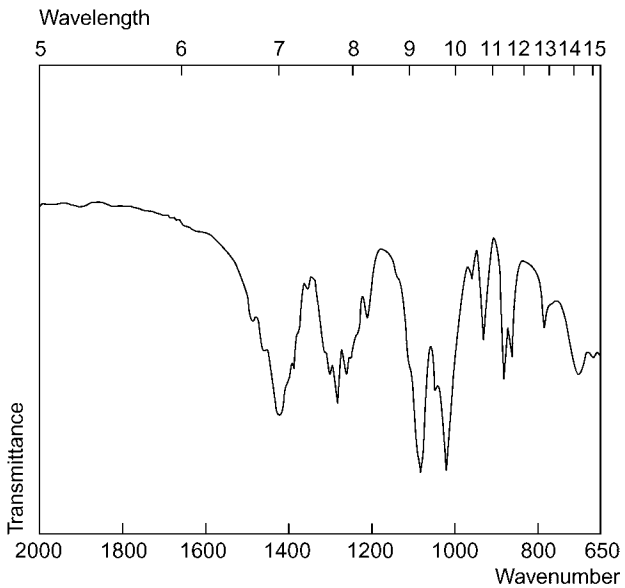
Diuretic
$C_6H_{14}O_6$ = 182.2
CAS—69-65-8

IUPAC Name 1,2,3,4,5,6-Hexanehexol
Synonyms Cordycepic acid; E421; manita; manitol; manna sugar; mannite; D-mannitol; mannitolum; NCI-C50362.
Proprietary Names *Diosmol*; *Manicol*; *Mannidex*; *Osmitrol*; *Osmosal*; *Resectisol*.

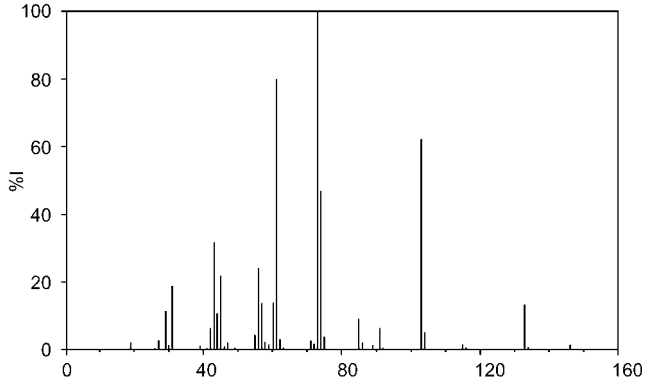


Chemical Properties A white odourless crystalline powder or granules with a sweet taste. Freely soluble in water (182 g/L at 25°); slightly soluble in pyridine, aniline, glycerol (1 g in 18 mL); very slightly soluble in alcohol; practically insoluble in ether. Mp 166° to 168°. Bp 290° to 295° at 3 to 5 mmHg. pK_a 13.5 (25°). Log *P* (octanol/water), −3.10.
Colour Test 3 mL of 100 g/L solution of pyrocatechol with 6 mL sulfuric acid. Add 0.3 mL of a 5 g of carbon dioxide free water diluted to 50 mL with solvent. Heat for 30 s.—Pink colour.
High Performance Liquid Chromatography Column: $LiNH_2$ Lichrosorb NH_2 (130 × 4 mm i.d.). Mobile phase: acetonitrile : deionised water (70 : 30), flow rate 2 mL/min. Detection: refractive index. Retention time: 6.8 min [Mills, Roberson 1993].

Column: sulfonated styrene–divinylbenzene copolymer with zinc ions Gelpack, GL-C64Z (150 × 6 mm i.d., 10 µm). Temperature: 80°. Mobile phase: acetonitrile : water (80 : 20), flow rate 1 mL/min. MS detection (APCI (atmospheric pressure chemical ionisation), SIM at *m/z* 217 for chloride ion). Retention time: 12.5 min [Niwa *et al.* 1993].
Infrared Spectrum Principal peaks at wavenumbers 1019, 1083, 1421, 1280 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 73, 61, 103, 74, 43, 56, 45, 31 (mannitol); *m/z* 115, 187, 139, 145, 157, 170, 259, 289 (mannitol hexaacetate).



Quantification
Blood **HPLC** UV detection (λ=228 nm). Limit of detection, 1 to 5 pg/L (benzoyl derivatives) [Oehlke *et al.* 1994].
Urine **GC** FID. Limit of detection, 0.9 µg/L [Shippee *et al.* 1992].

HPLC Column: carbohydrate Alltech 700 CH (300 × 6.5 mm, 10 µm). Temperature: 85°. Mobile phase: water, flow rate 0.5 mL/min. IS: cellbiose. ELS detection. Retention time: mannitol, 13.3 min; IS, 7.6 min. Limit of detection, 0.65 mg/L [Marsilio *et al.* 1998]. Column: HPIC-AS6 Dionex (250 × 40 mm). Mobile phase: 150 mmol/L sodium hydroxide, flow rate 1.0 mL/min. Electrochemical detection. Retention time: 3 min. Amperometric detection. Limit of detection, 0.3 mg/L [Fleming *et al.* 1990].
Disposition in the Body Only a small amount of mannitol is absorbed from the gastrointestinal tract after ingestion and is eliminated unchanged in urine (80% within 3 h). It is metabolised only very slightly to glycogen in the liver. Following IV injection it is excreted rapidly by the kidneys before metabolism can take place in the liver. It is freely filtered by the glomeruli and undergoes tubular reabsorption. It does not cross the blood–brain barrier, unless in very high concentrations, or penetrate the eye. Distributed in the extracellular fluid.
Toxicity Mannitol is mildly toxic by ingestion, IP and IV routes. It may cause blood pressure elevation, bladder tubule changes, nausea or vomiting. When heated to decomposition it emits acrid smoke and fumes.
Bioavailability Negligible oral bioavailability.
Half-life In healthy volunteers the plasma half-life is 0.25 to 1.7 h and in those with renal failure, 6 to 36 h.
Clearance Approximately 125 mL/h/kg in men and 116 mL/h/kg in women.
Dose Adult: range from 50 to 100 g by IV infusion of a 5 to 25% solution. Children: 0.25 to 2 g/kg body weight.

Fleming SC *et al.* (1990). Rapid and simultaneous determination of lactulose and mannitol in urine, by HPLC with pulsed amperometric detection, for use in studies of intestinal permeability. *Clin Chem* 36(5): 797–799.
Marsilio R *et al.* (1998). Simultaneous HPLC determination with light-scattering detection of lactulose and mannitol in studies of intestinal permeability in pediatrics. *Clin Chem* 44: 1685–1691.

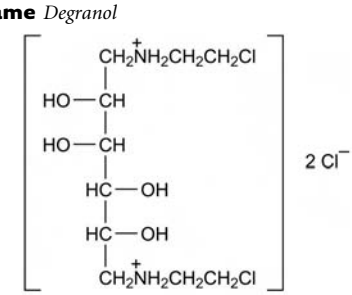
Mannomustine

Antineoplastic
$C_{10}H_{22}Cl_2N_2O_4,2HCl$ = 378.1
CAS—551-74-6

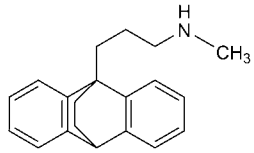
IUPAC Name 1,6-Bis(2-chloroethylamino)-1,6-dideoxy-D-mannitol dihydro chloride
Synonyms BCM; mannitol mustard.
Proprietary Name *Degranol*



Chemical Properties A white crystalline powder. Mp 241°, with decomposition. Soluble 1 in 2 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), −1.8.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1065, 1013, 1298, 1284, 1102, 1581 cm^{-1} (mannomustine hydrochloride, KBr disk).
Dose Mannomustine hydrochloride has been given in doses of 50 to 100 mg daily, by IV injection.

Maprotiline

Tetracyclic Antidepressant
$C_{20}H_{23}N = 277.4$
CAS—10262-69-8
IUPAC Name *N*-Methyl-9,10-ethanoanthracene-9(10*H*)-propanamine



Chemical Properties Mp 92° to 94°. pKa 10.5. Log *P* (octanol/water), 4.52 [Meylan, Howard 1995; Wille *et al.* 2005]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Maprotiline Hydrochloride

$C_{20}H_{23}N,HCl = 313.9$
CAS—10347-81-6
Synonyms Ba-34276; maprotilini hydrochloridum.
Proprietary Names *Aneural*; *Deprilept*; *Ludiomil*; *Maludil*; *Maprolu*; *Melodil*; *Mirpan*; *Psymion*.
Chemical Properties A white crystalline powder. Mp 230° to 232°. Slightly soluble in water; freely soluble in methanol and chloroform; practically insoluble in isooctane. Stable in human plasma for more than 3 months when stored at –2 2° [Aymard *et al.* 1997]. Plasma standards stored frozen at –2 0° are stable for 6 months [Salonen, Scheinin 1983]. Samples in whole blood stored at –4° are stable for 9 months [Alkalay *et al.* 1979].

Colour Test Liebermann's reagent—orange-brown; Mandelin's test—blue; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.15; system TB—R_f 0.18; system TC—R_f 0.05; system TE—R_f 0.36; system TL—R_f 0.02; system TAE—R_f 0.06; system TAF—R_f 0.71; system TAL—R_f 0.50.

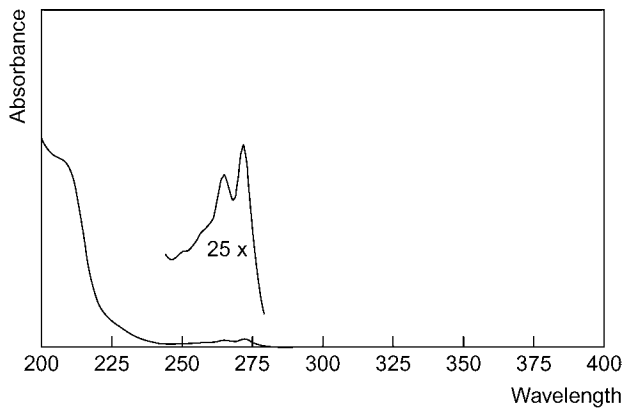
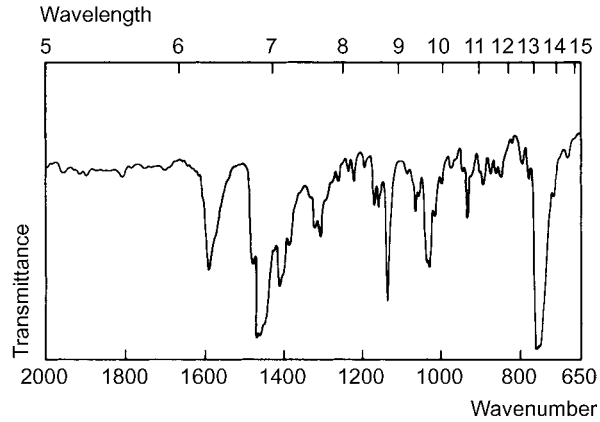
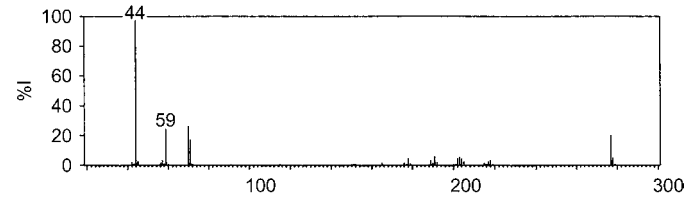
Ultraviolet Spectrum Aqueous acid—265, 272 nm ($A_1^1 = 52b$).



Infrared Spectrum Principal peaks at wavenumbers 759, 1140, 1592, 1032, 1308, 935 cm^{-1} (maprotiline hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 70, 59, 277, 71, 191, 278, 203.



Quantification

Blood **GC** Column: 5% phenyl 95% methyl silicone (12.7 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 15 mL/min. Temperature programme: 180° for 2 min to 280° at 15°/min for 3.33 min. NPD. Retention time: 6.6 min. Limit of detection not reported [Keller, Zollinger 1997]. Column: 1% OV-225 on 80/100 mesh Supelcoport (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30–40 mL/min. Temperature programme: 200 to 230°. ECD. Retention time: 3.65 min. Limit of detection, 10 µg/L [Alkalay 1982]. Column: 3% SP-2250 on 100/120 Supelcoport (6′ [1.8 m]). Carrier gas: He, 40 mL/min. Temperature: 270°. NPD. Retention time: 58 s. Limit of detection not reported [Rejent, Doyle 1982]. Column: 3% HI-EFF-8BP on Chromosorb W HP 100/120 mesh (300 × 3.0 mm i.d.). Carrier gas: 20 mL/min. Temperature: 245°. NPD. Limit of detection, maprotiline 20 µg/L, desmethylmaprotiline 50 µg/L [Sioufi, Richard 1980]. Column: 3% methylsilicone on Gas-Chrom Q (4′ × 3 mm i.d.). Carrier gas: N_2, 45 mL/min. Temperature programme: 230°. Limit of detection, <10 ng/sample [Geiger *et al.* 1975].

GC-MS Column: Supelco SPB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 5 min to 280° at 20°/min. SIM acquisition mode. Limit of detection, 25 ng/g [Namera *et al.* 1998]. Column: HP-5 Ultra 2 cross-linked 5% phenylmethyl silicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 2.25 min to 180° at 40°/min to 290° at 10°/min for 15 min. EI ionisation at 70 eV, continuous scan mode. Limit of detection, 0.5 mg/L [Polettini 1996]. Column: 1.5% Poly S-179 on 80/100 mesh (1.0 m × 2 mm i.d.). Carrier gas: CH_4, 20 mL/min. Temperature programme: 240 to 250°. CI. Retention time: 1.3–1.6 min. Limit of detection, 0.5 µg/L [Alkalay *et al.* 1979].

HPLC Column: C_8 reversed phase TSK gel Super-Octyl (100 × 4.6 mm i.d., 2 µm) or Hypersil MOS-C_8 (100 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L potassium dihydrogen phosphate (pH 7.0) : methanol (40 : 60), flow rate 0.6 mL/min. UV detection (λ = 254 nm). Retention time, maprotiline 5.6, desmethylmaprotiline 7.8 min. Limit of quantification, 0.05 mg/L [Tanaka *et al.* 1997]. Column: Spherisorb S5CN (250 × 3.2 mm i.d., 6.2 mm o.d.). Mobile phase: acetonitrile : methanol : 5 mmol/L sodium hydrogen phosphate (pH 7; 35 : 35 : 30), flow rate 1.5 mL/min. UV detection (λ = 215 nm). Retention time: ~10 min. Limit of detection not reported [Rejent, Doyle 1982].

Plasma **GC** Column: DB-17 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: N_2, 0.7 mL/min. Temperature programme: 140° to 220° at 20°/min to 270° at 2°/min. NPD. Retention time: 20.96 min. Limit of quantification, 200 µg/L [Ulrich, Martens 1997]. Column: fused silica capillary 5% phenylmethyl silicone (25 m × 0.31 mm i.d., 0.5 µm). Carrier gas: He, 30 mL/min. Temperature programme: 105° for 0.5 min to 295° at 25°/min. NPD. Retention time: 11.11 min. Limit of quantification, <10 ng [Drebit *et al.* 1988]. Column: 5% OV-17 on Gas-Chrom Q 100/120 mesh (1.83 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 255°. FID. Retention time: 11.5 min. Limit of detection, 2 µg/L [Charette *et al.* 1981]. See Blood [Geiger *et al.* 1975].

GC-MS Column: J & W-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min to 180° at 50°/min for 10 min to 300° at 10°/min for 2.5 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, 2 µg/L [Wille *et al.* 2007]. Column: Varian factorFOUR VF-5ms (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature

programme: 90° for 0.5 min to 180° at 50°/min for 10 min to 300° at 10°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection not reported [Wille *et al.* 2005]. Column: 1% OV-17 on 100/120 mesh Gas Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 225°. Multiple ion detection, 70 eV. Retention time: 3.0 min. Limit of detection, maprotiline and desmethylmaprotiline 2 µg/L [Jindal *et al.* 1980].

HPLC Column: Symmetry C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.067 mol/L potassium dihydrogen phosphate (pH 3.0) : acetonitrile (65 : 35), flow rate 1.2 mL/min. UV detection ($\lambda = 226$ or 400 nm). Retention time: 10.92 min, k' 0.82. Limit of quantification, 5 µg/L [Aymard *et al.* 1997]. Column: TSkgel ODS-80 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 100 mmol/L acetate buffer (pH 3.2; 2 : 3), flow rate 1.0 mL/min. Chemiluminescence detection. Retention time: 39.5 min. Limit of detection, 0.1 µg/L [Ishida *et al.* 1995]. Column: Nucleosil 50-7 (300 × 4.5 mm i.d., 7 µm). Mobile phase: hexane : absolute ethanol (95 : 5), flow rate 1.8 mL/min. Fluorometric detection ($\lambda_{ex} = 365$ nm, $\lambda_{em} = 420$ nm). Retention time: 3.8 min. Limit of detection, ~10 µg/L [Breyer-Pfaff *et al.* 1984]. Column: Zorbax Sil (250 × 4.6 mm i.d.). Mobile phase: ammonium hydroxide : methanol (2 : 998), flow rate 1.5 mL/min. UV detection ($\lambda = 214$ and 254 nm). Limit of detection, 10 µg/L [Sutfin *et al.* 1984]. Column: µBondapak C_{18}(300 × 3.9 mm i.d.). Mobile phase: acetonitrile : 0.1 mol/L potassium phosphate buffer (pH 2.5; 30 : 70), flow rate 2.0 mL/min. UV detection ($\lambda = 205$ nm). Limit of detection, 11 nmol/L [Salonen, Scheinin 1983]. Column: µBondapak C_{18} (300 × 4.6 mm i.d., 10 µm) or MC-18 (300 × 4.6 mm i.d., 5 µm). Mobile phase: 0.2 mol/L phosphate buffer (pH 4.7) : acetonitrile (80 : 20), flow rate 1.5 mL/min. UV detection ($\lambda = 214$ nm). Limit of detection, 3 ng [Wong, Waugh 1983]. See also Kuss, Feistenauer [1981].

LC-MS Column: Inertsil C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. SSI, positive ion mode, full scan mode. Retention time: 6.5 min. Limit of quantification, 0.2 mg/L, limit of detection, 0.15 mg/L [Shinozuka *et al.* 2006].

TLC For a TLC method, see Prinoth and Mutschler [1984].

Serum **GC** Column: 1.4% Carbowax 20M plus 1.4% KOH on GasChrom Q 60/80 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 210°. FID. Limit of detection, 40 nmol/L [Kärkkäinen, Seppälä 1980]. Column: SPB-1 100% polymethylsiloxane (60 m × 0.75 mm i.d., 1.0 µm). Carrier gas: He, 8 mL/min. Temperature programme: 260°. NSD. Retention time: approx. 8.5 min. Limit of detection, 800 µg/L [Rifai *et al.* 1988]. Column: 3% HI-EFF-8BP on Gas Chrom Q 80/100 mesh (1.2 m × 2 mm i.d.). Carrier gas: N_2, 25 mL/min. Temperature programme: 240°. AFID. Limit of quantification, 10 µg/L [Gupta *et al.* 1977].

GC-MS Column: 3% OV-17 80/100 mesh (1.2 m × 2 mm). Carrier gas: CH_4, 0.25 to 0.35 mmHg. Temperature programme: 270°. Multiple ion detection, CI. Limit of detection, 50 µg/L [Skrinska *et al.* 1984].

HPLC Column: LiChroCART Superspher 60 RP-select B (250 cm × 4 mm i.d., 4 µm). Mobile phase: water–TEA (pH 2.0) : acetonitrile (70 : 30), flow rate 1.5 mL/min. Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 300$ nm). Limit of quantification, 10.0 µg/L, limit of detection, 3.3 µg/L [Waschgler *et al.* 2002]. Column: CLC-ODS reversed phase (150 × 6 mm i.d.). Mobile phase: 0.1 mol/L phosphate buffer (pH 3.0) containing perchlorate (3 : 2), flow rate 1.2 mL/min. UV detection ($\lambda = 220$ nm). Limit of detection, 5 µg/L [Fukuchi *et al.* 1990]. Column: TSkgel ODS-80TM (150 × 4.0 mm i.d.). Mobile phase: acetonitrile : 100 mmol/L potassium phosphate buffer (pH 2.7; 32.5 : 67.5) containing 0.2 g/L sodium 1-heptane sulfonate, flow rate 1.0 mL/min. UV detection ($\lambda = 210$ nm). Limit of detection, ~10 µg/L [Matsumoto *et al.* 1989]. Column: Supelcosil-CN (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 7.0) : methanol (60 : 25 : 15), flow rate 1.7 mL/min. UV detection ($\lambda = 211$ nm). Retention time: 10.8 min. Limit of detection, 10 µg/L [Ketchum *et al.* 1983]. See also Koteel *et al.* [1982], Kristinsson [1981].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 6.7 µg/L [Kirchherr, Kühn-Velten 2006]. Column: Xterra MS C_{18} (50 × 2.1 mm i.d., 5 µm). ESI, positive ion mode, MRM acquisition mode. Retention time: 4.75 min. Limit of detection, 10 µg/L [Sauvage *et al.* 2006]. Column: µPorasil (300 × 3.9 mm i.d., 10 µm). Mobile phase: absolute ethanol : acetonitrile : *tert*-butylamine (98 : 2 : 0.05), flow rate 2.0 mL/min. UV detection ($\lambda = 214$ nm). Limit of detection, 15 µg/L [Beierle, Hubbard 1983].

Urine **GC** See Plasma [Drebit *et al.* 1988]. See Blood [Geiger *et al.* 1975; Rejent, Doyle 1982].

HPLC See Blood [Rejent, Doyle 1982; Tanaka *et al.* 1997].

Bile **GC** See Blood [Keller, Zollinger 1997].

Stomach Contents **GC** See Blood [Rejent, Doyle 1982; Keller, Zollinger 1997].

HPLC See Blood [Rejent, Doyle 1982].

Brain **GC** See Blood [Rejent, Doyle 1982].

HPLC See Blood [Rejent, Doyle 1982; Tanaka *et al.* 1997].

Hair **GC-MS** Column: HP-1 100% methyl silicone. Temperature programme: 100° for 2 min to 300° at 15 K/min for 10 min. SIM acquisition mode. Limit of detection, 5–50 ng/sample [Pragst *et al.* 1997].

LC-MS Column: RP-C_8-select B (125 × 2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate-0.1% formic acid (pH 3) : acetonitrile-0.1% formic acid (pH 3.0; 90 : 10 to 70 : 30 at 6.6 min to 30 : 70 at 26.6 min to 10 : 90 at 33.3 min). Positive ion mode, full scan mode or MRM acquisition mode. Limit of detection, 0.1 ng/mg [Müller *et al.* 2000].

Liver **GC** See Blood [Rejent, Doyle 1982].

HPLC See Blood [Rejent, Doyle 1982; Tanaka *et al.* 1997]. See also Rana *et al.* [2008], Yufu *et al.* [1984].

Skull **GC** Column: WCOT SE-30 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 44 cm/s. Temperature programme: 180° to 260° at 10°/min. Retention time: 21.07 min. Limit of detection not reported [Fernandez *et al.* 1985].

Disposition in the Body Slowly but completely absorbed following oral administration. Concentrations in the CSF are 2–13% of those in serum. Maprotiline is found in breast milk. It appears to undergo significant first-pass metabolism; bioavailability ~70%. After oral administration, ~66% of a dose is excreted in the urine and 30% in the faeces over a period of 21 days; <10% of the dose is excreted as unchanged drug. The principal metabolite is the desmethyl derivative, which has been shown to be active in animals, but hydroxylation also occurs to form phenolic derivatives, which may be further converted to aromatic methoxy ethers or excreted as glucuronide conjugates. *N*-Oxidation also occurs and maprotiline *N*-oxide has been reported to be active; numerous minor metabolites have been identified in urine.

Therapeutic Concentration Blood concentrations vary considerably between subjects and there appears to be no clear correlation between clinical response, dose, side-effects, and blood or plasma concentrations. Peak blood concentrations are usually attained 3–8 h after a single dose.

After a single oral dose of 75 mg to 6 subjects, peak blood concentrations of 0.012–0.037 mg/L (mean 0.023) and peak plasma concentrations of 0.016–0.031 mg/L (mean 0.024) were attained in 4–8 h [Maguire *et al.* 1980].

After daily oral doses of 50, 100, and 150 mg to 78 subjects, steady-state blood concentrations were: 0.02–0.15 mg/L (mean 0.07), 0.07–0.25 mg/L (mean 0.14), and 0.14–0.32 mg/L (mean 0.22) [Riess *et al.* 1975].

Following daily oral doses of 150 mg to 4 subjects for 22 days, steady-state serum concentrations were 0.05–0.24 mg/L for maprotiline and 0.02–0.13 mg/L for desmethylmaprotiline [Gupta *et al.* 1977].

Five inpatients were administered a single oral dose of 75 mg maprotiline. The following morning, mean serum concentration was 107 µg/L with inter-individual variations ranging from 75–158 µg/L [Kärkkäinen, Seppälä 1980].

Plasma concentrations of maprotiline in 20 patients ingesting 125 mg per day varied from 34–225 µg/L (128 ± 56 µg/L [461 ± 202 nmol/L] [Breyer-Pfaff *et al.* 1984].

Toxicity

The following postmortem tissue distribution was reported in a suicide case: axillary blood 6.2 mg/L, cardiac blood 2.0 mg/L, bile 161 mg/L, kidney 34.0 µg/g, liver 82.0 µg/g [Robinson *et al.* 1977].

In a fatality resulting from the ingestion of 4.5–6 g maprotiline, the following postmortem tissue concentrations were reported: blood 44.5 mg/L, brain 158 µg/g, liver 605 µg/g, urine 12.6 mg/L [Rejent, Doyle 1982].

A 47-year-old depressed female prescribed Ludiomil (maprotiline hydrochloride) and Mellaril (thioridazine hydrochloride) went missing. Her remains were found approximately a month later. The concentration of maprotiline was 20.4 µg/g in the skull [Fernandez *et al.* 1985].

A 52-year-old woman took an unknown quantity of Ludiomil coated tablets (75 mg). At postmortem, the following concentrations were found:

	Maprotiline (mg/L)	*N-Desmethylmaprotiline (mg/L)*
Peripheral blood	8.6	1.6
Heart blood	7.3	ND
Duodenal contents	518	23
Small intestine contents	491	26
Stomach contents	2771	77
Bile	137	6

ND, not determined.
[Keller, Zollinger 1997].

Following an overdose with maprotiline, hair concentration was 3.1 ng/mg [Müller *et al.* 2000].

Half-life Plasma half-life, 20–70 h (mean 45).

Volume of Distribution 23–70 L/kg (mean 52).

Clearance Plasma clearance, 6–20 mL/min/kg (mean 15).

Distribution in Blood Blood : plasma ratio, 1.7. However, the plasma : whole blood ratio has been reported to vary between individuals and may also vary between single and multiple dosing [Drebit *et al.* 1988].

Protein Binding Approximately 90%.

Note For a review of the pharmacokinetics of maprotiline, see Pinder *et al.* [1977]; for a review of the metabolism of some 'second'- and 'fourth'-generation antidepressants, see Rotzinger *et al.* [1999].

Dose Maprotiline hydrochloride 30 to 150 mg daily; doses of up to 225 mg daily may be required in severely depressed hospitalised patients.

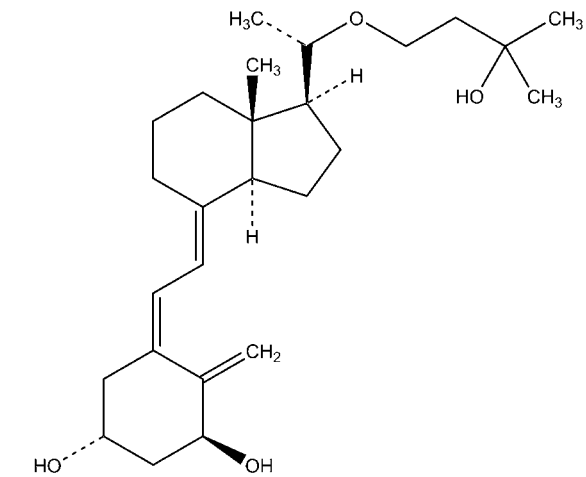
Maxacalcitol

Antihyperparathyroid, Antipsoriatic, Vitamin D Activity
$C_{26}H_{42}O_4$ = 418.6
CAS—103909-75-7

IUPAC Name (1*R*,3*S*,5*Z*)-5-[(2*E*)-2-[(1*S*,3a*S*,7a*S*)-1-[(1*S*)-1-(3-Hydroxy-3-methylbutoxy)ethyl]-7a-methyl-2,3,3a,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexane-1,3-diol

Synonyms 1α,25-Dihydroxy-22-oxavitamin D3; (+)-(5*Z*,7*E*,20*S*)-20-(3-hydroxy-3-methylbutoxy)-9,10-secopregna-5,7,10(19)-triene-1α,3β-diol; MC-1275; (1*R*,3*S*,5*Z*)-4-methylene-5-[(2*E*)-[(1*S*,3a*S*,7a*S*)-octahydro-1-[(1*S*)-1-(3-hydroxy-3-methylbutoxy)ethyl]-7a-methyl-4*H*-inden-4-ylidene]ethylidene]-1,3-cyclohexanediol; OCT; 22-oxacalcitriol; 22-oxa-1α,25-dihydroxyvitamin D_3; 22-oxa-1,25(OH)2D_3; Sch-209579.

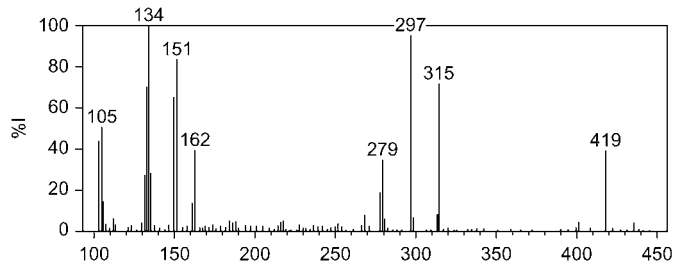
Proprietary Names *Oxarol*; *Prezios*.



Chemical Properties Colourless crystals. Mp 122°.

Ultraviolet Spectrum Ethanol—263 nm.

Mass Spectrum Principal ions at *m/z* 78, 131, 103, 503, 454, 80, 217, 544 (tri-TMS, pyro form), 75 eV [Ishigai *et al.* 1998].



Quantification

Plasma **GC-MS** Column: cross-linked methylsilicon fused silica (30 m × 0.1 mm i.d.). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 280° at 16°/min to 320° at 4°/min for 5 min. EI ionisation at 75 eV. Retention times (TMS derivatives): 12.2 min (pyro form), 13.0 min (isopyro form); 20-oxo-hexanor metabolite 8.7 min (pyro form), 9.3 min (isopyro form); 24*R*- hydroxylated metabolite 13.2 min, and 24*S*-hydroxylated metabolite 13.3 min (pyro forms); 25*R*-hydroxylated metabolite 13.8 min and 25*S*-hydroxylated metabolite 13.9 min (pyro forms). Limit of detection, 50 µg/L [Ishigai *et al.* 1997].

LC-MS Column: Capcell Pak C_{18} SG120 (250 × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : water (40 : 60), flow rate 1 mL/min. APCI, positive ion mode. Retention time: 25.8 min. Limit of detection, 5 µg/L [Ishigai *et al.* 1997].

Serum **LC-MS** Column: Capcell Pak C_{18} UG120 (250 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (90 : 10), flow rate

0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 4.5 min. Limit of quantification, 20 ng/L [Ishigai *et al.* 1998].

***Other* HPLC** Human Keratinocytes. Column: Zorbax-SIL (80 × 6.2 mm i.d., 3 μm). Mobile phase: hexane : isopropanol : methanol (91 : 7 : 2), flow rate 1.0 mL/min. UV detection (λ = 265 nm). Retention time: approx. 11.0 min. Limit of quantification not reported [Masuda *et al.* 1996]. Ointment. Column: YMC-Pack SIL A-004 (300 × 4.6 mm i.d.). Mobile phase: *n*-hexane : isopropanol : methanol (135 : 8 : 2), flow rate 2.0 mL/min. UV detection (λ = 265 nm). Limit of quantification not reported [Yamaguchi *et al.* 2006].

LC-MS Rat Skin. Column: C_{18} (150 × 2.0 mm i.d.). Mobile phase: methanol : 10 mmol/L ammonium acetate (85 : 15), flow rate 0.2 mL/min. API, positive ion mode, SIM acquisition mode. Limit of quantification not reported [Yamaguchi *et al.* 2006].

Disposition in the Body Readily absorbed from the gastrointestinal tract. The presence of bile is essential for adequate intestinal absorption; absorption may be decreased in patients with decreased fat absorption. *In vitro* metabolism studies of maxacalcitol in human keratinocytes have shown that it is extensively metabolised into a variety of hydroxylated and side-chain-truncated compounds. These include the polar compounds hexanor-1α,20-dihydroxyvitamin D_3, the 24- and 26-hydroxylated forms of maxacalcitol, and less polar compounds such as 3-*epi*-maxacalcitol and 2 further dehydrates (at the 24 and 25 positions, two pairs of epimers), all of which exhibit different degrees of activity. Vitamin D analogues and metabolites circulate in the blood bound to a specific α-globulin. Vitamin D analogues can be stored in adipose and muscle tissue for long periods of time. They are slowly released from such storage sites and from the skin where they are formed in the presence of sunlight or ultraviolet light. Vitamin D compounds and their metabolites are excreted mainly in the bile and faeces, with only small amounts appearing in urine; there is some enterohepatic recycling but it is considered to have a negligible contribution to vitamin D status.

Dose Given IV at a dose of 2.5 to 10 μg three times weekly; the dose may be gradually increased if necessary to a maximum of 20 μg three times weekly.

Ishigai M *et al.* (1997). Characteristics of mass spectrometric analyses coupled to gas chromatography and liquid chromatography for 22-oxacalcitriol, a vitamin D_3 analog, and related compounds. *J Chromatogr B Biomed Sci Appl* 704: 11–17.

Masuda S *et al.* (1996). In vitro metabolism of the vitamin D analog 22-oxacalcitriol, using cultured osteosarcoma, hepatoma, and keratinocyte cell lines. *J Biol Chem* 271: 8700–8708.

Yamaguchi K *et al.* (2006). Analysis of in vitro skin permeation of 22-oxacalcitriol having a complicated metabolic pathway. *Pharm Res* 23: 680–688.

Mazindol

Anorectic

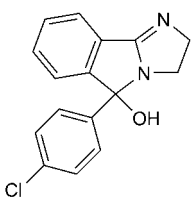
$C_{16}H_{13}ClN_2O$=284.7

CAS—22232-71-9

IUPAC Name 5-(4-Chlorophenyl)-2,3-dihydroimidazo[2,1-*a*]isoindol-5-ol

Synonym 5-(4-Chlorophenyl)-2,5-dihydro-3*H*-imidazo[2,1-*a*]isoindol-5-ol

Proprietary Names *Absten S*; *Dasten*; *Diestet*; *Fagolipo*; *Liofindol*; *Magrilon*; *Magrinex*; *Mazanor*; *Mazildene*; *Sanorex*; *Teronac*.



Chemical Properties Crystals. Mp 198° to 199°. Insoluble in water; soluble in ethanol. pK_a 8.6. Log *P* (octanol/water), 4.09 [Meylan, Howard 1995]. Mazindol is stable in plasma at room temperature for short-term (24 h) and long-term (30 day) periods. The short-term (24 h) stability of mazindol in human plasma at –70°, –20°, and 4° was acceptable although the sample at room temperature rapidly degraded. Stability in plasma was unaffected by 3 freeze-thaw cycles [Kim *et al.* 2009]. Mazindol was unstable in plasma left at room temperature and at 4° [Kaddoumi *et al.* 2001].

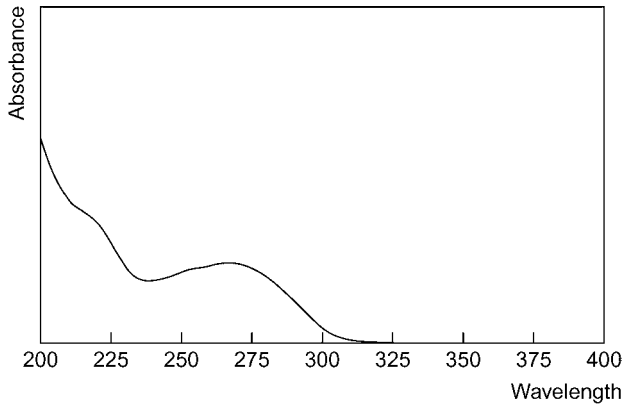
Colour Test Sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.07; system TC—R_f 0.13; system TE—R_f 0.53; system TL—R_f 0.13; system TAE—R_f 0.46; system TAF—R_f 0.65; system TAJ—R_f 0.04; system TAL—R_f 0.24.

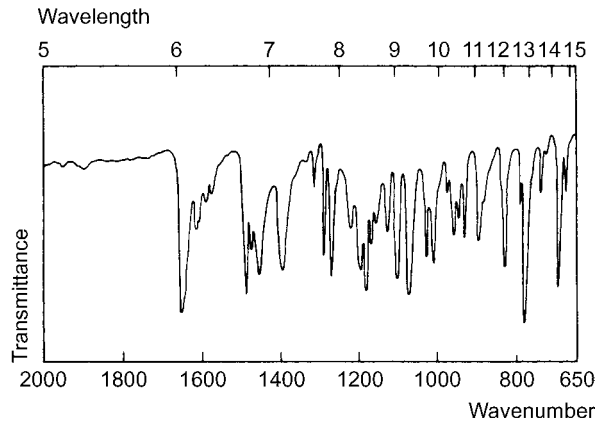
Gas Chromatography System GA—mazindol RI 2325, mazindol-AC RI 2705; system GB—mazindol RI 2504.

High Performance Liquid Chromatography System HA—*k* 1.8; system HC—*k* 0.20; system HX—RI 357; system HY—RI 286; system HZ—RT 3.6 min.

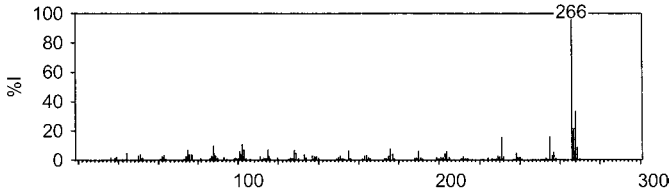
Ultraviolet Spectrum Aqueous acid—271 nm (A^1_1 = 509a); aqueous alkali—269 (A^1_1 = 170b), 275 nm (A^1_1 = 173b).



Infrared Spectrum Principal peaks at wavenumbers 763, 1656, 1063, 1175, 674, 1093 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 266, 268, 267, 255, 231, 102, 88, 176.



Quantification

***Plasma* HPLC** Column: Daisopak SP-120-5-ODS-BP (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile: 0.067 mol/L phosphate buffer (pH 3.5; 24 : 76), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: 17 min. Limit of quantification, 0.1 μg/L, limit of detection, 0.07 μg/L [Kaddoumi *et al.* 2001].

LC-MS Column: Capcell Pak MGII C_{18} (50 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 20 mmol/L ammonium formate (50 : 50, pH 3.5), flow rate 0.2 mL/min. ESI. Limit of quantification, 0.1 μg/L [Kim *et al.* 2009].

***Urine* GC-MS** Column: HP-1 cross-liked methyl silicone (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 1.15 mL/min. Temperature programme: 80° for 2 min to 280° at 40°/min for 1 min. SIM or full scan acquisition mode. Retention time: 7.23 min. Limit of detection, 100 μg/L [Valentine, Middleton 2000].

Disposition in the Body Absorbed after oral administration and slowly excreted in the urine, partly unchanged and partly as metabolites.

Therapeutic Concentration

Twenty-four healthy male volunteers were administered 2 mg mazindol orally. The mean maximum plasma concentration was 5.07 ± 1.7 μg/L, reached at 3.27 ± 1.1 h [Kim *et al.* 2009].

Half-life Approximately 12 to 24 h.

Dose 2 to 3 mg daily.

Kaddoumi A *et al.* (2001). High performance liquid chromatographic determination of mazindol in human plasma. *Analyst* 126: 1963–1968.

Kim SS *et al.* (2009). Validated method for determination of mazindol in human plasma by liquid chromatography/tandem mass spectrometry. *J Chromatogr B Analyt Technol Biomed Life Sci* 877: 1011–1016.

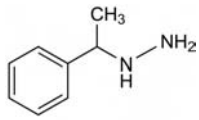
Mebanazine

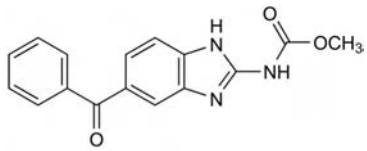
Antidepressant
$C_8H_{12}N_2$ = 136.2
CAS—65-64-5
IUPAC Name α-Methylbenzylhydrazine



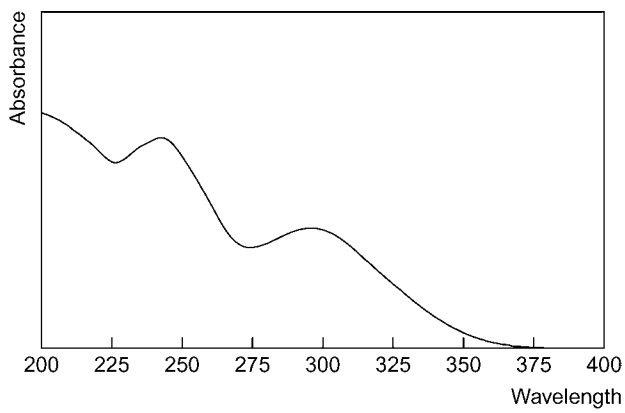
Chemical Properties Practically insoluble in water, ethanol and ether; soluble in chloroform.
Colour Tests Nessler's reagent—black; palladium chloride—black; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.48; system TC—R_f 0.69; system TL—R_f 0.63.
Gas Chromatography System GA—RI 1240.
High Performance Liquid Chromatography System HA—*k* 0.2.
Ultraviolet Spectrum Aqueous acid—251, 257, 261, 267 nm.
Infrared Spectrum Principal peaks at wavenumbers 699, 1175, 760, 1199, 1292, 1070 cm^{-1} (Nujol mull).
Dose Mebanazine has been given in doses of 5 to 30 mg daily.

Mebendazole

Anthelmintic
$C_{16}H_{13}N_3O_3$ = 295.3
CAS—31431-39-7
IUPAC Name Methyl-(5-benzoyl-1*H*-benzimidazol-2-yl)carbamate
Synonym R-17635
Proprietary Names *Anthex*; *Bantenol*; *Chanazole* (vet.); *Cipex*; *D-Worm*; *Lomper*; *Madicure*; *Menbandan*; *Mindol*; *Ovex*; *Ovitelmin* (vet.); *Oxitover*; *Pantelmin*; *Pharmamin* (vet.); *Pripsen*; *Sufil*; *Surfont*; *Telmin* (vet.); *Toloxim*; *Vermox*; *Wormgo*; *Wormstop*.

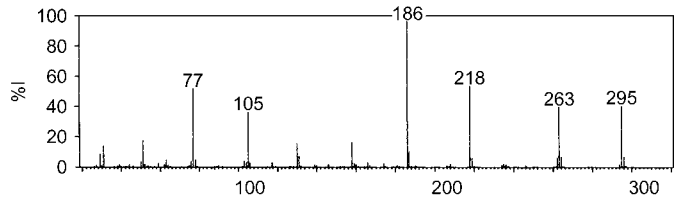


Chemical Properties A white to slightly-yellow amorphous powder. Mp about 290°. Practically insoluble in water, ethanol, chloroform, ether and dilute mineral acids; soluble in formic acid. Log *P* (octanol/water), 2.8.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.00; system TC—R_f 0.59; system TE—R_f 0.60; system TL—R_f 0.49; system TAE—R_f 0.80; system TAF—R_f 0.84; system TAJ—R_f 0.58; system TAK—R_f 0.57; system TAL—R_f 0.93 (Dragendorff spray).
High Performance Liquid Chromatography System HX—RI 438; system HY—RI 322; system HAA—retention time 16.1 min.
Ultraviolet Spectrum Acid isopropyl alcohol—234 (A^1_1=1000b), 288 nm (A^1_1=524b); alkaline isopropyl alcohol—270 (A^1_1=802b), 355 nm (A^1_1=653b).



Infrared Spectrum Principal peaks at wavenumbers 1635, 1260, 1590, 1730, 1230, 705 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 186, 218, 77, 295, 263, 105, 51, 158.

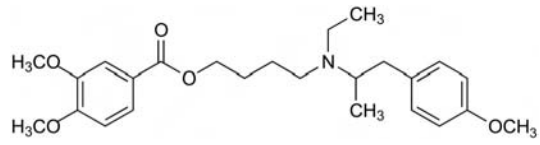


Quantification
Plasma **HPLC** UV detection. Limit of detection, 10 µg/L for mebendazole, 60 µg/L for the 5-(α-hydroxy) metabolite, 30 µg/L for the 2-amino metabolite [Allan *et al.* 1980].
Serum **HPLC** Coulometric detection. For method for quantification of mebendazole and its metabolites, see Betto *et al.* [1991].
Disposition in the Body Mebendazole is poorly absorbed after oral administration. It is metabolised to the 5-(α-hydroxy) derivative and by decarboxylation to the 2-amino metabolite, both of which are detectable in plasma at concentrations higher than those of unchanged mebendazole. <10% of a dose is excreted in the urine; the major urinary metabolite is the 2-amino-5-(α-hydroxy) derivative. Biliary excretion and enterohepatic circulation have been reported.
Therapeutic Concentration
Following single oral doses of 10 mg/kg to 5 subjects, peak plasma concentrations of 0.018 to 0.116 (mean 0.07) mg/L were attained in 2.5 to 7 (mean 5) h [Braithwaite *et al.* 1982].
Half-life Plasma half-life, 1.5 to 9 h.
Volume of Distribution About 2 L/kg.
Distribution in Blood Plasma : whole blood ratio, about 1.2.
Protein Binding About 95%.
Dose Usually 200 mg daily for 3 days.

Allan RJ *et al.* (1980). Two high-performance liquid chromatographic determinations for mebendazole and its metabolites in human plasma using a rapid Sep Pak C18 extraction. *J Chromatogr* 183: 311–319.
Betto P *et al.* (1991). Application of a high-performance liquid chromatography coulometric method for the estimation of mebendazole and its metabolites in human sera. *J Chromatogr* 563: 115–123.
Braithwaite PA *et al.* (1982). Clinical pharmacokinetics of high dose mebendazole in patients treated for cystic hydatid disease. *Eur J Clin Pharmacol* 22: 161–169.

Mebeverine

Antispasmodic
$C_{25}H_{35}NO_5$ = 429.6
CAS—3625-06-7
IUPAC Name 3,4-Dimethoxybenzoic acid 4-[ethyl[2-(4-methoxyphenyl)-1-methylethyl]amino]-butyl ester

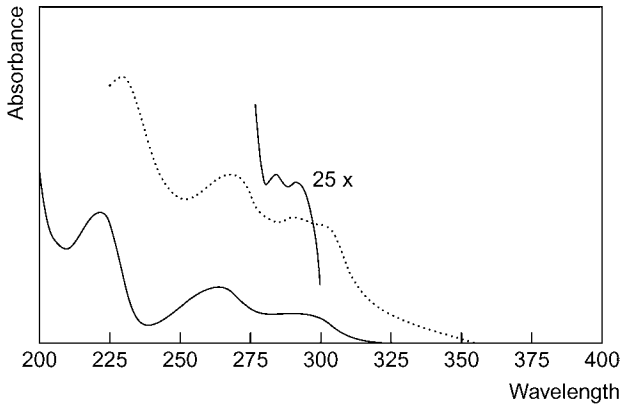


Chemical Properties Soluble in chloroform. Log *P* (octanol/water), 5.1.

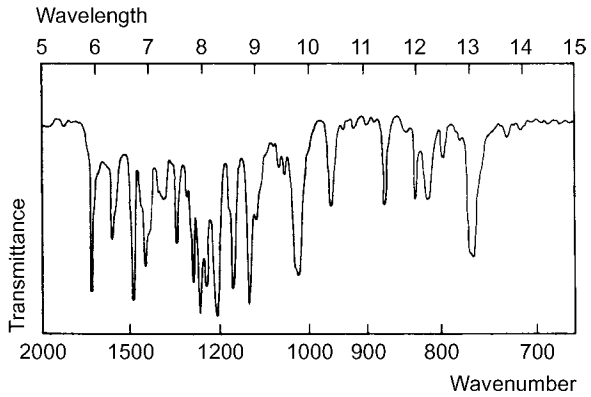
Mebeverine Hydrochloride

$C_{25}H_{35}NO_5$,HCl = 466.0
CAS-2753-45-9
Synonym CSAG 144
Proprietary Names *Bevispas*; *Colese*; *Colofac*; *Colopriv*; *Colotal*; *Duspatal*; *Duspatalin*; *Equilon*; *Mebemerck*; *Mebetin*; *Monosor*; *Spasmonal*; *Spasmopriv*.
Chemical Properties A white crystalline powder. Mp 131° to 136°. Soluble in water and ethanol; sparingly soluble in ether.

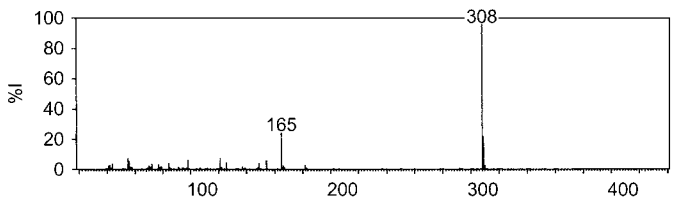
Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.40; system TC—R_f 0.53; system TE—R_f 0.86; system TL—R_f 0.49; system TAE—R_f 0.32 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 3045.
High Performance Liquid Chromatography System HA—*k* 1.9; system HX—RI 448; system HZ—retention time 7.1 min.
Ultraviolet Spectrum Aqueous acid—262 nm (A^1_1=307b); aqueous alkali—269, 290 nm.



Infrared Spectrum Principal peaks at wavenumbers 1216, 1266, 1132, 1510, 1715, 1174 cm^{-1} (mebeverine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 308, 165, 309, 121, 55, 154, 98, 56.



Quantification
Plasma **GC–MS** SIM. Limit of detection, 0.5 µg/L for mebeverine alcohol and desmethylmebeverine alcohol [Tulich *et al.* 1996].
Disposition in the Body Mebeverine is metabolised to 4-methoxyethylamfetamine.
Toxicity

In a fatality attributed to the ingestion of mebeverine and thioridazine, the following postmortem concentrations were reported: mebeverine, blood 36 mg/L, liver 15 µg/g, urine 24 mg/L; thioridazine, not detected in blood and urine, liver 2 µg/g [del Villar 1977].

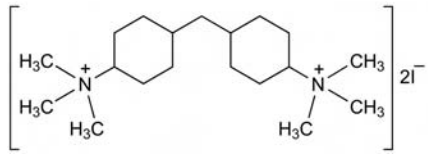
Dose 405 mg of mebeverine hydrochloride daily.

del Villar G (1977). *Bull Int Assoc Forensic Toxicol* 13(1&2): 23–24.
Tulich LJ *et al.* (1996). Determination of two mebeverine metabolites, mebeverine alcohol and desmethylmebeverine alcohol, in human plasma by a dual stable isotope-based gas chromatographic-mass spectrometric method. *J Chromatogr B Biomed Appl* 682(2): 273–281.

Mebezonium Iodide

Muscle Relaxant
$C_{19}H_{40}I_2N_2$ = 550.3
CAS—7681-78-9
IUPAC Name 4,4′-Methylenebis(cyclohexyltrimethylammonium)diiodide

Proprietary Name It is an ingredient of *Tanax* (vet.).



Chemical Properties A white crystalline powder. Mp 260°, with decomposition. Soluble in water.
Thin-layer Chromatography System TA—R_f 0.00 (acidified iodoplatinate solution, positive).
Infrared Spectrum Principal peaks at wavenumbers 961, 888, 831, 1621, 985, 1020 cm^{-1} (KBr disk).
Quantification
Blood **TLC–UV spectrophotometry** For method, see Bertol *et al.* [1983].
Urine **TLC–UV spectrophotometry** For method, see Bertol *et al.* [1983].
Disposition in the Body
Toxicity

In 3 fatalities due to the injection of a preparation containing mebezonium iodide and embutramide, the following postmortem concentrations (mg/L) were reported:

	Mebezonium iodide	*Embutramide*
Blood	4.5, 6.0, 7.5	3.0, 15.5, 12.1
Urine	0.8, 2.0, 1.8	2.0, 6.3, 4.5

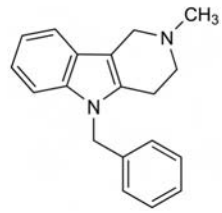
Mebhydrolin

Antihistamine
$C_{19}H_{20}N_2$ = 276.4
CAS—524-81-2
IUPAC Name 2,3,4,5-Tetrahydro-2-methyl-5-(phenylmethyl)-1*H*-pyrido[4,3-*b*]indole

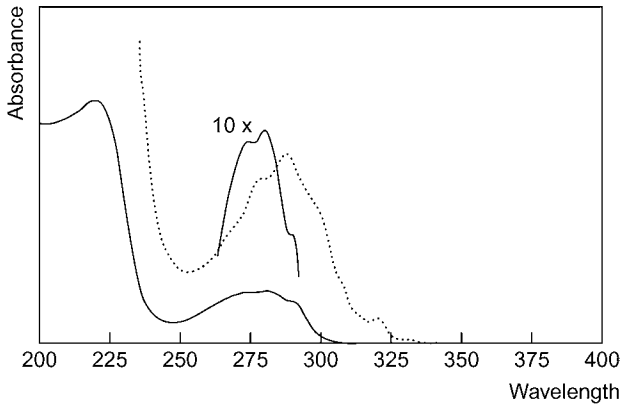


Chemical Properties A white crystalline powder. Mp 95°. Practically insoluble in water; freely soluble in ethanol, methanol, chloroform and acetone; slightly soluble in ether. pK_a 6.7. Log *P* (octanol/water), 3.8.

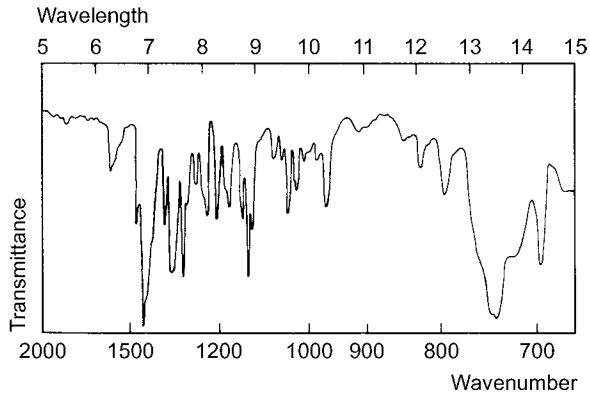
Mebhydrolin Napadisilate

$(C_{19}H_{20}N_2)_2,C_{10}H_8O_6S_2$ = 841.1
CAS—6153-33-9
Synonyms Diazolinum; mebhydrolin naphthalenedisulphonate.
Proprietary Names *Dayhist*; *Fabahistin*; *Incidal*; *Omeril*; *Posidol*.
Chemical Properties A white powder. Mp 280°, with decomposition. Practically insoluble in water; sparingly soluble in hot glacial acetic acid; soluble in hot formamide.

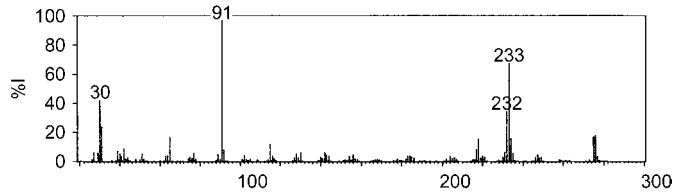
Colour Tests Mandelin's test—blue; Marquis test—grey-blue.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.27; system TC—R_f 0.45; system TE—R_f 0.65; system TL—R_f 0.20; system TAE—R_f 0.36; system TAF—R_f 0.46 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2450; system GB—RI 2575; system GC—RI 2739; system GF—RI 2920.
High Performance Liquid Chromatography System HA—*k* 3.0 (tailing peak); system HX—RI 411; system HZ—retention time 5.3 min.
Ultraviolet Spectrum Aqueous acid—286 ($A^{\frac{1}{1}}$=409b), 320 nm.



Infrared Spectrum Principal peaks at wavenumbers 737, 1134, 1316, 695, 1122, 1212 cm^{-1} (thin film).



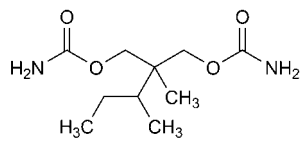
Mass Spectrum Principal ions at *m/z* 91, 233, 30, 232, 31, 276, 275, 65.



Dose 150 to 300 mg daily.

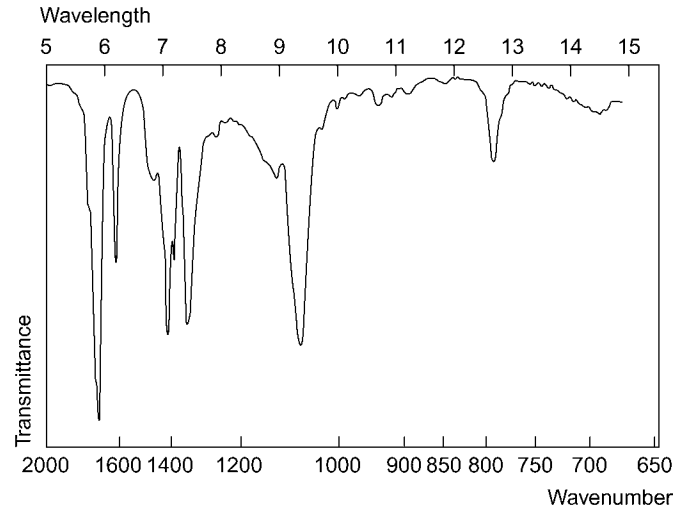
Mebutamate

Tranquilliser
$C_{10}H_{20}N_2O_4$ = 32.3
CAS—64-55-1
IUPAC Name [2-(Carbamoyloxymethyl)-2,3-dimethylpentyl] carbamate
Synonym 2-Methyl-2-(1-methylpropyl)-1,3-propanediol dicarbamate
Proprietary Names *Axiten*; *Butatensin*; *Capla*; *Carbuten*; *Dormate*; *Ipotensivo*; *Mebutina*; *No-Press*; *Prean*; *Sigmafon*; *Vallene*.

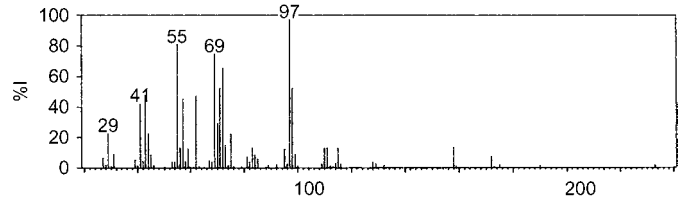


Chemical Properties A white crystalline powder. Mp 77° to 79°. Slightly soluble in water; soluble in most organic solvents. Log *P* (octanol/water), 1.4.
Colour Tests Furfuraldehyde—black; Nessler's reagent—brown (slow).
Thin-layer Chromatography System TB—R_f 0.00; system TC—R_f 0.33; system TD—R_f 0.10; system TE—R_f 0.60; system TF—R_f 0.35; system TAD—R_f 0.35; system TAE—R_f 0.82; system TAF—R_f 0.85; system TAG—R_f 0.56; system TAJ—R_f 0.35; system TAK—R_f 0.47; system TAL—R_f 0.87.

Gas Chromatography System GA—RI 1889.
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1682, 1070, 1710, 1601, 1140, 788 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 97, 55, 69, 72, 71, 98, 43, 62.

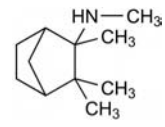


Quantification
Plasma **GC** Column: 3.8% UC-W98 methyl silicone on 80/100 mesh (121.9 cm). Carrier gas: He, 65 mL/min. Temperature programme: 180°. FID. Retention time: 2.9 min. Limit of detection, 1 mg/L [Douglas *et al.* 1969].
Urine **GC** See Plasma [Douglas *et al.* 1969].
Dose 0.9 to 1.2 g daily.

Douglas JF *et al.* (1969). Gas chromatographic determination of mebutamate, carisoprodol, and tybamate in plasma and urine. *J Pharm Sci* 58: 145–146.

Mecamylamine

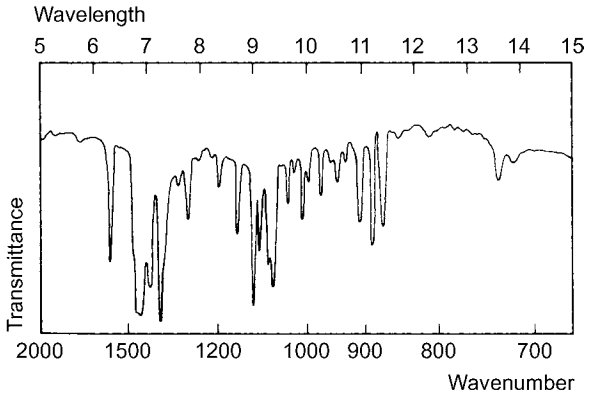
Antihypertensive
$C_{11}H_{21}N$ = 167.3
CAS—60-40-2
IUPAC Name *N*-2,3,3-Tetramethylbicyclo[2.2.1]heptan-2-amine



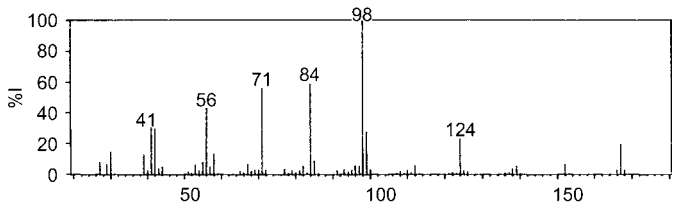
Chemical Properties An oily liquid. Slightly soluble in water. pK_a 11.3. Log *P* (octanol/water), 3.3.

Mecamylamine Hydrochloride
$C_{11}H_{21}N,HCl$ = 203.8
CAS—826-39-1
Proprietary Names *Inversine*; *Mevasine*.
Chemical Properties A white crystalline powder. Mp about 245°, with decomposition. Soluble 1 in 5 of water and 1 in 12 of ethanol; freely soluble in chloroform; practically insoluble in ether.
Thin-layer Chromatography System TA—R_f 0.16; system TB—R_f 0.51; system TC—R_f 0.02; system TL—R_f 0.04; system TAJ—R_f 0.00; system TAK—R_f 0.16; system TAL—R_f 0.58.
High Performance Liquid Chromatography System HA—*k* 1.7.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1111, 1068, 1078, 1592, 1098, 890 cm^{-1} (mecamylamine hydrochloride (Nujol mull)).



Mass Spectrum Principal ions at *m/z* 98, 84, 71, 56, 41, 42, 99, 124.

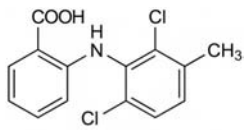


Quantification
Plasma **GC–MS** Mecamylamine, nicotine and cotinine. Limit of detection, <2 µg/L for mecamylamine [Jacob *et al.* 2000].
Disposition in the Body Mecamylamine is almost completely absorbed after oral administration; high concentrations are found in the liver and kidney. >50% of a dose is excreted in 24 h as unchanged drug in acid urine; the excretion is reduced if the urine is alkaline.
Dose 5 to 30 mg of mecamylamine hydrochloride daily.

Jacob P *et al.* (2000). Simultaneous determination of mecamylamine, nicotine, and cotinine in plasma by gas chromatography-mass spectrometry. *J Pharm Biomed Anal* 23: 653–661.

Meclofenamic Acid

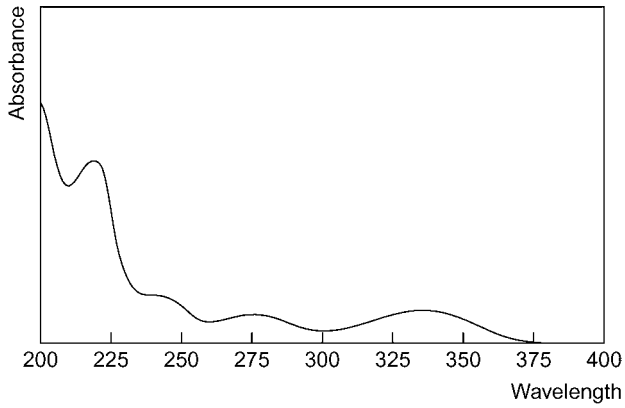
Analgesic
$C_{14}H_{11}Cl_2NO_2$ = 296.2
CAS—644-62-2
IUPAC Name 2-[(2,6-Dichloro-3-methylphenyl)amino]benzoic acid
Synonyms CI-583; INF-4668.
Proprietary Names *Arquel* (vet.); *Lenidolor*; *Movens.*



Chemical Properties White crystals. Mp 257° to 259° also reported as 248° to 250°. Practically insoluble in water. Log *P* (octanol/water), 6.0.

Meclofenamate Sodium
$C_{14}H_{10}Cl_2NNaO_2$ = 318.1
CAS—6385-02-0
Proprietary Names *Lenidolor*; *Meclodol*; *Meclomen*; *Movens.*
Chemical Properties Mp 289° to 291°. Sparingly soluble in water.

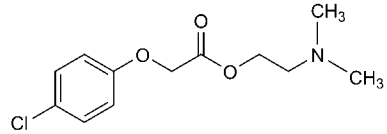
Thin-layer Chromatography System TE—R_f 0.12; system TF—R_f 0.43; system TG—R_f 0.38; system TAJ—R_f 0.59; system TAK—R_f 0.77; system TAL—R_f 0.92 (chromic acid solution, violet).
Gas Chromatography System GA—RI 2420; system GD—methyl derivati- veretention time 1.62 relative to n-$C_{16}H_{34}$; system GL—meclofenamic acid-Me RI 2240.
High Performance Liquid Chromatography Meclofenamic acid is used as a reference substance in System HV. System HX—RI 653; system HY—RI 690.
Ultraviolet Spectrum Aqueous alkali—275 (A^1_1= 240b), 319 nm (A^1_1=180b); methanol—242 (A^1_1=342b), 282 (A^1_1=235b), 331 nm (A^1_1=235b).



Dose The equivalent of 200 to 400 mg of meclofenamic acid daily.

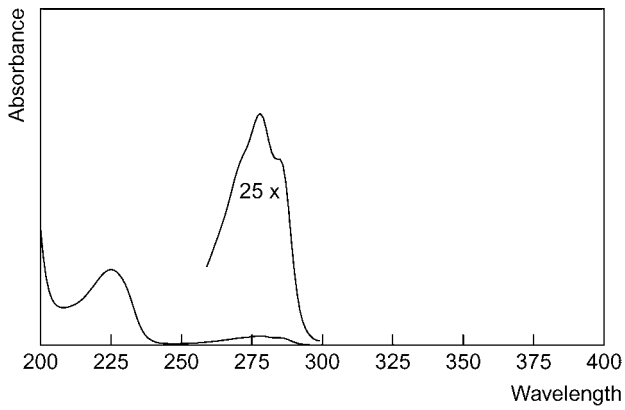
Meclofenoxate

CNS Stimulant
$C_{12}H_{16}ClNO_3$ = 57.7
CAS—51-68-3
IUPAC Name 2-Dimethylaminoethyl 2-(4-chlorophenoxy)acetate
Synonyms Centrophenoxine; clofenoxine; clophenoxate; deanol 4-chlorophenoxyacetate; 2-(dimethylamino)ethyl-(4-chlorophenoxy)acetate; meclofenoxane.

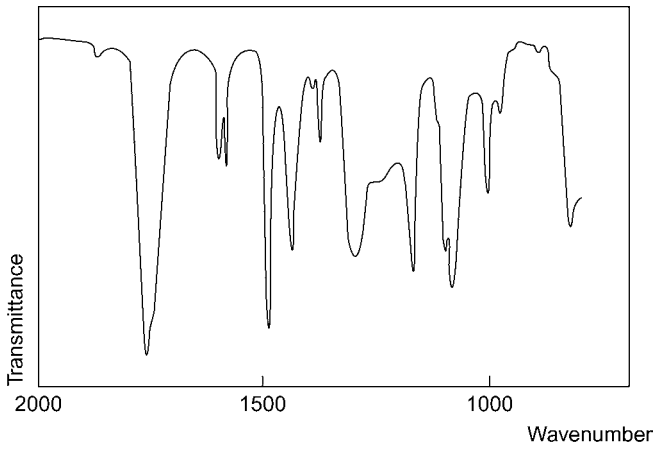


Meclofenoxate Hydrochloride
$C_{12}H_{16}ClNO_3$,HCl = 294.2
CAS—3685-84-5
Proprietary Names *Cerutil*; *Helfergin*; *Lucidril.*
Chemical Properties A white powder. Mp 136°. Soluble in cold water; sparingly soluble in cold isopropyl alcohol and acetone; practically insoluble in benzene, ether, and chloroform. It rapidly hydrolyses in aqueous solution. Log *P* (octanol/water), 1.96 [Meylan, Howard 1995].

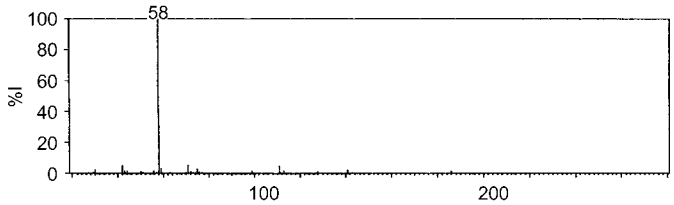
Thin-layer Chromatography System TA—R_f 0.77; system TB—R_f 0.26; system TC—R_f 0.42; system TE—R_f 0.67; system TL—R_f 0.22; system TAE—R_f 0.46; system TAG—R_f 0.22 (acidified potassium permanganate solution, positive).
Plates: Silicagel HF_{254}. Solvent system: dichloromethane : methanol : water (6 : 4 : 3). Reagent: methyl yellow (1% in ethanol). R_f 0.65 [Araman *et al.* 1992].
Gas Chromatography System GA—RI 1770; system GB—RI 1804; system GC—RI 2200.
High Performance Liquid Chromatography System HA—*k* 1.7.
Column: ZORBAX ODS (250 × 4.5 mm i.d., 5 µm). Mobile phase: 0.2% TEA in 0.01 mol/L ammonium carbonate : acetonitrile (70 : 30), flow rate 1.0 mL/min. UV detection (λ = 277 nm). Retention time: 5.39 min. Limit of quantification, 15 mg/L [El Bardicy *et al.* 2007]. Column: µBondapak C_{18}PN27324 (30 × 3.9 cm i.d.). Mobile phase: methanol : 1% ammonium carbonate (pH 3.2). Retention time: 8.03 min [Araman *et al.* 1992]. Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: methanol : 0.1% ammonium carbonate (pH 3.1; 55 : 45), flow rate 2.0 mL/min. UV detection (λ = 227 nm). Retention time: 2.2 min. Limit of detection, 25 mg/L [Tatsuhara, Tabuchi 1980].
Ultraviolet Spectrum Aqueous acid—277 nm (A^1_1 = 44a).



Infrared Spectrum Principal peaks at wavenumbers 1167, 1183, 1742, 1080, 833, 1768 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 111, 71, 42, 75, 59, 141, 113.



Quantification

Plasma **HPLC** Column: C_{18} (150 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 1.0% acetic acid (70 : 30), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.047 mg/L [Zou *et al.* 2008]. Column: TSK 410 (150 × 4 mm i.d.). Mobile phase: 50 mmol/L phosphate buffer (pH 2.5) : methanol (1 : 1), flow rate 1 mL/min. UV detection (λ = 280 nm). Limit of detection not reported [Yoshioka *et al.* 1987].

Disposition the Body

Therapeutic Concentration Twenty-four healthy male Chinese volunteers were administered a single dose of 200 mg meclofenoxate hydrochloride as a capsule or a tablet. There was a 1 week wash-out period between formulations. Mean maximum plasma concentrations for the capsule and the tablet formulation were 12.6 and 12.8 mg/L attained at 2.1 and 2.0 h, respectively [Zou *et al.* 2008]

Dose Meclofenoxate hydrochloride 0.9 to 1.5 g daily.

Mecloqualone

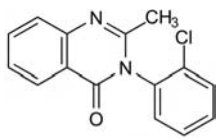
Hypnotic

$C_{15}H_{11}ClN_2O = 270.7$

CAS—340-57-8

IUPAC Name 3-(2-Chlorophenyl)-2-methyl-4(3*H*)-quinazolinone

Proprietary Name *Nubarene*



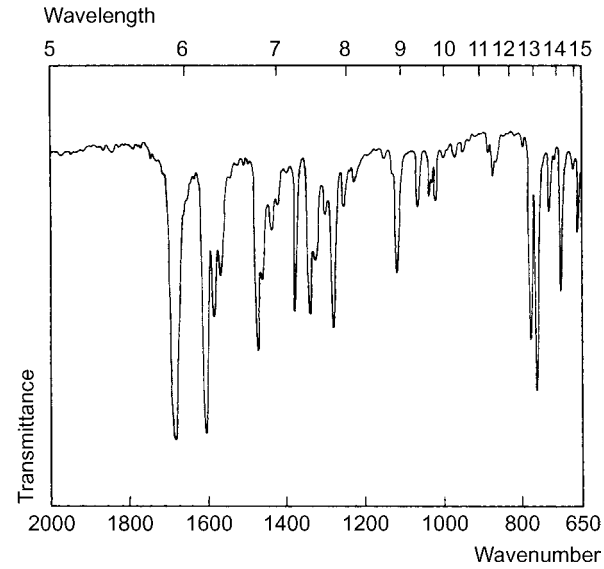
Chemical Properties Crystals. Mp 126° to 128°. Log *P* (octanol/water), 4.4.

Thin-layer Chromatography System TB—R_f 0.25; system TE—R_f 0.76; system TAE—R_f 0.80; system TAJ—R_f 0.77; system TAK—R_f 0.68; system TAL—R_f 0.96.

Gas Chromatography System GA—RI 2255.

High Performance Liquid Chromatography System HX—RI 482.

Infrared Spectrum Principal peaks at wavenumbers 1682, 1605, 768, 782, 1282, 1583 cm^{-1}.



Dose 150 to 300 mg, as a hypnotic.

Meclozine

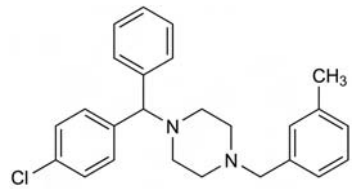
Antihistamine

$C_{25}H_{27}ClN_2 = 391.0$

CAS—569-65-3

IUPAC Name 1-[(4-Chlorophenyl)phenylmethyl]-4-[(3-methylphenyl)methyl] piperazine

Synonyms Histamethizine; meclizine; parachloramine.



Chemical Properties pK_a 3.1, 6.2 (25°). Log *P* (octanol/water), 5.9.

Meclozine Hydrochloride

$C_{25}H_{27}ClN_2,2HCl, H_2O = 481.9$

CAS—1104-22-9 (anhydrous); 31884-77-2 (monohydrate)

Synonyms Meclizine hydrochloride; meclizinium chloride; parachloramine hydrochloride.

Proprietary Names *Agyrax*; *Ancolan*; *Antivert*; *Antrizine*; *Bonamine*; *Bonine*; *Calmonal*; *Chiclida*; *Dizmiss*; *Dramamine II*; *Dramine*; *Duremesan*; *Marevit*; *Meni-D*; *Navicalm*; *Peremesin*; *Postafen(e)*; *Sea-legs*; *Suprimal*; *Vergon*; *Vertin*.

Chemical Properties A white or slightly-yellowish crystalline powder. Mp 217° to 224°, with decomposition. Soluble 1 in 1000 of water, 1 in 25 of ethanol and 1 in 5 of chloroform; practically insoluble in ether; freely soluble in pyridine.

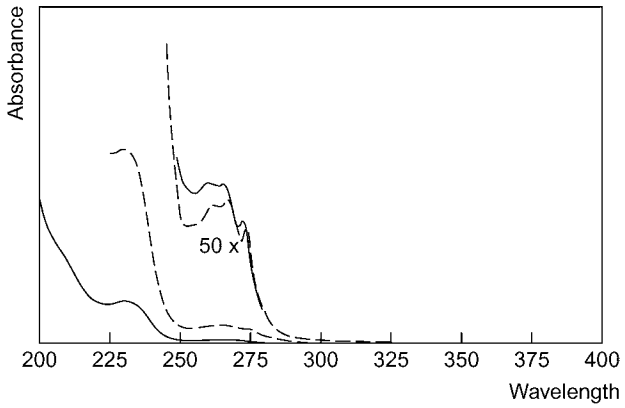
Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.61; system TC—R_f 0.79; system TE—R_f 0.87; system TL—R_f 0.70; system TAE—R_f 0.80; system TAF—R_f 0.88; system TAJ—R_f 0.65; system TAK—R_f 0.24; system TAL—R_f 0.95 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown-yellow; ninhydrin spray, positive).

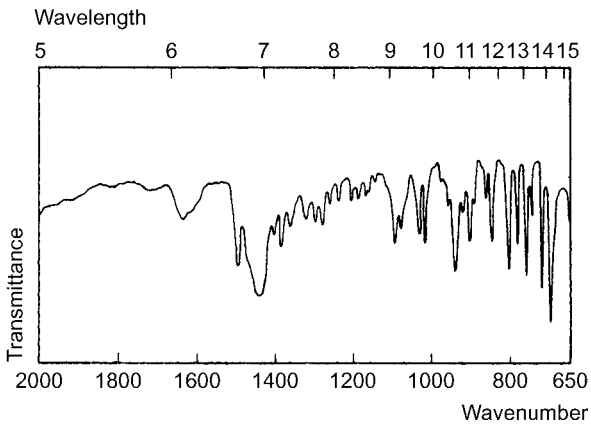
Gas Chromatography System GA—meclozine RI 3035, M (N-desalkyl-) RI 2520; system GB—RI 3193.

High Performance Liquid Chromatography System HA—*k* 0.7; system HX—RI 587; system HY—RI 398; system HAA—retention time 20.0 min.

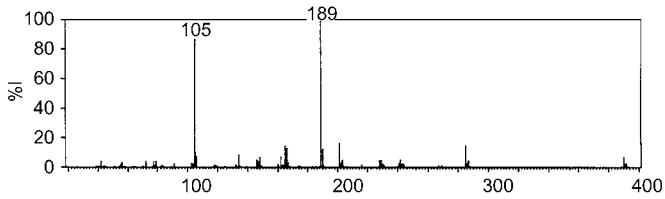
Ultraviolet Spectrum Ethanol—230 (A^1_1=391a), 266 (A^1_1=27b), 273 nm.



Infrared Spectrum Principal peaks at wavenumbers 700, 720, 760, 940, 805, 1491 cm^{-1} (meclozine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 189, 105, 201, 285, 165, 166, 190, 134.



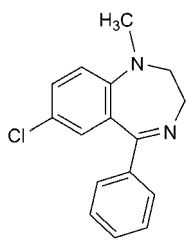
Quantification
Plasma **GC–MS** Limit of detection, 5 µg/L [Fouda *et al.* 1978].
Dose Usually 25 to 100 mg of meclozine hydrochloride daily.

Fouda HG *et al.* (1978). Selected ion monitoring assay for meclizine in human plasma. *Biomed Mass Spectrom* 5: 491–494.

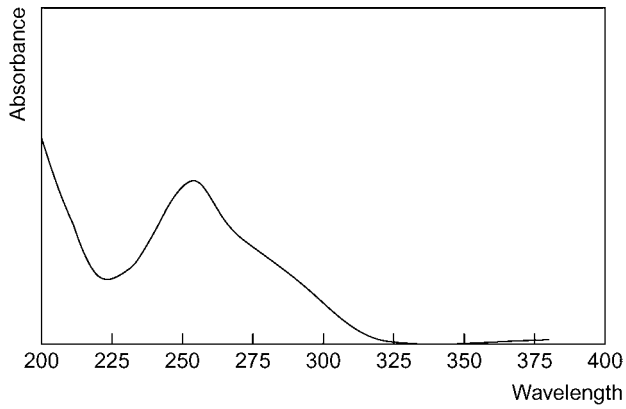
Medazepam

Benzodiazepine, Tranquilliser
$C_{16}H_{15}ClN_2 = 70.8$
CAS—2898-12-6

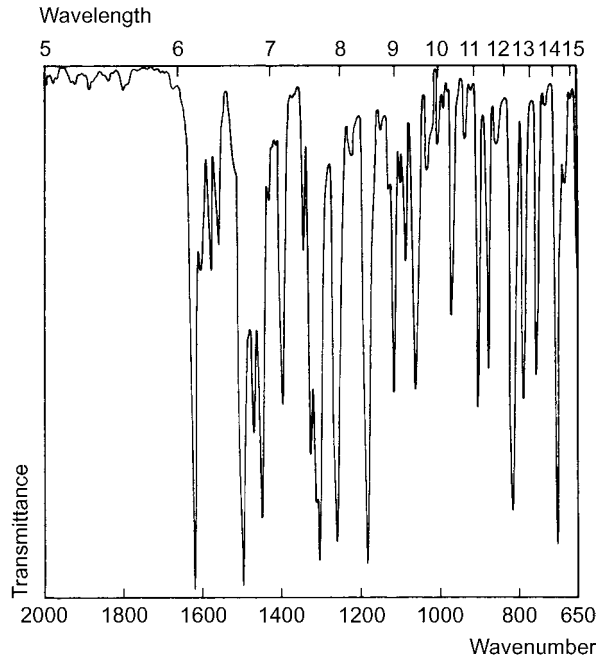
IUPAC Name 7-Chloro-1-methyl-5-phenyl-2,3-dihydro-1,4-benzodiazepine
Proprietary Names *Nobrium*; *Rudotel*.
Synonym 7-Chloro-2,3-dihydro-1-methyl-5-phenyl-1*H*-1,4-benzodiazepine



Chemical Properties A white to greenish-yellow crystalline powder. Mp 95° to 97° (crystals from ether and petroleum ether). Practically insoluble in water; soluble 1 in 8 of ethanol, 1 in 1 of chloroform, and 1 in 5 of ether. pKa 6.2 (37°). Log *P* (octanol/water), 4.41 [Capella-Peiro *et al.* 2002], (octanol/pH 7.4), 4.0. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Tests Nitric acid, cold—red; formaldehyde–sulfuric acid—orange (add water).
Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.41; system TC—R_f 0.74; system TD—R_f 0.54; system TE—R_f 0.78; system TF—R_f 0.40; system TL—R_f 0.62; system TAD—R_f 0.73; system TAE—R_f 0.79; system TAF—R_f 0.83; system TAJ—R_f 0.70; system TAK—R_f 0.12; system TAL—R_f 0.95 (acidified iodoplatinate solution, positive). See also Sawada *et al.* 1976].
Gas Chromatography System GA—medazepam RI 2235, M (nor-) RI 2280, nordazepam RI 2490, diazepam RI 2428; system GB—medazepam RI 2340, nordazepam RI 2625, diazepam RI 2556; system GF—medazepam RI 2640, diazepam RI 3045; system GG—medazepam RI 2620, nordazepam RI 3041, diazepam RI 2940.
High Performance Liquid Chromatography System HA—medazepam *k* 0.2; system HJ—*k* 7.05; system HK—*k* 4.44; system HX—RI 405; system HY—RI 334; system HZ—RT 5.4 min; system HAA—RT 15.8 min; system HAL—RT 8.2 min; system HAM—not detected; system HBH—k 41.46; system HBI—*k* 6.31.
Ultraviolet Spectrum Aqueous acid—253 nm ($A_1^1 = 860$a).

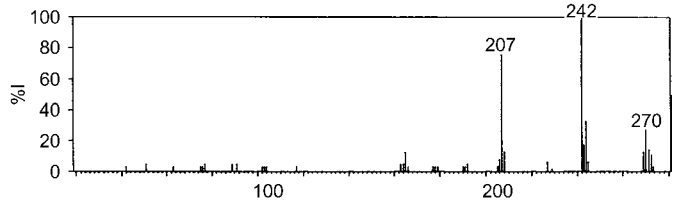


Infrared Spectrum Principal peaks at wavenumbers 1610, 1178, 1298, 700, 1255, 815 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 242, 207, 244, 270, 243, 271, 269, 165; nordazepam 242, 269, 270, 241, 243, 271, 244, 272; desmethylmedazepam 193, 255, 228, 256, 257, 165, 230, 258; diazepam 256, 283, 284, 285, 257, 255, 258, 286.

M



Quantification

Blood **GC** Column: 1% OV-17 or 2% OV-1 (213 × 0.4 cm i.d.). Carrier gas: Ar, 42 or 43 mL/min respectively. Temperature programme: 235° and 260°, respectively. FID. Retention time: 3.8 and 2.6 min, respectively. Limit of detection, 80 µg/L [Greaves 1974].

Plasma **GC** Column: SE-54 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 48 kPa. Temperature programme: 110° for 8 min to 300° at 10°/min for 10 min. FID or NPD. Limit of detection, 10 µg/L [Herráez-Hernández *et al.* 1996]. Column: 3% OV-17 on 60/80 mesh Gas Chrom Q (120 × 4 mm i.d.). Carrier gas: Ar: CH_4 (90 : 10), 100 to 110 mL/min. Temperature programme: 230°. ECD. Retention time: 4.2 min. Limit of detection, 40 µg/L [De Silva, Puglisi 1970].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.5 µg/L (SIM), limit of detection, 0.5 µg/L (scan) [Kratzsch *et al.* 2004].

Serum **HPLC** Column: Eclipse XDBC-8 (150 × 4.6 mm i.d., 5 µm) or Kromasil C_{18} (120 × 4.6 mm i.d., 5 µm). Mobile phase: 0.06 mol/L SDS : butanol (pH 7.0, 95 : 5), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 11 µg/L [Capella-Peiro *et al.* 2002].

LC-MS Column: LiChrospher 60-RP select B (100 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : water : acetonitrile (1 : 1 : 1, pH 6.0), flow rate 100 µL/min. ESI, SRM acquisition mode, positive ion mode. Limit of quantification, 2 µg/L [Kleinschnitz *et al.* 1996].

Urine **GC** See Plasma [De Silva, Puglisi 1970].

HPLC See Serum [Kleinschnitz *et al.* 1996].

LC-MS Column: 5% OV-101 Chromosorb G HP 100/120 mesh (600 × 2 mm i. d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Disposition in the Body Readily absorbed after oral administration. At least 5 metabolites have been identified [Schwartz, Carbone 1970]. The active metabolites desmethyldiazepam (nordazepam) and diazepam may be detected in the blood shortly after dosing; desmethyldiazepam accumulates during chronic treatment. Desmethylmedazepam has also been detected in plasma. A total of up to approx. 75% of a dose is excreted in the urine and ~20% is eliminated in the faeces. The major urinary metabolite is oxazepam glucuronide, 2– 3% of a dose being excreted in this form in 72 h; other urinary metabolites include desmethyldiazepam and temazepam.

Therapeutic Concentration

Following single oral doses of 10 mg given to four subjects, peak plasma concentrations of 0.14 to 0.26 g/L (mean 0.21) of medazepam were attained in ~1 h [Hailey, Baird 1979].

Doses of 10 to 50 mg given daily to 20 subjects, resulted in the following steady-state plasma concentrations: medazepam 0.01–0.16 g/L (mean 0.06), diazepam 0–0.12 g/L (mean 0.03), desmethyldiazepam 0.2–1.7 g/L (mean 0.7) [Bond *et al.* 1977].

Half-life Plasma half-lives, medazepam 1–2 h, desmethyldiazepam ~40–100 h; however, there is considerable intersubject variation (see Nordazepam).

Distribution in Blood Plasma : whole blood ratio, 1.9.

Protein Binding Almost completely bound.

Dose Usually 10 to 20 mg daily, but doses of up to 60 mg daily have been given.

Medroxyprogesterone Acetate

Progestational Steroid

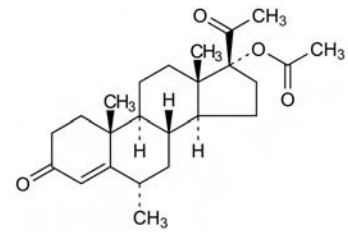
$C_{24}H_{34}O_4$ = 386.5

CAS—520-85-4 (medroxyprogesterone); 71-58-9 (acetate)

IUPAC Name 17α-Acetoxy-6α-methylprogesterone

Synonyms Methylacetoxyprogesterone; metipregnone.

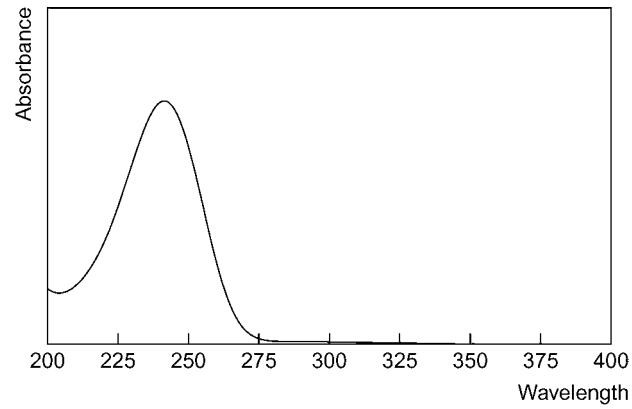
Proprietary Names *Adgyn Medro*; *Alti-MPA*; *Amen*; *Cycrin*; *Cykrina*; *Depocon*; *Depo-Prodasone*; *Depo-Provera*; *Depo-Ralovera*; *Farlutal*; *Gen-Medroxy*; *Gestoral*; *Novo-Medrone*; *Perlutex*; *Proclim*; *Prodafem*; *Prodasone*; *Progevera*; *Provera*; *Ralovera*.



Chemical Properties A white crystalline powder. Mp about 204°. A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 800 of ethanol, 1 in 50 of acetone and 1 in 10 of chloroform; slightly soluble in ether. Log *P* (octanol/water), 3.5 (medroxyprogesterone).

Thin-layer Chromatography System TP—R_f 0.80; system TQ—R_f 0.50; system TR—R_f 0.98; system TS—R_f 0.85, streaking may occur.

Ultraviolet Spectrum Ethanol—241 nm (A^1_1=426 a).



Infrared Spectrum Principal peaks at wavenumbers 1727, 1669, 1258, 1608, 967, 1188 cm^{-1} (medroxyprogesterone, KBr disk).

Quantification

Plasma **GC** ECD. Limit of detection, 5 µg/L [Rossi *et al.* 1979].

Mefenamic Acid

Analgesic

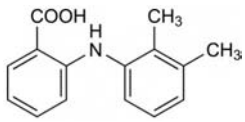
$C_{15}H_{15}NO_2 = 241.3$

CAS—61-68-7

IUPAC Name 2-[(2,3-Dimethylphenyl)amino]benzoic acid

Synonyms Acidum mefenamicum; CI-473; CN-35355; INF-3355.

Proprietary Names *Artriden*; *Contraflam*; *Coslan*; *Dysman*; *Dyspen*; *Fenamin*; *Lysalgo*; *Medicap*; *Mefacap*; *Mefalgic*; *Mefanacide*; *Mefenix*; *Mefic*; *Meflam*; *Namifen*; *Napan*; *Opustan*; *Parkemed*; *Pinalgesic*; *Ponac*; *Ponalar*; *Ponalgic*; *Ponmel*; *Ponstan*; *Ponstel*; *Ponstyl*; *Pontyl*; *Spiralgin*.



Chemical Properties A white to greyish-white microcrystalline powder. Mp 230° to 231°, with effervescence. Practically insoluble in water; soluble 1 in 185 of ethanol, 1 in 150 of chloroform, and 1 in 80 of ether; soluble in solutions of alkali hydroxides. pK_a 4.2. Log *P* (octanol/water), 5.1.

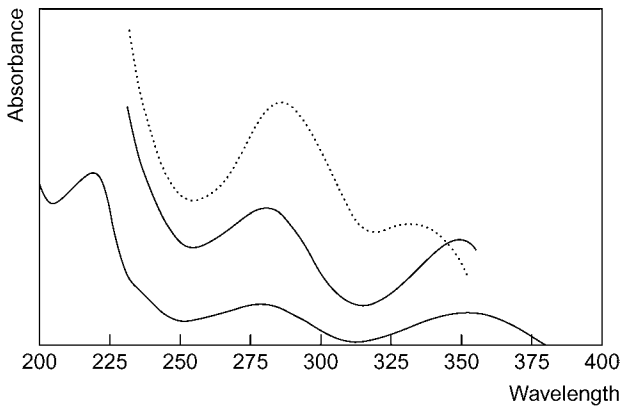
Colour Test Liebermann's reagent—blue.

Thin-layer Chromatography System TA—R_f 0.96; system TD—R_f 0.41; system TE—R_f 0.11; system TF—R_f 0.48; system TG—R_f 0.32; system TAD—R_f 0.54; system TAE—R_f 0.87; system TAJ—R_f 0.68; system TAK—R_f 0.86; system TAL—R_f 0.95 (chromic acid solution, green).

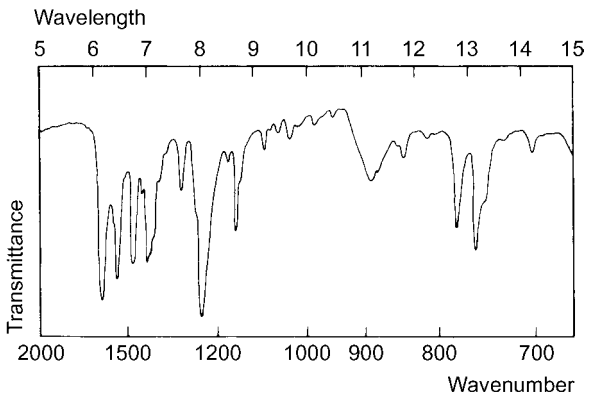
Gas Chromatography System GA—mefenamic acid RI 2201, mefenamic acid-Me RI 2069; system GB—RI 2370; system GD—mefenamic acid-Me RRT 1.45 (relative to n-$C_{16}H_{34}$).

High Performance Liquid Chromatography System HD—*k* 21.1; system HV—RRT 0.95 (relative to meclofenamic acid); system HX—RI 661; system HY—RI 686; system HAY—retention time 9.8 min; system HAX—retention time 13.1 min.

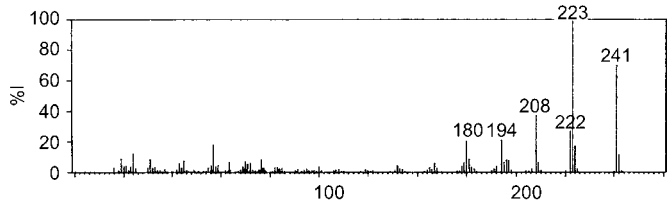
Ultraviolet Spectrum Acid methanol—279 (A_1^1=357a), 350 nm; aqueous alkali—285 (A_1^1=420a), 322 nm.



Infrared Spectrum Principal peaks at wavenumbers 1255, 1647, 1572, 1504, 757, 1163 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 223, 241, 208, 222, 194, 180, 77, 224; 3′-carboxymefenamic acid 44, 180, 209, 227, 223, 77, 208, 179; 3′-hydroxymethylmefenamic acid 209, 257, 180, 208, 210, 77, 44, 194.



Quantification

Plasma **HPLC** UV detection. Mefenamic acid and indometacin. Limit of detection, 80 µg/L for mefenamic acid [Niopas, Mamzoridi 1994]. UV detection. For method for quantification of mefenamic acid and other NSAIDs, see Streete [1989]. UV detection. For method for quantification of mefenamic acid and flufenamic acid, see Lin *et al.* [1980].

Serum **GC** FID. Limit of detection, 1 g/L [Dusci, Hackett 1978].

HPLC UV detection. For method for quantification of mefenamic acid and other NSAIDs, see Streete [1989].

Urine **HPLC** UV detection. Mefenamic acid and other anthranilic acid derivatives. Limit of detection, about 2 µg/L for mefenamic acid [Mikami *et al.* 2000]. UV detection. Mefenamic acid and other NSAIDs. Limit of quantification, 50 µg/L for mefenamic acid [Hirai *et al.* 1997].

Disposition in the Body Readily absorbed after oral administration. Metabolised by hydroxylation of the 3′-methyl group followed by oxidation to produce the 3′-carboxy metabolite; glucuronide conjugation also occurs. About 52% of a dose is excreted in the urine in 48 h, 6% as mefenamic acid and the other 46% as conjugated metabolites; about 20% of a dose is eliminated in the faeces, mostly as unconjugated 3′-carboxymefenamic acid. Trace amounts of mefenamic acid may be present in breast milk.

Therapeutic Concentration

Following a single oral dose of 1 g to 6 subjects, a mean peak plasma concentration of 10 g/L was attained in about 2 h; the free and conjugated 3′-hydroxymethyl and 3′-carboxy metabolites attained similar concentrations after about 3 h, and 6 to 8 h respectively [Glazko 1966].

After oral administration of 250 mg 3 times a day for four days to 10 subjects, peak plasma concentrations of 0.3 to 2.4 g/L (mean 0.9) were reported 2 h after the morning dose [Buchanan *et al.* 1968].

Administration of mefenamic acid at an oral dose of 2 mg/kg at 24-h intervals to 17 preterm infants with patent *ductus arteriosus* resulted in a peak plasma concentration of 1.2 to 6.1 mg/L (mean 3.8) at 2 to 18 h after the first dose. For closure of ductus to take place, plasma concentrations above 2 mg/L needed to be maintained for at least 12 h [Ito *et al.* 1994].

Toxicity Toxic effects are usually associated with plasma concentrations greater than 10 g/L.

In a survey of 29 cases of mefenamic acid overdose, plasma concentrations were in the range 11 to 148 g/L; in 11 of the cases convulsions occurred (mean plasma concentration 73 g/L). All the patients recovered [Balali-Mood *et al.* 1981].

Half-life Plasma half-life, about 2 to 4 h.

Protein Binding About 99%.

Dose Up to 1.5 g daily.

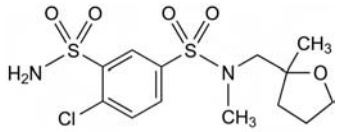
Mefruside

Diuretic

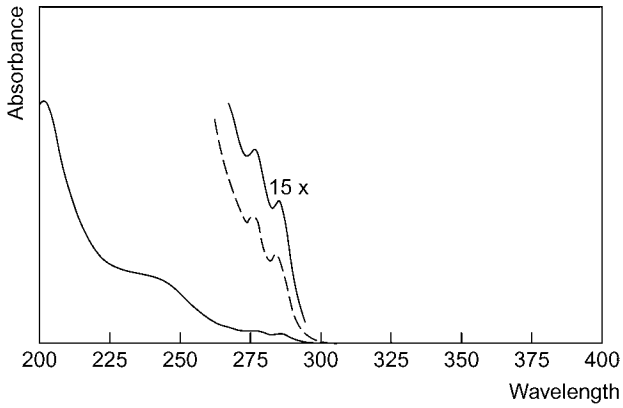
$C_{13}H_{19}ClN_2O_5S_2 = 382.9$

CAS—7195-27-9

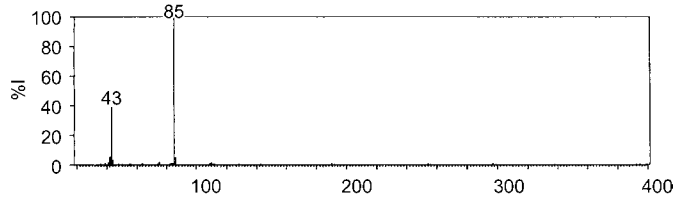
IUPAC Name 4-Chloro-N^1-methyl-N^1-[(tetrahydro-2-methyl-2-furanyl)methyl]-1,3-benzenedisulfonamide
Proprietary Name *Baycaron*



Chemical Properties A white powder. Mp 148° to 149°. Practically insoluble in water; soluble in dilute solutions of sodium hydroxide. Log *P* (octanol/water), 1.5.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—blue; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.45; system TE—R_f 0.67; system TF—R_f 0.58; system TAD—R_f 0.55.
Gas Chromatography System GA—mefruside-Me_2 RI 2860; system GX—mefruside-Me_2 retention time 7.4; M (5-oxo-)-Me_2 retention time 9.8 min; system GY—mefruside-Me_2 retention time 4.7; M (5-oxo-)-Me_2 retention time 5.1 min.
High Performance Liquid Chromatography System HN—*k* 8.67; system HY—RI 417.
Ultraviolet Spectrum Methanol—276 (A_1^1=44a), 284 nm.



Infrared Spectrum Principal peaks at wavenumbers 1162, 1176, 819, 1041, 746, 909 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 85, 43, 42, 86, 44, 41, 75, 110.



Quantification
Blood **GC** AFID. For method, see Fleuren *et al.* [1979].
Plasma **GC** AFID. Limit of detection, 25 ng for 5-oxomefruside and its hydroxycarboxylic acid analogue [Fleuren *et al.* 1980]. AFID. Limit of detection, 5 µg/L [Fleuren *et al.* 1979].
Urine **GC** AFID. For method, see Fleuren *et al.* [1979].
HPLC UV detection. For method for quantification of mefruside and its metabolites, see Little *et al.* [1977].
Erythrocytes **GC** AFID. Limit of detection, 25 ng for 5-oxomefruside and its hydroxycarboxylic acid analogue [Fleuren *et al.* 1980]. AFID. For method, see Fleuren *et al.* [1979].
Disposition in the Body Readily absorbed after oral administration. About 13% of a dose is excreted in the urine as 5-oxomefruside, about 35 to 55% as the hydroxycarboxylic acid analogue of 5-oxomefruside and up to about 15% as a conjugate of this acid analogue. Both of these metabolites appear to be active. <1% of the dose is excreted as unchanged drug.
Therapeutic Concentration There is considerable intersubject variation in plasma concentrations after therapeutic doses.
Peak plasma concentrations of 0.07 to 0.13 mg/L were attained 2 to 5 h after a single oral dose of 50 mg to 6 subjects [Fleuren *et al.* 1980].
Half-life Plasma half-life, mefruside 3 to 12 h (mean 7), 5-oxomefruside 10 to 14 h, hydroxycarboxylic acid analogue 8 to 12 h.
Volume of Distribution About 6 L/kg.
Clearance Plasma clearance, 5 to 30 mL/min/kg (mean 13).
Distribution in Blood Plasma : whole blood ratio, about 0.03.
Dose 25 to 100 mg daily.

Fleuren HL *et al.* (1979). Quantitative gas chromatographic determination of mefruside in body fluids by extractive methylation and nitrogen detection. *Arzneimittelforschung* 29: 1041–1047.

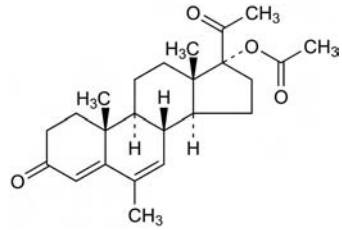
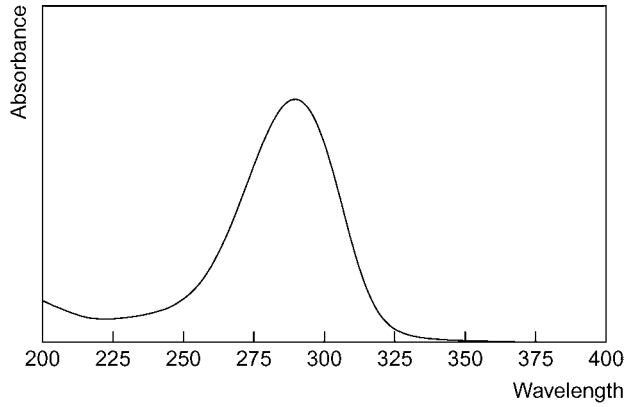
Megestrol Acetate

Progestational Steroid
$C_{24}H_{32}O_4$ = 384.5
CAS—3562-63-8 (megestrol); 595-33-5 (acetate)
IUPAC Name 17-Hydroxy-6-methylpregna-4,6-diene-3,20-dione acetate
Proprietary Names *Acestrol*; *Borea*; *Maygace*; *Megace*; *Megefren*; *Megestat*; *Megestil*; *Megestin*; *Megostat*; *Nia*; *Niagestin*; *Prazoken*.



Chemical Properties A white to creamy-white crystalline powder. Mp about 217°. A solution in chloroform is dextrorotatory. Practically insoluble in water; soluble 1 in 55 of ethanol, 1 in 0.8 of chloroform and 1 in 130 of ether; soluble in acetone. Log *P* (octanol/water), 4.0.
Thin-layer Chromatography System TP—R_f 0.80; system TQ—R_f 0.50; system TR—R_f 0.98; system TS—R_f 0.85, streaking may occur.
Ultraviolet Spectrum Dehydrated alcohol—287 nm (A_1^1=630a).



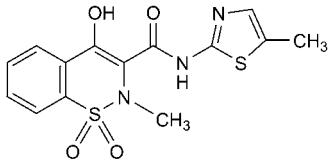
Infrared Spectrum Principal peaks at wavenumbers 1263, 1249, 1733, 1662, 1712, 1630 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 281, 43, 282, 187, 107, 91, 55, 105.
Quantification
Plasma **HPLC** UV detection. Limit of detection, 5 µg/L [Gaver *et al.* 1985].
Serum **HPLC** UV detection. Limit of detection, 5 µg/L for megestrol acetate and cyproterone acetate [Dikkeschei *et al.* 1990].
Dose 40 to 320 mg daily.

Dikkeschei LD *et al.* (1990). Determination of megestrol acetate and cyproterone acetate in serum of patients with advanced breast cancer by high-performance liquid chromatography. *J Chromatogr* 529: 145–154.
Gaver RC *et al.* (1985). Liquid chromatographic procedure for the quantitative analysis of megestrol acetate in human plasma. *J Pharm Sci* 74: 664–667.

Meloxicam

COX-2 Inhibitor, NSAID
$C_{14}H_{13}N_3O_4S_2$ = 51.4
CAS—71125-38-7
IUPAC Name 3-[Hydroxy-[(5-methyl-1,3-thiazol-2-yl)amino]methylidene]-2-methyl-1,1-dioxobenzo[*e*]thiazin-4-one
Synonyms 4-Hydroxy-2-methyl-*N*-(5-methyl-2-thiazolyl)-2*H*-1,2-benzothiazine-3-carboxamide-1,1-dioxide; UH-AC-62.

Proprietary Names *Metacam*; *Mobic*.



Chemical Properties Crystals from ethylene chloride with Mp 254°. pK_{a1} 1.1; pK_{a2} 4.2. Log *P* (octanol/water), 3.43. Stock solutions at –2 0° were stable for at least 30 days. Applying freeze-thaw did not appear to affect the samples [Zhang, Choi 2008]. Plasma samples were unaffected by 3 freeze-thaw cycles and were stable for at least 1 month when stored at –7 0°; defrosting samples and keeping them at room temperature for 6 h had no effect.[Bae *et al.* 2007].

High Performance Liquid Chromatography System HZ—retention time 6.8 min.

Quantification

Plasma **HPLC** Column: Superspher 60 RP-Select B (125 × 3.0 mm i.d., 5 µm). Mobile phase: 2.5 g pentanesulfonic acid, 3.0 g potassium dihydrogen phosphate, 750 g acetonitrile, 300 g methanol (pH 3.75) in 1.5 L, flow rate 1.0 mL/min. UV detection (λ = 355 nm). Retention time: 2.6 min. Limit of quantification, 25 µg/L [Gschwend *et al.* 2007]. Column: Sunfire C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L potassium monophosphate : acetonitrile (60 : 40, pH 3.6), flow rate 1.2 mL/min. UV detection (λ = 355 nm). Retention time: 11.6 min. Limit of quantification, 8.96 µg/L [Bae *et al.* 2007]. Column: RP-18e (100 × 4.6 mm i.d.). Mobile phase: 20 mmol/L disodium hydrogen phosphate (pH 6) : methanol (9 : 1 for 2 min to 6 : 4 in 0.01 min to 6 : 4 until 9 min), flow rate 2 mL/min. DAD (λ = 356 nm). Limit of detection, 30 µg/L [Medvedovici *et al.* 2005]. Column: Lichrospher C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: 170 mmol/L sodium acetate buffer (pH 3.3) : acetonitrile (62 : 38), flow rate 1.0 mL/min. UV detection (λ = 355 nm). Retention time: 6.0 min. Limit of quantification, 50 µg/L; limit of detection, 10 µg/L [Dasandi *et al.* 2002]. Column: Lichrocart RP C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: 50 mmol/L diammonium hydrogen phosphate : methanol : acetonitrile (50 : 40 : 10), flow rate 1 mL/min. UV detection (λ = 364 nm). Retention time: 2.7 min. Limit of quantification, 0.1 mg/L, limit of detection, 0.029 mg/L [Velpandian *et al.* 2000]. Column: ODS Hypersil (125 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : acetonitrile : acetic acid (600 : 500 : 50 : 20) with 1 g 1-heptanesulfonic acid, flow rate 1.5 mL/min. Fluorometric detection (λ_{ex} = 355 nm, λ_{em} = 500 nm). Limit of detection, 70 µg/L [Schmid *et al.* 1995]. See also Türck *et al.* [1995].

LC-MS Column: Prevail C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (70 : 30), flow rate 100 µL/min. TIS, positive ion mode, MRM acquisition mode. Retention time: 1.8 min. Limit of quantification, 20 µg/L [Rigato *et al.* 2006]. Column: Sunfire (100 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : 15 mmol/L ammonium formate (pH 3.0; 60 : 40), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.5 µg/L [Ji *et al.* 2005]. Column: Phenomenex Luna C_{18} (150 × 2 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.2% aqueous formic acid (65 : 35, pH 3.1), flow rate 0.3 mL/min. ESI. Retention time: ~2.5 min. Limit of quantification, 8.96 µg/L [Wiesner *et al.* 2003].

Serum **HPLC** Column: µBondapak C_{18} (250 × 4.6 mm i.d., 10 µm). Mobile phase: 1% acetic acid : acetonitrile (54 : 46), flow rate 1.0 mL/min. UV detection (λ = 360 nm). Limit of quantification, 45 µg/L, limit of detection, 10 µg/L [Zhang, Choi 2008].

Disposition in the Body Meloxicam is well absorbed after oral administration, reaching maximum concentration 5 to 6 h after once daily dose of 15 mg. After a single 15 mg intramuscular dose, the mean maximum plasma concentration is only approximately twice that observed after oral administration. Intravenous administration is associated with a markedly higher initial concentration (ratio IV/PO 2.99/0.93) followed by a rapid decline. Meloxicam is extensively metabolised via oxidation and the metabolites (4 isolated in total; ~97% of the dose) are excreted via urine and faeces in equal proportions. Less than 0.5% appears as the unchanged drug in urine. The pharmacokinetics of meloxicam alter in renal impairment, with lower total plasma meloxicam concentrations and higher free fractions being observed at creatinine clearances of 20–40 mL/min. However, there is no apparent risk of increased toxicity.

Therapeutic Concentration

Twenty-four healthy male subjects were administered 15 mg meloxicam as two different tablet formulations in a bioequivalence assessment. The mean maximum plasma concentrations were 1147 ± 192 and 1065 ± 181 µg/L, reached at 5 h [Gschwend *et al.* 2007.

A separate study of 24 healthy volunteers who received a 15 mg dose of meloxicam as one of two different tablet formulations showed mean maximum plasma concentrations of 1120 and 1210 µg/L reached at 4 h [Rigato *et al.* 2006].

In another similar study, the 24 healthy volunteers received a 15 mg dose of meloxicam as one of two different tablet formulations. Mean maximum plasma concentrations were 1303.26 ± 364.8 and 1345.41 ± 407.44 µg/L, reached at 3.4 and 5.6 h, respectively [Medvedovici *et al.* 2005].See also [Marcelín-Jiménez *et al.* 2005].

A single oral dose of 15 mg meloxicam was administered to 11 healthy Korean volunteers. A mean maximum plasma concentration of 1446 µg/L was reached at 4.1 h. The elimination half-life was ~22 h [Bae *et al.* 2007].

A single oral dose of 15 mg meloxicam was administered to 26 healthy volunteers. The mean maximum plasma concentration was 1538 µg/L reached at ~4.5 h. The elimination half-life was ~24 h [Wiesner *et al.* 2003].

Six healthy volunteers (aged 27 to 49 years) were administered a single oral 30 mg dose after an overnight fast or 10–20 min after a continental (light) breakfast. The fasting individuals reached peak plasma concentrations of 1.51 mg/L at ~10.7 h compared with the fed volunteers, who showed peak concentrations of 1.43 mg/L at 9.7 h. In a second study, 16 healthy volunteers (aged 24 to 47 years) were administered a 15 mg dose after a 12 h fast or immediately after a high fat breakfast. Those given the dose after the fast showed peak concentrations of 0.928 mg/L at 8.8 h and those with the dose coadministered with a high fat meal reached 1.14 mg/L approximately 6.1 h after ingestion [Türck *et al.* 1995].

Four healthy males were administered an intravenous 30 mg dose (over 15 min) or a single oral 30 mg dose, 2 h after a light breakfast. Peak plasma concentrations were 5.35 mg/L and 3.09 mg/L for the IV and oral doses, respectively, attained 2 h after administration [Schmid *et al.* 1995].

Bioavailability Approximately 89%.

Half-life 25–20 h.

Volume of Distribution 11.5–16.5 L (decreased by coadministration with a high fat meal); also reported as 10 L.

Clearance Plasma, 7.25–8.5 mL/min.

Distribution in Blood <10% in red blood cells.
Protein Binding 99.4%, mainly to albumin.
Dose Orally and via suppositories: the usual dose is 7.5 to 15 mg daily. A lower daily dose of 7.5 mg is recommended in the elderly and those on renal dialysis.

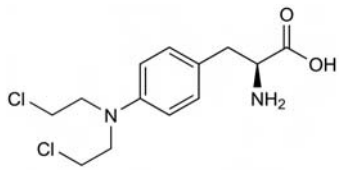
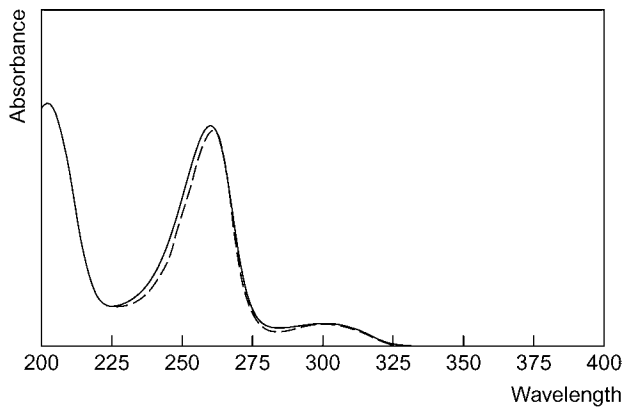
Melphalan

Antineoplastic
$C_{13}H_{18}Cl_2N_2O_2 = 305.2$
CAS—148-82-3

IUPAC Name 4-[Bis(2-chloroethyl)amino]-L-phenylalanine
Synonyms PAM; phenylalanine nitrogen mustard.
Note Merphalan is the racemic form of melphalan; medphalan is the D-isomer of melphalan.
Proprietary Name *Alkeran*



Chemical Properties A white to buff-coloured powder. Mp about 177° to 180°, with decomposition. Practically insoluble in water, chloroform and ether; soluble in ethanol and propylene glycol; soluble in dilute mineral acids. Log *P* (octanol/water), −0.5.
High Performance Liquid Chromatography System HAA—retention time 12.9 min.
Ultraviolet Spectrum Methanol—260 (A^{1}_{1}=707a), 301 nm.



Infrared Spectrum Principal peaks at wavenumbers 1621, 1513, 1186, 1160, 1250, 1205 cm^{-1} (KBr disk).
Quantification
Blood **HPLC** Fluorescence detection. Limit of detection, <30 µg/L [Osterheld *et al.* 1988].
Plasma **HPLC** UV detection. For method, see Pinguet *et al.* [1996]. Melphalan and metabolites. Limit of detection, <1.4 ng for melphalan [Wu *et al.* 1995]. For method, see Silvestro *et al.* [1991]. See Blood [Osterheld *et al.* 1988]. Fluorescence detection. Limit of detection, 10 µg/L [Woodhouse, Henderson 1982]. UV detection. Limit of detection, 50 µg/L [Chang *et al.* 1978].
Perfusate **HPLC** See Plasma [Wu *et al.* 1995].
Tissue **HPLC** See Plasma. Limit of detection, <7.2 ng for melphalan [Wu *et al.* 1995].
Therapeutic Concentration
When administered as a 24 h continuous IV infusion to 21 subjects at a dose of 20, 30 and 40 mg/m^2, steady-state melphalan concentrations of 0.080, 0.121 and 0.206 mg/L were obtained; the maximum tolerated dose was 30 mg/m^2 [Pinguet *et al.* 2000].
Dose 200 to 300 µg/kg daily, orally, for 4 to 6 days.

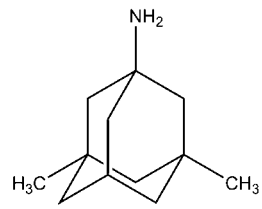
Memantine

Amine, NMDA Antagonist, Treatment of Alzheimer's Disease
$C_{12}H_{21}N = 179.3$
CAS—19982-08-2

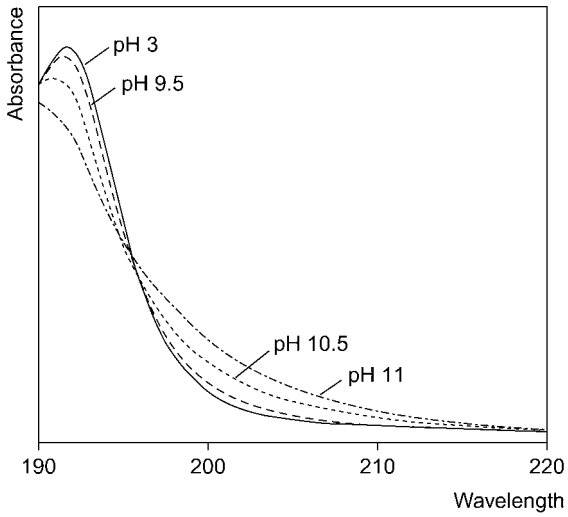
IUPAC Name 3,5-Dimethyladamantan-1-amine
Synonyms 1-Amino-3,5-dimethyladamantane; D-145; 3,5-dimethyl-1-adamantanaamine; 3,5-dimethyltricyclo[3.3.1.1.3,7]decan-1-amine; DMAA.



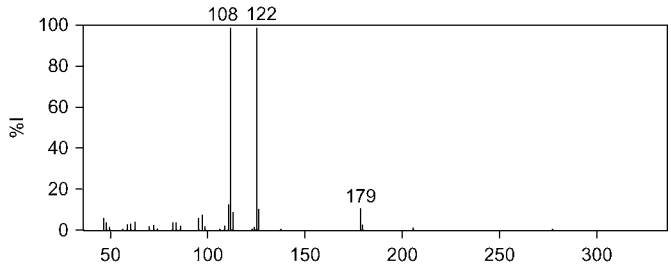
Chemical Properties Oil. Stable in plasma samples for at least 150 days at –20° [Almeida *et al.* 2007].

Memantine Hydrochloride

$C_{12}H_{21}N,HCl = 215.8$
CAS—41100-52-1
Proprietary Names *Abixa*; *Akatinol*; *Axura*; *Carrier*; *Conxine*; *Ebixa*; *Eutebrol*; *Fentina*; *Lucidex*; *Memax*; *Memox*; *Merital*; *Mimetix*; *Namenda*; *Neuroplus*; *Pronervon*.
Chemical Properties Fine white to off-white powder. Mp 258°. Soluble in water. pK_a 10.4. Log *P* (octanol/water), 3.28 [Koeberle *et al.* 2003].
High Performance Liquid Chromatography Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : ethanol : water : trifluroacetic acid (40 : 20 : 40 : 0.1), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 470 nm, λ_{em} = 540 nm). Retention time: ~35 min (4-fluoro-7-nitro-2,1,3-benzoxadiazole derivative). Limit of quantification, 25 µg/L [Higashi *et al.* 2006]. Column: C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : tetrahydrofuran : water: triethylamine (75 : 10 : 15 : 0.02), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 348 nm). Retention time: 8.5 min ([2-naphthoxy]acetic acid derivative). Limit of quantification, 0.5 µmol/L, limit of detection, 0.15 µmol/L [Duh *et al.* 2003].
Capillary Electrophoresis Capillary: uncoated fused silica (430 cm × 75 µm i.d., 36.5 cm to detector). Buffer: 5 mmol/L 4-methylbenzylamine in ethanol : water (1 : 4, pH 9.0). UV detection (λ = 210 nm). Limit of quantification, 2 mg/L; limit of detection, 0.35 mg/L [Reichova *et al.* 2002].
Ultraviolet Spectrum Principal peak at 192 nm[Reichova *et al.* 2002].



Mass Spectrum Principal ions at *m/z* 108, 122, 179, 164 [Wesemann *et al.* 1982].



Quantification

Blood **GC-MS** Column: DB-5MS capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 8.3 mL/min. Temperature programme: 80° to 300° at 20°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 2.3 min. Limit of quantification, 0.1 mg/L; limit of detection, 0.01 mg/L [Bynum *et al.* 2007].

Plasma **GC-MS** Column: DB-5MS capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 100° for 1 min to 300° at 40°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 4.8 min (pentafluorobenzyl chloride derivative). Limit of quantification, 117 ng/L; limit of detection, 10 ng/L [Leis *et al.* 2002].

HPLC Column: Lichrospher C_{18} (150 × 6.0 mm i.d., 5 µm). Mobile phase: methanol : water (85 : 15), flow rate 1.0 mL/min. UV detection (λ = 256 nm). Retention time: 21 min (anthraquinone-2-sulfonyl chloride derivative). Limit of quantification, 50 µg/L; limit of detection, 20 µg/L [Shuangjin *et al.* 2007]. Column: C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : tetrahydrofuran : water : triethylamine (75 : 10 : 15 : 0.02), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 348 nm). Retention time: 8.5 min ([2-naphthoxy]acetic acid derivative). Limit of quantification, 0.5 µmol/L; limit of detection, 0.15 µmol/L [Duh *et al.* 2003]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.025 mol/L monobasic potassium phosphate : acetonitrile (27 : 73) with 0.5 mL *o*-phosphoric acid and 0.6 mL *n*-butylamine, flow rate 1.8 mL/min. Fluorescence detection (λ_{ex} = 235 nm, λ_{em} = 470 nm). Retention time: 12.1 min (dansyl chloride derivative). Limit of quantification, 3 µg/L [Suckow *et al.* 1999].

LC-MS Column: C_{18} (50 × 3.0 mm i.d., 3 µm). Mobile phase: methanol : water : formic acid (80 : 20 : 0.1), flow rate 0.15 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.1 µg/L [Almeida *et al.* 2007]. Column: Zorbax SB-C_8 (150 × 4.6 mm i.d., 3.5 µm). APCI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.5 µg/L [Rao *et al.* 2005].

Urine **GC-MS** Column: DB-5MS capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 8.3 mL/min. Temperature programme: 80° to 300° at 20°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 2.3 min. Limit of quantification, 0.1 mg/L; limit of detection, 0.01 mg/L [Bynum *et al.* 2007].

HPLC Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : tetrahydrofuran : water : triethylamine (75 : 10 : 15 : 0.02), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 348 nm). Derivatisation agent: (2-naphthoxy)acetyl chloride. Limit of detection, 0.2 µmol/L [Duh *et al.* 2005].

Vitreous Humour **GC-MS** See Urine [Bynum *et al.* 2007].

Stomach Contents **GC-MS** See Urine [Bynum *et al.* 2007].

Liver **GC-MS** See Urine [Bynum *et al.* 2007].

Other **GC** Rat Tissue. Column: glass column with 2% Emulphor OU on GasChrom P 80-100 mesh (1 m × 3.4 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 180°. FID. Retention time: 2.5 min. Limit of detection, 60 ng/g [Wesemann *et al.* 1982].

HPLC Melanin. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.2% acetic acid (pH 7.0, 45 : 55), flow rate 0.3 mL/min for 18 min to 1.5 mL/min for 11 min. Fluorescence detection (λ_{ex} = 370 nm, λ_{em} = 506 nm). Retention time: 15.2 min (dansyl chloride derivative). Limit of detection, 0.012 µmol/L [Higashi, Fujii 2005].

LC-MS Melanin. Column: ODS-3 (100 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% formic acid in water : 0.1% formic acid in methanol (50 : 50 to 30 : 70 over 3 min for 2 min), flow rate 0.8 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 3.6 min. Limit of quantification, 0.10 nmol/L when sample prepared in deionised water [Koeberle *et al.* 2003].

Disposition in the Body Well absorbed after oral doses with peak plasma concentrations achieved in approx. 3 to 8 h. It undergoes partial hepatic metabolism; the main metabolites include *N*-3,5-dimethyl-gludantan and 1-nitroso-3,5-dimethyl-adamantane. The majority of a dose is excreted unchanged via the kidney (50%); some active renal tubular secretion and re-absorption occurs. The remainder of memantine that is not excreted as unchanged drug in urine is converted to the polar metabolites memantine glucuronide conjugate (approx. 25%), 6-hydroxy-memantine and 1-nitroso-deaminated memantine, which are minimally active. Memantine rapidly crosses the blood–brain barrier and is detectable in CSF approx. 30 min after infusion.

Therapeutic Concentration

A group of 32 volunteers with different degrees of renal impairment was administered a single oral dose of 20 mg memantine hydrochloride. Mean peak plasma concentrations for the different groups were reported as follows:

Parameter	*Healthy subjects*	*Renal impairment*		
		Mild	*Moderate*	*Severe*
CL_{CR} (mL/min)	93.5	60.9	41.6	20.1
C_{max} (µg/L)	22.1	19.3	24.3	25.8
Time (h)	7.6	7.0	9.0	8.3

The cumulative amount of drug excreted (Cum.Ae) in urine was also measured and reported as:

Parameter	*Healthy subjects*	*Renal impairment*		
		Mild	*Moderate*	*Severe*
Memantine				
Cum.Ae (mg)	7.95	5.44	6.43	3.82
% Dose	47.9	32.8	38.7	23.0
Memantine plus glucuronic acid conjugate				
Cum.Ae (mg)	12.35	11.80	10.62	7.41
% Dose	74.3	71.0	63.9	44.6

[Periclou *et al.* 2006].

A single oral dose of 20 mg memantine was given to 21 healthy young volunteers (mean age 26.1 years). The mean peak plasma concentration was 29.3 µg/L after 4.8 h. In another study where glyburide (1.25 mg) and metformin (250 mg) were co-administered with 20 mg memantine, the mean peak plasma concentration of memantine was 27.9 µg/L after 6 h, thus demonstrating a lack of interaction between the drugs [Rao *et al.* 2005].

Nineteen healthy young volunteers (mean age 27.4 years) were administered 10 mg memantine as a single dose on day 1. Following a 14-day washout period, donepezil was administered once daily in the morning starting at 5 mg/day for 7 days and escalated to 10 mg/day for 22 days thereafter. On the final morning of donepezil treatment (day 43), subjects received both memantine and donepezil 10 mg. The mean peak plasma concentration of memantine without donepezil (day 1) was 12.8 µg/L after 6.5 h. On day 43, the mean peak plasma concentration of memantine (with co-administered donepezil) was 13.0 µg/L after 6.5 h, thus demonstrating a lack of interaction between the drugs [Periclou *et al.* 2004].

Toxicity

A 62-year-old man with a history of early-onset Alzheimer's disease and hypertension was found dead in bed. He had prescriptions for donepezil, clonazepam, propoxyphene with paracetamol, venlafaxine, and memantine. Postmortem memantine concentrations in blood and tissues were reported as follows:

Matrix	*Memantine concentration*
Blood (aorta, mg/L)	1.80
Blood (iliac, mg/L)	0.65
Urine (mg/L)	6.20
Gastric (mg/kg)	6.20
Vitreous humour (mg/L)	0.39
Liver (mg/kg)	6.10

The memantine levels were not considered to be toxic and concentrations of the other medicines were within therapeutic ranges. However, chloroform was detected at 10 mg/L in aortic and iliac blood and 12 mg/kg in liver. The cause of death was therefore attributed to chloroform poisoning [Bynum *et al.* 2007].

Bioavailability 100%.

Half-life Ranges from 60 to 100 h, although under alkaline conditions the rate of elimination is reduced.

Volume of Distribution Approximately 9 to 10 L/kg.

Clearance In subjects with normal renal function 170 mL/min/1.73 m^2.

Protein Binding Approximately 45%.

Dose In the treatment of Alzheimer's disease, the initial dose of memantine hydrochloride is 5 mg daily in the morning for the first week; this should be increased in weekly increments of 5 mg to a maximum dose of 20 mg daily. Doses of 10 mg daily and over should be taken in two divided doses. Reduced doses are recommended in patients with renal impairment.

Menadione

Vitamin K Analogue

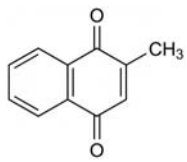
$C_{11}H_8O_2$ = 172.2

CAS—58-27-5

IUPAC Name 2-Methyl-1,4-naphthalenedione

Synonyms Menaphthene; menaphthone; methylnaphthochinonum; vitamin K_3.

Proprietary Names *Kappaxin*; *Kayquinone*; *Thyloquinone*. It is an ingredient of *Bilkaby*.



Chemical Properties A bright-yellow crystalline powder. On exposure to light it decomposes and darkens to light brown. Mp 105° to 107°. Insoluble in water; soluble 1 in 60 of ethanol and 1 in 10 of benzene; moderately soluble in chloroform and carbon tetrachloride; soluble in ether. Log *P* (octanol/water), 2.2.

Caution The powder is irritating to the respiratory tract and to the skin. The ethanolic solution has vesicant properties.

Menadione Sodium Bisulfite

$C_{11}H_8O_2NaHSO_3,3H_2O$ = 330.3

CAS—130-37-0 (anhydrous); 6147-37-1 (trihydrate)

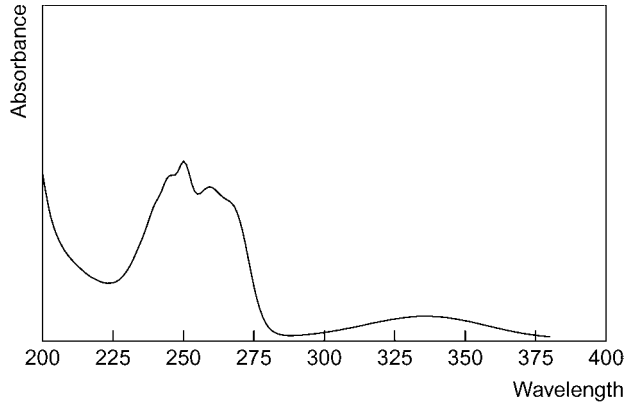
Synonyms Kavitanum; vikasolum.

Proprietary Names *Hykinone*; *Klotogen*; *K-Thrombin*.

Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in about 2 of water; slightly soluble in ethanol; almost insoluble in ether and benzene.

Colour Test Dissolve about 0.5 mg in 5 mL of ethanol and add 2 mL of strong ammonia solution and a few drops of ethyl cyanoacetate—violet; add 5 mL of sodium hydroxide solution—brown-yellow. The violet colour is destroyed on the addition of acid or on exposure to sunlight.

Ultraviolet Spectrum Aqueous acid—244 (A^1_1=1052b), 249 (A^1_1=1133b), 261 (A^1_1=990b), 340 nm (A^1_1=159b).



Quantification

Plasma **HPLC** Limit of detection, <10 µg/L [Hu *et al.* 1995].

Dose Menadione is usually administered by IM injection as a 0.5% solution in oil.

Hu OY *et al.* (1995). Determination of anticancer drug vitamin K3 in plasma by high-performance liquid chromatography. *J Chromatogr B Biomed Appl* 666: 299–305.

Menthol

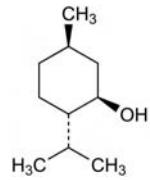
Decongestant, Antipruritic

$C_{10}H_{20}O$ = 156.3

CAS—89-78-1; 1490-04-6; 2216-51-5 (–); 15356-70-4 (±)

IUPAC Name 5-Methyl-2-propan-2-ylcyclohexan-1-ol

Synonyms Mentol; (1α,2β,5α)-5-methyl-2-(1-methylethyl)cyclohexanol.



Chemical Properties Menthol is natural laevo-menthol, obtained from the volatile oils of various species of *Mentha* (Labiatae), or synthetic laevo-menthol, or racemic menthol. Colourless crystals or crystalline powder. Mp of 41° to 43° and of (±)-menthol,27° to 28°(rising on prolonged stirring to 30° to 32°). Slightly soluble in water; soluble 1 in 0.2 of ethanol, 1 in 0.25 of chloroform and 1 in 0.4 of ether; freely soluble in glacial acetic acid and liquid petrolatum. Log *P* (octanol/water), 3.4.

Gas Chromatography System GA—RI 1206; system GB—RI 1194.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1046, 1026, 995, 1102, 1078, 979 cm^{-1} (Nujol mull).

Mass Spectrum Principal ions at *m/z* 81, 95, 71, 41, 67, 55, 138, 123.

Quantification

Plasma **GC** FID. Limit of detection, 1 µg/L for menthol, camphor and methylsalicylate [Valdez *et al.* 1999].

Urine **GC** FID. Limit of detection, 250 µg/L for menthol and its glucuronide [Kaffenberger, Doyle 1990].

Disposition in the Body Menthol is excreted in the bile and urine as a glucuronide conjugate; the various stereoisomers differ quantitatively in the extent to which they conjugate with glucuronic acid. Menthol may occur in the conjugated form as a metabolite of pulagone which is a constituent of pulegium oil.

Toxicity The minimum lethal dose has been estimated to be about 2 g. The application of drops or ointments containing menthol to the nostrils of infants is dangerous and may cause instant collapse. Ingestion of excess menthol may cause severe abdominal pain and coma.

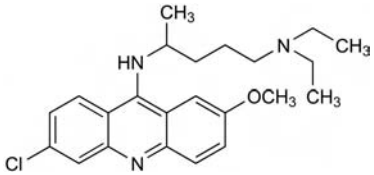
Kaffenberger RM, Doyle MJ (1990). Determination of menthol and menthol glucuronide in human urine by gas chromatography using an enzyme-sensitive internal standard and flame ionization detection. *J Chromatogr* 527: 59–66.

Valdez JS *et al.* (1999). Sensitive and selective gas chromatographic methods for the quantitation of camphor, menthol and methyl salicylate from human plasma. *J Chromatogr B Biomed Sci Appl* 729: 163–171.

Mepacrine

Antimalarial, Antiprotozoal
$C_{23}H_{30}ClN_3O = 400.0$
CAS—83-89-6

IUPAC Name N^4-(6-Chloro-2-methoxy-9-acridinyl)-N^1,N^1-diethyl-1,4-pentanediamine
Synonyms Acrichinum; acrinamine; atebrine; chinacrina; quinacrine.



Chemical Properties pK_a 7.7, 10.3 (20°). Log *P* (octanol/water), 5.8.

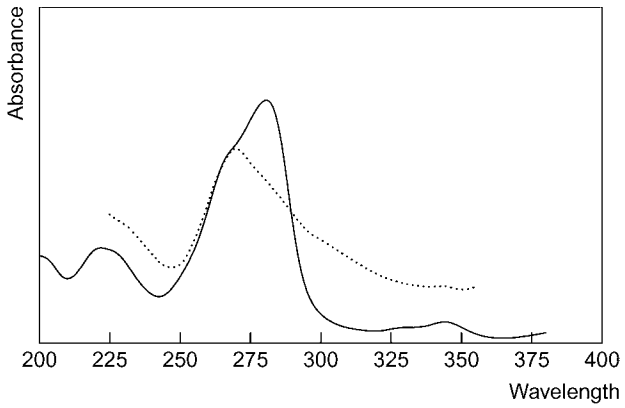
Mepacrine Hydrochloride

$C_{23}H_{30}ClN_3O,2HCl,\ 2H_2O = 508.9$
CAS—69-05-6 (anhydrous); 6151-30-0 (dihydrate)
Synonyms Antimalarinae chlorhydras; erion; quinacrine hydrochloride.
Proprietary Name *Atabrine*
Chemical Properties A bright yellow crystalline powder. Mp 248° to 250°, with decomposition. Soluble 1 in about 35 of water, more soluble in hot water; slightly soluble in ethanol; very slightly soluble in chloroform; insoluble in ether, benzene and acetone.

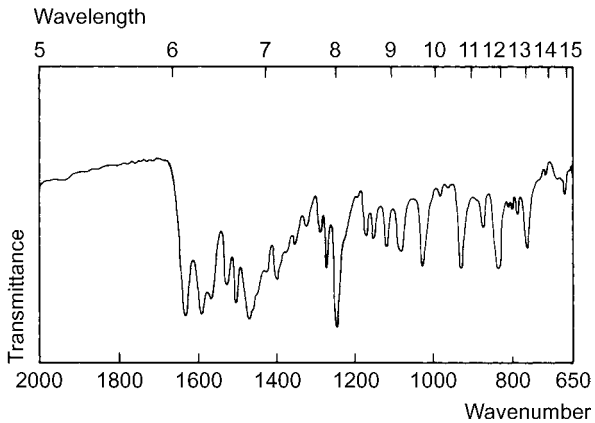
Mepacrine Mesilate

$C_{23}H_{30}ClN_3O,2CH_3SO_3H,\ H_2O = 610.2$
CAS—316-05-2 (anhydrous)
Synonym Mepacrine methanesulphonate
Chemical Properties Bright yellow crystals. Soluble 1 in 3 of water and 1 in 36 of ethanol.

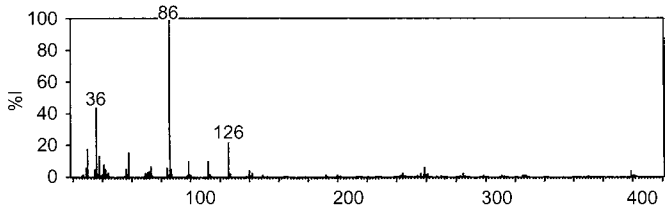
Colour Tests Mandelin's test—violet→yellow; Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.43; system TB—R_f 0.15; system TC—R_f 0.05; system TL—R_f 0.09 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HX—RI 345; system HY—RI 299.
Ultraviolet Spectrum Aqueous acid—279 (A^1_1=1706a), 343 nm; aqueous alkali—270, 345 nm.



Infrared Spectrum Principal peaks at wavenumbers 1245, 1627, 1587, 1500, 1560, 1522 cm^{-1} (mepacrine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 36, 126, 30, 58, 38, 112, 99.



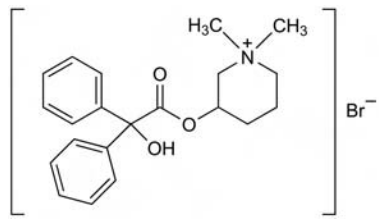
Quantification
***Plasma* HPLC** Fluorescence detection [Bjorkman, Elisson 1987].
Disposition in the Body Readily absorbed after oral administration; it appears in the blood within 2 h, peak concentrations being attained in 8 h. Mepacrine accumulates in the body during chronic administration and is widely distributed, high concentrations being found in the liver, lungs and spleen; it also persists in the skin and finger-nails. The urine and skin may become yellow. It is excreted very slowly in the urine and bile with significant amounts detectable in the urine for at least 2 months after the discontinuation of therapy. Several metabolites are excreted but these account for not more than 5% of the dose.
Toxicity Large doses may give rise to nausea and vomiting and occasionally to transient mental disturbances. Attempts at suicide with massive doses have not been successful.
Half-life About 5 days.
Distribution in Blood Concentrated in the erythrocytes.
Protein Binding About 90%.
Dose 300 to 900 mg daily.

Bjorkman S, Elisson LO (1987). Determination of quinacrine (mepacrine) in plasma by high-performance liquid chromatography with fluorimetric detection. *J Chromatogr* 420: 341–348.

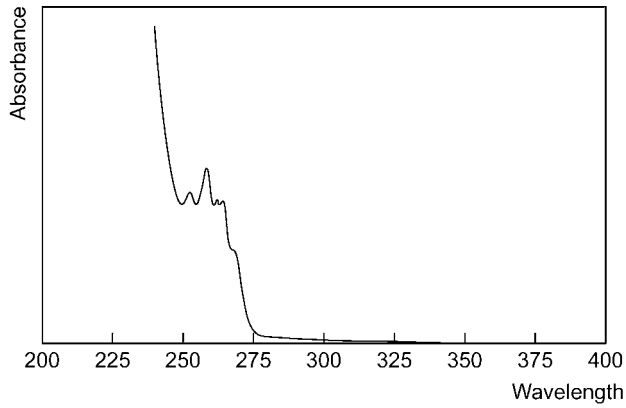
Mepenzolate Bromide

Anticholinergic
$C_{21}H_{26}BrNO_3 = 420.3$
CAS—25990-43-6 (mepenzolate); 76-90-4 (bromide)

IUPAC Name 3-[(Hydroxydiphenylacetyl)oxy]-1,1-dimethylpiperidinium bromide
Proprietary Names *Cantil*; *Cantril*; *Gastropidil*; *Trancolan*.



Chemical Properties A white or light cream-coloured powder. Mp 228° to 229°, with decomposition. Soluble 1 in 110 of water, 1 in 120 of dehydrated alcohol, 1 in about 630 of chloroform and 1 in about 8 of methanol; practically insoluble in ether. Log *P* (octanol/water), −0.8.
Colour Tests The following tests are performed on mepenzolate nitrate: Liebermann's reagent—brown; Marquis test—orange (transient).
Thin-layer Chromatography System TA—R_f 0.01; system TAJ—R_f 0.42; system TAK—R_f 0.04; system TAL—R_f 0.52 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2327.
High Performance Liquid Chromatography System HA—*k* 4.1 (tailing peak).
Ultraviolet Spectrum Aqueous acid—252, 258 (A^1_1=11b), 261, 263 nm.

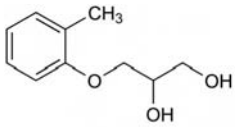


M

Infrared Spectrum Principal peaks at wavenumbers 1220, 1727, 1163, 763, 1062, 1093 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 97, 105, 77, 96, 42, 183, 98, 82.
Dose 75 to 200 mg daily.

Mephenesin

Muscle Relaxant
$C_{10}H_{14}O_3$ = 182.2
CAS—59-47-2
IUPAC Name 3-(2-Methylphenoxy)-1,2-propanediol
Synonyms Cresoxydiol; glykresin.
Proprietary Names *Decontractyl*; *DoloVisano M*.



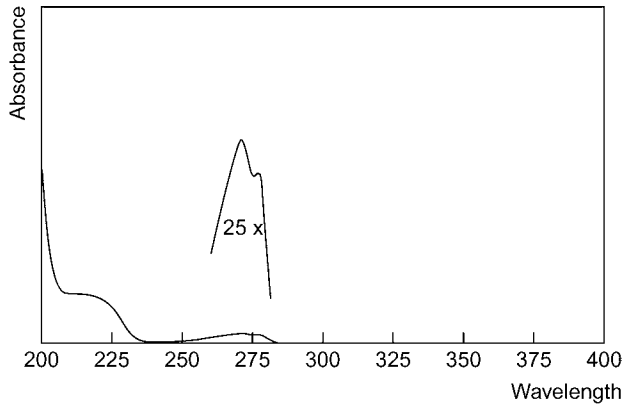
Chemical Properties White crystals or crystalline aggregates. Mp 70° to 71°. Soluble 1 in 100 of water, 1 in 8 of ethanol and 1 in 12 of chloroform; soluble in ether; freely soluble in propylene glycol. Log *P* (octanol/water), 1.4.

Mephenesin Carbamate

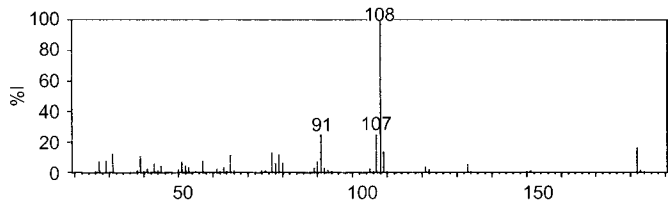
$C_{11}H_{15}NO_4$ = 225.2
CAS—533-06-2
Chemical Properties White crystals. Mp 93°. Slightly soluble in water; freely soluble in ethanol; soluble 1 in 50 of chloroform.

Colour Tests Mephenesin carbamate: Mandelin's test—grey-brown; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.02; system TC—R_f 0.43; system TL—R_f 0.57; system TAE—R_f 0.87; system TAF—R_f 0.89; system TAJ—R_f 0.45; system TAK—R_f 0.29; system TAL—R_f 0.78 (Marquis reagent, positive).

System TD—Mephenesin carbamate R_f 0.14; system TE—Mephenesin carbamate R_f 0.55; system TF—Mephenesin carbamate R_f 0.36; system TAD—Mephenesin carbamate R_f 0.35 (furfuraldehyde reagent, positive).
Gas Chromatography System GA—RI 1568.
High Performance Liquid Chromatography System HA—*k* 0.2; system HX—RI 364; system HY—RI 322.
Ultraviolet Spectrum Aqueous acid—270 (A_1^1=87a), 276 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1047, 1248, 1124, 1493, 756, 748 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 108, 107, 91, 182, 109, 77, 79, 31; mephenesin carbamate 118, 108, 182, 91, 225, 107, 57, 75.

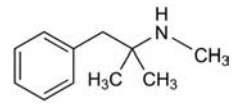


Disposition in the Body Readily absorbed after oral administration and widely distributed throughout the tissues. It is rapidly metabolised to the inactive metabolites, β-(*o*-methylbenzoyloxy)lactic acid and β-(2-methyl-4-hydroxyphenoxy)lactic acid. <2% of a dose is excreted in the urine as unchanged drug.
Therapeutic Concentration
Following a single oral dose of 3 g to 4 subjects, a mean peak plasma concentration of about 10 mg/L was attained in 0.5 h [London, Poet 1957].
Toxicity
A 43-year-old woman, who ingested between 5.5 and 11 g of mephenesin recovered within about 10 h following treatment [Barron, Milliken 1960].
Dose 0.5 to 6 g of mephenesin daily.

Barron DW, Milliken TG (1960). Mephenesin poisoning. *Lancet* 1: 262.
London I, Poet RB (1957). Comparative plasma levels of mephenesin and its carbamic acid ester. *Proc Soc Exp Biol Med* 94: 191.

Mephentermine

Sympathomimetic
$C_{11}H_{17}N$ = 163.3
CAS—100-92-5
IUPAC Name *N*,2-Dimethyl-1-phenylpropan-2-amine
Synonyms Mephenterdrine; mephetedrine; *N*,α,α-trimethylbenzeneethanamine.

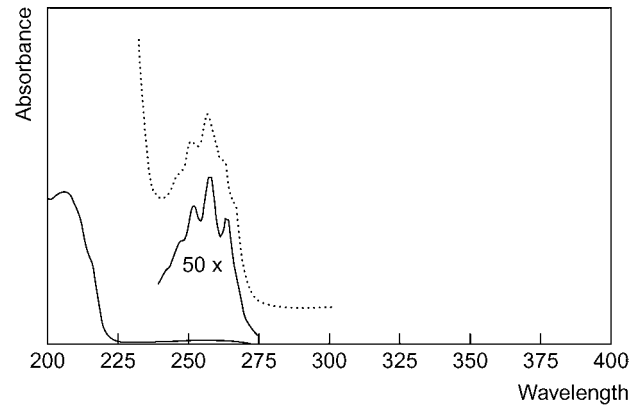


Chemical Properties A clear, colourless to pale yellow liquid. Practically insoluble in water; freely soluble in ethanol; soluble in ether. pK_a 10.4. Log *P* (octanol/water), 2.7.

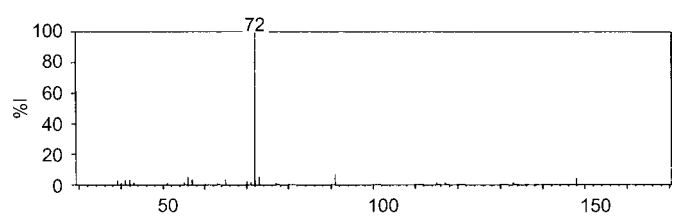
Mephentermine Sulfate

$(C_{11}H_{17}N)_2,H_2SO_4,\ 2H_2O$ = 460.6
CAS-1212-72-2 (anhydrous); 6190-60-9 (dihydrate)
Proprietary Names *Wyamine*. It is an ingredient of *Emergent-Ez*.
Chemical Properties Colourless crystals or white crystalline powder. Mp 215° to 217°, with decomposition. Soluble 1 in about 20 of water and 1 in 150 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Liebermann's reagent—red-orange; Marquis test—orange→brown.
Thin-layer Chromatography System TA—R_f 0.25; system TB—R_f 0.34; system TC—R_f 0.08; system TE—R_f 0.40; system TL—R_f 0.02; system TAE—R_f 0.06; system TAJ—R_f 0.00; system TAK—R_f 0.03; system TAL—R_f 0.36 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown).
Gas Chromatography System GA—mephentermine RI 1240, mephentermine-TFA RI 1335, mephentermine-AC RI 1501, phentermine RI 1155; system GB—mephentermine RI 1250, phentermine RI 1191; system GC—mephentermine RI 1668, phentermine RI 1450.
High Performance Liquid Chromatography System HA—mephentermine *k* 1.5, phentermine *k* 0.6; system HC—*k* 2.48; system HX—RI 294; system HY—RI 246.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=10c), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1111, 711, 1162, 696, 763, 1587 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 72, 91, 73, 56, 148, 65, 57, 42; phentermine 58, 91, 42, 41, 134, 65, 59, 40.



Quantification

Urine GC FID. Mephentermine, chlorphentermine and phentermine [Beckett, Brookes 1971].
Disposition in the Body Readily absorbed after oral or parenteral administration and rapidly metabolised by demethylation and hydroxylation. About 50 to

85% of a dose is excreted in the urine unchanged, together with 15 to 20% as phentermine. Conjugated *N*-hydroxymephentermine has also been detected in the urine in small quantities.

Toxicity The estimated minimum lethal dose in children up to 2 years of age is 200 mg, and in adults is 2 g.

Half-life Derived from urinary excretion data, about 6 to 20 h.

Dose The equivalent of 15 to 80 mg of mephentermine has been given parenterally.

Beckett AH, Brookes LG (1971). The metabolism and urinary excretion in man of phentermine, and the influence of N-methyl and p-chloro-substitution. *J Pharm Pharmacol* 23: 288–294.

Mephenytoin

Anticonvulsant

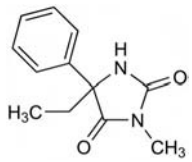
$C_{12}H_{14}N_2O_2 = 218.3$

CAS—50-12-4

IUPAC Name 5-Ethyl-3-methyl-5-phenyl-2,4-imidazolidinedione

Synonyms Mephenetoin; methoin; methantoin; phenantoin.

Proprietary Names *Epilan*; *Insulton*; *Mesantoin*; *Phenantoin*; *Sacerno*.



Chemical Properties Colourless lustrous crystals or white crystalline powder. Mp 136° to 137°. Soluble 1 in 1400 of water, 1 in 15 of ethanol, 1 in 3 of chloroform and 1 in 90 of ether. pK_a 8.1. Log *P* (octanol/water), 1.7.

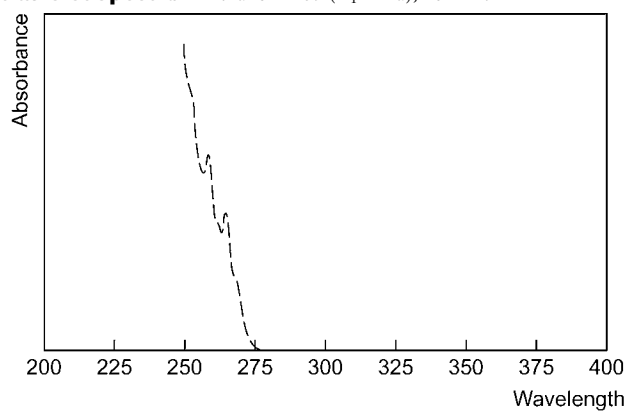
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange; mercurous nitrate—black.

Thin-layer Chromatography System TD—R_f 0.62; system TE—R_f 0.74; system TF—R_f 0.58; system TAD—R_f 0.66; system TAJ—R_f 0.64; system TAK—R_f 0.70; system TAL—R_f 0.91.

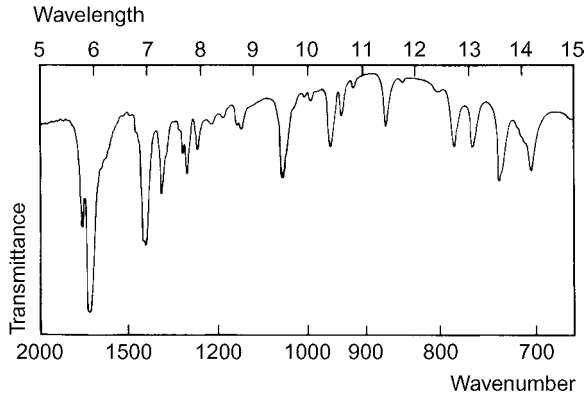
Gas Chromatography System GA—mephenytoin RI 1785, M (4-OH-) RI 2400, M (OH-methoxy-) RI 2380, M (nor-) RI 1950; system GE—mephenytoin RRT 0.55 and RRT 0.73 for 5-ethyl-5-phenylhydantoin (both relative to phenytoin); system GAJ—RRT 0.918 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HY—RI 366; system HZ—retention time 3.7 min; system HAX—retention time 6.0 min; system HAY—retention time 5.4 min.

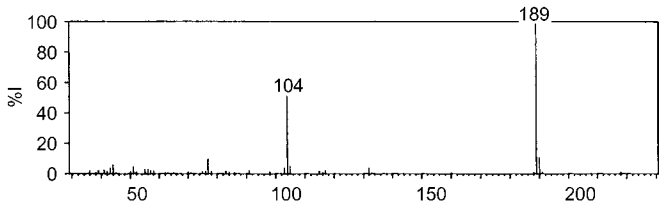
Ultraviolet Spectrum Ethanol—257 (A_1^1 = 11a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1704, 1754, 733, 1052, 1302, 702 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 189, 104, 190, 77, 44, 105, 132, 103.



Quantification

Plasma **GC-MS** Limit of detection, 10 µg/L for mephenytoin, 50 µg/L for 5-ethyl-5-phenylhydantoin [Yonekawa, Kupferberg 1979].

Serum **GC** FID. Limit of detection, 5 mg/L for mephenytoin, 10 mg/L for 5-ethyl-5-phenylhydantoin [Raisys *et al.* 1979].

HPLC UV detection. Limit of detection, 1 mg/L for mephenytoin and 5-ethyl-5-phenylhydantoin [Kabra *et al.* 1978].

Urine **HPLC** UV detection (comparison with GC). Limit of detection, 12.5 µg/L for mephenytoin enantiomers [Huang *et al.* 1998]. Electrochemical detection. Limit of detection, <0.76 mg/L for 4-Hydroxymephenytoin [Tanaka *et al.* 1996]. UV detection. 4′-Hydroxymephenytoin [Xie *et al.* 1995]. UV detection. Limit of detection, 25 µg/L for mephenytoin, 50 µg/L for 4′-hydroxymephenytoin [Ruan *et al.* 1994]. UV detection. Mephenytoin and metabolites [Küpfer *et al.* 1982].

Disposition in the Body Rapidly absorbed after oral administration. During chronic administration the major metabolite is 5-ethyl-5-phenylhydantoin (nirvanol) which is a more active anticonvulsant than mephenytoin and accounts for at least 22% of the daily dose in the 24-h urine. After a single dose, the major metabolite is 4-hydroxymephenytoin which is excreted in the urine as a glucuronide conjugate and accounts for 43% of a dose in 24 h; only about 1% of a single dose is excreted in the urine as 5-ethyl-5-phenylhydantoin; 5-ethyl-5-(4-hydroxyphenyl)-hydantoin has also been detected in the urine in both free and conjugated forms, together with minor amounts of other conjugated hydroxy metabolites; very little unchanged drug is excreted in the urine.

Therapeutic Concentration In plasma, mephenytoin plus metabolites, usually in the range 15–40 mg/L.

Following a single oral dose of 7 mg/kg to 5 subjects, peak serum concentrations of about 3 mg/L each of mephenytoin and 5-ethyl-5-phenylhydantoin were attained in about 1 h and 27 h respectively [Troupin 1979].

A mean steady-state serum concentration of 26 mg/L of total hydantoin was reported for 173 subjects receiving daily oral doses averaging 6.8 mg/kg; mephenytoin concentrations averaged 8% of the total hydantoin concentration [Troupin *et al.* 1976].

Toxicity The estimated minimum lethal dose is 5 g. Mephenytoin gives rise to toxic symptoms more frequently than phenytoin and cases of fatal aplastic anaemia have been reported; the toxicity of the drug is attributed to the proven toxicity of 5-ethyl-5-phenylhydantoin. Acute overdosage may result in coma.

Half-life Plasma half-life, after a single dose, mephenytoin about 7 h, 5-ethyl-5-phenylhydantoin about 95 h; the half-life of the metabolite decreases to about 72 h during chronic treatment.

Saliva Plasma : saliva ratio, about 1.6.

Protein Binding About 40%.

Dose Initially, 50 to 100 mg daily; maintenance, 200 to 600 mg daily.

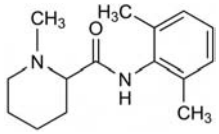
Mepivacaine

Anaesthetic (Local)

$C_{15}H_{22}N_2O = 246.4$

CAS—96-88-8

IUPAC Name *N*-(2,6-Dimethylphenyl)-1-methyl-2-piperidinecarboxamide



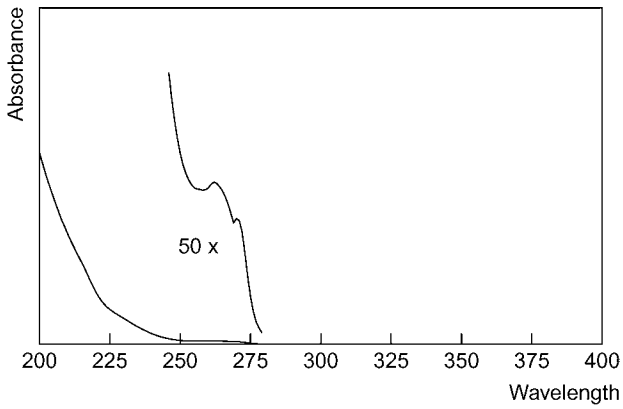
Chemical Properties Yellow-white crystals. Mp 150° to 151° (crystals from ether). pK_a 7.7 (20°). Log *P* (octanol/water), 1.9. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Mepivacaine Hydrochloride

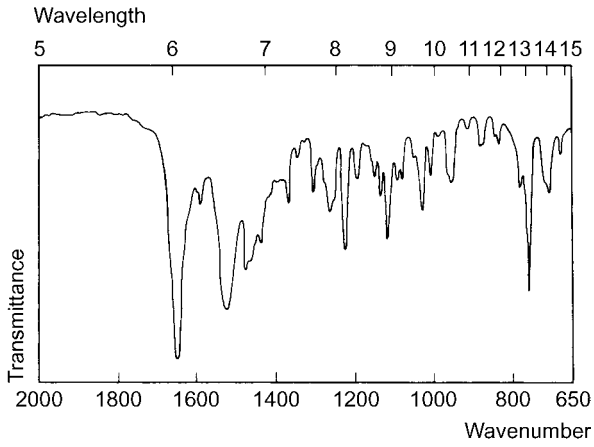
$C_{15}H_{22}N_2O,HCl = 282.8$
CAS—1722-62-9

Synonyms Mepivacaini chloridum; mepivacaini hydrochloridum.
Proprietary Names *Carbocain(e)*; *Chlorocain*; *Isocaine*; *Isogaine*; *Mecain*; *Meaverin*; *Mepi-Mynol*; *Mepicain*; *Mepident*; *Mepiforan*; *Mepyl*; *Optocain*; *Pericaina*; *Polocaine*; *Scandicain(e)*; *Scandinibsa*; *Scandonest*; *Tevacaine*.
Chemical Properties A white crystalline powder. Mp 262° to 264°. Freely soluble in water and methanol; soluble 1 in 10 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

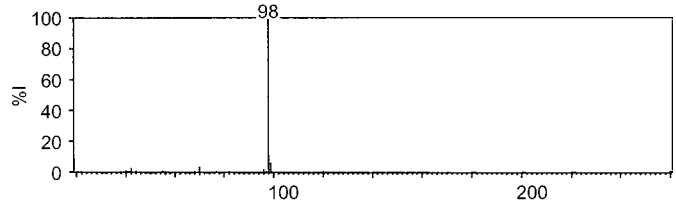
Colour Test Liebermann's reagent—brown-orange.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.31; system TC—R_f 0.62; system TE—R_f 0.66; system TL—R_f 0.48; system TAE—R_f 0.63; system TAF—R_f 0.60; system TAJ—R_f 0.28; system TAK—R_f 0.02; system TAL—R_f 0.40 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive).
Gas Chromatography System GA—mepivacaine RI 2065, M (OH-) RI 2410, M (oxo-) RI 2400; system GF—RI 2345; system GQ—retention time 7.2 min.
High Performance Liquid Chromatography System HA—*k* 0.9; system HQ—*k* 1.09; system HX—RI 296; system HY—RI 260; system HZ—retention time 2.6 min; system HAX—retention time 7.7 min; system HAY—retention time 4.2 min.
Ultraviolet Spectrum Aqueous acid—263 (A_1^1=18a), 271 nm.



Infrared Spectrum Principal peaks at wavenumbers 1650, 1523, 760, 1220, 1123, 1265 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 98, 99, 70, 42, 96, 55, 41, 40 (no peaks above 100).



Quantification

Blood **GC** FID. Limit of detection, 40 ng [Ashling *et al.* 1969].
GC-MS Mepivacaine and other local anaesthetics [Watanabe *et al.* 1998].
Plasma **GC-MS**. SIM acquisition mode, *m/z* 82. Limit of quantification, 40 µg/L, limit of detection, 50 µg/L for mepivacaine and other local anaesthetics [Ohshima, Takayasu 1999].
HPLC UV detection. Limit of detection, 100 µg/L [Murtaza *et al.* 2001]. UV detection. Limit of detection, 3 µg/L for mepivacaine enantiomers [Vletter *et al.* 1996].
Serum **HPLC** UV detection. Limit of detection, 100–150 µg/L for mepivacaine enantiomers [Siluveru, Stewart 1997a; Siluveru, Stewart 1997b].
Urine **GC** FID. Mepivacaine and 3 metabolites [Thomas, Meffin 1972].
GC-MS See Plasma [Ohshima, Takayasu 1999].
Body Fluids **GC** SID. Limit of detection, 5–10 pg for mepivacaine and other local anaesthetics [Hattori *et al.* 1991].
Biological Samples **GC** NSD. Mepivacaine and other local anaesthetics [Lau *et al.* 1991].

Disposition in the Body Rapidly absorbed into the circulation following epidural and paracervical injection. Mepivacaine crosses the placenta and the ratio of fetal to maternal concentrations has been reported to be about 0.7. Rapidly metabolised by hydroxylation to the 3′- and 4′-hydroxy metabolites and by *N*-demethylation to 2′,6′-pipecoloxylidide (PPX). Over 50% is excreted as metabolites into the bile but only small amounts are eliminated in the faeces; this may be due to enterohepatic circulation. Less than 10% of a dose is excreted in the urine as unchanged drug in 24 h; about 16% of a dose is excreted in the 24-h urine as 3′-hydroxymepivacaine, 12% as 4′-hydroxymepivacaine and 2% as 2′,6′-pipecoloxylidide; the excretion of unchanged drug is increased in acid urine and in neonates.
Therapeutic Concentration In plasma, usually in the range 2–5 mg/L.
Following epidural administration of 250–580 mg to 8 subjects, plasma concentrations at delivery were 3.7–5.5 mg/L (mean 4.7) for mepivacaine and <0.1–0.38 mg/L for 2′,6′-pipecoloxylidide [Meffin *et al.* 1973].
Following paracervical injection of 200 mg to 5 subjects, peak plasma concentrations of 1.4–4.0 mg/L (mean 2.3) were attained in about 30 min [Teramo, Rajamaki 1971].
Toxicity
Mepivacaine had been given as a local anaesthetic (between 75 and 150 mL of a 2% solution) to a young woman who died while undergoing cosmetic surgery. Postmortem concentrations were: blood 50 mg/L, bile 50 mg/L, brain 51 µg/g, kidney 51 µg/g, liver 75 µg/g, spleen 72 µg/g. Salicylate and glutethimide were also found in the blood and urine [Sunshine, Fike 1964].
Half-life Plasma half-life, about 2 to 3 h.
Volume of Distribution About 1 L/kg.
Clearance Plasma clearance, about 5 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 1.1.
Protein Binding About 77%.
Note For a review of the pharmacokinetics of local anaesthetics, see Tucker and Mather [1979].
Dose Mepivacaine hydrochloride is given by injection in doses of up to 400 mg; maximum of 1 g in 24 h.

Meprobamate

Tranquilliser

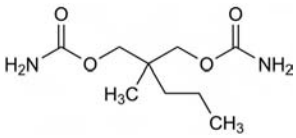
$C_9H_{18}N_2O_4 = 218.3$

CAS—57-53-4

IUPAC Name 2-Methyl-2-propyl-1,3-propanediol dicarbamate

Synonyms Meprobamatum; meprotanum.

Proprietary Names *Cyrpon*; *Dapaz*; *Epikur*; *Equanil*; *Meprate*; *Mepro*; *Meprodil*; *Meprospan*; *Miltaun*; *Miltown*; *Neuramate*; *Norgagil*; *Novalm*; *Novo-Mepro*; *Pertranquil*; *Procalmadiol*; *Quanil*; *Reposo-Mono*; *Restenil*; *Anobamat*; *Visano N*; *Visano-mini*. It is an ingredient of *Deprol*; *Epromate*; *Equagesic*; *Equazine M*; *Micrainin*; *Paxidal*.



Chemical Properties Colourless crystals or white crystalline powder. Mp 104° to 106° (crystals from hot water). Soluble 1 in 240 of water, 1 in 7 of ethanol, 1 in 80 of chloroform and 1 in 70 of ether; freely soluble in acetone. Log *P* (octanol/water), 0.7. Extraction yield (chlorobutane), 0.1 [Demme *et al.* 2005].

Colour Test Furfuraldehyde—black; Nessler's reagent (100°)—grey-black.

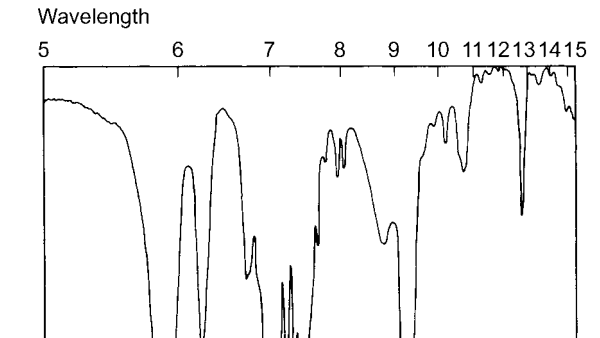
Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.00; system TC—R_f 0.32; system TD—R_f 0.09; system TE—R_f 0.56; system TF—R_f 0.36; system TL—R_f 0.58; system TAD—R_f 0.32; system TAE—R_f 0.63; system TAF—R_f 0.87; system TAJ—R_f 0.35; system TAK—R_f 0.29; system TAL—R_f 0.78 (furfuraldehyde reagent, positive; Van Urk reagent, yellow).

Gas Chromatography System GA—RI 1785; system GB—RI 1854; system GF—RI 2460.

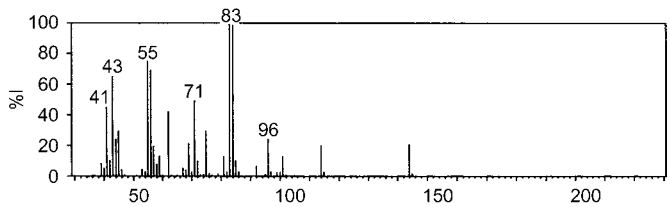
High Performance Liquid Chromatography System HZ—RT 2.4 min.

Ultraviolet Spectrum No significant absorption, 230–360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1688, 1069, 1090, 1590, 1310, 1140 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 83, 84, 55, 56, 43, 71, 41, 62 (no peaks above 160).



Quantification

Blood **GC-MS** Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 140° for 0.5 min to 290° at 30°/min for 2.5 min. SIM acquisition mode. Limit of quantification, 0.4 mg/L, limit of detection, 0.4 mg/L [Downey *et al.* 2009].

Plasma **GC** Column: CP SIL 5 CB (25 m × 0.25 mm i.d., 0.12 μm). Temperature: 190°. FID. Retention time: 3 min. Limit of detection, 1 mg/L [Trenque *et al.* 1993]. Column: 3% OV 17 on 100/120 mesh Chromosorb W HP (1.80 m × 2.0 mm i.d.). Carrier gas: N_2, 0.95 bar. Temperature: 190°. FID. Retention time: 6.6 min. Limit of detection, 1 mg/L [Gaillard *et al.* 1992] Column: 3% SE-30 on Chromosorb W 80/100 mesh (1.5 m × 6.3 mm i.d.). Carrier gas: He, 50 mL/min. Temperature: 115°. FID. [Martis, Levy 1974].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 190° for 5 min to 245° at 30°/min to 255° at 2°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 4.33 min. Limit of quantification, 1.93 mg/L, limit of detection, 0.58 mg/L. [Daval *et al.* 2006]. Column: HP-1 methylmethylsiloxane capillary (12 m × 0.2 mm i.d.). Carrier gas: He, 1.8 mL/min. Temperature programme: 100° for 3 min to 280° at 30°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 25 μg/L [Kintz, Mangin 1993].

HPLC UV detection [Gupta, Eng 1980].

Serum **GC** See Plasma [Gaillard *et al.* 1992].

Urine **GC** See Plasma [Martis, Levy 1974].

GC-MS See Plasma. Limit of detection, 20 μg/L [Kintz, Mangin 1993].

Hair **GC-MS** Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° to 240° at 25°/min to 300° at 10°/min for 0.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.4 ng/mg, limit of detection, 0.12 ng/mg [Kim *et al.* 2005]. See Plasma. Limit of detection, 0.2 ng/mg [Kintz, Mangin 1993].

Disposition in the Body Meprobamate is readily absorbed after oral administration. It is widely distributed and mainly metabolised in the liver. Approximately 90% of a dose is excreted in the urine in 24 h, with ~10–20% of the dose as unchanged drug and the remainder as metabolites, mainly 2-hydroxypropylmeprobamate and meprobamate *N*-glucuronide. Approximately 10% of the dose is eliminated in the faeces. Meprobamate crosses the placenta. Levels in breast milk may be up to 4 times higher than those found in plasma.

Meprobamate is a minor metabolite of tybamate and is a metabolite of carisoprodol.

Therapeutic Concentration In plasma, usually in the range 5–20 g/L.

Following 2 oral doses of 800 mg, given to 5 subjects over a period of 1.5 h, peak blood concentrations of 18.6–26.6 g/L (mean 23.8) were attained in ~3.5 h [Parker *et al.* 1970].

Toxicity The estimated minimum lethal dose is 12 g, although recovery has occurred after much larger doses. Blood concentrations greater than ~50 g/L may cause coma, and fatalities have usually been associated with blood concentrations greater than ~70 g/L.

In 19 fatalities involving meprobamate overdose, postmortem blood concentrations of 41–397 mg/L (mean 182) were reported [Gaillard *et al.* 1997].

A postmortem blood concentration of 204.6 mg/L was reported in a fatality resulting from the deliberate ingestion of 90 tablets (400 mg tablets) of meprobamate; the highest tissue concentration was found in the heart (708 μg/g) [Kintz *et al.* 1988].

In 4 cases of severe meprobamate intoxication, maximum plasma concentrations of 176, 180, 190, and 203 mg/L were reported; all patients survived (1 was resuscitated from cardiac arrest), with 3 being teated with charcoal haemoperfusion [Jacobsen *et al.* 1987].

The following postmortem tissue concentrations were reported in 16 deaths caused solely by meprobamate ingestion: blood 35–240 g/L (mean 95), liver 58–360 mg/g (mean 148) [Baselt, Cravey 1977].

Half-life Plasma half-life, 6–17 h (mean 11); it may be much longer after chronic administration and may be dose dependent.

Volume of Distribution ~0.7 L/kg.

Distribution in Blood Plasma : whole blood ratio, ~0.2–0.3.

Protein Binding ~20%.

Dose 1.2 to 2.4 g daily.

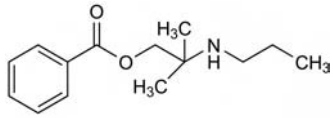
Meprylcaine

Anaesthetic (Local)
$C_{14}H_{21}NO_2$ = 235.3
CAS—495-70-5

IUPAC Name 2-Methyl-2-propylaminopropyl benzoate



Chemical Properties An oil. Practically insoluble in water; soluble in ethanol and ether.

Meprylcaine Hydrochloride

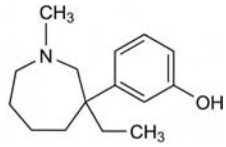
$C_{14}H_{21}NO_2$,HCl = 271.8
CAS-956-03-6
Chemical Properties A white crystalline powder. Mp 150° to 153°. Soluble 1 in 6 of water, 1 in 5 of ethanol, 1 in 3 of chloroform and 1 in 12 of ether.

Ultraviolet Spectrum Aqueous acid—232 nm (A^1_1=422b).
Mass Spectrum Principal ions at *m/z* 100, 58, 105, 77, 56, 101, 41, 70.

Meptazinol

Narcotic Analgesic
$C_{15}H_{23}NO$ = 233.4
CAS—54340-58-8

IUPAC Name 3-(3-Ethylhexahydro-1-methyl-1*H*-azepin-3-yl)phenol
Proprietary Name *Meptid* (tablets)

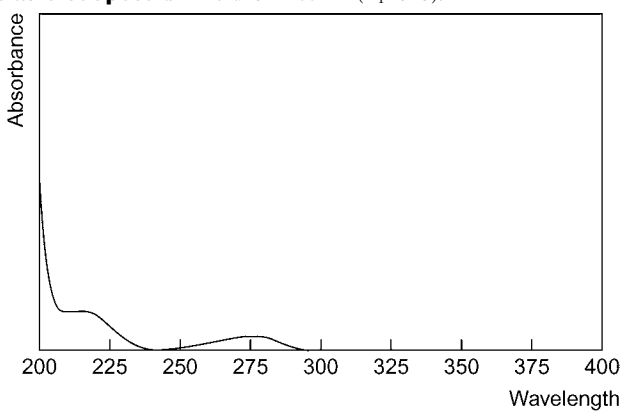


Chemical Properties Crystals. Mp 127° to 133°. Very slightly soluble in water; soluble in ethanol; sparingly soluble in chloroform and ether. pK_a 8.7 (-NH_2), 11.9 (phenol). Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Meptazinol Hydrochloride

$C_{15}H_{23}NO$,HCl = 269.8
CAS—59263-76-234154-59-1 (±)
Proprietary Names *Meptid* (injection); *Meptidol*.
Chemical Properties A white crystalline powder. Mp 183° to 187°. Soluble 1 in about 4 of water and 1 in 12 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Gas Chromatography System GA—meptazinol RI 1920, M (nor-) RI 1995, M (oxo-) RI 2410; system GB—meptazinol RI 1980, M (nor-) RI 2069, M (oxo-) RI 2600; system GM—meptazinol RRT 0.429, M (nor-) RRT 0.428 (all relative to iprindole).
High Performance Liquid Chromatography System HA—*k* 3.1; system HY—RI 269.
Ultraviolet Spectrum Ethanol—277 nm (A^1_1=91b).



Infrared Spectrum Principal peaks at wavenumbers 1580, 708, 795, 1225, 1205, 1300 cm^{-1} (meptazinol hydrochloride, KBr disk).

Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, 3 µg/L [Frost 1981].
Biological Samples **HPLC** [Rudolphi, Blaschke 1995].
Disposition in the Body Readily and almost completely absorbed after oral administration. Rapidly absorbed after intramuscular or rectal administration. It is excreted rapidly in the urine, mainly as the glucuronide conjugate, with <5% of a dose as unchanged drug, and about 5 to 10% as 7-oxometazinol. Both metabolites are inactive. Over 50% of a dose is excreted in the urine in 9 h and over 60% in 24 h. <10% of an oral dose is eliminated in the faeces.
Therapeutic Concentration
Following a single oral dose of 200 mg to 9 subjects, peak plasma concentrations of 0.01 to 0.11 mg/L (mean 0.06) were attained in 0.25 to 2 h; accumulation in plasma did not occur after repeated oral administration [Norbury *et al.* 1983].
After a single IM dose of 50 mg to 4 subjects, peak plasma concentrations of 0.19 to 0.26 mg/L (mean 0.22) were attained in 10 min [Davies *et al.* 1982].
Toxicity
A 61-year-old woman who recovered after intentionally ingesting 200 mg meptazinol with whisky had serum meptazinol and alcohol levels of 20.1 and 210 mg/L, respectively, approx. $2^1/_2$ h after the overdose [Davison *et al.* 1987].
Bioavailability 2 to 19% (mean 9) owing to extensive first-pass metabolism.
Half-life Plasma half-life, about 2 h.
Volume of Distribution About 5 L/kg.
Clearance Plasma clearance, about 30 mL/min/kg.
Protein Binding About 27%.
Dose 200 mg, orally, every 4 h; the equivalent of 50 to 100 mg of meptazinol parenterally.

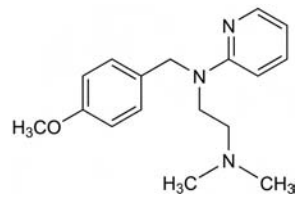
Mepyramine

Antihistamine
$C_{17}H_{23}N_3O$ = 285.4
CAS—91-84-9

IUPAC Name *N*-[(4-Methoxyphenyl)methyl]-*N*′,*N*′-dimethyl-*N*-2-pyridinyl-1,2-ethanediamine
Synonyms Pyranisamine; pyrilamine; RP-2786.

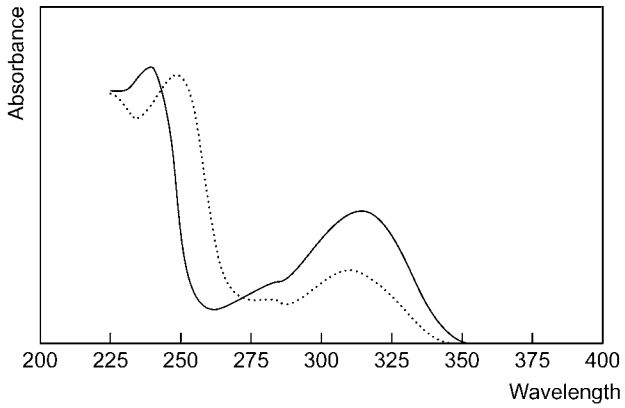


Chemical Properties An oily liquid. pK_a 4.0, 8.9 (25°). Log *P* (octanol/water), 2.8.

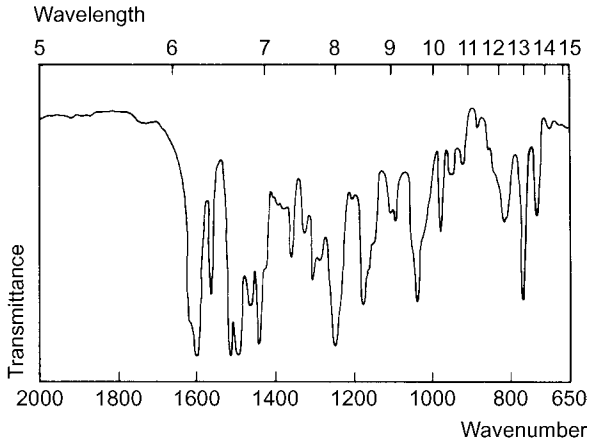
Mepyramine Maleate

$C_{17}H_{23}N_3O$,$C_4H_4O_4$ = 401.5
CAS-59-33-6
Proprietary Names *Anthisan*. It is an ingredient of many proprietary preparations—see Sweetman [2009].
Chemical Properties A white or creamy-white crystalline powder. Mp 100° to 101°. Soluble 1 in 0.4 of water, 1 in 2.5 of ethanol and 1 in 1.5 of chloroform; slightly soluble in ether and benzene.

Colour Tests Cyanogen bromide—yellow; Mandelin's test—violet; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.39; system TC—R_f 0.25; system TE—R_f 0.58; system TL—R_f 0.14; system TAE—R_f 0.22; system TAF—R_f 0.33 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red).
Gas Chromatography System GA—mepyramine RI 2220, M (*N*-desalkyl-)RI 2120, M (*N*-desmethoxybenzyl-) RI 1580; system GB—RI 2328; system GF—RI 2560.
High Performance Liquid Chromatography System HA—*k* 3.9; system HX—RI 448; system HY—RI 257.
Ultraviolet Spectrum Aqueous acid—239 (A^1_1=633a), 316 nm; aqueous alkali—248, 312 nm.



Infrared Spectrum Principal peaks at wavenumbers 1492, 1512, 1598, 1247, 1175, 1035 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 121, 58, 72, 71, 214, 122, 215, 78.
Quantification
Urine **HPLC** Fluorescence detection. Limit of detection, 1 ng/g [Thompson, Holder 1984].
Postmortem Tissues **GC** FID [Johnson 1981].
Disposition in the Body Absorbed after oral administration.
Toxicity
In a fatality due to mepyramine ingestion, the following postmortem tissue concentrations were reported: blood 11 mg/L, brain 71 µg/g, liver 18 µg/g [Johnson 1981].
Dose 0.3 to 1 g of mepyramine maleate daily.

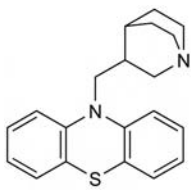
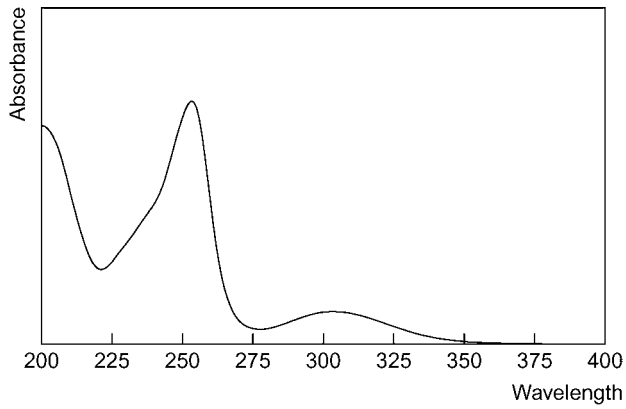
Mequitazine

Antihistamine
$C_{20}H_{22}N_2S$ = 322.5
CAS—29216-28-2
IUPAC Name 10-(1-Azabicyclo[2.2.2]oct-3-ylmethyl)-10*H*-phenothiazine
Synonym LM-209
Proprietary Names *Metaplexan*; *Mircol*; *Primalan*; *Primasone*; *Quitadrill*.

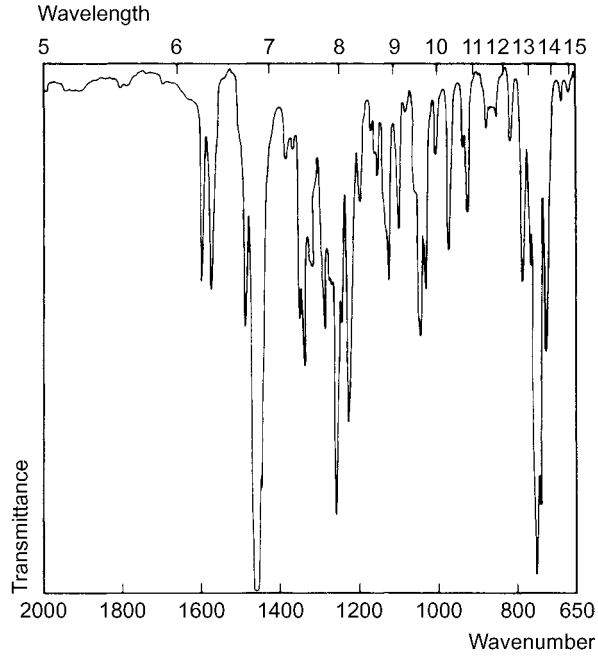


Chemical Properties Mp about 143°. Practically insoluble in water; soluble in ethanol and chloroform. Log *P* (octanol/water), 5.7.

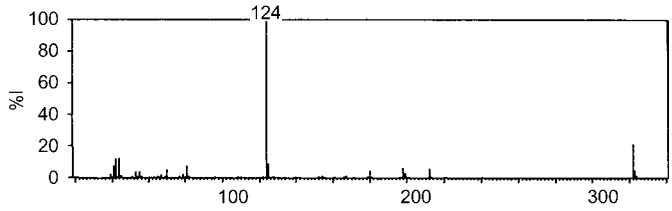
Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrest reagent—red; FPN reagent—orange-red; Liebermann's reagent—green; Mandelin's test—red; Marquis test—red (slow); sulfuric acid (100°)—red (slow).
Thin-layer Chromatography System TA—R_f 0.10; system TB—R_f 0.06; system TC—R_f 0.06; system TE—R_f 0.27; system TL—R_f 0.00; system TAE—R_f 0.03.
Gas Chromatography System GA—mequitazine RI 2780, M (phenothiazine) RI 2020, M (sulfoxide) RI 3120, M (sulfone) RI 3250; system GB—mequitazine RI 2939, M (phenothiazine) RI 2130.
High Performance Liquid Chromatography System HA—*k* 8.3 (tailing peak).
Ultraviolet Spectrum Aqueous acid—256 (A_1^1=1060a), 307 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 751, 1250, 742, 1220, 729, 1042 cm^{-1} (KBr disk).



Mass Spectrum

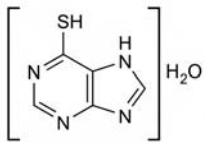


Dose 10 mg daily.

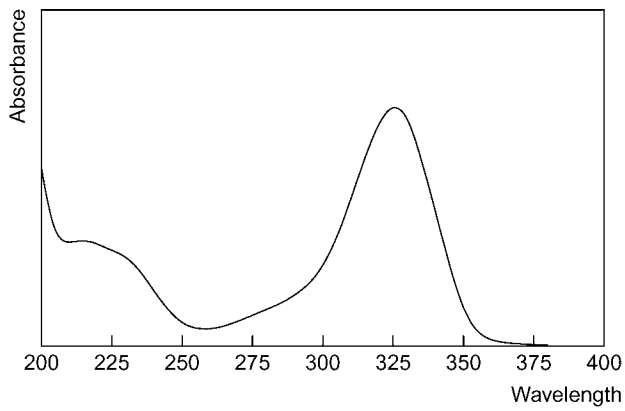
Mercaptopurine

Antineoplastic
$C_5H_4N_4S,H_2O$ = 170.2
CAS—50-44-2 (anhydrous); 6112-76-1 (monohydrate)

IUPAC Name 3,7-Dihydropurine-6-thione hydrate
Synonyms 1,7-Dihydro-6*H*-purine-6-thione monohydrate; 6MP.
Proprietary Names *Ismipur*; *Mercaptina*; *Puri-Nethol*.



Chemical Properties A yellow crystalline powder which darkens on exposure to air and light. Mp 308° with decomposition. Insoluble in water, acetone, chloroform and ether; soluble in hot ethanol; soluble in solutions of alkali hydroxides. pK_a 7.7, 11.0 (20°). Log *P* (octanol/water), 0.0.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.02; system TF—R_f 0.00; system TAE—R_f 0.77.
Gas Chromatography System GA—RI 1517.
High Performance Liquid Chromatography System HX—RI 187.
Ultraviolet Spectrum Mercaptopurine monohydrate: aqueous acid—325 nm (A^1_1=1165a); aqueous alkali—231 (A^1_1=831a), 310 nm (A^1_1=1160a).



Infrared Spectrum Principal peaks at wavenumbers 1610, 1220, 1570, 1010, 865, 780 cm^{-1} (KBr disk).
Quantification
Plasma **GC-MS** Limit of detection, 2 µg/L [Floberg *et al.* 1981].
HPLC UV detection. Mercaptopurine and metabolites. Limit of detection, 3.5 µg/L for mercaptopurine [Bruunshuus, Schmiegelow 1989]. Fluorescence detection. Limit of detection, <2 µg/L [Jonkers *et al.* 1982].
Urine **HPLC** Limit of detection, 1.7 µg/L for mercaptopurine, see Plasma [Bruunshuus, Schmiegelow 1989].
Disposition in the Body Readily absorbed after oral administration. It is distributed throughout the body water and diffuses into the cerebrospinal fluid. Mercaptopurine is activated in the body by intracellular conversion to nucleotide forms including the ribonucleotide thioinosinic acid. It is metabolised by xanthine oxidase to inactive 6-thiouric acid which is excreted in the urine; inorganic sulfate may also be present. About 50% of an oral dose is excreted in the urine in 24 h, up to 8% as unchanged drug. Small amounts are excreted for up to 17 days. Mercaptopurine is a metabolite of azathioprine.
Therapeutic Concentration
After a single oral dose of 75 mg/m^2 to 14 children (mean age 13 years) with acute lymphoblastic leukaemia, peak plasma concentrations of 0.04 to 0.28 mg/L (mean 0.14) were attained in 0.5 to 4 h (mean 2) [Zimm *et al.* 1983].
Daily oral doses of 75 mg/m^2 to 89 children with acute lymphoblastic leukaemia produced mean peak plasma concentrations of 0.10 (range 0.02 to 0.39) mg/L occurring at 0.5 to 3 h [Balis *et al.* 1998].
Five children with acute lymphoblastic leukaemia or malignant lymphoma were treated with 50 mg/m^2 oral mercaptopurine daily and 5 were treated with the same dose administered by rapid IV injection. The plasma concentrations were 0.23 to 0.42 mg/L (median 0.26) 5 min after IV infusion and 0.005 to 0.18 mg/L (median 0.06) 1 h after oral administration; the time to peak plasma concentration following oral administration varied (1 h in 4 children, 2 h in 4 children and 3 h in 2 children) [Mawatari *et al.* 2001].
Toxicity
A 64-year-old woman took 200 mg of mercaptopurine every 8 h for about 2 weeks, because of an error in dispensing. She died 3 days later and the following postmortem concentrations were reported: blood 110 mg/L, bile 16 mg/L, brain 10 µg/g, kidney 33 µg/g [Lin *et al.* 1982].
Bioavailability About 16% and very variable.
Half-life Plasma half-life, about 0.5 to 1.5 h.
Protein Binding About 20%.
Dose Initially 2.5 mg/kg daily, orally.

Balis FM *et al.* (1998). Pharmacokinetics and pharmacodynamics of oral methotrexate and mercaptopurine in children with lower risk acute lymphoblastic leukemia: a joint children's cancer group and pediatric oncology branch study. *Blood* 92: 3569–3577.

Mercury

Metal
Hg = 200.6
CAS—7439-97-6

Synonyms Colloidal mercury; hydrargyrum; liquid silver; metallic mercury; quicksilver.
Chemical Properties Silver-white heavy, mobile, liquid metal. Solid mercury is tin-white, ductile and malleable. Mp −38.87°. Bp 356.72°. Practically insoluble in water; soluble in sulfuric acid upon boiling, in lipids; readily soluble in nitric acid; insoluble in hydrochloric acid; slightly soluble in pentane. Valencies: Hg(+1) and Hg(+2). Used in manufacture of scientific instruments, all mercury salts, pharmaceuticals, agricultural chemicals and anti-fouling paints; in dentistry, electroanalysis.

Mercuric (II) Chloride
$HgCl_2$ = 271.5
CAS—7487-94-7
Synonyms Bichloride of mercury; corrosive sublimate; dichloromercury; mercury chloride; mercury dichloride; mercury perchloride.
Proprietary Names *Calochlor*; *Fungchex*; *TL 898*.
Chemical Properties Crystals, granules or powder. Mp 277°. Bp 302°. Soluble in water; very soluble in alcohol, benzene, ether, glycerol, acetone, ethyl acetate; slightly soluble in carbon disulfide, pyridine. Used for preserving wood and anatomical specimens, disinfecting, browning and etching steel and iron, intensifier in photography, white reserve in fabric printing, tanning leather, electroplating aluminium, depolariser for dry batteries, freeing gold from lead, staining wood, manufacture of inks, and treating seed potatoes. Important reagent in analytical chemistry.

Mercuric (II) Sulfide
HgS = 232.7
CAS—1344-48-5
Synonyms Artificial cinnabar; Chinese red; Chinese vermillion; CI pigment red 106; CI 77766; etiops mineral; quicksilver vermillion; red mercury sulfide; vermillion.
Chemical Properties Two forms exist: black or greyish black amorphous powder (mercuric chloride, black) or bright scarlet-red powder (mercuric sulfide, red). Transition temperature (red to black) 386°.

Mercurous (I) Chloride
Hg_2Cl_2 = 472.1
CAS—10112-91-1
Synonyms Mercury monochloride; mercury protochloride; mercury subchloride; mild mercury chloride.
Proprietary Names *Calogren*; *Calomel*; *Calotab*; *Cyclosan*.
Chemical Properties White heavy powder. Sublimes at 400° to 500° without melting. Practically insoluble in water; insoluble in alcohol, ether. Used as cathartic, diuretic, antiseptic, antisyphilitic, in dark green Bengal lights, in fungicides, in pesticides, for calomel electrodes.

Mercuric Acetate
$HgC_4H_6O_4$ = 318.7
CAS—1600-27-7
Synonyms Bis(acetyloxy) mercury; diacetocymercury; mercuriacetate.
Chemical Properties White crystalline powder with a slight acetic odour. Mp 178° to 180°. Very soluble in water; soluble in alcohol, acetic acid. Used for mercuration of organic compounds; for the absorption of ethylene.

Methylmercuric Chloride
$HgCH_3Cl$ = 251.1
CAS—115-09-3
Synonyms Chloromethylmercury; methylmercury chloride; methylmercury monochloride; monomethyl mercury chloride.
Proprietary Name *Caspan*

Chemical Properties White crystals. Mp 170°. Slightly soluble in water; soluble in DMSO, ethanol, acetone. Formerly used as disinfectant for grain seeds.

Dimethylmercury

C_2H_6Hg = 230.7
CAS—593-74-8
Chemical Properties Colourless liquid. Bp 92°. Insoluble in water; soluble in ether, alcohol. Used in the preparation of NMR standards and MS calibration standards.

Phenylmercuric Acetate

$HgC_8H_8O_2$ = 336.8
CAS—62-38-4
Synonyms (Acetato)phenylmercury; acetoxyphenylmercury; phenylmercuriacetate.
Proprietary Names *Cerasan Slaked Lime*; *Gollitox*; *Liquiphene*; *Mersolite*; *Nylmerate*; *PMA*; *PMAC*; *Pmacetate*; *PMAS*; *Riogen*; *Scutl*; *Tag Fungicide*; *Tag HL-331*.
Chemical Properties Small white to cream lustrous prisms. Mp 149°. Soluble in water, alcohol, benzene, acetone, trichloromethane, ether. Used in inks, adhesives, caulking compounds, interior and exterior paints, as fungicide in seed dressings, as a catalyst in polyurethane manufacture.

Colour Tests Reinsch test. Applicable to urine, gastric contents and scene residues. Clean a 5 mm × 10 mm square of copper foil (2–3 cm copper wire) with aqueous nitric acid (500 mL/L) until shiny. Rinse the copper with purified water and add 10 mL of concentrated hydrochloric acid and 20 mL of test sample in a 100 mL conical flask. Heat on a boiling water bath in a fume cupboard for 1 h. Cool and gently wash the copper with purified water.—A silvery deposit is imparted to the copper if mercuric compounds are present (antimony, arsenic, bismuth, selenium and tellurium give black deposits).

Confirmatory Test Applied to the silver stained foil. Add 0.1 mL of copper (I) iodide suspension to a filter paper. Lay the foil onto the suspension, cover and leave for 1–12 h.—The presence of mercury is indicated by the development of a salmon-pink colour, which may take up to 12 h to appear with low concentrations. Limit of detection, 5 mg/L. (The copper (I) iodide suspension is prepared by dissolving 5 g of copper (II) sulfate and 3 g of ferrous sulfate in 10 mL of purified water with continuous stirring and adding 5 g of potassium iodide in 50 mL of water. The copper (I) iodide precipitate that forms is filtered, washed with water and transferred to a brown glass bottle using a small volume of water (the suspension is stable).

Quantification Specimen collection: Blood—10 mL K-EDTA tube; urine—20 mL plastic universal container (must be hard plastic without preservative; stored specimens require acidification and freezing to avoid loss of mercury).
Note For reference values for mercury in the German population, see Wilhelm *et al.* [2004].
Blood **GC** Column: DB-5 (30 m × 0.24 mm i.d., 0.25 µm). Temperature programme: 85° for 2 min to 200° at 20°/min for 1 min. Carrier gas: He, 1 kg/cm^3. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.5 µg/L [Brunmark *et al.* 1992]. Column: 1.5% OV-17 and 1.95% QF-1 Chromosob W-HP on 80/100 mesh (1.22 m × 4 mm i.d.). Carrier gas: N_2, 120 mL/min. Temperature: 110° for methyl- and ethylmercury, 180° for phenylmercury. Limit of detection, 1.36, 1.30 and 1.12 ppb for methyl-, ethyl- and phenylmercury, respectively [Cappon, Smith 1977]

AAS Perkin-Elmer model 107 (λ = 253.7 nm). Limit of detection not reported [Ngim *et al.* 1988].

ICP-MS Perkin-Elmer Sciex Elan 5000. Nebuliser gas: 1.0 mL/min. Limit of detection, 60 ng/L [White 1999].
Urine **AAS** Pye Unicam mercury hollow cathode lamp (λ = 253.7 nm). Limit of detection, 0.82 µg/L for inorganic mercury [Littlejohn *et al.* 1976].

GC-ICP-MS Limit of detection, 2–12 pg/L [Kresimon *et al.* 2001].

ICP-MS Plasma gas: 15 L/min. Nebuliser gas: 0.825 L/min. Auxillary gas: 0.8 L/min. Limit of detection, 0.03 µg/L [Schramel *et al.* 1997].
Ocular Fluid **ICP-MS** Perkin-Elmer Sciex Elan 6100. Limit of detection, 1 µg/L [Erie *et al.* 2005].
Hair **AAS** Model 3390A integrator (λ = 253.7 nm). Limit of detection, 0.1 µg/L for mineral mercury, 0.44 µg/L for organic mercury [Pineau *et al.* 1990].

ICP-MS Limit of detection, 0.07 mg/kg [Nadal *et al.* 2005]. Plasma gas: 15 L/min. Auxiliary gas: 0.8 L/min. Nebuliser gas: 0.8 L/min. Limit of detection not reported [Samanta *et al.* 2004].
Nail **ICP-MS** See Hair [Samanta *et al.* 2004].
Other **ICP-MS** Solid and Liquid Food Samples. Limit of quantification, 2 µg/kg for solid samples, 0.2 µg/L for liquid samples; limit of detection, 0.6 µg/kg for solid samples, 0.06 µg/L for liquid samples [Cheung Chung *et al.* 2008]. Seafood. Perkin-Elmer Elan 6000. Limit of detection, 0.05 mg/kg [Falcó *et al.* 2006]. Food. Varian-Vista with ultrasonic nebuliser. Limit of detection, 0.04 mg/kg [Llobet *et al.* 2003]. Meals from Catering Establishments. Plasma gas: 15 L/min. Auxiliary gas: 0.9 L/min. Nebuliser gas: 0.73 L/min. Limit of quantification, 2 µg/kg [Noel *et al.* 2003].
Note For the direct determination of organic mercury in water, urine and blood by AAS following sodium borohydride reduction, see Margel and Hirsh [1984].

Disposition in the Body When metallic mercury vapour is inhaled, ≈75% is absorbed efficiently by the lung and passes into the circulation. The metal is lipid soluble and reaches the brain fairly rapidly. Slow oxidation to divalent mercury occurs and 2% of the absorbed dose is excreted in the urine and 9% in the faeces over a 7 day period. Mercuric salts are more soluble than the mercurous form and, as a result, are more rapidly and extensively absorbed from the gut. Significant amounts are deposited in the liver and kidneys. Methyl mercury is lipid soluble and accumulates in fatty tissues such as the brain. Approximately 50% of an oral dose of methylmercury is sequestered, initially in the liver. It is slowly converted to inorganic divalent mercury, most likely by the intestinal flora. The whole-body half-life is ~70 days and over 49 days ~35% of an oral dose is excreted in the faeces and 3% in the urine. Hair concentrations are thought to correlate well with blood concentrations during exposure to methylmercury.

Normal concentrations: Blood—<4 µg/L (20 nmol/L), urine—<5 µg/L (25 nmol/L), brain—0.04 to 0.23 mg/kg, hair—1.4 to 15 mg/kg, kidney—0.2 to 2.6 mg/kg, liver—0.16 to 1.3 mg/kg, lung—0.02 to 0.30 mg/kg. Occupational exposure: urine (pre-shift) total mercury—<35 µg/g creatinine, blood (end of shift)—<15 µg/L (75 nmol/L).
Note For concentrations in the brain regions of 8 postmortem subjects, see Glomski *et al.* [1971].
Toxicity Inhalation of metallic mercury can lead to an acute pneumonitis (mercury fume fever) accompanied by gastrointestinal disorders and damage to the CNS. Chronic exposure to metallic mercury vapour causes mainly psychological disturbances, fatigue, weight loss and tremor. Five exposed victims who developed these symptoms had blood mercury concentrations of 0.4 to 0.9 mg/L and urine concentrations of 2.4 to 8.3 mg/L [Sexton *et al.* 1978].

A 24-year-old man committed suicide by injecting himself with heroin and cutting his left wrist. Postmortem examination of his heart revealed metallic droplets consistent with mercury. Tissue concentrations of mercury were as follows:

Tissue	*Concentration*
Blood	0.04 mg/L
Bile	0.7 mg/L
Urine	0.17 mg/L
Brain	0.1 mg/kg
Hair	0.43 mg/kg
Heart	106 g/kg
Kidney	180 mg/kg
Liver	7.5 mg/kg
Lung	543 mg/kg
Stomach	0.02 mg/kg

The deceased had injected himself with mercury 5 months previously in a separate suicide attempt [Kedziora, Duflou 1995].

A 33-year-old man presented with densities on his chest radiograph. His serum mercury concentration was 67.0 µg/L. Three months later the concentration was 65.2 µg/L and the concentration in his hair was 5.7 mg/kg. The patient finally admitted to injecting mercury that he had obtained from thermometers. The granulomas were excised and 3 months later his serum mercury concentration had fallen to 11.4 µg/L and at 5 months to 8.7 µg/L [Netscher *et al.* 1991].

A 79-year-old Cree Indian whose main diet was fish had postmortem mercury concentrations of 0.32, 0.40, 2.5, 5.1, 0.43 and 0.15 mg/kg in his cerebrum, cerebellum, liver, kidney, heart and spleen, respectively [Wheatley *et al.* 1979].

A 3-year-old child who died after playing with metallic mercury had mercury concentrations of 1.3 mg/kg (brain), 3.7 mg/kg (lung), 3.9 mg/kg (liver) and 14 to 30 mg/kg (kidney). Antemortem urine concentrations ranged from 0.16 to 0.86 mg/L [Johnson *et al.* 1978].

A 16-year-old boy presented with a firm, erythematous, subcutaneous mass that contained metallic mercury. He admitted deliberate injection of mercury into the skin; his urine concentration of mercury was 2.3 mg/L [Lupton *et al.* 1985].

Chronic use of a skin-lightening cream caused kidney damage in several patients and urine mercury concentrations of 0.09 to 0.25 mg/L were measured [Gerstner, Huff 1977].

Some Chinese herbal medicines contain mercuric sulfide or mercurous chloride, and chronic use has led to toxicity with urine levels of up to 2.8 mg/L [Kang-Yum, Oransky 1992].

The hair of autistic children had mercury concentrations of 4.5 mg/kg compared with 0.3 mg/kg in controls [Fido, Al Saad 2005].

The lethal dose of a soluble inorganic mercury salt is ~1 g.

Two adults who absorbed lethal amounts of mercury after receiving peritoneal lavage following surgery had postmortem blood concentrations of 1.7 and 2.1 mg/L [Cross *et al.* 1979].

Mercury concentrations at postmortem in an adult who died 2 h following the ingestion of a large dose of mercuric chloride were 22 mg/L (blood), 3 mg/kg (brain), 56 mg/kg (liver) and 136 mg/kg (kidney) [Klendshoj, Rejent 1966].

Chronic poisoning is produced in adults by a daily intake of 0.3 mg of methylmercury and at steady state, approximate concentrations are 0.2 mg/L (blood) and 60 mg/kg (hair), with a body mercury burden of 20 to 30 mg [National Academy of

Sciences Panel on Mercury 1978]. In moderate poisoning, hair methylmercury concentrations have reached 200 to 800 mg/kg [Gerstner, Huff 1977] and in severe intoxications have been as high as 2436 mg/kg [Pierce *et al.* 1972]. Following large-scale incidents of methylmercury poisoning in Iraq and Japan (Minimata), liver concentrations in 57 Iraqi victims were 1.4 to 76 mg/kg and ranged from 22 to 71 mg/kg in Minimata victims [Magos *et al.* 1976]. Suspected exposure to mercury is also suggestive of decreased brain weights [Takeuchi *et al.* 1996].

An outbreak of inorganic mercury poisoning resulted in blood concentrations ranging from 183 to 620 µg/L and hair concentrations ranging from 0.7 to 114 mg/kg [Sexton *et al.* 1978].

Total mercury concentrations in 8 fatal cases of accidental methylmercury poisoning were 0.6 to 6.0 mg/L (blood), 18 to 35 mg/kg (brain), 4.2 to 78 mg/kg (liver) and 2.4 to 41 mg/kg (kidney) [Al Saleem 1976].

Note For a review of the methylmercury epidemic in Iraq in 1971–1972, see Greenwood [1985] and the Supplement to volume 53 of the *Bulletin of the World Health Organization*. For a study of mortality and survival of Minamata disease following the repeated ingestion of methylmercury-contaminated fish, see Tamashiro *et al.* [1985]; for a study of the causes of death in Minamata disease, see Tamashiro *et al.* [1984]; for biological monitoring of mercury in workers in hazardous-waste incineration, see Schuhmacher *et al.* [2002]. For a study of mercury in the blood, serum and red blood cells of patients with motor neuron disease, see Pamphlett *et al.* [2001]. Mercury toxicity has been implicated in the deaths of Mozart [Fluker [1972] and Robert Burns [Buchanan, Kean 1982].

Half-life Inorganic mercury, 24 days, methylmercury, 52 days.

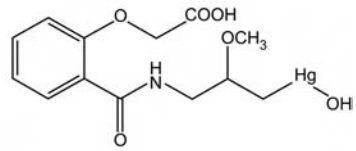
Mersalyl Acid

Diuretic

CAS—486-67-9

IUPAC Name Hydron; mercury(2+); 2-[2-(2-methoxypropylcarbamoyl)phenoxy]acetate; hydroxide



Chemical Properties A mixture of {3-[2-(carboxymethoxy)benzamido]-2-methoxypropyl}-hydroxymercury ($C_{13}H_{17}HgNO_6 = 483.9$) and its anhydrides. A white, slightly hygroscopic powder. Slightly soluble in water and dilute mineral acids; soluble in solutions of alkali hydroxides. Log *P* (octanol/water), −1.5 (mersalyl sodium).

Mersalyl Sodium

$C_{13}H_{16}HgNNaO_6 = 505.9$

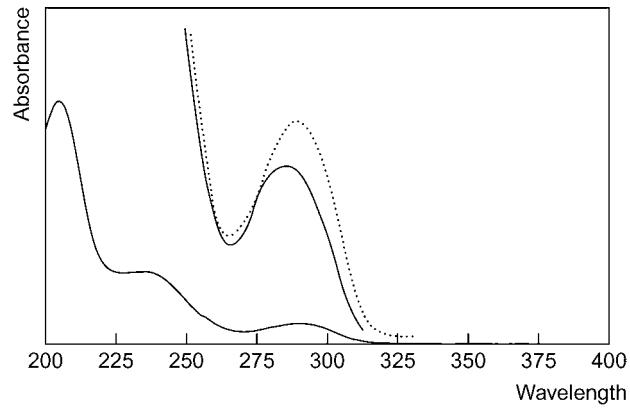
CAS—492-18-2

Synonym Mersalyl

Chemical Properties A white deliquescent powder. Soluble 1 in 1 of water, 1 in 3 of ethanol and 1 in 2 of methanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.24.

Ultraviolet Spectrum Aqueous acid—286 nm; aqueous alkali—290 nm (A^1_1=63b).



Dose 50 to 200 mg of mersalyl sodium, intramuscularly.

Mescaline

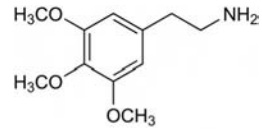
Hallucinogen

$C_{11}H_{17}NO_3 = 211.3$

CAS—54-04-6

IUPAC Name 3,4,5-Trimethoxybenzeneethanamine

Synonym Mezcaline



Chemical Properties An alkaloid obtained from the cactus *Lophophora williamsii* (= *Anhalonium williamsii* = *A. lewinii*) (Cactaceae), which grows in the northern regions of Mexico. The cactus is also known as 'peyote' or 'peyotl' and dried slices of the cactus are called 'mescal buttons'. Crystals that take up carbon dioxide from air. Mp 35° to 36°. Moderately soluble in water; soluble in ethanol, chloroform and benzene; practically insoluble in ether and petroleum ether. pK_a 9.6. Log *P* (octanol/water), 0.8.

Mescaline Hydrochloride

$C_{11}H_{17}NO_3$,HCl = 247.8
Chemical Properties Needles. Mp 181°. Soluble in water and alcohol.

Mescaline Sulfate Dihydrate

$(C_{11}H_{17}NO_3)_2$,H_2SO_4, $2H_2O$ = 540.7
Chemical Properties Prisms. Mp 183° to 186°. Soluble in hot water and methanol; sparingly soluble in cold water and ethanol.

Mescaline Acid Sulfate

$C_{11}H_{17}NO_3$,H_2SO_4 = 309.4
Chemical Properties Crystals. Mp 158°.

N-Benzoylmescaline

$C_{17}H_{21}NO_3$ = 287.4
Chemical Properties Needles. Mp 121°. Very soluble in alcohol and ether.

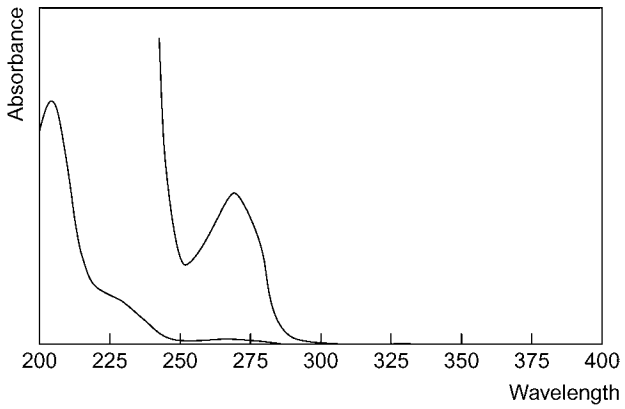
N-Methylmescaline

$C_{12}H_{19}NO_3$ = 225.3
Chemical Properties Occurs naturally. Bp 130° to 140°.

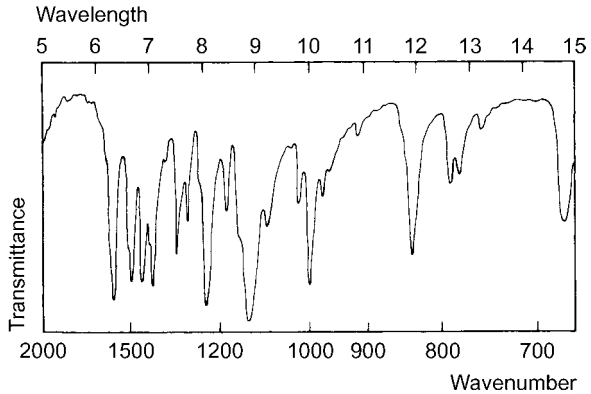
N-Acetylmescaline

$C_{13}H_{19}NO_4$ = 253.3
Chemical Properties Occurs naturally. Mp 94°.

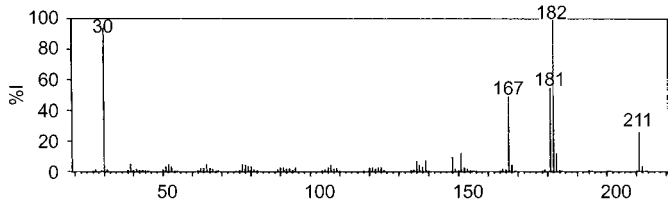
Colour Test Liebermann's reagent—black; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.20; system TB—R_f 0.03; system TC—R_f 0.10; system TE—R_f 0.24; system TL—R_f 0.12; system TAE—R_f 0.06; system TAF—R_f 0.63; system TAJ—R_f 0.02; system TAK—R_f 0.09; system TAL—R_f 0.51 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; FPN reagent, positive; Marquis test, yellow; ninhydrin spray, positive).
Gas Chromatography System GA—mescaline RI 1680, mescaline-AC RI 2160, mescaline precursor (trimethoxyphenylacetonitrile) RI 1610.
High Performance Liquid Chromatography System HA—*k* 1.3; system HB—*k* 16.82; system HC—*k* 2.17; system HX—RI 272; system HY—RI 243.
Ultraviolet Spectrum Aqueous acid—268 nm (A^1_1 = 34c). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1127, 1242, 1592, 996, 1513, 834 cm^{-1} (mescaline hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 182, 30, 181, 167, 211, 183, 151, 148.



Quantification

Plasma **GC-MS** Limit of quantification, 5 µg/L [Habrdova *et al.* 2005].
LC-MS Column: strong cation exchange separation. ESI, MRM acquisition mode. Limit of quantification, 10 µg/L [Beyer *et al.* 2007].
Urine **HPLC** Column: ODS (3 µm). Mobile phase: acetonitrile : water : phosphoric acid : hexylamine. DAD (λ= 198 or 220 nm). Limit of detection, 26–56 µg/L and 0.04 µg/mg [Helmlin, Brenneisen 1992].
LC-MS Column: HyPurity C_{18} (5 µm). Mobile phase: methanol : ammonium acetate buffer. Limit of detection, 3–5 µg/L [Björnstad *et al.* 2008].
Hair **GC-MS** Limit of quantification, <0.08 ng/mg [Kim *et al.* 2007].
Other **GC-MS** MFD. Limit of detection, 5 µg/L [Van Peteghem *et al.* 1980].
Disposition in the Body Mescaline is readily absorbed after oral administration. It is concentrated in the kidneys, liver and spleen. Approximately 90% of a dose is excreted in the urine in 24 h, with ~30% as 3,4,5-trimethoxyphenylacetic acid, which is inactive; the remainder is mostly unchanged drug, together with 3,4-dihydroxy-5-methoxyphenylacetic acid, which is excreted as a glutamine conjugate. Other metabolites include *N*-acetylmescaline and *N*-acetyl-3,4-dimethoxy-5-hydroxyphenethylamine.
Toxicity Mescaline induces psychotic changes similar to those produced by lysergide, but it is less potent. The effects of a single dose may persist for ~12 h.

In a mescaline-related fatality, where the individual ran off a cliff and plunged 600 feet to his death, the concentrations were reported to be 9.7 mg/L, 70.8 µg/g and 1163 mg/L in the blood, liver, and urine, respectively [Reynolds, Jindrich 1985].

Note For a report of a fatal peyote ingestion, see Nolte, Zumwalt [1999].
Protein Binding Partly bound.

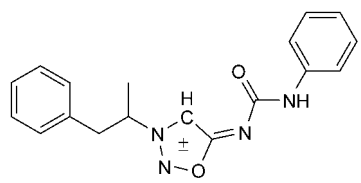
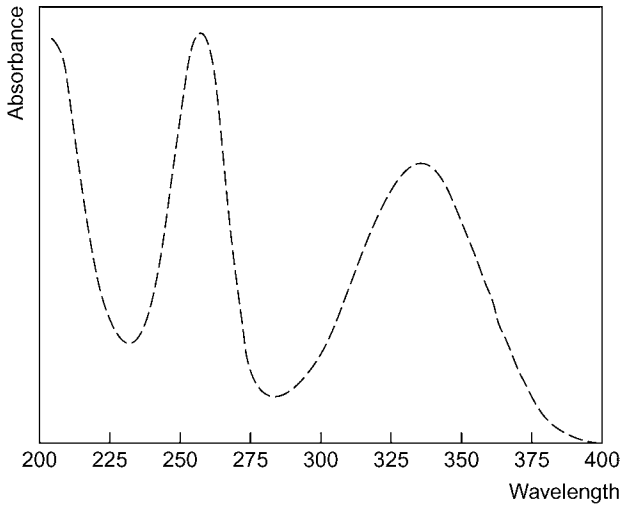
Mescarb

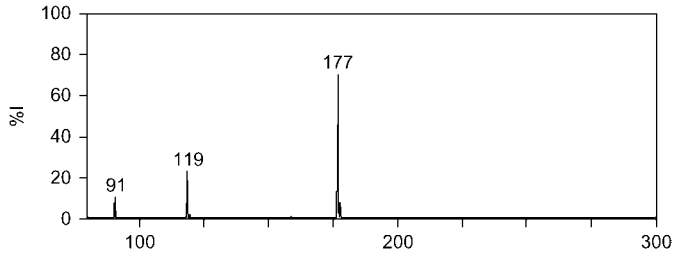
CNS Stimulant
$C_{18}H_{18}N_4O_2$=22.4
CAS—34262-84-5
IUPAC Name *N*-Phenyl-*N*′-[3-(1-phenylpropan-2-yl)oxadiazol-3-ium-5-yl] carbamimidate
Synonyms 3-(α-Methylphenethyl)-*N*-(phenylcarbamoyl)sydnone imine; sidnocarb; sydnocarbum; synocarb.



Chemical Properties Plasma and urine extracts are stable over time [Shpak *et al.* 2005].
Ultraviolet Spectrum



Mass Spectrum



Quantification

Plasma **LC-MS** Column: Zorbax SB-C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.2 mmol/L ammonium acetate (pH 6.7) : methanol (80 : 20 to 40 : 60 over 20 min), flow rate 0.2 mL/min. ESI, positive ion mode. Retention time: 29.9 min. Limit of quantification, 0.6 µg/L, limit of detection, 0.1 µg/L [Shpak *et al.* 2005].

Urine **HPLC** Column: Ultrasphere, C_{18} ODS (75 × 4.6 mm i.d., 3 µm). Mobile phase: 0.1 mol/L ammonium acetate (pH 3) : acetonitrile (90 : 10 to 85 : 15 in 2 min to 55 : 45 in 3 min to 40 : 60 in 3 min for 1 min), flow rate 1 mL/min. DAD (λ = 200 to 400 nm). Retention time: 7.8 min. Limit of detection not reported [Ventura *et al.* 1993].

LC-MS Column: Thermo Gold C_{18} (50 × 2.1 mm i.d., 3 µm). Mobile phase: 15 mmol/L ammonium formate containing 0.1% formic acid : acetonitrile (100 : 0 to 20 : 80 at 6.0 min for 2.5 min to 100 : 0 at 9 min for 4 min), flow rate 200 µL/min for 8 min to 400 µL/min for 1 min to 200 µL/min. ESI, positive ion mode, SRM acquisition mode. Limit of detection, 5.0 µg/L [Kang *et al.* 2007]. Column: Discovery-Supelco C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.1% acetic acid : acetonitrile with 0.1% acetic acid (85 : 15 to 40 : 60 in 7 min to 0 : 100 at 14 min), flow rate 0.25 mL/min. ESI, MRM acquisition mode, CID. Limit of detection, 100 µg/L [Mazzarino, Botré 2006]. Column: Nucleosil C_{18} (100 × 3.0 mm i.d., 5 µm). Mobile phase: 1% acetic acid : acetonitrile (85 : 15 for 2 min to 45 : 55 in 10 min to 35 : 65 in 8 min to 85 : 15 for 10 min. ESI. Limit of detection not reported [Deventer *et al.* 2005]. See Plasma. Limit of quantification, 0.05 µg/L, limit of detection, 0.001 µg/L [Shpak *et al.* 2005]. Column: Zorbax SB-C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.2 mmol/L ammonium acetate : methanol (80 : 20 to 40 : 60 at 20 min for 15 min), flow rate 0.2 mL/min for 20 min, 0.3 mL/min for 15 min. API-ES, MRM acquisition mode. Retention time: 29.9 min. Limit of quantification, 1 µg/L [Appolonova *et al.* 2004].

Note Mesocarb is a psychostimulant in clinical practice in Russia as a primary and adjunct therapy for several psychiatric disorders. It is a stimulant with an addiction liability and toxicity less than that of amfetamines. For a literature review of the toxicokinetics of amfetamines and their *N*-alkyl derivatives, see Kraemer and Maurer [2002].

Mesoridazine

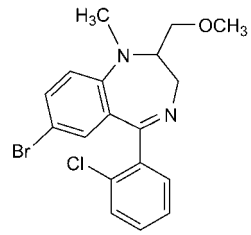
Tranquilliser

$C_{21}H_{26}N_2OS_2$=86.6

CAS—5588-33-0

IUPAC Name 10-[2-(1-Methylpiperidin-2-yl)ethyl]-2-methylsulfinylphenothiazine

Synonyms Mesuridazine; 10-[2-(1-methyl-2-piperidinyl)ethyl]-2-(methylsulfinyl)-10*H*-phenothiazine.



Chemical Properties Soluble in chloroform. Log *P* (octanol/water), 5.6.

Mesoridazine Benzenesulfonate

$C_{21}H_{26}N_2OS_2,C_6H_6O_3S$ = 544.7

CAS—32672-69-8

Synonym Mesoridazine besilate

Proprietary Name *Serentil*

Chemical Properties A white to pale yellow, crystalline powder. Mp ~ 178° with decomposition. Soluble 1 in 1 of water, 1 in 11 of ethanol, 1 in 3 of chloroform and 1 in 6300 of ether; freely soluble in methanol.

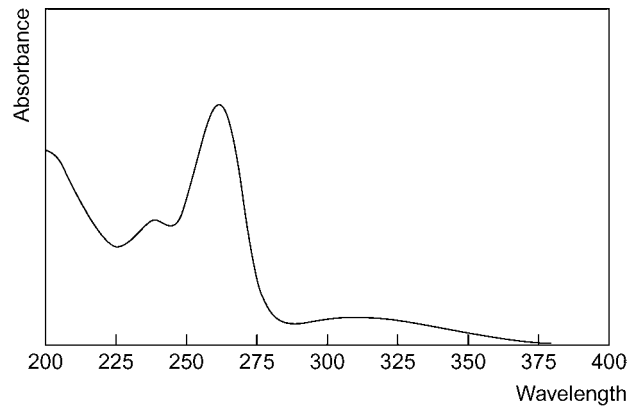
Colour Tests Formaldehyde–sulfuric acid—violet; Forrest reagent—red; FPN reagent—red; Mandelin's test—green-brown; Marquis test—red→violet; sulfuric acid—violet→blue.

Thin-layer Chromatography System TA—R_f 0.38; system TB—R_f 0.03; system TC—R_f 0.06; system TE—R_f 0.30; system TAE—R_f 0.11; system TAG—R_f 0.01 (Acidified iodoplatinate solution, positive).

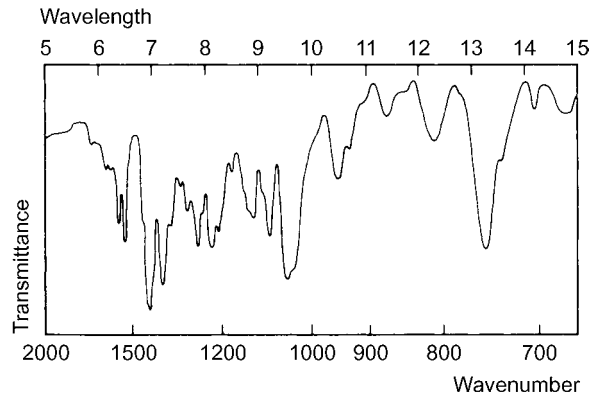
Gas Chromatography System GA—RI 3380; system GB—RI 3629.

High Performance Liquid Chromatography System HA—*k* 5.0; system HY—RI 337; system HZ—RT 3.4 min; system HAX—RT 10.1 min; system HAY—RT 5.0 min.

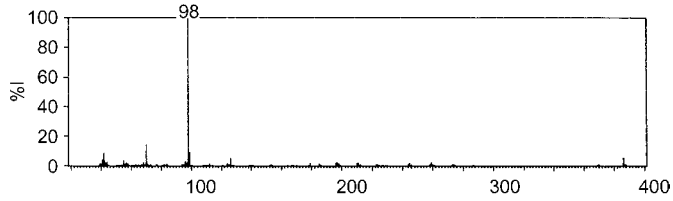
Ultraviolet Spectrum Aqueous acid—238, 262 (A_1^1 = 773b), 310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1050, 752, 1239, 1282, 1562, 1091 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 98, 70, 99, 42, 386, 126, 55, 41.



Quantification

Blood **HPLC** Column: μBondapak C_{18}. Mobile phase: methanol : water (66 : 34) containing 1% acetic acid and 0.005 mol/L 1-heptane sulfonic acid sodium salt, flow rate 2 mL/min. UV detection (λ = 263 nm). Limit of detection, 0.25 mg/L [McCutcheon 1979].

Plasma **GC** Column: 3% OV-17 on Chromosorb Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: He, 100 mL/min. Temperature programme: 275°. FID. Retention time: ~8.9 min. Limit of detection, 50 μg/L [Dinovo *et al.* 1974; Dinovo *et al.* 1976].

Note For a radioimmunoassay in plasma, see Chakraborty *et al.* [1987].

Disposition in the Body Readily absorbed after oral administration. The major metabolite is sulforidazine which is pharmacologically active. Mesoridazine is a major metabolite of thioridazine [Lin *et al.* 1993].

Therapeutic Concentration Following a single IM injection of 2 mg/kg to 6 subjects, peak plasma concentrations of 0.1–1.1 mg/L (mean 0.5) for mesoridazine, and 0.1–0.6 mg/L (mean 0.3) for sulforidazine, were attained in ~4 h [Gottschalk *et al.* 1976].

Toxicity

In a fatality attributed to the ingestion of 2.5 g mesoridazine, the following postmortem tissue concentrations were reported: blood 3 mg/L, kidney 17 μg/g, and liver 114 μg/g. In a second case in which 8 g had been ingested, the postmortem blood concentration was 4 mg/L [Donlon, Tupin 1977].

A 23-year-old female died approximately 6–6.5 h after ingesting an unknown quantity of mesoridazine. Her antemortem blood level of mesoridazine was 16 mg/L [Vertrees, Siebel 1987].

Half-life Plasma half-life, mesoridazine 2–9 h (mean 5), sulforidazine 6–25 h (mean 13).

Dose The equivalent of 150 mg mesoridazine daily; up to 400 mg daily has been given.

Mestanolone

Anabolic Steroid

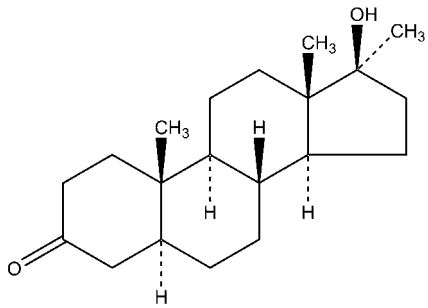
$C_{20}H_{32}O_2$ = 304.5

CAS—521-11-9

IUPAC Name (5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-17-Hydroxy-10,13,17-trimethyl-2,4,5,6,7,8,9,11,12,14,15,16-dodecahydro-1*H*-cyclopenta[a]phenanthren-3-one

Synonyms 17β-Hydroxy-17α-methyl-3-androstanone; (5α,17β)-17-hydroxy-17-methylandrostan-3-one; 17α-methylandrostan-17β-ol-3-one; 17α-methylandrostan-3-on-17β-ol.

Proprietary Names *Anabo*; *Antalone*; *Duramin*; *Mechiaron*; *Prohormo*; *Protenolon*; *Tantarone*.



Chemical Properties Crystals. Mp 192° to 193°. Insoluble in water. Soluble in acetone, alcohol, ether and ethyl acetate. Log *P* (octanol/water), 3.52 [Meylan, Howard 1995], 4.29 [ACD 2007].

Mass Spectrum Principal ions at *m/z* 360, 375, 390, 405 (MO-TMS derivative).

Quantification

Urine **GC-MS** Column 1: HP5 SE54 fused silica capillary cross-linked 5% phenyl methylsilicone (17 m × 0.2 mm i.d., 0.3 μm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. Column 2: OV1 fused silica capillary cross-linked methylsilicone (20 m × 0.25 mm i.d., 0.33 μm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. EI ionisation at 70 eV. Limit of detection not reported [Schanzer *et al.* 1992].

HPLC Column: Merck Lichrosorb (R) RP_{18} (100 × 4.0 mm i.d., 5.0 μm). Mobile phase: acetonitrile : water (30 : 70 to 80 : 20 after 20 min), flow rate 1.0 mL/min. Limit of detection not reported [Schanzer *et al.* 1992].

Hair **GC-MS** Column: CP-SIL 5 CB fused silica (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 300° at 20°/min. EI ionisation at 70 eV. Limit of quantification, 0.1 ng/mg; limit of detection, 0.05 ng/mg [Deng *et al.* 1999].

Disposition in the Body A healthy male volunteer was administered 20 mg mestanolone orally. No mestanolone or its epimer were detected in urine over 72 h after dosing. The metabolite 17α-methyl-5α-androstane-3α,17β-diol and its 17β-methyl epimer were detected and reported to be 2.26% and 0.02% of the applied dose of mestanolone, respectively [Schanzer *et al.* 1992]. Another healthy male volunteer was administered 10 mg mestanolone orally. No trace of the 17-epimer and dehydration products of the administered steroid were detected in urine over 72 h after dosing [Bi, Masse 1992].

Toxicity Anabolic 17β-hydroxy-17α-methyl steroids are well known for their potent liver toxicities and carcinogenicities [Lovisetto *et al.* 1979].

Mesterolone

Androgen

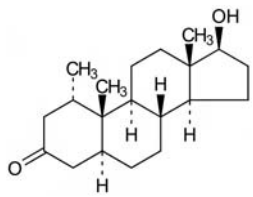
$C_{20}H_{32}O_2$ = 304.5

CAS—1424-00-6

IUPAC Name (1*S*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-17-Hydroxy-1,10,13-trimethyl-1,2,4,5,6,7,8,9,11,12,14,15,16,17-tetradecahydrocyclopenta[*a*]phenanthren-3-one

Synonym (1α,5α,17β)-17-Hydroxy-1-methylandrostan-3-one

Proprietary Names *Mestoranum*; *Pro-Viron*.



Chemical Properties A white crystalline powder. Mp about 210°. Practically insoluble in water; soluble 1 in 50 of ethanol, 1 in 6 of chloroform and 1 in 150 of ether. Log *P* (octanol/water), 3.5.

High Performance Liquid Chromatography System HATb—RRT 1.52 (relative to testosterone).

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1706, 1068, 1055, 1252, 1238, 1032 cm^{-1} (KBr disk).

Quantification

Urine **GC-MS** Mesterolone and other anabolic steroids. Limits of detection, 5 to 20 ppb [Choi *et al.* 1999].

Hair **GC-MS** Mesterolone and other anabolic steroids. Limits of detection, 0.002 to 0.05 μg/L [Deng *et al.* 1999].

Dose 50 to 100 mg daily.

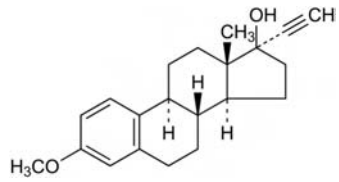
Choi MH *et al.* (1999). Determination of anabolic steroids by gas chromatography/negative-ion chemical ionization mass spectrometry and gas chromatography/negative-ion chemical ionization tandem mass spectrometry with heptafluorobutyric anhydride derivatization. *Rapid Commun Mass Spectrom* 13: 376–380.

Deng XS *et al.* (1999). Detection of anabolic steroids in head hair. *J Forensic Sci* 44: 343–346.

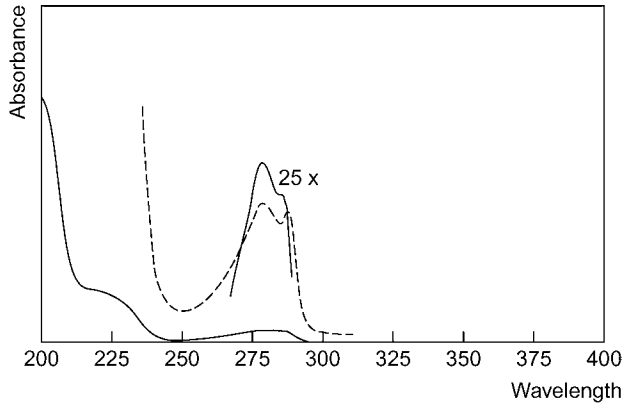
Mestranol

Oestrogen
$C_{21}H_{26}O_2$ = 310.4
CAS—72-33-3

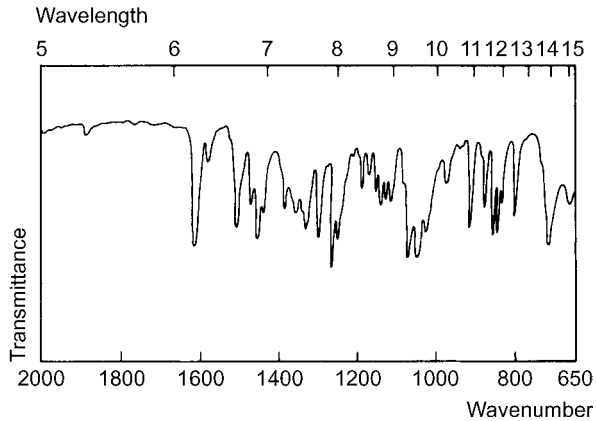
IUPAC Name (8*R*,9*S*,13*S*,14*S*,17*R*)-17-Ethynyl-3-methoxy-13-methyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[*a*]phenanthren-17-ol
Synonyms EE3ME; ethinyloestradiol-3-methyl ether; (17α)-3-methoxy-19-nor-pregna-1,3,5(10)-trien-20-yn-17-ol.
Proprietary Names It is an ingredient of *Enovid*, *Genora*, *Menophase*, *Necon*, *Nelova*, *Norethin*, *Norinyl* and *Ortho-Novin*.



Chemical Properties A white to creamy-white, crystalline powder. Mp 146° to 154°. Practically insoluble in water; soluble 1 in 44 of ethanol, 1 in 4.5 of chloroform and 1 in 23 of ether; soluble in dioxane and acetone; slightly soluble in methanol. Log *P* (octanol/water), 4.7.
Caution Mestranol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.
Colour Tests Antimony pentachloride—green; Liebermann's reagent—red; naphthol-sulfuric acid—red/red; sulfuric acid—orange-red (yellow fluorescence under ultraviolet light).
Thin-layer Chromatography System TP—R_f 0.86; system TQ—R_f 0.52; system TR—R_f 0.90; system TS—R_f 0.90.
Gas Chromatography System GA—RI 2612.
Ultraviolet Spectrum Methanol—278 (A^1_1=61a), 287 nm.



Infrared Spectrum Principal peaks at wavenumbers 1255, 1060, 1035, 1612, 1291, 1241 cm^{-1} (KBr disk).

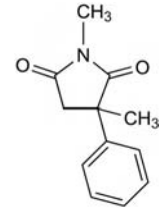


Mass Spectrum Principal ions at *m/z* 227, 310, 174, 284, 147, 160, 173, 199.
Dose Up to 100 µg daily.

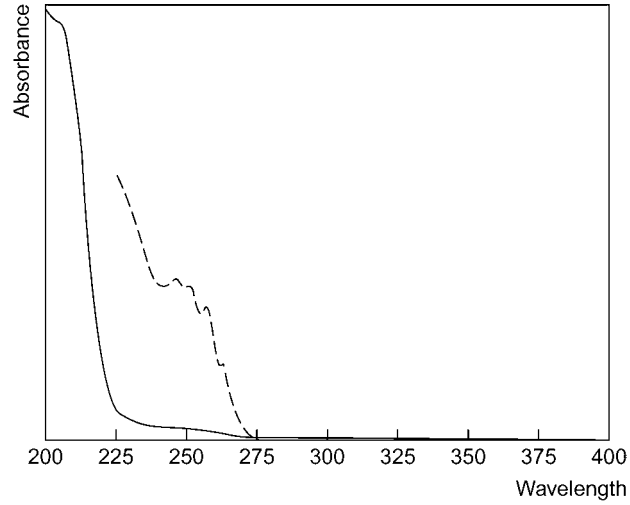
Mesuximide

Anticonvulsant
$C_{12}H_{13}NO_2$ = 203.2
CAS—77-41-8

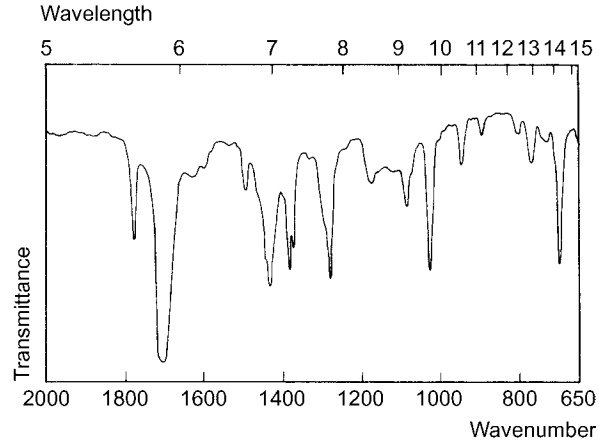
IUPAC Name 1,3-Dimethyl-3-phenyl-2,5-pyrrolidinedione
Synonym Methsuximide
Proprietary Names *Celontin*; *Petinutin*.



Chemical Properties A white to greyish-white crystalline powder. Mp 50° to 56°. Soluble 1 in 350 of water, 1 in 3 of ethanol, 1 in <1 of chloroform and 1 in 2 of ether. Log *P* (octanol/water), 1.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Thin-layer Chromatography System TA—R_f 0.76; system TE—R_f 0.86; system TAE—R_f 0.90; system TAJ—R_f 0.85; system TAK—R_f 0.70; system TAL—R_f 0.98.
Gas Chromatography System GA—mesuximide RI 1705; M (nor-) RI 1750; M (OH-) RI 2220; M (nor-OH-) RI 2300; system GE—RRT 0.35; system GAJ—RRT 0.689.
High Performance Liquid Chromatography System HE—*k* 6.02; system HY—RI 387; system HZ—retention time 4.8 min.
Ultraviolet Spectrum Methanol—247 (A^1_1=21a), 252, 258, 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1705, 1282, 1030, 699, 1775, 1086 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 118, 117, 203, 103, 77, 78, 119, 91.
Quantification
Plasma **GC** ECD. *N*-desmethylmesuximide, limit of detection, 500 µg/L [Wallace *et al.* 1979].
Serum **GC** See Plasma [Wallace *et al.* 1979]. FID. Limit of detection, 1 mg/L [Bonitati 1976].
HPLC UV detection. Limit of detection, 1 mg/L [Kabra *et al.* 1978].
Body Fluids **GC** FID. Limit of detection, 0.5 mg/L for mesuximide and 5 mg/L for *N*-desmethylsuximide [Cardella *et al.* 1988].

Disposition in the Body Rapidly absorbed after oral administration and metabolised to the active *N*-desmethyl derivative. <1% of a dose is excreted in the urine as unchanged drug. The major urinary metabolites are conjugated 4-hydroxyphenyl derivatives; minor metabolites include the 3-hydroxy, 2-hydroxymethyl and 2-dihydrodihydroxyphenyl derivatives. Mesuximide increases its own rate of metabolism on chronic dosing.

Therapeutic Concentration In plasma, *N*-desmethylmesuximide, usually in the range 10 to 40 mg/L.

Following daily oral doses of 600 to 1200 mg to 8 subjects experiencing good seizure control, steady-state plasma concentrations of 0.01 to 0.11 mg/L (mean 0.04) and 16 to 37 mg/L (mean 25) for mesuximide and the *N*-desmethyl metabolite, respectively, were reported [Strong *et al.* 1974].

Toxicity The estimated minimum lethal dose is 5 g. Toxic effects are usually associated with plasma *N*-desmethylmesuximide concentrations of >40 mg/L.

In a case of severe coma, which began several hours after the ingestion of nearly 10 g mesuximide in a suicide attempt, blood concentrations of 18 mg/L of mesuximide and 44 mg/L of the *N*-desmethyl metabolite were reported 14 h after ingestion; the coma persisted for about 80 h and correlated with the presence of the *N*-desmethyl metabolite in the blood [Karch 1973].

Half-life Plasma half-life, mesuximide about 3 h, but may reduce to one quarter of this value on chronic dosing; *N*-desmethylmesuximide about 30 to 40 h.

Protein Binding Not significantly bound.

Dose 0.3 to 1.2 g daily; up to 3.6 g daily has been given.

Bonitati J (1976). Gas-chromatographic analysis for succinimide anticonvulsants in serum: macro- and micro-scale methods. *Clin Chem* 22: 341–345.

Metabutethamine

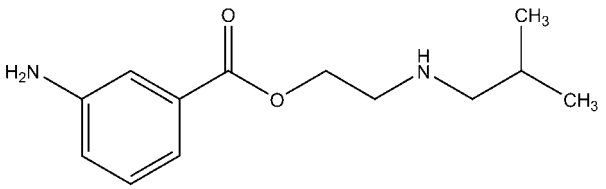
Anaesthetic (Local)

$C_{13}H_{20}N_2O_2$ = 236.3

CAS—4439-25-2

IUPAC Name 2-(2-Methylpropylamino)ethyl 3-aminobenzoate

Synonym 2-Isobutyaminoethyl *m*-aminobenzoate



Chemical Properties Metabutethamine is an isomer of butethamine. Metabutethamine is extracted by organic solvents from aqueous alkaline solutions.

Metabutethamine Hydrochloride

$C_{13}H_{20}N_2O_2$,HCl = 272.8

CAS—550-01-6

Synonym Primacaine hydrochloride

Proprietary Name *Unacaine Hydrochloride*

Chemical Properties A white crystalline solid or powder. Mp 181° to 184°. Soluble in water; slightly soluble in ethanol and chloroform.

Colour Tests Diazotisation test—red (limit of detection, 0.1 µg); Vitali's test—yellow/yellow (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1—R_f 0.60 (location reagent acidified iodoplatinate spray, positive reaction; *p*-dimethylaminobenzaldehyde spray, yellow).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—228 and 275 nm with an inflexion at 280 nm.

Disposition in the Body

Toxicity Metabutethamine is used by injection in dentistry, usually as a 3.8% solution with adrenaline. It provides a relatively short duration of anaesthesia. It is considerably less toxic than procaine hydrochloride when injected SC or IP, but has about the same toxicity when injected IV [Cahill *et al.* 1965].

Cahill JF *et al.* (1965). The relation between acute toxicity and critical rate of disposal of several local anaesthetics. *Can J Physiol Pharmacol* 43: 343–349.

Metabutoxycaine

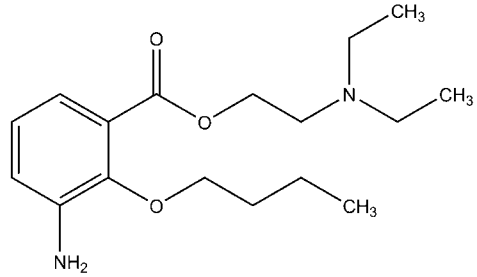
Anaesthetic (Local)

$C_{17}H_{28}N_2O_3$ = 308.4

CAS—3624-87-1

IUPAC Name 2-Diethylaminoethyl 3-amino-2-butoxybenzoate

Synonyms 3-Amino-2-butoxybenzoic acid 2-(diethylamino)ethyl ester; 2-butoxy-3-aminobenzoic acid β-diethylaminoethyl ester; 2′-diethylaminoethyl 3-amino-2-butoxybenzoate; β-diethylaminoethyl 2-butoxy-3-aminobenzoate.



Chemical Properties Metabutoxycaine is extracted by organic solvents from aqueous alkaline solutions.

Metabutoxycaine Hydrochloride

$C_{17}H_{28}N_2O_3$,HCl = 344.9

CAS—550-01-6

Synonym Primacaine hydrochloride

Chemical Properties A white crystalline powder. Mp 117° to 120°. Very soluble in water and ethanol; very slightly soluble in ether; sparingly soluble in ether.

Thin-layer Chromatography Sunshine and Fike [1964] described 3 systems which separate metabutoxycaine and other local anaesthetics.

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—313 nm.

Disposition in the Body

Toxicity Metabutoxycaine is used in dentistry as a 1.5% solution with adrenaline. Its potency is greater than that of procaine hydrochloride in the same concentration [Harris, Worley 1958].

Harris SC, Worley RC (1958). Comparative local anesthetic potencies of lidocaine and metabutoxycaine. *J Am Dent Assoc* 57: 66–70.

Sunshine I, Fike WW (1964). Value of thin-layer chromatography in two fatal cases of intoxication due to lidocaine and mepivacaine. *N Engl J Med* 271: 487–490.

Metaclazepam

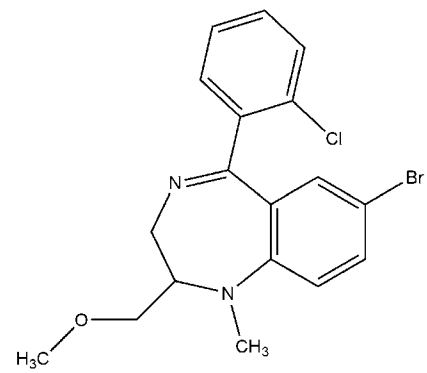
Anxiolytic, Benzodiazepine

$C_{18}H_{18}BrClN_2O$=393.7

CAS—84031-17-4

IUPAC Name 7-Bromo-5-(2-chlorophenyl)-2-(methoxymethyl)-1-methyl-2,3-dihydro-1,4-benzodiazepine

Synonyms a-2547; brometazepam; 7-bromo-5-(2-chlorophenyl)-2,3-dihydro-2-(methoxymethyl)-1-methyl-1*H*-1,4-benzodiazepine; KC-2547; metuclazepam.



Chemical Properties Yellow, odourless crystals. Mp 88° to 90°. pK_a 5.5 [Fernandez-Arciniega, Hernandez 1985], 5.9 [Althaus *et al.* 1986] Log *P* (octanol/buffer pH 7), 2000; (octanol/buffer pH 2), 3.

Metaclazepam Hydrochloride

$C_{18}H_{18}BrClN_2O$,HCl = 430.2

CAS—61802-93-5

Synonym Brometazepam hydrochloride

Proprietary Name *Talis*

Chemical Properties A bright orange, crystalline powder with a slightly bitter taste. Mp 193° to 196°. Solubility: 43 g/100 mL water; 73 g/100 mL methanol; 14 g/100 mL ethanol; 29 g/100 mL chloroform; 0.02 g/100 mL benzene.

Thin-layer Chromatography System TA—R_f 0.77 (metaclazepam), R_f 0.76 (M nor); system TB—R_f 0.40 (metaclazepam), R_f 0 (M dinor), R_f 0.15 (M nor); system TC—R_f 0.73 (metaclazepam), R_f 0.68 (M nor); system TD—R_f 0.47 (metaclazepam), R_f 0.33 (M nor); system TE—R_f 0.79 (metaclazepam), R_f 0.46 (M dinor)

0.09, R_f 0.73 (M nor); system TF—R_f 0.35 (metaclazepam), R_f 0.9 (M dinor), R_f 0.25 (M nor); system TAD—R_f 0.71 (metaclazepam), R_f 0.65 (M nor); system TAE—R_f 0.82 (metaclazepam), R_f 0.81 (M dinor), R_f 0.81 (M nor); system TAF—R_f 0.84 (metaclazepam), R_f 0.84 (M nor); system TAG—R_f 0.62 (metaclazepam), R_f 0.58 (M nor).

Plates: silica gel $60F_{254}$. Mobile phase: toluene : acetone (85 : 15). Detection fluorescence quenching at 254 nm. R_f 0.48 [Althaus *et al.* 1986].

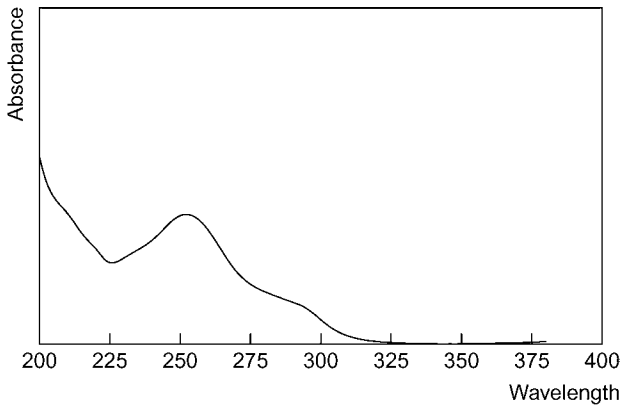
Gas Chromatography System GA—metaclazepam RI 2640, M *O*-desmethyl, RI 2730, M nor, RI 2690.

Column: Chromopack WCOT fused silica CP-Sil 5CB (25 m × 0.32 mm i.d.). Temperature programme: 200° to 300° at 4°/min. Carrier gas: He, 30 cm/s. NSD. Retention time: ~15 min [Althaus *et al.* 1986].

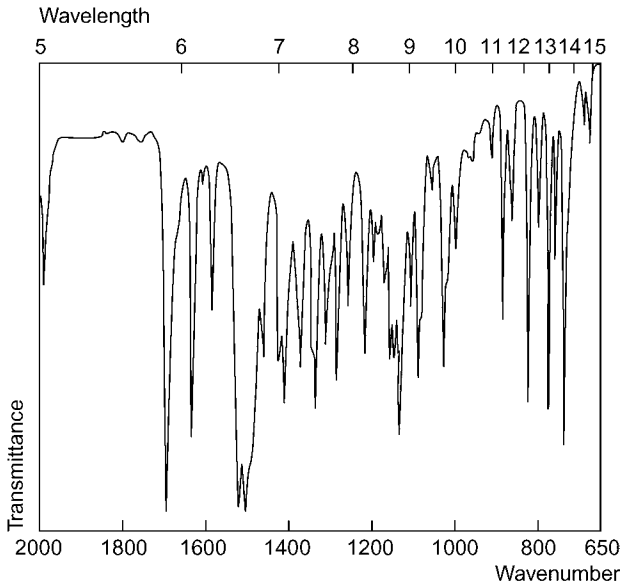
High Performance Liquid Chromatography System HX—RI 451 (metaclazepam), RI 393 (M dinor), RI 425 (M nor).

Column: ODS Hypersil (30 + 100 × 4.0 mm i.d., 5 µm). Mobile phase: water : methanol (350 : 650) plus 1 mL 40% methylamine, flow rate 1.2 mL/min. UV detection (λ = 230 nm). Retention time: 11.6 min [Althaus *et al.* 1986]

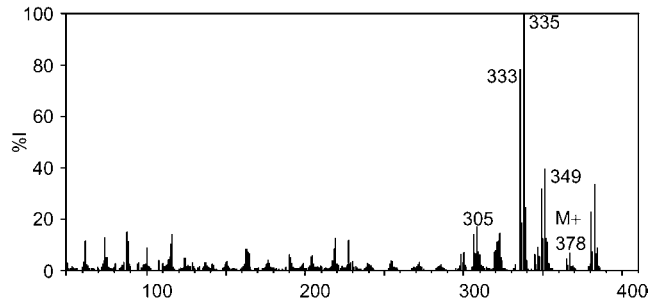
Ultraviolet Spectrum Aqueous methanol—464, 380, 242 nm; aqueous methanolic hydrochloride (0.1 mol/L)—464 (A^1_1 = 151), 255 (A^1_1 = 561) nm; aqueous methanolic sodium hydroxide—377 (A^1_1 = 58), 274 (A^1_1 = 196), 236 (A^1_1 = 535) nm.



Infrared Spectrum Principal peaks at wavenumbers 1646, 1482, 772, 735, 2365, 819 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 335, 333, 349, 305, 378 (M nor).



Quantification

Note For a thin-layer chromatography method, see Althaus *et al.* [1986].

Plasma **LC-MS** Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.025 mg/L (SIM), limit of detection, 0.025 mg/L (scan) [Kratzsch *et al.* 2004].

Urine **LC-MS** Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Disposition in the Body Metaclazepam is rapidly metabolised yielding *N*-1 desmethyl and *O*-desmethyl benzapines as the main active products [Borchers *et al.* 1984]. No accumulation after repetitive administration is observed. Small amounts are distributed in breast milk.

Dose The oral daily dose is 15 mg.

Metadoxine

Treatment of Alcohol Poisoning

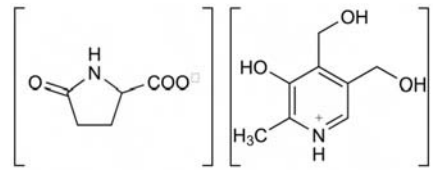
$C_{13}H_{18}N_2O_6$ = 298.3

CAS—74536-44-0

IUPAC Name 3-Hydroxy-4,5-di(hydroxymethyl)-2-methylpyridine-5-oxo-2-pyrrolidinecarboxylaten

Synonyms Pyridoxine pyrrolidonecarboxylate; pyridoxol L, 2-pyrrolidone-5-carboxlate.

Proprietary Name *Metadoxil*



Chemical Properties A white, odourless, crystalline powder with acidic taste. Mp 96° to 98°. Soluble in water.

Dose Two 500 mg tablets daily; 300 to 600 mg daily by IM or IV administration.

Metadrenaline

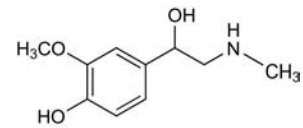
Catecholamine Metabolite

$C_{10}H_{15}NO_3$ = 197.2

CAS—5001-33-2

IUPAC Name 4-[1-Hydroxy-2-(methylamino)ethyl]-2-methoxyphenol

Synonyms 4-Hydroxy-3-methoxy-α-(methylaminomethyl)benzenemethanol; metanephrine.

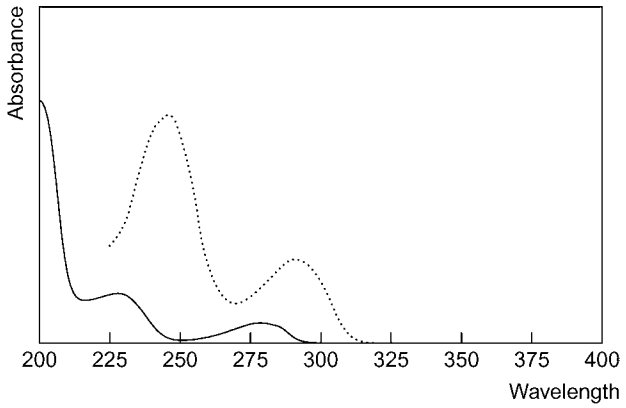


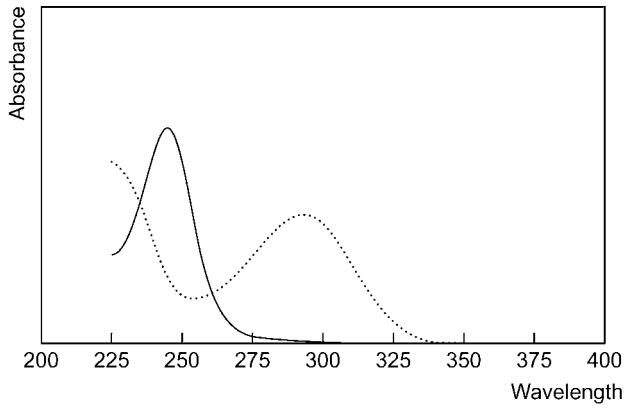
Chemical Properties Log *P* (octanol/water), −0.6.

Colour Tests Mandelin's test—green; Marquis test—orange→violet-brown.

Thin-layer Chromatography System TA—R_f 0.21 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—277 nm; aqueous alkali—245, 291 nm.





Quantification See Normetadrenaline.
Disposition in the Body Metadrenaline is a metabolite of adrenaline.

Metaldehyde

Molluscicide
$(C_2H_4O)_x$
CAS—9002-91-9

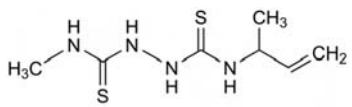
IUPAC Name 2,4,6,8-Tetramethyl-1,3,5,7-tetraoxocane
Proprietary Names It is an ingredient of many proprietary preparations used for the destruction of slugs. As a compressed fuel, it is known as *Meta*.
Chemical Properties A polymer of acetaldehyde. A white crystalline solid which burns readily with a non-luminous carbon-free flame and sublimes at 112°. In the presence of acids it decomposes slowly to acetaldehyde. Practically insoluble in water; soluble in benzene and chloroform; sparingly soluble in alcohol and ether.
Colour Test Add 1 drop of sulfuric acid to a small amount of solid, then add a trace of pyrocatechol—violet-red.
Gas Chromatography System GA—RI 1020.
Infrared Spectrum Principal peaks at wavenumbers 1094, 1113, 1163, 1074, 975, 1205 cm^{-1} (KBr disk).
Quantification
Plasma **GC** [Booze, Oehme 1985].
Urine **GC** [Booze, Oehme 1985].
Disposition in the Body
Toxicity Metaldehyde probably decomposes slowly in the body to acetaldehyde which is further oxidised. Fatalities have occurred after the ingestion of about 3 g.

Booze TF, Oehme FW (1985). Gas chromatographic analysis of metaldehyde in urine and plasma. *J Anal Toxicol* 9: 172–173.

Metallibure

Hypothalamus and Pituitary Suppressant
$C_7H_{14}N_4S_2 = 218.3$
CAS—926-93-2

IUPAC Name 1-But-3-en-2-yl-3-(methylcarbamothioylamino)thiourea
Synonym *N*-Methyl-*N*′-(1-methyl-2-propenyl)-1,2-hydrazinedicarbothioamide

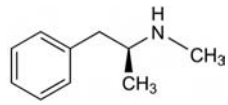


Chemical Properties A white powder. Mp 198° to 200°, with decomposition. Practically insoluble in water and chloroform; soluble 1 in 100 of acetone and 1 in 200 of methanol; soluble in pyridine. Log *P* (octanol/water), 0.3.
Caution Protective gloves should be worn when handling metallibure.
Colour Tests Nessler's reagent (100°)—black; palladium chloride—orange.
Thin-layer Chromatography System TA—R_f 0.79 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—243 nm (A_1^1=1340b); aqueous alkali—293 nm.

Metamfetamine

Central Stimulant, Phenethylamine
$C_{10}H_{15}N = 149.2$
CAS—537-46-2

IUPAC Name (2*S*)-*N*-Methyl-1-phenylpropan-2-amine
Synonyms *d*-Deoxyephedrine; desoxyephedrine; (α*S*)-*N*,α-dimethylbenzeneethanamine; methamphetamine; methylamfetamine; methylamphetamine; phenylmethylaminopropane.
Note Metamfetamine in a smokeable and snortable form: crank; crystal; crystal meth; ice; meth; speed.
Proprietary Name *Norodin*

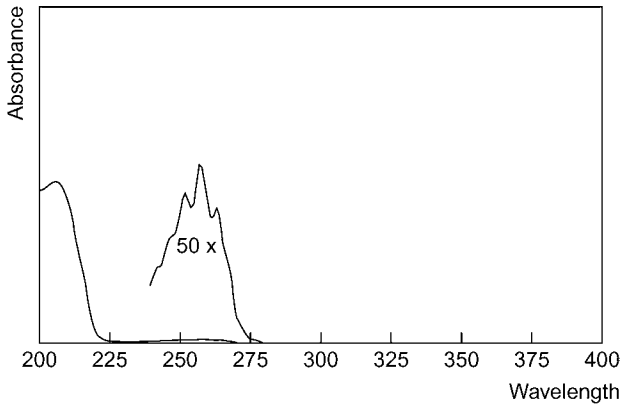


Chemical Properties A clear, colourless, slowly volatile, mobile liquid. Bp ~214°. Slightly soluble in water; miscible with ethanol, chloroform and ether. pK_{a1} 10.1 [Huestis, Cone 2007], pK_{a2} 9.87 [Fan *et al.* 2005]. Log *P* (octanol/water), 2.07 [Fan *et al.* 2005]. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].

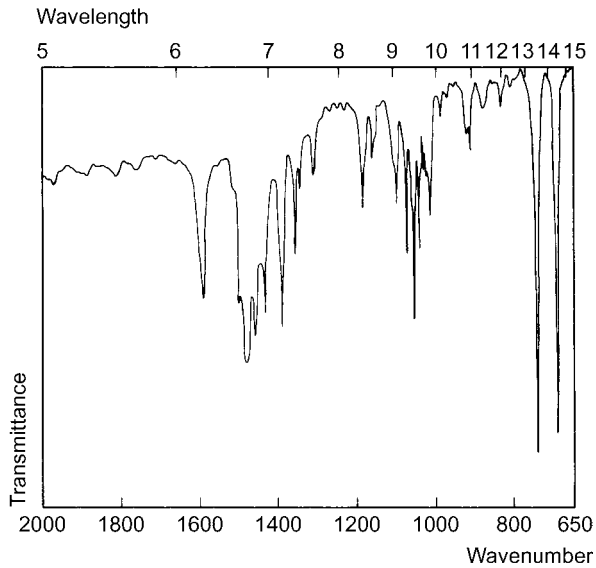
Metamfetamine Hydrochloride

$C_{10}H_{15}N,HCl = 185.7$
CAS—51-57-0
IUPAC Name (2*S*)-*N*-methyl-1-phenylpropan-2-amine hydrochloride
Proprietary Names *Amphedroxyn*; *Desfedrin*; *Desoxyfed*; *Desoxyn*; *Destim*; *Doxephrin*; *Drinalfa*; *Gerobit*; *Hiropon*; *Isophen*; *Madrine*; *Methampex*; *Methedrine*; *Methylisomyn*; *Pervitin*; *Soxysympamine*; *Syndrox*; *Tonedron*.
Chemical Properties White crystals or crystalline powder. Mp 170° to 175°. Soluble 1 in 2 of water, 1 in 4 of ethanol and 1 in 5 of chloroform; practically insoluble in ether. Log *P* (octanol/water), −0.66 [Meylan, Howard 1995].

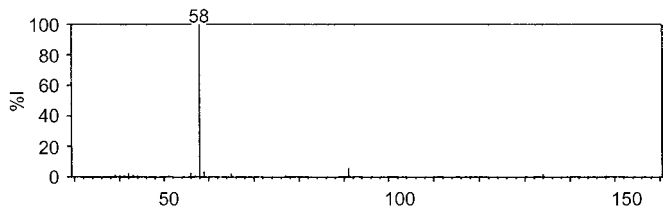
Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.31; system TB—R_f 0.28; system TC—R_f 0.13; system TE—R_f 0.42; system TL—R_f 0.05; system TAE—R_f 0.09; system TAF—R_f 0.63; system TAJ—R_f 0.00; system TAK—R_f 0.03; system TAL—R_f 0.45 (acidified iodoplatinate solution—positive; acidified potassium permanganate—positive; Dragendorff spray—positive; Marquis test—brown; ninhydrin (spray)—positive).
Gas Chromatography System GA—metamfetamine RI 1175, amfetamine RI 1125, M (4-OH-)(pholedrine) RI 1885, M (OH-methoxy-) RI 1810; system GB—metamfetamine RI 1200, amfetamine RI 1150; system GC—metamfetamine RI 1722, amfetamine RI 1536; system GF—metamfetamine RI 1335, amfetamine RI 1315; system GAD—metamfetamine RT 8.5 min, amfetamine RT 7.5 min.
High Performance Liquid Chromatography System HA—metamfetamine *k* 2.0, amfetamine *k* 0.9; system HB—metamfetamine *k* 10.52, amfetamine *k* 8.48; system HC—metamfetamine *k* 2.07, amfetamine *k* 0.98; system HX—RI 262; system HY—RI 216; system HZ—RT 2.4 min; system HAA—RT 8.4 min.
Ultraviolet Spectrum Aqueous acid—252, 257 (A_1^1= 12.1a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 747, 698, 1060, 1491, 1590, 1085 cm^{-1} (metamfetamine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 91, 59, 134, 65, 56, 42, 57 (metamfetamine); 44, 91, 40, 42, 65, 45, 39, 43 (amfetamine).



Quantification

Blood **GC** Limit of detection, 220 µg/L [Sun *et al.* 2007].

GC-MS Column: HP-5MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 60° for 1 min to 220° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 5.3 min for metamfetamine, 4.66 min for amfetamine, 7.14 min for 3,4-methylenedioxymethamfetamine (MDMA) [Gunn *et al.* 2010]. Column: DB-5HT (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 2.5 to 3.5 mL/min. Temperature programme: 130° for 0.1 min to 230° at 70°/min for 0.17 min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 µg/L for metamfetamine and amfetamine [Gunnar *et al.* 2007]. EI ionisation, positive ion mode, SIM acquisition mode. Limit of detection, 1.5 µg/L for metamfetamine and 1.1 µg/L for amfetamine [Hasegawa *et al.* 2007]. Column: HP-5MS. SIM acquisition mode [Rasmussen *et al.* 2006]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 1 min to 300° at 10°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5.0 ng/g for metamfetamine and amfetamine [Nishida *et al.* 2002; Nishida *et al.* 2003] Column: PTE-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.4 mL/min. Temperature programme: 60° for 3 min to 280° at 20°/min for 3 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.5 ng/g for metamfetamine and amfetamine [Okajima *et al.* 2001]. See also Nagasawa *et al.* [1996], Namera *et al.* [2000] and Sato and Mitsui [1997].

LC-MS Column: Agilent HPLC 1100 with a Varian Pursuit 3 C_{18} column (3 × 100 mm, 3 µm). Mobile phase: methanol-ammonium formate. Limit of quantification, 0.0005–0.01 mg/kg for metamfetamine and other drugs of abuse [Bjork *et al.* 2010]. Column: Nucleodur Sphinx RP. Mobile phase: 10 mmol/L ammonium formate buffer and acetonitrile. Limit of quantification, 2.5 µg/L for metamfetamine and related drugs, limit of detection, 0.05–0.5 µg/L for metamfetamine and related drugs, [Fernández Mdel *et al.* 2009]. Column: BEH C_{18} (50 × 2.1 mm i.d.). Mobile phase: aqueous pyrrolidine : methanol (52 : 48), flow rate 0.4 mL/min. ESI, positive ion mode, SIR acquisition mode. Retention time: 1.81 min for metamfetamine, 1.2 min for amfetamine [Apollonio *et al.* 2006]. Column: Uptispher ODB C_{18} (150 × 2.1 mm, 5 µm). Mobile phase: acetonitrile and 2 mmol/L formate buffer (pH 3.0). Limit of quantification, 0.1 µg/L for metamfetamine and other amfetamines [Chèze *et al.* 2007].

Plasma **GC** Column: HP-5 5% phenylmethyl (25 × 0.32 m, 0.52 µm). Carrier gas: He, 2.5 mL/min. Temperature programme: 70° to 120° at 30°/min to 185° at 5°/min to 300° at 70°/min for 1.5 min. NPD. Limit of detection, 1 µg/L [Cheung *et al.* 1997]. Column: HP Ultra-1 (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 110° for 0.5 min to 150° at 5°/min for 7.25 min to 300° at 50°/min for 3 min. Retention time: 11.72 min for metamfetamine, 9.76 min for amfetamine. Limit of detection, <10 µg/L for metamfetamine and amfetamine [Jacob *et al.* 1995].

GC-MS See Blood [Gunn *et al.* 2010]. Limit of quantification, 2.5 µg/L for metamfetamine and metabolites [Huestis, Cone 2007]. Column: 5% phenylmethylsiloxane HP-5MS (30 m × 0.25 mm i.d., 250 nm. Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 180° at 30°/min to 230° at 5°/min to 310° at 30°/min. NICI, SIM acquisition mode. Limit of detection, <1 µg/L [Peters *et al.* 2003a]. Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° to 250° at 10°/min to 310° at 30°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 5 µg/L for metamfetamine and related drugs [Peters *et al.* 2003b]. Column: HP-5MS (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 180° at 30°/min to 230° at 5°/min to 310° at 30°/min. NICI, SIM acquisition mode. Limit of quantification, 5 µg/L for metamfetamine and amfetamine, limit of detection, 1 µg/L for metamfetamine and amfetamine [Peters *et al.* 2002].

HPLC Column: Daisopak SP-120-5-ODS-BP (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L citrate buffer (pH 4.0, 55 : 45), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 325 nm, λ_{em} = 430 nm). Limit of detection, 0.87 µg/L for metamfetamine and 0.46 µg/L for amfetamine [Nakashima *et al.* 2003].

LC-MS Column: Alltima C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L formic acid (10 : 90 for 2 min to 25 : 75 in 16 min to 35 : 65 in 0.1 min to 100 : 0 in 12 min. TIS, positive ion mode, MRM acquisition mode. Retention time: 14 min. Limit of quantification, 1.2 µg/L; limit of detection, 0.2 µg/L [Sergi *et al.* 2009]. Column: CAPCELL PAK SCX UG 80 (250 × 1.5 mm i.d.). Mobile phase: 25 mmol/L ammonium acetate (pH 4.0) : acetonitrile (3 : 7), flow rate 0.2 mL/min. ESI, SRM acquisition mode. Limit of detection, 50 µg/L for metamfetamine and related drugs and metabolites [Kuwayama *et al.* 2008]. Column: Hypersil BDS-C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (75 : 25), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.2 µg/L [Wood *et al.* 2003].

Serum **GC-MS** See Blood [Gunn *et al.* 2010]. See Plasma [Peters *et al.* 2002]. Column: DB-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° to 120° at 30°/min to 180° at 20°/min to 250° at 30°/min for 0.5 min. Limit of detection, 50 ng/L for metamfetamine and 80 ng/L for amfetamine [Lee *et al.* 2000]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 1 min to 200° at 20°/min to 240° at 5°/min to 310° at 30°/min for 6 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 6.1 min for metamfetamine, 5.3 min for amfetamine. Limit of quantification, 1.8 µg/L for metamfetamine, 4.9 µg/L for amfetamine, limit of detection, 1.4 µg/L for metamfetamine, 1.5 µg/L for amfetamine [Weinmann *et al.* 2000].

Note For a fluoroimmunoassay, see Kimura *et al.* [2005].

Urine **TLC** Limit of detection, for *p*-hydroxymetamfetamine, 10 ng [Kato *et al.* 2005].

GC Limit of detection, 10 µg/L [Wang *et al.* 2008]. Column: HP-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 1.5 min to 300° at 12.5 min for 7 min. FID. Limit of quantification, 0.1 mg/L, limit of detection, 0.05 mg/L [Shakleya *et al.* 2006]. Column: AT-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° for 1 min to 280° at 20°/min for 5 min. FID. Limit of detection, 30 µg/L for metamfetamine and amfetamine [Raikos *et al.* 2003]. Column: CB-5 methylphenylpolysiloxane (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 110° to 140° at 10°/min to 20° at 30°/min for 3 min. NPD. Limit of detection, ~35 µg/L for metamfetamine and amfetamine [Taylor *et al.* 1989]. Column: 2% Thermon-3000 on Chromosorb W (AW-DMCS) 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 200°. ECD. Retention time: 3.3 min for metamfetamine and 6.9 min for amfetamine. Limit of detection, 10 µg/L for metamfetamine and amfetamine [Terada *et al.* 1982]. See Plasma [Cheung *et al.* 1997; Jacob *et al.* 1995].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 127 kPa. Temperature programme: 70° for 1 min to 300° at 20°/min for 2 min. EI ionisation at 70 eV, full scan mode. Limit of detection, 5 µg/L for metamfetamine and MDMA, 10 µg/L for amfetamine and methylenedioxiamfetamine (MDA) [Nakamoto *et al.* 2010]. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 160° at 60°/min for 0.5 min to 210° at 50°/min for 0.5 min to 250° at 40°/min for 0.5 min to

280° at 30°/min for 2 min. NCI. Limit of quantification, 43.5 ng/L for metamfetamine and 4 ng/L for amfetamine, limit of detection, 13.04 ng/L for metamfetamine and 1.20 ng/L for amfetamine [Chung *et al.* 2009]. Column: DB-1MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 2 min to 140° at 20°/min to 190° at 10°/min to 250° at 20°/min for 1 min. SIM acquisition mode. Limit of detection, 0.1 μg/L for metamfetamine and 0.5 μg/L for amfetamine [He *et al.* 2009]. Column: HP-5MS (20 m × 250 μm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 1 min to 190° at 20°/min for 2 min to 250° at 5°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, ≤7.7 μg/L, limit of detection, ≤2.3 μg/L [Aasim *et al.* 2008]. See Plasma [Huestis, Cone 2007]. Column: DB-5MS (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 2 mL/min. Temperature programme: 60° for 1 min to 200° at 20°/min to 300° at 40°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.08 μg/L for metamfetamine and 0.1 μg/L for amfetamine [Kumazawa *et al.* 2007]. See also Miranda *et al.* [2007], Saito *et al.* [2007], Fuh *et al.* [2006], Fujii *et al.* [2006], Lua *et al.* [2006], Maresová *et al.* [2006], Holler *et al.* [2005], Klette *et al.* [2005], Wang *et al.* [2005], Dasgupta, Spies [1998], Paul *et al.* [2004], Huang *et al.* [2002], Namera *et al.* [2002], Stout *et al.* [2002], Yamada *et al.* [2002], Wu *et al.* [2001], Jurado *et al.* [2000], Hensley, Cody [1999], Myung *et al.* [1998], Dallakian *et al.* [1996], Meatherall [1995], Platoff *et al.* [1992], Gan *et al.* [1991], Taylor *et al.* [1989]. HPLC Column: CAPCELL PAK SXC. Mobile phase: 0.1 mol/L borate buffer (pH 9.4). UV detection (λ = 210 nm). Limit of quantification, 0.005 mg/L [Kumihashi *et al.* 2007]. Column: Symmetryshield RP8 (150 × 4.6 mm i.d., 3.5 μm). Mobile phase: water : acetonitrile (90 : 10) with 25 mmol/L phosphate (pH 3.0), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, 0.3 μg/L for metamfetamine and amfetamine [He *et al.* 2007]. Column: C_8 Genesis (150 × 4.6 mm, 5 μm). Mobile phase: acetonitrile : phosphate buffer (pH 2.5) containing 0.3% TEA (12 : 88). Metamfetamine and related drugs [Bugamelli *et al.* 2006]. Column: Kromasil ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.02 mol/L disodium hydrogen phosphate-0.02 mol/L methanesulfonic acid (pH 2.9, 12.5 : 87.5), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, 1.4–4.0 μg/L for metamfetamine and related drugs [Fan *et al.* 2005]. Column: CAPCELL PAK C_{18} UG 120 S5 (250 × 1.5 mm i.d., 5 μm). Mobile phase: 0.1 mol/L Tris-HCl buffer (pH = 7.0) : acetonitrile (45 : 55), flow rate 0.2 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 440 nm). Limit of detection, 0.67 fmol/injection for metamfetamine and 0.14 fmol/injection for amfetamine [Al Dirbashi *et al.* 2000a]. See also al Dirbashi *et al.* [1999a]; al Dirbashi *et al.* [1998a]; al Dirbashi *et al.* [1998b]; al Dirbashi *et al.* [1997]; Makino *et al.* [1999], Foster *et al.* [1998], Campins-Falcó *et al.* [1996],Campins Falcó [1995], Molins Legua *et al.* [1995], Hayakawa *et al.* [1993].

LC-MS Column: Nucleodur Sphinx RP. Mobile phase: 10 mmol/L ammonium formate buffer : acetonitrile. Limit of quantification, 25 μg/L, limit of detection, 0.25–2.5 μg/L, for metamfetamine and related drugs [Fernández Mdel *et al.* 2009]. Column: C_{18} (100 × 2 mm i.d., 3 μm). Mobile phase: 25 mmol/L formic acid-1% acetonitrile : 25 mmol/L formic acid-90% acetonitrile (91 : 9 to 80 : 20 in 4 min to 0 : 100 in 3 min to 91 : 9 for 5 min), flow rate 0.3 mL/min. ESI, SRM acquisition mode. k' 3.1 for metamfetamine, 2.8 for amfetamine. Limit of quantification, 28 μg/L for metamfetamine, 143 μg/L for amfetamine, limit of detection, 8 μg/L for metamfetamine, 43 μg/L for amfetamine [Andersson *et al.* 2008]. Column CAPCELL PAK C_{18} MG II (150 × 2 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium formate (pH 4) acetonitrile, flow rate 230 μL/min. Limit of detection, <1.95 μg/L for metamfetamine and related drugs [Kim *et al.* 2008]. See Plasma [Kuwayama *et al.* 2008]. Column: Atlantis dC_{18} (100 × 2.1 mm i.d., 3 μm). Mobile phase: acetonitrile : ammonium formate buffer (pH 3.0, 0 : 100 for 1 min to 50 : 50 in 10 min for 2.5 min to 0 : 100 in 0.5 min for 5 min), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 8.5 min. Limit of quantification, 0.5 μg/L for metamfetamine and 1–2 μg/L for amfetamine, limit of detection, 0.5 μg/L for metamfetamine and amfetamine [Concheiro *et al.* 2007a; Concheiro *et al.* 2007b]. Column: Alltech Platinum EPS C_{18} (30 × 2.1 mm i.d., 1.5 μm). Mobile phase: 0.01 mol/L ammonium formate (pH 3) : acetonitrile (77 : 23), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 0.05 mg/L for metamfetamine and amfetamine [Cheng *et al.* 2007]. See Blood [Chèze *et al.* 2007]. See also Katagi *et al.* [1996], Katagi *et al.* [2000] and Wu, Fuh [2005].

CE Column: fused silica capillary. Mobile phase: 50 mmol/L phosphate buffer (pH 3) : acetonitrile (80 : 20) and 100 mmol/L SDS. Limit of detection, 20 μg/L for metamfetamine and 15 μg/L for amfetamine and *p*-hydroxymetamfetamine [Cheng *et al.* 2006]. Column: fused silica capillary. Mobile phase: 25 mmol/L phosphate buffer (pH 2.5) : methanol (80 : 20) and 100 mmol/L SDS. Limit of detection, 15 μg/L [Lin *et al.* 2006].

Note For a comparison of 6 immunoassays for detection of metamfetamine and other amfetamines, see Verstraete, Heyden [2005]; for a fluoroimmunoassay in serum, see Kimura *et al.* [2005]; for a radioimmunoassay see Inayama *et al.* [1980].

LC-MS Limit of quantification, 0.5 μg/g for metamfetamine and other amfetamines, limit of detection, 0.1 μg/g for metamfetamine and other amfetamines [**Tabernero *et al.* 2009**]. ESI. Metamfetamine and amfetamine enantiomers and selegiline and metabolites [Nishida *et al.* 2006].

Note For a review of methods for the analysis of metamfetamine and its metabolites in hair, see Takayama *et al.* [2003].

Other **HPLC** Clothing. UV detection (λ = 330 nm) or fluorescence detection (λ_{ex} = 440 nm). Limit of detection, 37.3 pg (fluorescence) and 0.4 pg (UV) for metamfetamine and amfetamine [al Dirbashi *et al.* 2001].

Note For a review of the determination of metamfetamine enantiomers, see Jirovský *et al.* [1998].

Disposition in the Body Metamfetamine is readily absorbed after oral administration. Approximately 70% of a dose is excreted in the urine in 24 h. Under normal conditions, up to 43% of a dose is excreted as unchanged drug, up to 15% as 4-hydroxymetamfetamine, and ~5% as amfetamine, the major active metabolite. A number of other metabolites have been identified. Excretion of unchanged drug is dependent on the urinary pH, being increased in acidic urine and greatly reduced (to ~2% of a dose) if the urine is alkaline.

Metamfetamine is a metabolite of benzfetamine and selegiline.

Therapeutic Concentration In plasma, usually in the range 0.01–0.05 mg/L.

Following a single oral dose of 12.5 mg metamfetamine hydrochloride to 10 subjects, a mean peak blood concentration of ~0.02 mg/L was attained in ~2 h [Driscoll *et al.* 1971].

Average concentrations of 111 and 281 μg/L (metamfetamine) and 4 and 15 μg/L (amfetamine) were found in breast milk 24 h after IV administration of amfetamines to 2 breastfeeding mothers [Bartu *et al.* 2009].

Toxicity The estimated minimum lethal dose is 1 g, but fatalities attributed to metamfetamine are rare.

The following postmortem tissue concentrations, mg/L or μg/g, were reported in a 25-year-old female found dead after the IV abuse of metamfetamine followed by ingestion of ~1.5 g:

	Metamfetamine	Amfetamine
Blood	43	0.35
Brain	101.8	0.86
Kidney	75.5	0.72
Liver	174.6	1.30
Urine	277.5	10.0

[Kojima *et al.* 1984].

A 37-year-old man who died following mixed drug abuse had the following postmortem metamfetamine concentrations: blood 0.7 mg/L, bile 21.7 mg/L, urine 32.0 mg/L, gastric contents 2.9 mg/L, liver 2.2 μg/g and brain 2.7 μg/g [Moore *et al.* 1996].

Of 146 deaths in which metamfetamine was detected in the blood, 52 were directly attributed to the drug and 92 were classified as drug-related; a large proportion of the deaths resulted from homicidal (27%) or suicidal (15%) violence. The metamfetamine blood concentration in the 92 drug-related deaths was reported to be in the range 0.05–9.30 mg/L (median, 0.42), with 90% of the population having concentrations <2.20 mg/L. In 17 metamfetamine-related traffic deaths, the blood concentration was reported to be 0.05–2.60 mg/L, with most deaths occurring at concentrations >0.5 mg/L [Logan *et al.* 1998].

In 413 deaths where metamfetamine was detected, blood levels of metamfetamine and amfetamine were 2.08 mg/L and 0.217 mg/L, respectively, in cases where metamfetamine was related to the cause of

death. These levels were not significantly different from those where metamfetamine use was not related to the cause of death (1.78 and 0.19 mg/L, respectively) [Karch *et al.* 1999].

A pilot who died in a civil aircraft accident had postmortem blood levels of metamfetamine (1.13 mg/L) and amfetamine (0.022 mg/L). Urine levels of metamfetamine and amfetamine were 59.2 and 1.50 mg/L, respectively. Metamfetamine was distributed throughout the body, including the brain. Metamfetamine levels in gastric contents were 575-fold higher than amfetamine levels [Chaturvedi *et al.* 2004].

A 20-year-old woman who had drugs enclosed in plastic bags in her vagina, developed metamfetamine toxicity. Serum levels of metamfetamine and amfetamine were 3.1 and 0.11 mg/L, respectively [Kashani, Ruha 2004].

In another case, a man who died within 1 h of an IV injection of metamfetamine had a femoral blood level of 1.5 mg/L. Levels of 132 µg/g were found in the first three 2 cm hair samples and overall the levels in hair provided evidence of chronic metamfetamine use for >8 months [Beránková *et al.* 2005].

A man who collapsed shortly after an IV injection of metamfetamine was in a coma for 9 days before he died. More than 9 days after administration, metamfetamine was not detected in postmortem blood, urine or liver, but levels in hair were 1.1 µg/g [Ago *et al.* 2006].

Another case of 'body stuffing' in which a 25-year-old man had delayed onset toxicity after ingesting metamfetamine wrapped in plastic has been reported [Hendrickson *et al.* 2006].

There is a further report of 3 men in their thirties who attempted to smuggle metamfetamine 498, 292, and 73 g by 'body packing' the drug as packages each containing ~14 g wrapped in plastic film and Scotch tape. One man died from acute metamfetamine poisoning from ~20 g metafetamine that had leaked from the packages into his stomach. The plasma level of metamfetamine was 8.6 mg/L ~17 h before he died. Postmortem levels of metamfetamine and amfetamine in cardiac blood were 63.5 and 1.2 mg/L, respectively. Urine levels were 4518 and 72.4 mg/L, respectively; gastric contents were 8490 and 16.9 mg/L, respectively [Takekawa *et al.* 2007].

In a retrospective review of metamfetamine-related deaths, the median blood level was 0.2 mg/L (range, 0.02–15); other drugs, mainly bezodiazepines and morphine, were identified in 89% of cases [Kaye *et al.* 2008].

A woman in her late thirties who was hospitalised for 13 days following a road traffic accident suffered a cardiopulmonary arrest and died. At postmortem it was concluded that her injuries were not the cause of death. Postmortem cardiac blood levels of metamfetamine and amfetamine were 0.178 and 0.051 mg/L, respectively. Metamfetamine was also found in hair samples indicating metamfetamine use for at least 3 months before death [Ago *et al.* 2009].

A 49-year-old man who believed he was being followed by the police swallowed an '8-ball of meth' (one-eighth of an ounce of metamfetamine, equivalent to ~3 g). Levels of 3 mg/L metamfetamine were found in blood samples taken in hospital; postmortem femoral blood levels were 30 mg/L [Kiely *et al.* 2009].

There is another report of a fatality in a 39-year-old man who at postmortem was found to have 158 columned-shaped packages wrapped in tinfoil and plastic containing a total of 390 g metamfetamine in his alimentary tract. One package in his stomach had ruptured and was empty. Postmortem levels of metamfetamine were cardiac blood 24.5 mg/L, urine 191 mg/L, liver 116 mg/L and gastric contents 1045 mg/L [Li *et al.* 2009].

For other reports of fatalites associated with metamfetamine, see Logan *et al.* [1996], Molina, Jejurikar [1999], Sribanditmongkol *et al.* [2000] and Yamamoto *et al.* [1991]. For a report of recovery after overdose with ~2.3 g metamfetamine administered IV, see Buffum, Shulgin [2001].

Half-life Plasma half-life, ~9 h.

Dose 2.5 to 25 mg of metamfetamine hydrochloride daily, orally; 15 to 20 mg IM, or 10 to 15 mg IV.

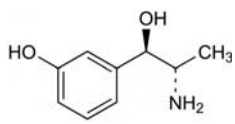
Metaraminol

Sympathomimetic
$C_9H_{13}NO_2 = 167.2$
CAS—54-49-9

IUPAC Name 3-[(1*R*,2*S*)-2-Amino-1-hydroxypropyl]phenol
Synonyms (α*R*)-α-[(1*S*)-1-Aminoethyl]-3-hydroxybenzenemethanol; hydroxynorephedrine.



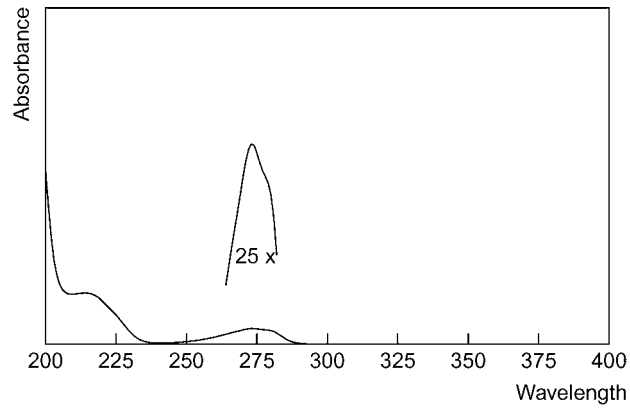
Chemical Properties pK_a 8.6. Log *P* (octanol/water), −0.3.

Metaraminol Tartrate

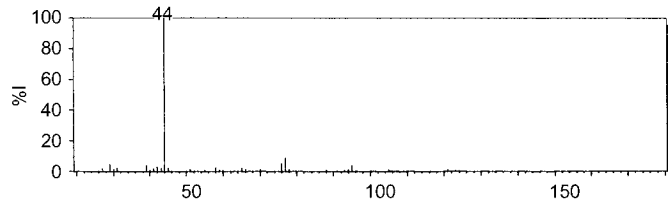
$C_9H_{13}NO_2,C_4H_6O_6 = 317.3$
CAS—33402-03-8

Synonyms Metaradrini bitartras; metaraminol acid tartrate; metaraminol bitartrate.
Proprietary Names *Aramin(e)*; *Levicor.*
Chemical Properties A white crystalline powder. Mp 176° to 177°. Soluble 1 in 3 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Folin-Ciocalteu reagent—blue; Mandelin's test—blue.
Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.18; system TL—R_f 0.24; system TAE—R_f 0.13; system TAF—R_f 0.76; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.20 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—metaraminol-AC_3 RI 2065.
High Performance Liquid Chromatography System HA—*k* 0.9; system HX—RI 84.
Ultraviolet Spectrum Aqueous acid—272 nm (A^1_1=110a); aqueous alkali—238 (A^1_1=533b), 292 nm (A^1_1=180b).



Infrared Spectrum Principal peaks at wavenumbers 1263, 1304, 1216, 1591, 1136, 1063 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 44, 77, 76, 29, 95, 39, 58, 42.

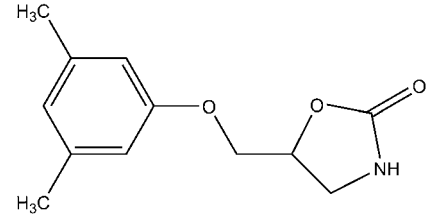


Dose The equivalent of 2 to 10 mg of metaraminol, subcutaneously or intramuscularly.

Metaxalone

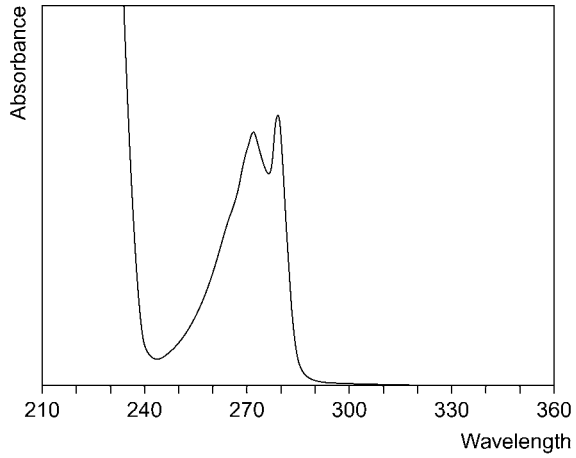
Oxazolidine, Skeletal Muscle Relaxant
$C_{12}H_{15}NO_3 = 221.3$
CAS—1665-48-1

IUPAC Name 5-[(3,5-Dimethylphenoxy)methyl]-1,3-oxazolidin-2-one
Synonyms AHR-438; 5-(3,5-xylyloxymethyl)oxazolidin-2-one.
Proprietary Name *Skelaxin*

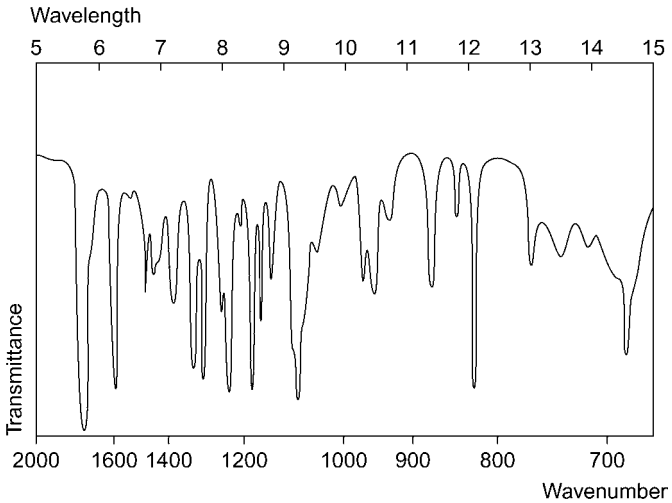


Chemical Properties White, odourless, bitter crystalline powder. Mp 121° to 125°. Freely soluble in chloroform, soluble in alcohol and propylene glycol, very slightly soluble in water [Kleber *et al.* 1964].
Colour Test Add 2 mL of a 1 in 1000 solution of vanillin in sulfuric acid solution (65 in 100) to 1 mL of a 1 mg/mL metaxalone solution in sulfuric acid solution—A cherry-red solution develops in approx. 10 min [Kleber *et al.* 1964].

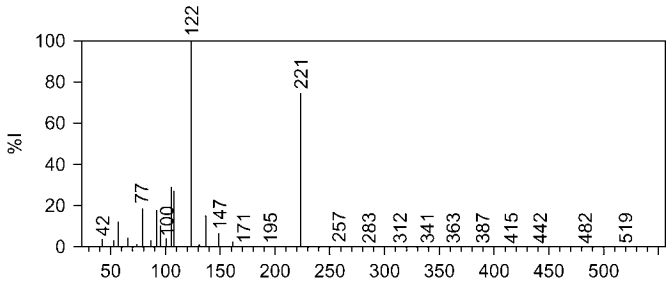
Ultraviolet Spectrum Alcohol—280, 272 nm [Kleber *et al.* 1964].



Infrared Spectrum See Kleber *et al.* [1964].



Mass Spectrum Principal ions at *m/z* 122, 221, 105, 91 [Poklis *et al.* 2004].



Quantification

Blood **GC** Column: DB-5 5% phenylmethyl silicone (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° for 1 min to 260° at 25°/min for 6 min. NPD. Limit of quantification, 25 µg/L [Moore *et al.* 2005]. Column: DB-5 (15 m × 0.53 mm i.d., 1.5 µm). Carrier gas: He, 18 mL/min. Temperature programme: 120° to 300° at 20°/min. FID. Retention time: 6.4 min. Limit of quantification not reported [Poklis *et al.* 2004].

GC-MS Column: HP-5 (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 30°/min to 260° at 10°/min to 300° at 20°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of quantification, 2.5 mg/L [Moore *et al.* 2005]. Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° for 2 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, full scan mode. Limit of quantification not reported [Poklis *et al.* 2004]. Column: HP-1 methyl silicone (12.5 m × 0.2 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° to 280° at 20°/min. Full scan mode. Limit of quantification, 5 mg/L [Gruszecki *et al.* 2003].

Plasma **LC-MS** Column: C_{18} (150 × 3.9 mm i.d., 5 µm). Mobile phase: 0.5% glacial acetic acid : acetonitrile (20 : 80), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification not reported [Mistri *et al.* 2007]. Column: C_{18} (150 × 3.9 mm i.d., 5 µm). Mobile phase: 0.03% formic acid : acetonitrile (20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 50 µg/L [Nirogi *et al.* 2006].

Urine **GC** See Blood [Poklis *et al.* 2004].

GC-MS Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° for 2 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, full scan mode. Limit of quantification not reported [Poklis *et al.* 2004].

Vitreous Humour **GC** See Blood [Poklis *et al.* 2004].

GC-MS See Blood [Poklis *et al.* 2004].

Stomach Contents **GC** See Blood [Poklis *et al.* 2004].

GC-MS See Blood [Gruszecki *et al.* 2003; Poklis *et al.* 2004].

Bile **GC** See Blood [Poklis *et al.* 2004].

GC-MS See Blood [Poklis *et al.* 2004].

Brain **GC-MS** See Blood [Gruszecki *et al.* 2003].

Liver **GC** Column: DB-5 5% phenylmethyl silicone (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° for 1 min to 260° at 25°/min for 6 min. NPD. Limit of quantification, 5.0 mg/L [Moore *et al.* 2005]. See Blood [Poklis *et al.* 2004].

GC-MS See Blood. Limit of quantification, 5.0 mg/L [Moore *et al.* 2005]. See Blood [Gruszecki *et al.* 2003; Poklis *et al.* 2004].

Disposition in the Body Metaxalone is absorbed from the gastrointestinal tract, metabolised in the liver, and excreted in urine as metabolites. One metabolite is formed by the oxidation of 1 of the methyl groups to the carboxy analogue and appears in the urine as the glucuronide conjugate. Approximately 27% of the dose is excreted unchanged in urine and between 15 and 30% recovered is in faeces as metaxalone and its acid metabolite.

Therapeutic Concentration

A group of 6 healthy volunteers were administered an oral dose of 800 mg metaxalone under both fasted and fed conditions. Mean peak plasma concentrations were approx. 4.0 and 1.8 mg/L in the fed and fasted studies, respectively, achieved within 5 to 6 h. Similar results were obtained in another study where, after a single 400 mg metaxalone oral dose was administered to healthy volunteers under fasted conditions, a peak plasma concentration of approx. 866 µg/L was reached after 3.3 h. When the same dose was administered after a high-fat meal, the peak plasma concentration increased by between 115 and 178% [Nirogi *et al.* 2006].

Toxicity

A 21-year-old female was found dead in her bedroom. She had been prescribed multiple medications including metaxalone. The following postmortem drug concentrations were found in aortic blood: 19 mg/L metaxalone, 190 mg/L paracetamol, 0.28 mg/L hydrocodone, and <0.1 mg/L diazepam, nordiazepam, amitriptyline and nortriptyline. The following metaxalone concentrations were reported in other specimens: 17 mg/L in femoral blood, 44 mg/L in bile, 70 mg/kg in liver, 7 mg/L in urine, 202 mg/kg in gastric contents and 14 mg/L in vitreous humour [Poklis *et al.* 2004].

A 29-year-old female with cartilage-hair hypoplasia (a syndrome of short-limbed dwarfism) was found dead alongside 2 prescription bottles for forty 400 mg tablets of metaxalone and an empty litre bottle of wine. One of the metaxalone bottles was empty and the other contained 21 tablets. Femoral and heart blood concentrations were 39 and 54 mg/L, respectively. Brain and liver concentrations were 163 and 195 mg/kg, respectively. Total gastric and duodenum contents were 75 and 164 mg, respectively. Citalopram, ethanol, chlorphenamine and caffeine were also detected but at levels below those consistent with fatalities for these substances [Gruszecki *et al.* 2003].

A 54-year-old female with a history of pancreatitis and lower limb myopathy was found dead alongside several bottles of medication (flurazepam, gabapentin, citalopram, paracetamol and metaxalone). The measured blood and liver metaxalone concentrations were 21 mg/L and 82 mg/kg, respectively. The following blood concentrations were also found: 97 mg/L paracetamol, 0.4 mg/L citalopram and 24 mg/L gabapentin [Moore *et al.* 2005].

Half-life After a high-fat meal, 2 to 3 h; under fasted conditions, 9.2 h.

Dose Oral 800 mg three or four times daily.

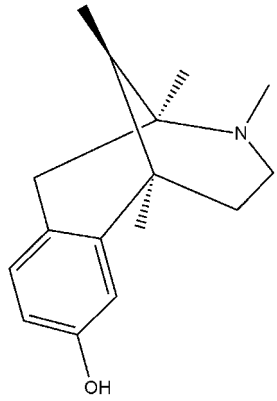
Metazocine

Narcotic

$C_{15}H_{21}NO$ = 231.3

CAS—114-91-0

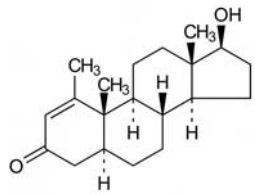
Synonyms 1,2,3,4,5,6-Hexahydro-8-hydroxy-3,6,11-trimethyl-2,7-methano-3-benzazocine; NIH 7410.



Chemical Properties Occurs as crystals from methanol. Mp 232° to 235°. Metazocine is extracted by organic solvents from aqueous alkaline solutions.
Colour Tests Ammonium molybdate test—bright blue→green (limit of detection, 1.0 µg); ammonium vanadate test—greenish-brown (limit of detection, 1.0 µg); formaldehyde-sulfuric acid test—brown→greenish-grey→dull grey (limit of detection, 1.0 µg); Vitali's test—yellow/yellow/bright orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.21 (location reagents: acidified iodoplatinate spray, positive reaction; potassium permanganate spray, positive reaction).

Metenolone

Anabolic Steroid
$C_{20}H_{30}O_2$ = 302.5
CAS—153-00-4
IUPAC Name (5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-17-Hydroxy-1,10,13-trimethyl-4,5,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[*a*]phenanthren-3-one
Synonyms (5α,17β)-17-Hydroxy-1-methylandrost-1-en-3-one; methenolone.



Chemical Properties A crystalline powder. Mp 149.5° to 152°, also reported as 160° to 161°. Log *P* (octanol/water), 3.69.

Metenolone Acetate
$C_{22}H_{32}O_3$ = 344.5
CAS—434-05-9
Synonyms NSC-74226; SH-567; SQ-16496.
Proprietary Names *Primobolan*; *Primonabol*.
Chemical Properties Mp 138°. Soluble in methanol, ether and chloroform.

Metenolone Enantate
$C_{27}H_{42}O_3$ = 414.6
CAS—303-42-4
Synonyms Methenolone anantate; metenolone enanthate; methenolone oenanthate; NSC-64967; SH-601; SQ-16374.
Proprietary Names *Primobolan-Depot*; *Primonabol-Depot*.

Thin-layer Chromatography System TE—R_f 0.87; system TF—R_f 0.62; system TAE—R_f 0.92.

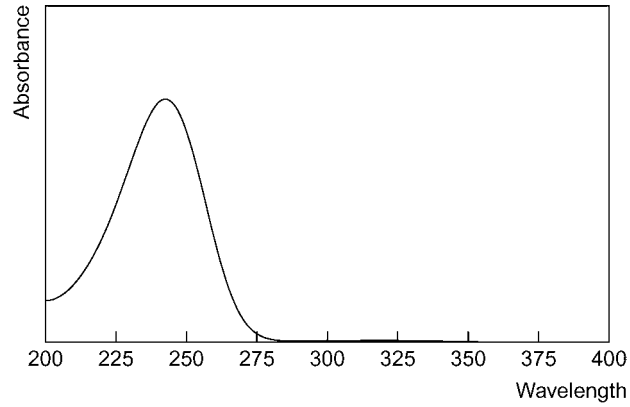
System 1: plate: silica gel IB2-F (Baker-flex with a fluorescent indicator). Mobile phase: *n*-hexane : ethylacetate (6:4). R_f 0.35.

System 2: plate: silica gel 60 F_{254} (silanised pre-coated). Mobile phase: acetone : water (3:1). R_f 0.62. UV detection (λ = 254 nm) or 2,4-dinitrophenylhydrazine reagent [Cavrini *et al.* 1983].
Gas Chromatography System GAI—metenolone RRT 0.993; 1-methylen-5α-androstan-3α-ol-17-one RRT 0.905 (both relative to 17α-methyl-5α-androstan-3β,17β-diol).

Column: 5% phenylmethylpolysiloxane cross-linked capillary (30 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 150° for 2 min, to 300° at 20°/min, held for 2 min. Injector temperature: 280°. IS: 1,2-d_2-testosterone. MS detection (NCI, precursor ion *m/z* 428). Retention time: metenolone metabolite (PFP derivative), 9.1 min [Choi *et al.* 1998].

High Performance Liquid Chromatography System HX—RI 809; system HATa—metenolone acetate RRT 1.26, metenolone enantate RRT 1.87(both relative to testosterone); system HATb—metenolone acetate RRT 3.54(relative to testosterone).

Column: RP monomeric C_{18} MicroPack MCH-10 (300 × 4.0 mm i.d., 10 µm). Mobile phase: acetonitrile : water (92:8), flow rate 2 mL/min. UV detection (λ=240 nm). Retention time: metenolone, 2.9 min; metenolone acetate, 3.5 min; metenolone enantate, 9.1 min [Cavrini *et al.* 1983].
Ultraviolet Spectrum Principal peak at 243 nm.

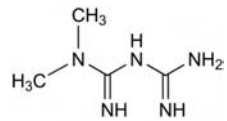


Infrared Spectrum Principal peaks at wavenumbers 1655, 1600, 1290, 1210, 1125, 1075 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 136, 123, 148, 83, 93, 107, 161, 67 (acetate); 136, 43, 123, 148, 161, 113, 83, 414.
Disposition in the Body Metenolone is metabolised and excreted in urine as the parent drug and its metabolites including, 1-methylen-5α-androstan-3α-ol-17-one.
Toxicity Moderately toxic by ingestion and IP routes.
Dose A usual dose of 10 to 20 mg daily is administered orally as the acetate and intramuscularly as the enanthate in doses of 100 mg every 2 to 4 weeks.

Cavrini V *et al.* (1983). *Int J Pharm* 13: 333–343.
Choi M *et al.* (1998). Determination of four anabolic steroid metabolites by gas chromatography/mass spectrometry with negative ion chemical ionization and tandem mass spectrometry. *Rapid Commun Mass Spectrom* 12: 1749–1755.

Metformin

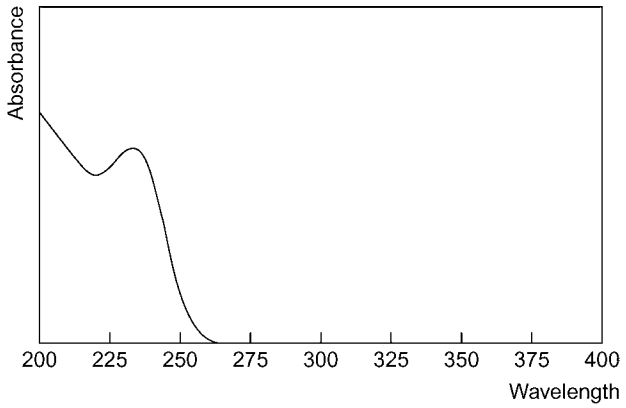
Antidiabetic
$C_4H_{11}N_5$ = 129.2
CAS—657-24-9
IUPAC Name *N,N*-Dimethylimidodicarbonimidic diamide
Synonym LA-6023



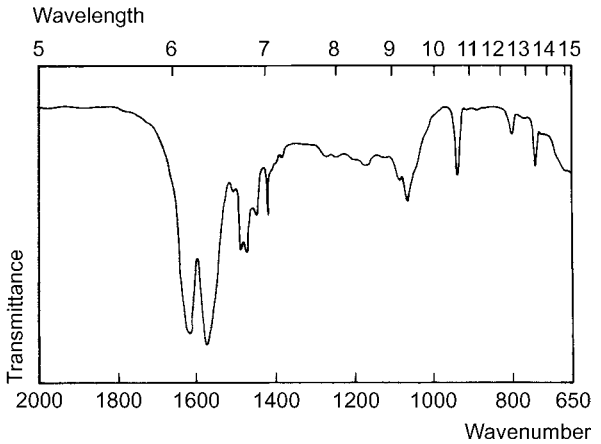
Chemical Properties pK_a 2.8, 11.5 (32°). Log *P* (octanol/water), −2.6.

Metformin Hydrochloride
$C_4H_{11}N_5$,HCl = 165.6
CAS—1115-70-4
Proprietary Names *Biocos*; *Diabesin*; *Diabetase*; *Diabetex*; *Diabex*; *Diaformin*; *Diformin*; *Glifage*; *Glucamet*; *Glucinan*; *Glucobon*; *Glucoformin*; *Glucohexal*; *Glucomet*; *Glucophage*; *Glycon*; *Glymax*; *Mediabet*; *Meglucon*; *Mescorit*; *Met*; *Metfirex*; *Metforem*; *Metiguanide*; *Novomet*; *Orabet*; *Stagid*.
Chemical Properties A white, hygroscopic, crystalline powder. Mp ~225°. Soluble 1 in 2 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

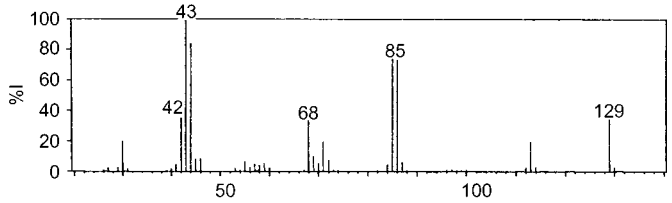
Thin-layer Chromatography System TA—R_f 0.01; system TAD—R_f 0.00; system TAE—R_f 0.03, R_f 0.93; system TAF—R_f 0.48; system TL—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00, R_f 0.80 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted; system GB—metformin, not eluted, metformin-nitrobenzoyltriazine RI 3050.
High Performance Liquid Chromatography System HX—RI 60; system HZ—RT 1.7 min; system HAA—RT 2.8 min.
Ultraviolet Spectrum Methanol—236 nm (A^1_1 = 1163b).



Infrared Spectrum Principal peaks at wavenumbers 1580, 1620, 1063, 1075, 935, 740 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 44, 85, 86, 42, 129, 68, 30.



Quantification

Plasma **GC** Column: 3% OV-17 on silanised Chromosorb W 80/100 mesh (2.0 m × 3 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 250°. AFID. Limit of detection, 25 µg/L [Brohon, Nöel 1978].

HPLC Column: reversed-phase phenyl type. Mobile phase: phosphate : acetonitrile, flow rate 1.0 mL/min. UV detection (λ= 236 nm). Retention time: 7.5 min. Limit of quantification, 30 µg/L [Porta *et al.* 2008]. Mobile phase: 10 µmol/L ammonium formate buffer : 0.1% formic acid in acetonitrile. SRM acquisition mode. Limit of quantification, 1–5 µg/L [Wang, Miksa 2007]. Column: Phenomenex Luna CN 100A (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 30 µmol/L ammonium acetate pH 5.0 (80 : 20), flow rate 0.2 mL/min. Limit of detection, 1 µg/L [Zhang *et al.* 2007]. Column: silica (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : 40 µmol/L aqueous sodium dihydrogen phosphate (pH 6, 25 : 75). Limit of quantification, 15.6 g/L [Amini *et al.* 2005]. UV detection (λ= 236 nm). Limit of quantification, <20 µg/L [Zhang *et al.* 2002]. See also Bonfigli *et al.* [1999], Cheng, Chou [2001], Charles *et al.* [1981], Huupponen *et al.* [1992], Kah, Kok [1998] and Vesterqvist *et al.* [1998],

LC-MS Column: HyPurity C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 3.0, 70 : 30), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 1.5 min. Limit of quantification, 20 µg/L [Mistri *et al.* 2007]. Column: Nucleosil C_{18} column (50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 10 µmol/L ammonium acetate pH 7.0 (20 : 20 : 60), flow rate 0.65 mL/min. APCI source, MRM acquisition mode. Limit of detection, 0.25 µg/L [Wang *et al.* 2004]. Column: C_8, (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : formic acid (70 : 30 : 1), flow rate 0.5 mL/min. APCI, positive ion mode, SRM acquisition mode. Limit of quantification, 2 µg/L [Chen *et al.* 2004]

Urine **GC** See Plasma [Brohon, Nöel 1978].

HPLC See Plasma [Charles *et al.* 1981].

Breast Milk **HPLC** See Plasma [Zhang *et al.* 2002].

Disposition in the Body Metformin is slowly absorbed after oral administration. Approximately 30–50% of an oral dose is excreted in the urine as unchanged drug in 24 h, and ~30% of the dose is eliminated unchanged in the faeces.

Therapeutic Concentration

Following single oral doses of 0.5 g and 1.5 g to 4 subjects, peak plasma concentrations of 0.59–1.3 mg/L (mean 1.0) and 1.8–4.0 mg/L (mean 3.1), respectively, were attained in ~2 h [Tucker *et al.* 1981].

Following daily oral doses of 0.5 g to 6 subjects, 1.7 g to 13 subjects and 2.5 g to 12 subjects, mean steady-state plasma concentrations of 0.16, 0.38 and 1.0 mg/L, respectively, were reported [Sirtori *et al.* 1978].

Toxicity

Plasma and urine concentrations of 85 and 389 mg/L, respectively, were reported in 1 subject, 12 h after the ingestion of 25.5 g; death occurred after 2 weeks [Larcan *et al.* 1979].

A 58-year-old man who died after ingesting ~20 g metformin plus 4.8 g diltiazem had an initial metformin level of 110 mg/L [Barrueto *et al.* 2002].

Bioavailability ~50–60%.

Half-life Plasma half-life after IV administration, ~1.5–4 h; half-life derived from urinary excretion data, ~16 h.

Volume of Distribution Variously reported as 1–4 L/kg.

Clearance Plasma clearance, ~7–10 mL/min/kg.

Protein Binding Not significantly bound.

Note For a review of the clinical pharmacokinetics of metformin, see Scheen [1996].

Dose Metformin hydrochloride 1.5 to 3 g daily.

Methacholine Chloride

Parasympathomimetic

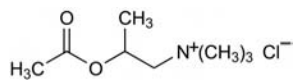
$C_8H_{18}ClNO_2$ = 195.7

CAS—55-92-5 (methacholine); 62-51-1 (chloride)

IUPAC Name 2-Acetyloxypropyl(trimethyl)azanium chloride

Synonyms Acetyl-β-methylcholine chloride; 2-(acetyloxy)-*N,N,N*-trimethyl-1-propanaminium chloride.

Proprietary Names *Amechol*; *Mecholyl*; *Provocholine*.



Chemical Properties Colourless, very hygroscopic crystals, or a white crystalline powder. Mp 170° to 173°. Soluble 1 in 0.4 of water, 1 in 1.2 of ethanol and 1 in 2.1 of chloroform; insoluble in ether. Log *P* (octanol/water), −3.0.

M

Methacholine Bromide

$C_8H_{18}BrNO_2$ = 240.1
CAS—333-31-3

Chemical Properties A white, very hygroscopic, crystalline powder. Mp about 148°. Soluble 1 in 0.3 of water, 1 in 0.8 of ethanol (90%) and 1 in 1.3 of chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).

Infrared Spectrum Principal peaks at wavenumbers 1739, 1248, 1066, 1632, 972, 1128 cm^{-1} (KBr disk).

Dose Methacholine has been given subcutaneously in doses of 10 to 25 mg (chloride), or orally in doses of 200 to 600 mg daily (bromide).

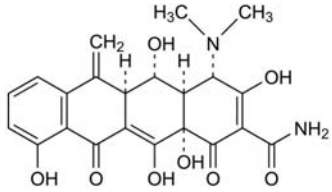
Methacycline

Antibiotic

$C_{22}H_{22}N_2O_8$ = 442.4
CAS—914-00-1

IUPAC Name (2*Z*,4*S*,4*aR*,5*S*,5*aR*,12*aS*)-2-[Amino(hydroxy)methylidene]-4-(dimethylamino)-5,10,11,12*a*-tetrahydroxy-6-methylidene-4,4*a*,5,5*a*-tetrahydrotetracene-1,3,12-trione

Synonyms [4*S*-(4α,4aα,5α,5aα,12aα)-4-Dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-2-naphthacenecarboxamide; méthylènecycline; 6-methyleneoxytetracycline.



Chemical Properties pK_a 3.1, 7.6, 9.5 (20°). Log *P* (octanol/pH 7.5), −0.4.

Methacycline Hydrochloride

$C_{22}H_{22}N_2O_8$,HCl = 478.9
CAS—3963-95-9

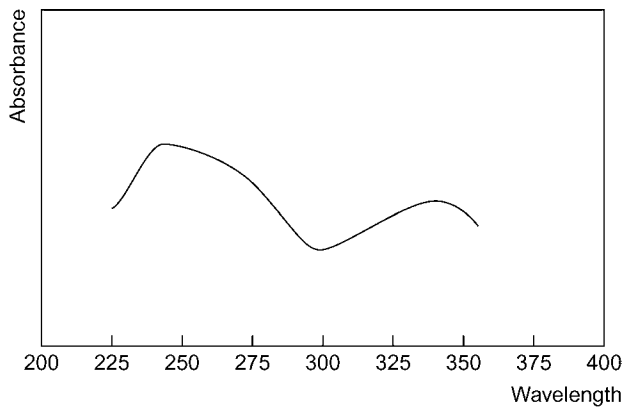
Proprietary Names *Esarondil*; *Lysocline*; *Optimycin*; *Physiomycine*; *Rondomycin (e)*; *Rotilen*; *Stafilon*.

Chemical Properties A yellow crystalline powder. Mp about 205°, with decomposition. Soluble 1 in 65 to 1 in 100 of water, 1 in 80 to 1 in 300 of ethanol and 1 in 30 of methanol; practically insoluble in chloroform and ether.

Colour Tests Benedict's reagent—red; formaldehyde-sulfuric acid—red-orange; Mandelin's test—yellow→orange→violet; Marquis test—orange; sulfuric acid—red.

Thin-layer Chromatography System TA—R_f 0.05, streaking (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—243 (A^1_1=524a), 340 nm.



Infrared Spectrum Principal peaks at wavenumbers 1615, 1575, 1658, 1224, 1258, 1206 cm^{-1} (KBr disk).

Dose Usually 600 mg of methacycline hydrochloride daily.

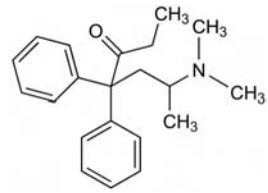
Methadone

Narcotic Analgesic

$C_{21}H_{27}NO$ = 309.5
CAS—76-99-3; 297-88-1 (±)

IUPAC Name 6-Dimethylamino-4,4-diphenyl-3-heptanone

Synonyms Amidine; amidone.



Chemical Properties Mp 78°. It is soluble in water at 48.5 mg/L (25°). pK_a 8.3 (20°); 8.94 (25°). Log *P* (octanol/pH 7.4), 2.1; (octanol/water), 3.93. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Methadone Hydrochloride

$C_{21}H_{27}NO$,HCl = 345.9
CAS—1095-90-5; 125-56-4 (±)

Synonyms Methadoni hydrochloridum; phenadone.

Proprietary Names *Adolan*; *Biodone*; *Dolmed*; *Dolophine*; *Eptadone*; *Heptadon*; *Ketalgine*; *Mephenon*; *Metasedin*; *Methaddict*; *Methadose*; *Methex*; *Pallidone*; *Phymet DTF*; *Physeptone*; *Pinadone DTF*; *Symoron*; *Synastone*.

Chemical Properties Colourless crystals or white crystalline powder. Mp 235° (platelets from alcohol and ether). Solubility (g/100 mL): water 12, alcohol 8, propan-2-ol 2.4; practically insoluble in ether and glycerol.

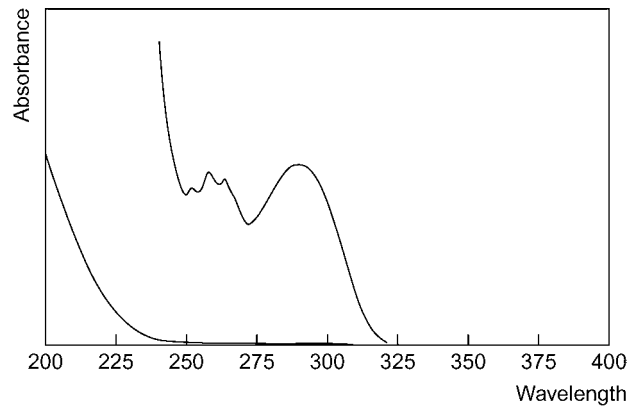
Colour Test Liebermann's reagent—brown-orange; Mandelin's test—green→blue

Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.59; system TC—R_f 0.20; system TE—R_f 0.77; system TL—R_f 0.27; system TAE—R_f 0.16; system TAF—R_f 0.60; system TAJ—R_f 0.08; system TAK—R_f 0.00; system TAL—R_f 0.45 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).

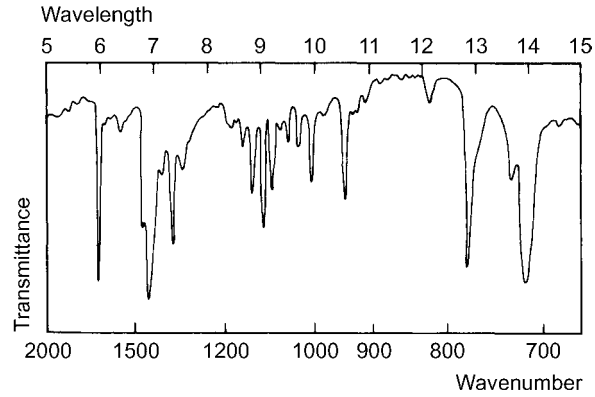
Gas Chromatography System GA—methadone RI 2145, M (2-ethylidene-1,5-dimethyl-3,3-diphenylpyrrolidine (EDDP)) RI 2040, M (2-ethyl-5-methyl-3,3-diphenyl-1-pyrroline (EMDP)) RI 2021, M (nor-) RI 2095; system GB—methadone RI 2228, M (EDDP) RI 2120, M (EMDP) RI 2069; system GC—RI 2470; system GF—methadone RI 2370, M (EDDP) RI 2280, M (EMDP) RI 2190; system GM—methadone RRT 0.606, M (EDDP) RRT 0.520 (both relative to irpindole).

High Performance Liquid Chromatography System HA—methadone *k* 2.2, M (EDDP) *k* 2.8, M (EMDP) *k* 0.2; system HC—*k* 1.03; system HX—RI 440; system HY—RI 343; system HZ—RT 8.5 min; system HAA—RT 15.8 min; system HAX—RT 16.5 min; system HAY—RT 8.4 min.

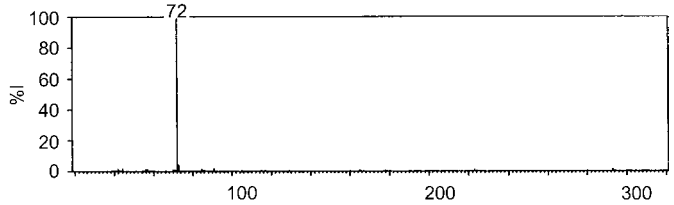
Ultraviolet Spectrum Aqueous acid—253, 259, 264, 292 nm (A^1_1= 18a).



Infrared Spectrum Principal peaks at wavenumbers 710, 1709, 769, 1107, 943, 1133 cm^{-1} (methadone hydrochloride, (Nujol mull)).



Mass Spectrum Principal ions at *m/z* 72, 73, 91, 293, 223, 165, 85, 71 (methadone); 208, 193, 130, 115, 91, 165, 179, 207 (EMDP).



Quantification

Blood **GC** Column: 3% OV-101 plus 0.1% potassium hydroxide on Chromosorb W-HP 100/120 mesh (1.8 m (6 ft) × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 215°. AFID. Limit of detection, <0.005 mg/L [Jacob *et al.* 1981]. FID. Limit of detection, 0.02 mg/L [Thompson, Caplan 1977].

GC-MS Column: DB-35MS (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 2.0 mL/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 25 μg/L, limit of detection, 10 μg/L [Gunnar *et al.* 2006].

LC-MS Column: Chiral-AGP (100 mm × 4.0-mm i.d., 5 μm). Mobile phase: acetonitrile : 10 μmol/L ammonium acetate buffer (pH 7.0, 22 : 78). ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.003 mg/kg, limit of detection, 0.001 mg/kg. [Johansen, Linnet 2008].

Plasma **GC** Column: Silica SE-52-CB (13 m × 0.25-mm i.d., 0.25 μm). Carrier gas: He, 50 psi. Temperature programme: 70° to 240° at 20°/min. NPD. Retention time: 11.9 min. Limit of quantification, 500 μg/L [Schmidt *et al.* 1993]. See Blood [Jacob *et al.* 1981].

GC-MS Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 80° to 270° at 40°/min for 2 min to 300° at 40°/min for 4 min. EI ionisation. Limit of quantification, 2 μg/L, limit of detection, 0.6 μg/L. [Nikolaou *et al.* 2008]. Column: HP-5 phenylmethylsiloxane (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 1 min to 210° at 50°/min to 240° at 5°/min to 290° at 60°/min for 2 min. EI ionistaion at 70 eV, SIM acquisition mode. Limit of quantification, 20 μg/L, limit of detection, 6 μg/L [Bermejo *et al.* 2000]. Column: 3% OV-17 on 80/100 mesh Chromosorb W HP (1.6 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 200° to 270° at 10°/min. EI ionisation at 70 eV Limit of detection, 0.04 mg/L [Kang, Abbott 1982]. See also Alburges *et al.* [1996].

HPLC Column: reversed phase C_8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: phosphate buffer containing TEA : methanol : acetonitrile (pH 6.0, 40 : 50 : 10). Limit of quantification, 1 μg/L, limit of detection, 400 ng/L [Mercolini *et al.* 2007]. Column: X-Terra RP8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.02 mol/L phosphate buffer (pH 6.53, 10 : 90 to 15 : 85 at 5 min to 20 : 80 at 7 min to 35 : 65 at 10 min to 50 : 50 at 15 min for 5 min to 10 : 90 at 22 min), flow rate 0.7 mL/min for 5 min to 0.8 mL/min until 20 min to 0.7 mL/min. DAD (λ= 292 nm). Retention time: 18.9 min. Limit of detection, 0.049 mg/L [Fernandez *et al.* 2006]. Column: reversed phase Zorbax (150 × 4.6 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium formate (pH 4.0) : acetonitrile (97 : 3 for 2 min to 87 : 13 at 2.6 min to 84.5 : 15.5 at 8.0 min to 20 : 80 at 8.1 min until 11 min to 97 : 3 at 11.1 min until 15 min), flow rate 1.0 mL/min. TIS, MRM acquisition mode. Retention time: 10.8 min. Limit of detection, 5 μg/L [Rook *et al.* 2005]. Column: Cyclobond Type I-Beta RSP. Mobile phase: acetonitroile : methanol; 1% TEA (pH 6.0, 200 : 50 : 750), flow rate 0.6 mL/min. UV detection (λ= 210 nm). Limit of quantification, 5 μg/L. [Norris *et al.* 1994]. See also Buice *et al.* [1982] and Schmidt *et al.* [1992].

LC-MS Column: chiral-AGP (100 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate buffer (pH 7.0, 18 : 82), flow rate 0.9 mL/min. MSD, SIM acquisition mode. [Rodriguez-Rosas *et al.* 2007].

Note For a fluorescence polarisation immunoassay for the quantification of methadone, see Beck *et al.* [1990] and Kell, Techman [1996].

Serum **GC** Column: 3% SP-2250 on Supelcoport 100/120 mesh (1.8 m × 3 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 220°. TID. Limit of detection, 1.5 μg/L [Chikhi-Chorfi *et al.* 1998].

HPLC Column: Cyclobond I-2000 RSP (250 × 4.6 mm i.d., 0.45 μm). Mobile phase: 0.1% TEA : 0.6% glacial acetic acid (pH 5.0), flow rate 0.3 mL/min. UV detection (λ= 220 nm). Limit of quantification, 2.5 μg/L [Boulton, DeVane 2000]. Column: Cyclobond 1-2000 RSP. UV detection (λ= 210 nm) [Pham-Huy *et al.* 1997]. Column: Chiral-AGP (100 × 4.0 mm i.d., 5 μm). Mobile phase: propan-2-ol : 10 mmol/L phosphate buffer: *N,N*-dimethyloctylamine (pH 6.6, 900 : 100 : 1), flow rate 0.6 mL/min. UV detection (λ= 205 nm). Limit of quantification, 25 μg/L, limit of detection, 10 μg/L [Rudaz, Veuthey 1996]. Column: CN and Chiral AGP. Mobile phase: acetonitrile : dimethyloctylamine : phosphate buffer. UV detection (λ= 200 nm). Limit of quantification, 5 nmol/L [Kristensen *et al.* 1994].

Urine **GC** Carrier gas: N_2, 1.0 mL/min. Temperature programme: 100° for 0.5 min to 300° at 20°/min for 3 min. NPD. Limit of detection, 0.001 mg/L [Myung *et al.* 1999]. See Serum [Chikhi-Chorfi *et al.* 1998]. See Plasma [Schmidt *et al.* 1993]. See Blood [Jacob *et al.* 1981; Thompson, Caplan 1977].

GC-MS Column: BPX5 (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 100° for 1 min to 310° at 20°/min for 3.5 min. PICI, full scan mode. Limit of quantification, 20 μg/L, limit of detection, 10 μg/L [Moore *et al.* 2001]. See Plasma [Alburges *et al.* 1996].

HPLC Column: Cyclobond I 2000 RSP (250 × 4.6 mm i.d.). Mobile phase: methanol : acetonitrile : 1% TEA (pH 6.0, 9 : 11 : 80), flow rate 1.0 mL/min. UV detection (λ= 210 nm). Limit of quantification, 0.125 μmol/L [Foster *et al.* 2000]. See Serum [Boulton, DeVane 2000]. Column: SymmetryShield RP18 (150 × 3.9 mm i.d., 5 μm). Mobile phase: 0.1% trifluroacetic acid : methanol (60 : 40), flow rate 1.0 mL/min. UV detection (λ= 210 nm). Limit of detection, 20 μg/L [Cheng *et al.* 1999]. Column: LiChrospher RP8 coupled in series with a chiral AGP. UV detection (λ= 200 nm). Limit of quantification, 0.03 μmol [Angelo *et al.* 1999]. See Serum [Pham-Huy *et al.* 1997].

CSF **GC** See Plasma [Schmidt *et al.* 1993].

Oral Fluid **GC** See Serum [Chikhi-Chorfi *et al.* 1998].

GC-MS Column: HP-5 (12 m × 0.22 mm i.d., 0.33 μm). Temperature programme: 90° for 2 min to 200° at 30°/min for 5 min to 290° at 30°/min. EI ionisation at 70 eV. Limit of quantification, 45 μg/L, limit of detection, 4 μg/L [dos Santos Lucas *et al.* 2000]. See Plasma [Kang, Abbott 1982].

Meconium **GC-MS** Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 38 cm/s. Temperature programme; 150° for 0.5 min to 240° at 30°/min for 7.5 min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 ng/g, limit of detection, 10 ng/g [Elsohly *et al.* 2001].

HPLC DAD [Stolk *et al.* 1997].

Sweat **GC-MS** Column: chiral-AGP (100 × 4 mm i.d., 5 μm). Mobile phase: propan-2-ol : 2 mmol/L ammonium carbonate buffer (pH 5.8, 8 : 92 for 8 min to 20 : 80 at 9 min until 18 min to 8 : 92 at 18.5 min), flow rate 500 μL/min. ESI, positive ion mode. Limit of detection, 2 ng/patch [Kintz *et al.* 1998].

Hair **GC-MS** Column: DB-5MS (15 × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 80° for 1 min to 280° at 20°/min for 4 min. PICI. Limit of quantification, 0.05 ng/mg, limit of detection, 0.01 ng/mg [Girod, Staub 2001]. Column: HP-5 (12 m × 0.22 mm i.d., 0.33 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 1 min to 200° at 30°/min for 5 min to 290° at 30°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 1 ng/mg [Lucas *et al.* 2000]. Column: HP-5-MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 2 min to 300° at 20°/min for 2 min. SIM acquisition mode. Limit of quantification, 0.1 ng/mg, limit of detection, 0.03 ng/mg [Sporkert, Pragst 2000a]. Column: HP 95% dimethylsiloxane 5% diphenylsiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 2 min to 205° at 30°/min to 240° at 2.5°/min to 290° at 30°/min. Retention time: 13.05 min. Limit of detection, 0.1 ng/mg [Sporkert, Pragst 2000b].

LC-MS Column: Zorbax SB-Phenyl (2.1 × 100 mm, 3.5 μm). Mobile phase: 25 mmol/L formic acid : acetonitrile (98 : 2 to 80 : 20 for 3 min to 10 : 90 in 4 min for 2 min). ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.0125 ng/mg [Hegstad *et al.* 2008].

Liver **GC-MS** See Plasma [Alburges *et al.* 1996].

Nail **GC-MS** [Lemos *et al.* 2000].

Note For an enzyme immunoassay for the quantification of methadone in serum, saliva and hair see Piekoszewski *et al.* [2001].

Disposition in the Body

Methadone is rapidly absorbed after oral administration and widely distributed in the tissues, with higher concentrations in the liver, lungs and kidneys than in the blood. It crosses the placental barrier and is also found in breast milk. Metabolism is mainly catalysed by the cytochrome P450 isozyme CYP3A4, but other isozymes may be involved. The main metabolic reaction is *N*-demethylation, resulting in a substance that spontaneously cyclises to form the major metabolites EDDP and EMDP, neither of which are active. Hydroxylation to methadol followed by *N*-demethylation to normethadol also occurs to some extent. Other metabolic reactions occur and there are at least eight known metabolites. In subjects on methadone maintenance, ~20–60% of a dose is excreted in the urine in 24 h, with up to ~33% of the dose as unchanged drug and up to ~43% as EDDP; EMDP accounts for ~5–10% of the dose. The ratio of EDDP to unchanged methadone is usually very much higher in the urine of patients on methadone maintenance treatment than in simple overdose cases. Urinary excretion of unchanged drug is pH dependent, being increased in acid urine. Up to 30% of a dose may be eliminated in the faeces, but this appears to decrease with increasing dosage. Approximately 75% of the total excreted material is unconjugated.

Therapeutic Concentration In plasma, usually in the range 0.05–1.0 mg/L. During methadone maintenance treatment, there are often considerable fluctuations in plasma concentrations from day to day, and there appears to be a decrease in concentration as dispositional tolerance develops.

Two regimens of epidural administration of methadone were compared in 90 patients requiring postoperative analgesia: 60 received initial doses of 3 to 6 mg followed by 6–12 mg every 24 h by continuous infusion for 72 h; a further 30 received repeated epidural boluses of 3–6 mg every 8 h for 72 h. The mean plasma methadone concentrations were as follows (mg/L):

	Continuous infusion	*Bolus infusion*
After 24 h	0.07769	0.11188
After 48 h	0.05029	0.07080
After 72 h	0.04905	0.07776

Both regimens provided satisfactory postoperative analgesia [Prieto-Alvarez *et al.* 2002].

In 180 patients receiving methadone maintenance therapy (10–350 mg daily), satisfactory abstinence from illicit opiates was obtained with an (*R*)-methadone plasma concentration of 0.25 mg/L and a racemic methadone concentration of 0.4 mg/L, with a higher specificity being calculated for

(*R*)-methadone; doses required to produce the required concentration could theoretically range from 55–921 mg daily in a 70 kg patient [Eap *et al.* 2000].

In 18 patients maintained on methadone 7.5–130 mg (0.12–1.9 mg/kg) daily for at least 2 months, opioid responses were strongly correlated with changes in plasma racemic methadone concentrations; peak plasma concentrations of 0.069–0.98 mg/L were achieved in ~3 h and pre-dose concentrations were 0.044–0.614 mg/L. Small changes in plasma concentrations had a relatively large effect on withdrawal severity [Dyer *et al.* 1999].

Twenty long-term opiate addicts were administered a mean oral dose of 60 mg methadone hydrochloride (range, 10–225). The peak plasma methadone concentrations varied from 0.124–1.255 mg/L and 0.01–0.301 mg/L and the steady-state concentrations from 0.065–0.63 mg/L and 0.005–0.055 mg/L [de Vos *et al.* 1995].

Toxicity The estimated minimum lethal dose is 50 mg, but addicts on maintenance treatment may tolerate doses of 200 mg or more. In non-addicted subjects, toxic reactions are associated with plasma concentrations in the region of 1–2 mg/L, and concentrations above 2 mg/L may be lethal. With serious overdose, respiratory depression, extreme somnolence including stupor or coma, skeletal muscle flaccidity, cold and clammy skin, bradycardia and hypotension may occur and with severe overdose, circulatory collapse, cardiac arrest and death can occur.

In 3 cases in which death was attributed to methadone overdose, liver concentrations of 1.9, 1.3 and 0.7 µg/g and urine concentrations of 13, 25 and 4 µg/L, respectively, were reported [Nelson, Selkirk 1975].

In 23 fatalities in which methadone was involved, the following postmortem tissue concentrations, mg/L or µg/g (mean, n), were reported:

	Methadone	*EDDP*
Blood	0–3 (1.2, 21)	0–0.4 (0.1, 10)
Bile	1.1–75 (13, 18)	0.2–315 (41, 18)
Brain	0.23–2.2 (0.9, 7)	—
Kidney	0.51–18.3 (3.5, 19)	0.5–3.1 (1.2, 14)
Liver	0.05–49.5 (6, 23)	0.02–2.7 (0.6, 16)
Lung	1.6–110 (16, 17)	0.01–0.98 (0.2, 10)
Spleen	1.6–20.9 (5.3, 7)	0–0.98 (0.7, 4)
Urine	0.52–76.2 (21, 22)	0.4–46.2 (11, 17)

[Garriott *et al.* 1973; Robinson, Holder 1973; Robinson, Holder 1974; Robinson, Williams 1971].

M

Methadone was held to be the sole cause of death in 55 out of 111 fatalities involving methadone; 50 of these victims were aged between 17 and 51 years and 5 were under 14. For the adult deaths, the mean methadone concentration was 0.584 mg/L (range, 0.084–2.7). For those aged 15 to 49 years, death was from a combination of methadone and other drugs in 56 cases (mean methadone concentration 0.576 mg/L; range, 0.049–2.44) [Milroy, Forrest 2000].

From 1997–1998, methadone was detected in 38 out of 3317 reported deaths in San Francisco, USA, and 17 of these deaths were deemed as being caused by methadone toxicity. The mean blood methadone concentration was 0.957 mg/L and the mean EDDP concentration was 0.253 mg/L. The mean ratio of methadone to EDDP in blood was 13.6 : 1.0 [Karch, Stephens 2000].

Half-life Plasma half-life after a single dose, 10–25 h (mean, 15); increased during long-term maintenance therapy to 13–55 h (mean, 30).

Volume of Distribution ~4 L/kg.

Clearance Plasma clearance, ~2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.3.

Protein Binding Approximately 92%, but there is considerable intersubject variation.

Dose For pain, initially, 2.5 to 10 mg methadone hydrochloride every 3 to 8 h; doses of 30 mg have been given. In treatment of opioid dependence, initially 10 to 20 mg daily, increased to achieve stabilisation to a usual dose of 40 to 60 mg daily.

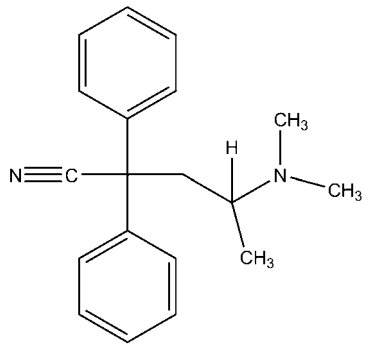
Methadone Intermediate

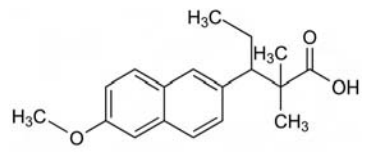
Narcotic Intermediate
$C_{19}H_{22}N_2$ = 278.4
Synonym 4-Cyano-2-(*N,N*-dimethylamino)-4,4-diphenylbutane



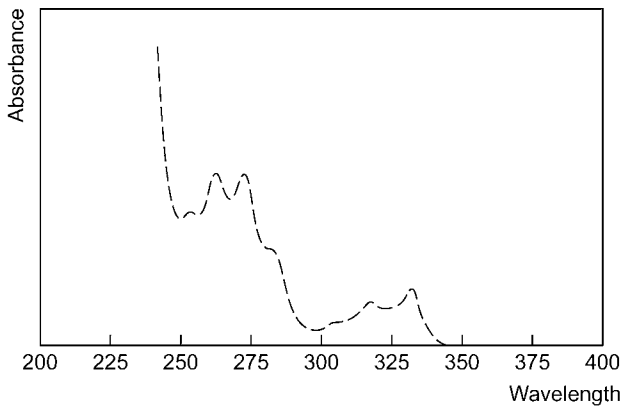
Chemical Properties Off-white powder. Slightly soluble in dilute acetic acid. Extracted by ether from aqueous alkaline solutions.
Thin-layer Chromatography System T1—R_f 0.65 and R_f 0.55 (location reagent acidified iodoplatinate spray, positive reaction).

Methallenestril

Oestrogen
$C_{18}H_{22}O_3$ = 286.4
CAS—517-18-0
IUPAC Name 3-(6-Methoxynaphthalen-2-yl)-2,2-dimethylpentanoic acid
Synonyms Methallenoestrol; 3-(6-methoxy-2-naphthyl)-2,2-dimethylvaleric acid.
Proprietary Name *Vallestril*



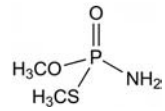
Chemical Properties A white crystalline powder. Mp about 138°. Very slightly soluble in water; soluble 1 in 10 of ethanol, 1 in 2 of chloroform and 1 in 8 of ether. Log *P* (octanol/water), 5.3.
Thin-layer Chromatography System TP—R_f 0.79; system TQ—R_f 0.18; system TR—R_f 0.70; system TS—R_f 0.54, streaking may occur.
Ultraviolet Spectrum Methanol—253, 264 (A_1^1=180a), 273 (A_1^1=180a), 317, 332 nm.



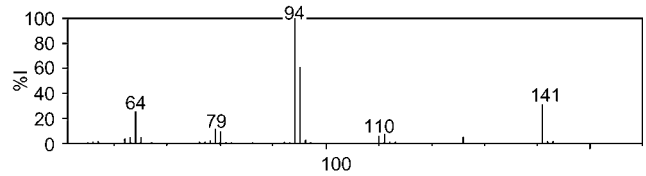
Infrared Spectrum Principal peaks at wavenumbers 1689, 1232, 1270, 857, 1606, 1149 cm^{-1} (KBr disk).
Dose 3 to 9 mg daily.

Methamidophos

Acaricide, Insecticide
$C_2H_8NO_2PS$ = 141.1
CAS—10265-92-6
IUPAC Name [Amino(methylsulfanyl)phosphoryl]oxymethane
Synonyms Acephate-met; Bayer 71628; ENT 27396; Ortho 9006; phosphoramidothioc acid *O,S*-dimethyl ester; SRA 5172.
Proprietary Names *Filitox*; *Metikar*; *Monitor*; *Nitofol*; *Nuratron*; *Patrole*; *Pillaron*; *Swipe*; *Tam*; *Tamanox*; *Tamaron*; *Vetaron*.



Chemical Properties A colourless, crystalline solid. Mp 54°. Readily soluble in water (90 g/L at 20°), ethanol, isopropanol (1400 g/L at 20°), xylene (<100 g/L at 20°), benzene (<100 g/L at 20°), dichloromethane (<25 g/L at 20°), toluene, diethyl ether (<25 g/L at 20°), kerosene (<10 g/L at 20°) and hexane (<10 g/L at 20°). Log *P* (octanol/water), −0.80.
Thin-layer Chromatography System TX—R_f 0.01; system TY—R_f 0.00.
Gas Chromatography System GA—RI 1190.
Column DB1 or DB1701 (30 m × 0.32 mm i.d., 0.25 µm), Temperature programmed from 130° (held 1 min) to 250° (held 2 min) at 10°/min. Carrier gas: He. TSD. Retention time 4 min (DB1), 7.1 min (DB1701) [Lewin *et al.* 1993].
Mass Spectrometry Principal ions at *m/z* 94, 95, 141, 64, 79, 80, 111, 110.

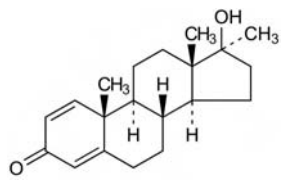


Quantification
Blood **GC** TSD. Limit of detection, 45 µg/L [Lewin *et al.* 1993].
Liver **GC** See Blood [Lewin *et al.* 1993].
Disposition in the Body Methamidophos is rapidly absorbed through the stomach, lungs and skin after exposure and is eliminated primarily via urine.
Toxicity Methamidophos is highly toxic via oral, dermal and inhalation administration. The allowed daily intake is 0.0006 mg/kg.
A 61-year-old male plantation worker collapsed and was admitted to hospital. A bottle of Nitofol (methamidophos) was found on the floor beside him. He died 11 h after ingestion. Toxicological analysis showed that there was a concentration of 130 mg/L methamidophos in his blood and 240 mg/L in his liver. The cause of death was due to an overdose of methamidophos [Lewin *et al.* 1993].

Lewin JF *et al.* (1993). *TIAFT Bulletin Case Notes* 23(1): .

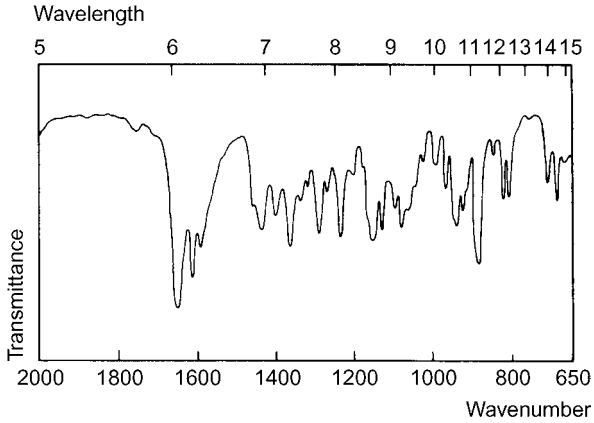
Methandienone

Anabolic Steroid
$C_{20}H_{28}O_2$ = 300.4
CAS—72-63-9
IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-10,13,17-trimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[*a*]phenanthren-3-one
Synonym (17β)-17-Hydroxy-17-methylandrosta-1,4-dien-3-one; methandrostenolone.
Proprietary Names *Anabol*; *Danabol*; *Dianabol*; *Melic*; *Metastenol*; *Nerobol*; *Vetanabol* (vet.).



Chemical Properties A white or faintly yellowish-white, crystalline powder. Mp 163° to 167°. Practically insoluble in water; soluble 1 in 2 of ethanol, 1 in <1 of chloroform and 1 in 70 of ether. Log *P* (octanol/water), 3.5.
Thin-layer Chromatography System TA—R_f 0.86; system TE—R_f 0.80; system TP—R_f 0.65; system TQ—R_f 0.10; system TR—R_f 0.87; system TS—R_f 0.61; system TAJ—R_f 0.44; system TAK—R_f 0.61; system TAL—R_f 0.92; system TAM—R_f 0.88.

Gas Chromatography System GA—RI 2672; system GAG—RRT 1.2(relative to testosterone); system GAI—urinary metabolites: 17α-methyl-5β, (α)-androstan-3α,17β-diol RRT 0.925; 17α-methyl-5β-androst-1-en-3α,17β-diol RRT 0.921; 17α-methyl-1,4-androstadien-6β,17β-diol-3-one RRT 1.117 (relative to 17α-methyl-5α-androstan-3β,17β-diol); system GAR—retention time 13.2 min.
High Performance Liquid Chromatography System HAR—RRT 0.86 (relative to testosterone); system HATb—RRT 0.87 (relative to testosterone).
Ultraviolet Spectrum Dehydrated alcohol—245 nm (A^{1}_{1}=516a).
Infrared Spectrum Principal peaks at wavenumbers 1660, 1620, 886, 1601, 1160, 1240 cm^{-1} (KBr disk).



Quantification
Urine **GC** Limit of detection, 30 ng for methandienone, 10 ng for 17-epimethandienone and 6β-hydroxy-17-epimethandienone [Dürbeck *et al.* 1978].
GC-MS Methandienone metabolites [Kokkonen *et al.* 1999].
HPLC UV detection. Limit of detection, 5 ng [Frischkorn, Frischkorn 1978].
Dose Initially 2.5 to 5 mg daily.

Dürbeck HW *et al.* (1978). Gas chromatographic and capillary column gas chromatographic–mass spectrometric determination of synthetic anabolic steroids. I. Methandienone and its metabolites. *J Chromatogr* 167: 117–124.

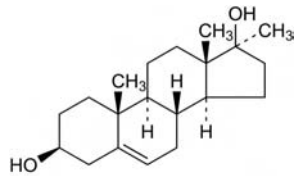
Kokkonen J *et al.* (1999). Comparison of sensitivity between gas chromatography-low-resolution mass spectrometry and gas chromatography-high-resolution mass spectrometry for determining metandienone metabolites in urine. *J Chromatogr B Biomed Sci Appl* 734: 179–189.

Methandriol

Anabolic Steroid
$C_{20}H_{32}O_2$ = 304.5
CAS—521-10-8
IUPAC Name (3*S*,8*R*,9*S*,10*R*,13*S*,14*S*,17S)-10,13,17-Trimethyl-1,2,3,4,7,8,9,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthrene-3,17-diol
Synonyms MAD; mestenediol; methylandrostenediol; (3β,17β)-17-methylandrost-5-ene-3,17-diol.
Proprietary Names *Androdiol*; *Androteston-M*; *Crestabolic*; *Diolostene*; *Masdiol*; *Megabion*; *Methanabol*; *Methandiol*; *Methosten*; *Metisione*; *Metocryst*; *Nabadial*; *Neostene*; *Neutrirmone*; *Neutrosteron*; *Notandron*; *Protandren*; *Sinasex*; *Troformone*.

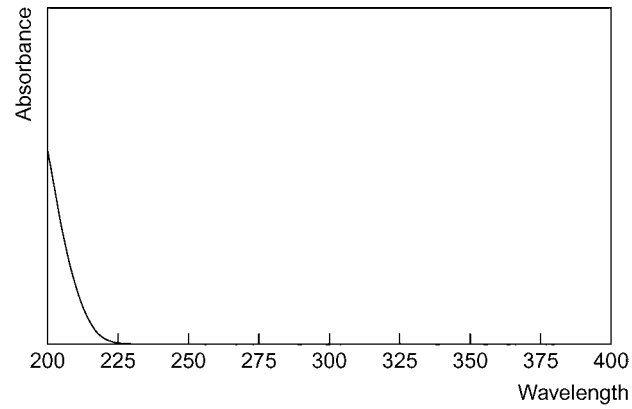


Chemical Properties A crystalline powder. Mp 205.5° to 206.5°. Insoluble in water; slightly soluble in some organic solvents. Log *P* (octanol/water), 4.35.

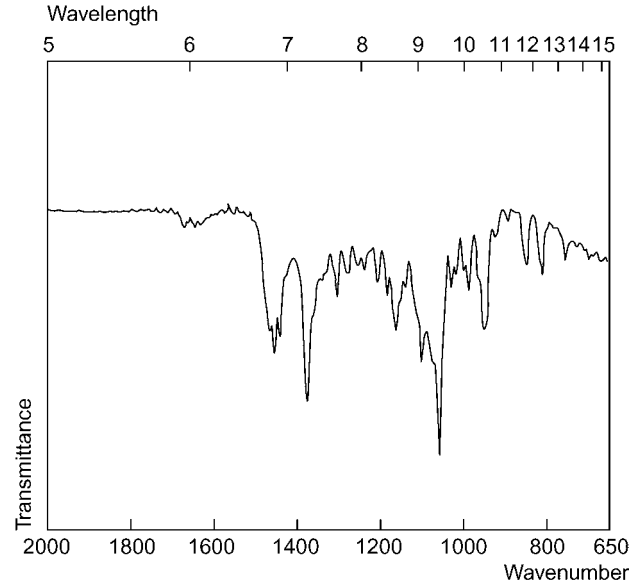
Methandriol Diacetate
$C_{24}H_{36}O_4$ = 388.5
CAS—2061-86-1
Chemical Properties Mp 145° to 146° (crystals from hexane).

Methandriol Dipropionate
$C_{26}H_{40}O_4$ = 416.6
CAS—3593-85-9
Synonym Methylandrostendiol dipropionate
Proprietary Name *Probolin*

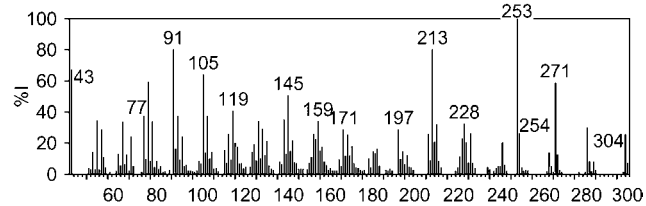
Gas Chromatography System GAG—methandriol RRT 0.89, methandriol dipropionateRRT 1.70 (both relative to testosterone); system GAI—urine metabolite: 17α-methyl-5β-androstan-3α,17β-diol RRT 0.925 (relative to 17α-methyl-5α-androstan-3β,17β-diol); system GAR—retention time 12.3; (methandriol dipropionate) retention time 15.2 min.
Column: 3% OV-1 Chromosorb WHP 80/100 mesh (4′ × $^{1}/_{4}$″). Temperature: 280°. Carrier gas: N_2, flow rate 32 mL/min. Detection: flame ionisation. RI: 2637 [Mills, Roberson 1993].
High Performance Liquid Chromatography System HAR—methandriol RRT 1.25, methandriol dipropionate RRT 1.25 (both relative to testosterone); system HATb—methandriol RRT 1.29(relative to testosterone); system HATb—methandriol dipropionate RRT 2.75(relative to testosterone).
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1449, 1372, 1054, 942 cm^{-1}; (methandriol dipropionate) 1725, 1189, 1075 cm^{-1} (KBr disks).



Mass Spectrum Principal ions at *m/z* 253, 91, 213, 43, 105, 271, 79, 145; (dipropionate) *m/z* 57, 342, 253, 268, 145, 147, 81, 91 .



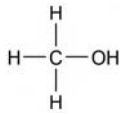
Disposition in the Body Methandriol is excreted in urine as metabolites, one of which is 17α-methyl-5β-androstan-3α,17β-diol.

Mills T, Roberson JC (1993). *Instrumental Data for Drug Analysis*, 2nd edn. Boca Raton: CRC Press, 2: 1384–1385.

Methanol

Solvent
CH_3OH = 32.04
CAS—67-56-1

Synonym Methyl alcohol



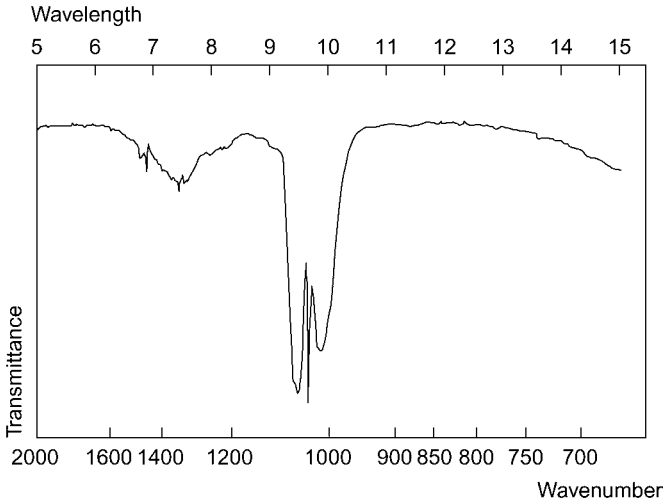
Chemical Properties A clear, colourless, highly flammable liquid. Bp 63.5° to 65.7°. Refractive index 1.328 to 1.329. Miscible with water, ethanol, benzene, chloroform, ether, ketones, and most other organic solvents. pK_a 15.3. Log *P* (octanol/water), 0.8.

Note The commercial substance known as 'wood naphtha', 'pyroxylic spirit', or 'wood spirit' contains 60–90% of methanol, together with acetone and other empyreumatic impurities. The variety used for denaturing ethanol (see under Ethanol) contains not less than 72% of methanol.

Colour Test Potassium dichromate (method 2)—green.

Gas Chromatography System GA—RI 491; system GI—retention time 0.7 min.

Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 31, 32, 29, 30, 28, 33, 34, 27; formic acid 29, 46, 45, 28, 44, 30, 47, –.

Quantification

Blood **GC** FID. Direct injection [Manno, Manno 1978].

Urine **GC** See Blood [Manno, Manno 1978].

Disposition in the Body Readily absorbed after oral administration and distributed in the body according to the water content of the tissues; it may also be absorbed by inhalation or through intact skin. It is metabolised, much more slowly than ethanol, by oxidation to formaldehyde, formic acid, and possibly other products. Oxidation to formaldehyde is probably accomplished by alcohol dehydrogenase since the metabolism is inhibited by ethanol. Maximum concentrations of formic acid in the blood and urine occur 2–3 days after ingestion. Small amounts of methanol are excreted unchanged in the urine and expired air and about 10% of a dose is excreted in the urine as formic acid.

Blood Concentration Endogenous blood-methanol concentrations are ~1.5 mg/L, and urinary formic acid concentrations are usually ~12–17 mg/L.

Toxicity The initial effects of methanol are much milder than those of ethanol and toxic effects are not usually seen until after a latent period of 8–36 h; the symptoms may include severe upper abdominal pain, visual disturbance often proceeding to incurable blindness, severe metabolic acidosis, and prolonged coma which may terminate in death from respiratory failure. The fatal dose varies greatly but is usually between 100 and 200 mL in adults, although ingestion of 30 mL is potentially lethal; permanent blindness has been caused by as little as 10 mL. Toxic effects are usually associated with blood concentrations >100 mg/L and blood concentrations >200 mg/L are indicative of severe poisoning and may be lethal. The maximum permissible atmospheric concentration is 200 ppm.

A 44-year-old man suffering from methanol intoxication was found comatose and had a serum concentration of 5.83 g/L on admission. The subject died 40 h later and the following postmortem concentrations were found (g/L or mg/g): blood 1.42, bile 1.75, brain 1.59, heart 0.93, kidney 1.30, liver, 1.07, lung 1.27, vitreous humour 1.73. [Wu Chen *et al.* 1985.]

The following postmortem tissue concentrations were reported in a 41-year-old man who died after ingesting a large quantity of methanol: kidney 5.13 mg/g, liver 4.18 mg/g, vitreous humour 3.96 g/L, heart 3.45 mg/g, urine 3.43 g/L, pericardial fluid 3.29 g/L, blood 2.84 g/L, stomach contents 2.21 g/L. [Pla *et al.* 1991.]

In 2 fatalities caused by ingestion of methanol (~100 g), femoral blood concentrations of methanol and formic acid were 2.19 and 0.41 g/L, respectively, in the first subject and 1.96 and 0.38 g/L in the second. [Kinoshita *et al.* 1998.]

Volume of Distribution ~0.6 L/kg.

Note For a review of methanol poisoning and its treatment, see Barceloux *et al.* 2002.

Methanthelinium Bromide

Anticholinergic

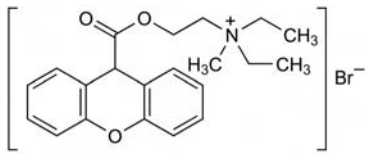
$C_{21}H_{26}BrNO_3$ = 420.3

CAS—5818-17-7 (methanthelinium); 53-46-3 (bromide)

IUPAC Name *N,N*-Diethyl-*N*-methyl-2-[(9*H*-xanthen-9-ylcarbonyl)oxy]-ethanaminium bromide

Synonyms Bromuro de metantelina; dixamonum bromidum; methantheline bromide; methanthine bromide.

Proprietary Names *Asabaine*; *Avagal*; *Banthine*; *Bronerg*; *Doladene*; *Evogal*; *Gastron*; *Gastrosedan*; *Metanyl*; *Metaxan*; *Methanide*; *Uldumont*; *Vagamin*; *Vagantin*; *Xanteline*; *Xantenol.*



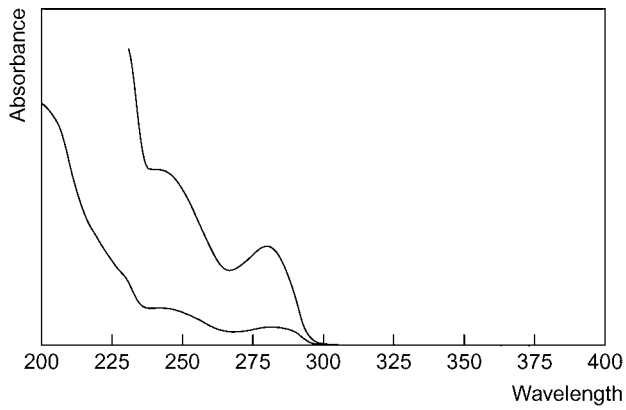
Chemical Properties A white crystalline powder. Mp 171° to 177°. Soluble 1 in less than 5 of water, ethanol and chloroform; practically insoluble in ether. Aqueous solutions decompose on standing. Log *P* (octanol/water), 1.7.

Colour Tests Mandelin's test—orange; Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.02; system TB—R_f 0.00; system TE—R_f 0.76; system TAE—R_f 0.03 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 418.

Ultraviolet Spectrum Aqueous acid—282 nm (A^1_1=65a).



Infrared Spectrum Principal peaks at wavenumbers 1155, 1248, 1724, 761, 1200, 755 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 72, 181, 85, 152, 42, 44, 58, 43.

Dose Methanthelinium bromide has been given in doses of 200 to 400 mg daily.

Methaphenilene

Antihistamine

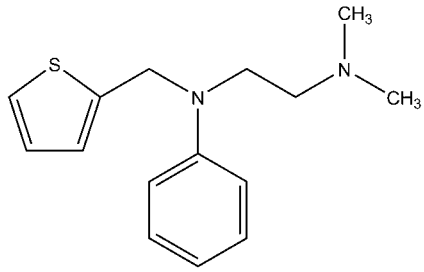
$C_{15}H_{20}N_2S$ = 260.4

CAS—493-78-7

IUPAC Name *N*′,*N*′-Dimethyl-*N*-phenyl-*N*-(thiophen-2-ylmethyl)ethane-1,2-diamine

Synonyms 00836; diatrin base; *N,N*-dimethyl-*N*′-phenyl-*N*′-(2-thenyl) ethylenediamine; *N,N*-dimethyl-*N*′-phenyl-*N*′-(2-thienylmethyl)-1,2-ethanediamine; RP-2740; W-50 base.

M



Chemical Properties Dark-yellow oil. Bp 183° to 185°. Methaphenilene is extracted by organic solvents from aqueous alkaline solutions.

Methaphenilene Hydrochloride

$C_{15}H_{20}N_2S,HCl = 296.9$
CAS—7084-07-3
Proprietary Names *Diatrine*; *Enstamine*; *Nilhistin*.
Chemical Properties A white-to-pale-yellow crystalline powder with a faint odour. Mp 184° to 189°. Soluble in water; sparingly soluble in ethanol and chloroform; almost insoluble in ether [Council on Pharmacy and Chemistry of the American Medical Association 1951].

Colour Tests Ammonium molybdate test—grey-blue (limit of detection, 1.0 µg); ammonium vandate test—orange→purple (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—dull purple (limit of detection, 1.0 µg); Vitali's test—red-brown/greenish-brown/brown (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.53 (location reagent acidified iodoplatinate solution, positive reaction).
Gas Chromatography System G2/225—retention time 1.30 (relative to diphenhydramine).
Disposition in the Body *N*-Oxide formation is a more important pathway in methaphenilene metabolism compared with methapyriline. This could explain the carcinogenicity of methapyrilene [Kammerer, Schmitz 1988] as well as the methylation of deoxycytosine [Hernandez *et al.* 1989].
Toxicity The estimated lethal dose in humans is 25 to 250 mg/kg. The LD_{50} (IP) in mice is 117 mg/kg. Methaphenilene (32 mmole) failed to induce tumours in F344 rats [Lijinsky, Kovatch 1986], although it was mutagenic in the Ames assay when tested with and without S9 activation [Kammerer *et al.* 1986], but it was non-mutagenic in Salmonella [Andrews *et al.* 1984]. Methaphenilene is a peroxisome proliferator [Reznik-Schuller, Lijinsky 1983].
Case Study

An 81-year-old man was taking methaphenilene for nasal congestion and cough. After 1 month of treatment he had a temperature of 101.4° and a pulse rate of 110 bpm. Three days later, he had a white blood cell count of 3600 with 99% lymphocytes and 1% monocytes. He was hospitalised immediately and started on a regimen of penicillin and blood transfusions. For 3 days his condition was critical, but improved on the 4th day. He was kept in hospital under observation for 19 days, then discharged [Drake 1950].

Dose Usually up to 200 mg daily.

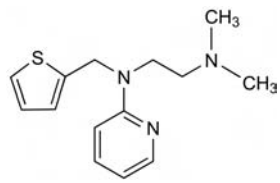
Methapyrilene

Antihistamine
$C_{14}H_{19}N_3S = 261.4$
CAS—91-80-5
IUPAC Name *N*,*N*-Dimethyl-*N*′-2-pyridinyl-*N*′-(2-thienylmethyl)-1,2-ethanediamine
Synonym Thenylpyramine



Chemical Properties A liquid. pK_a 3.7, 8.9 (25°). Log *P* (octanol/water), 2.9.

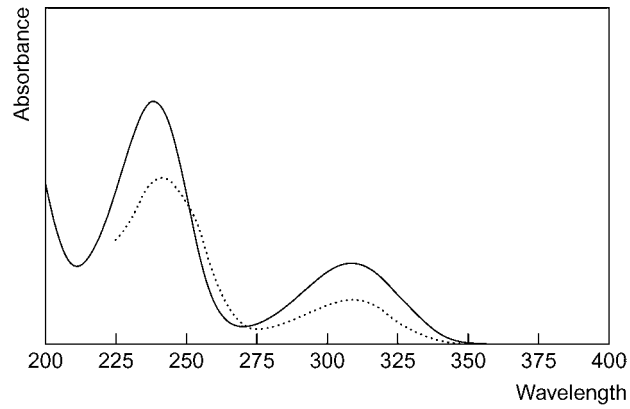
Methapyrilene Fumarate

$(C_{14}H_{19}N_3S)_2,3C_4H_4O_4 = 871.0$
CAS—33032-12-1
Chemical Properties A white crystalline powder. Mp 135° to 136°. Soluble 1 in 20 of water and 1 in 30 of ethanol.

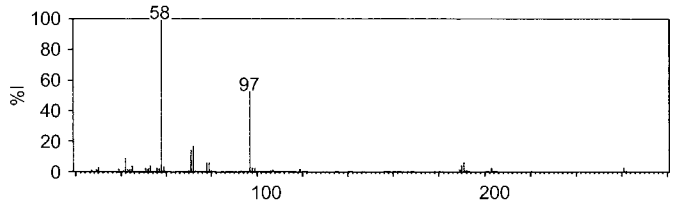
Methapyrilene Hydrochloride

$C_{14}H_{19}N_3S,HCl = 297.8$
CAS—135-23-9
Synonym Methapyrilenium chloride
Chemical Properties A white crystalline powder. Mp 162°. Soluble 1 in 0.5 of water, 1 in 5 of ethanol and 1 in 3 of chloroform; practically insoluble in ether and benzene.

Colour Tests Liebermann's reagent—red-brown; Mandelin's test—black-violet; Marquis test—black-violet; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.41; system TC—R_f 0.26; system TE—R_f 0.66; system TL—R_f 0.13; system TAE—R_f 0.21; system TAF—R_f 0.24; system TAJ—R_f 0.20; system TAK—R_f 0.00; system TAL—R_f 0.48 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet).
Gas Chromatography System GA—RI 1981; system GF—RI 2305.
High Performance Liquid Chromatography System HA—*k* 4.1; system HX—RI 342; system HY—RI 197.
Ultraviolet Spectrum Aqueous acid—237 (A^{1}_{1}=720a), 314 nm; aqueous alkali—241, 312 nm.



Infrared Spectrum Principal peaks at wavenumbers 1592, 765, 1558, 1250, 1158, 1316 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 97, 72, 71, 42, 191, 79, 78.



Quantification

Blood **GC** FID [Winek *et al.* 1977].
Plasma **GC** AFID. Limit of detection, 10 µg/L [Baselt, Franch 1980].
Urine **GC** Limit of detection, 50 µg/L, see Plasma [Baselt, Franch 1980]. See Blood [Winek *et al.* 1977].
Tissues **GC** See Blood [Winek *et al.* 1977].
Disposition in the Body Variably and incompletely absorbed after oral administration. <2% of a dose is excreted in the urine as unchanged drug in 24 h.
Therapeutic Concentration

After a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.006 to 0.05 mg/L (mean 0.024) were attained in about 1.5 h [Calandre *et al.* 1981].

Toxicity Methapyrilene has been shown to be carcinogenic in rats and is little used. Fatalities have occurred after ingestion of 7 g or more and toxic effects have been associated with plasma concentrations >30 mg/L. In 13 fatalities attributed to methapyrilene overdose, reported blood concentrations ranged from 2 to 380 mg/L (mean 50) (salicylamide and ethanol were also detected in several cases).

The following postmortem tissue concentrations were reported in one fatality: blood 9 mg/L, kidney 52 µg/g, liver 82 µg/g, lung 119 µg/g, urine 200 mg/L [Ainsworth, Biggs 1977].

Half-life Plasma half-life, about 1 to 2 h.
Volume of Distribution About 4 L/kg.
Clearance Plasma clearance, about 30 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, about 1.0.
Dose Methapyrilene hydrochloride has been given in doses of up to 200 mg daily.

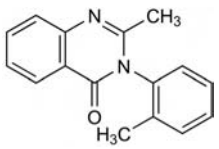
Methaqualone

Hypnotic, Sedative
$C_{16}H_{14}N_2O = 250.3$
CAS—72-44-6

IUPAC Name 2-Methyl-3-(2-methylphenyl)-4(3*H*)-quinazolinone
Synonyms Methachalonum; methaqualonum; QZ-2; R-148; TR-495; CI-705; CN-38703.
Proprietary Names *Mequin*; *Normi-Nox*; *Pallidan*; *Quaalude*. It is an ingredient of *Toquilone Compositum*.

A preparation containing methaqualone and diphenhydramine hydrochloride was formerly marketed under the proprietary name *Mandrax*. Methaqualone has been withdrawn from the market in many countries because of problems with abuse.



Chemical Properties A white crystalline powder. Mp 120° to 116°. Practically insoluble in water; soluble 1 in 12 of ethanol, 1 in 1 of chloroform and 1 in 50 of ether. pK_a 2.5. Log *P* (octanol/water), 4.3. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Methaqualone Hydrochloride

$C_{16}H_{14}N_2O,HCl = 286.8$
CAS—340-56-7
Chemical Properties A white crystalline powder. Mp 255° to 265°. Practically insoluble in water; soluble in ether and ethanol.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.36; system TC—R_f 0.80; system TD—R_f 0.63; system TE—R_f 0.78; system TL—R_f 0.56; system TAE—R_f 0.79; system TAF—R_f 0.84 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

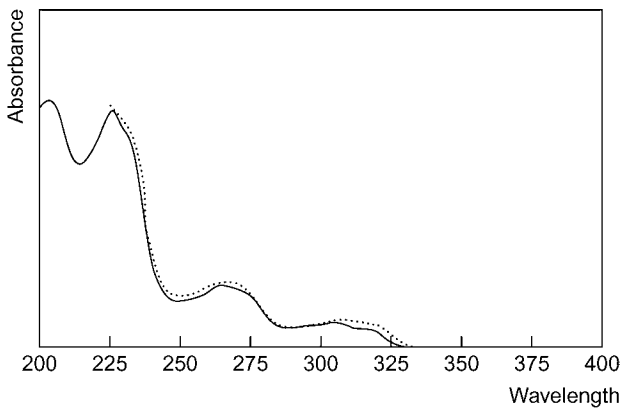
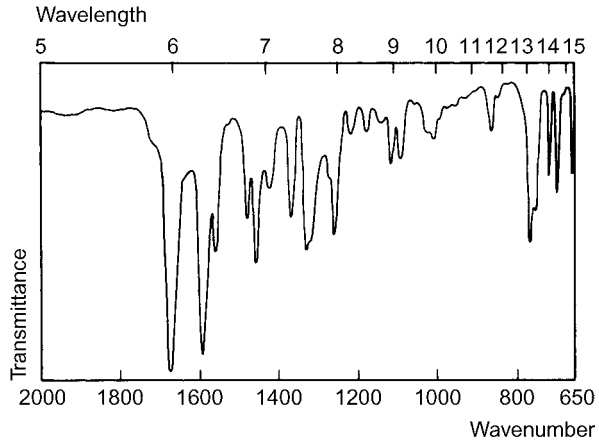
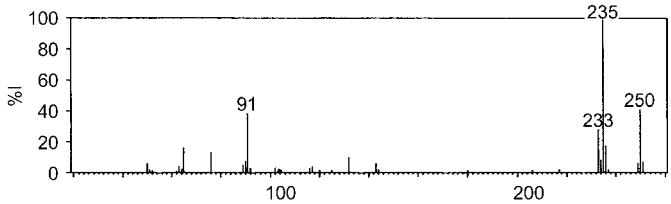
Ultraviolet Spectrum Aqueous acid—234 (A_1^1=1320a), 269 nm; aqueous alkali—265 (A_1^1=347b), 306 nm.



Infrared Spectrum Principal peaks at wavenumbers 1682, 1599, 1565, 770, 1265, 697 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 235, 250, 91, 233, 236, 65, 76, 132; 4′-hydroxymethaqualone 251, 266, 249, 77, 143, 76, 252, 39.



Quantification

Blood **GC** UV detection or FID. Total amount of methaqualone and its metabolites. [Liu *et al.* 1994].
GC-MS [Plaut *et al.* 1998].
Plasma **GC** AFID. Methaqualone and the 2′-hydroxymethyl metabolite. Limit of detection, 20 µg/L [Peat, Finkle 1980].
HPLC UV detection. Limit of detection, 1 µg/L [Hux *et al.* 1982].
Urine **GC** See Blood [Liu *et al.* 1994].
GC-MS Limit of detection in urine, about 0.1 mg/L, see Blood [Plaut *et al.* 1998]. Comparison with immunoassays [Brenner *et al.* 1996]. Methaqualone and metabolites [Kazyak *et al.* 1977].
RIA–TLC Limit of detection, 1 mg/L for methaqualone and metabolites [Budd *et al.* 1980].
Gastric Contents **GC-MS** See Blood [Plaut *et al.* 1998].
Saliva **GC** See Plasma [Peat, Finkle 1980].
Hair **GC-MS** See Blood [Plaut *et al.* 1998].
Disposition in the Body Readily absorbed after oral administration and widely distributed throughout the body. The major metabolites are 4′-hydroxymethaqualone, 2′-hydroxymethylmethaqualone and their *O*-glucuronides or *O*-methyl ethers, and methaqualone *N*-oxide. A large number of metabolites are known and there is considerable intersubject variation in the relative amounts produced. About 40–50% of a dose is excreted in the urine in 72 h, mostly as conjugated metabolites, with <2% of a dose as unchanged drug. In 24 h, about 10% of a dose is excreted in the urine as the conjugated 4′-hydroxy metabolite, 7% as the *N*-oxide, 5% as the conjugated 2′-hydroxymethyl derivative and about 3% each as the conjugated 2-hydroxymethyl, 3′-hydroxy and 6-hydroxy metabolites. Up to 4% of a dose may be eliminated unchanged in the faeces.
Therapeutic Concentration In plasma, usually in the range 0.4–5 mg/L.
After a single oral dose of 250 mg of the base to 7 subjects, peak plasma concentrations of 1.0–4.0 mg/L (mean 2.2) were attained in 2 h; following an equivalent dose of the hydrochloride, peak plasma concentrations of 2.0–4.9 mg/L (mean 3.7) were attained in 1 h [Goenechea *et al.* 1973].
After daily oral doses of 300 mg to 8 subjects, a mean maximum steady-state plasma concentration of 3.7 mg/L was reported [Nayak *et al.* 1974].
Toxicity The estimated minimum lethal dose is 5 g in non-tolerant subjects. Drug accumulation is likely in chronic dosing because of the long half-life. Toxic effects may be associated with plasma concentrations >2 mg/L, and plasma concentrations greater than about 8 mg/L are likely to produce coma and may be lethal. The 2′-hydroxymethyl metabolite, which has been found unconjugated in both blood and urine in overdose cases, may contribute to the degree of intoxication.
Abuse of methaqualone, particularly when taken in conjunction with diphenhydramine, has been reported.

The following postmortem concentrations were reported in a 62-year-old man who died after ingesting methaqualone and diphenhydramine with suicidal intent: blood 800 mg/L and 20 mg/L, bile 30 and 13 mg/L, gastric contents 12 000 and 7 mg/L, respectively [Fucci 1996].

In 6 fatal cases, postmortem blood concentrations of 5–42 mg/L (mean 22) and liver concentrations of 26–89 μg/g (mean 55) were reported [Baselt, Cravey 1977].

In 19 mildly poisoned patients the plasma concentration on admission to hospital ranged from 2–20 mg/L (mean 9). In 9 more severe cases, a mean peak concentration of 27 mg/L was reached within 12 h of admission to hospital [Lawson, Brown 1966].

Half-life Plasma half-life, ≈20–60 h (mean 35); a slower terminal elimination half-life of up to ≈72 h has also been reported.
Volume of Distribution About 6 L/kg.
Distribution in Blood Plasma : whole blood ratio ≈1.1 at therapeutic concentrations decreasing to ≈0.5 at concentrations of 20 mg/L.
Saliva Plasma : saliva ratio, ≈9.
Protein Binding About 75–95% (concentration-dependent).
Note For a review of the pharmacokinetics of hypnotic drugs, see Breimer [1977].
Dose Usually up to 300 mg daily.

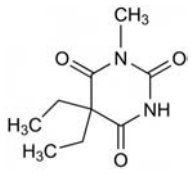
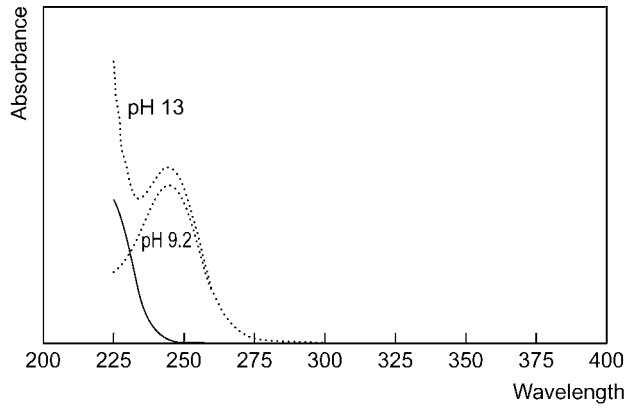
Metharbital

Anticonvulsant, Barbiturate
$C_9H_{14}N_2O_3$ = 198.2
CAS—50-11-3

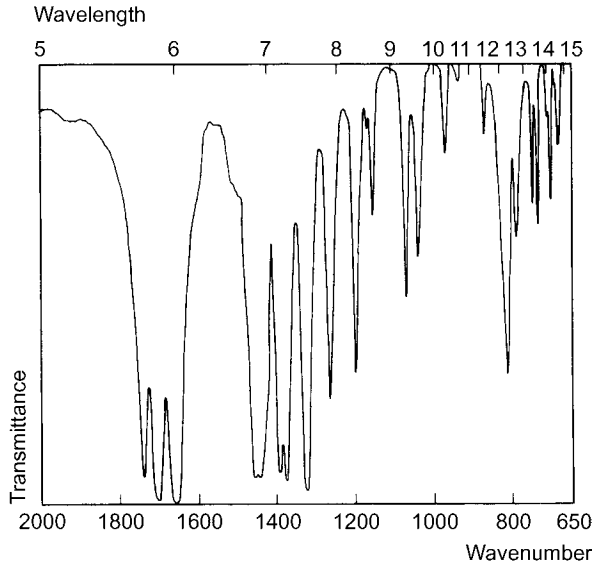
IUPAC Name 5,5-Diethyl-1-methyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione
Synonyms Endiemal; metharbitone.
Proprietary Name *Gemonil*



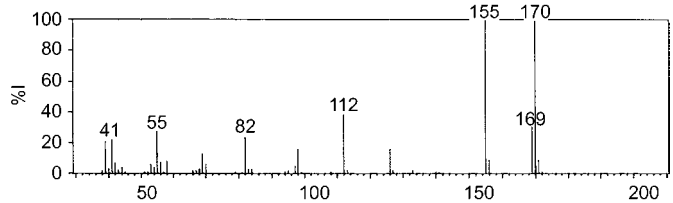
Chemical Properties A white crystalline powder. Mp 151° to 155°. Soluble 1 in 830 of water, 1 in 23 of ethanol and 1 in 40 of ether. pK_a 8.3 (20°). Log *P* (octanol/water), 1.2.
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.66; system TE—R_f 0.54; system TF—R_f 0.65; system TH—R_f 0.86; system TAD—R_f 0.69; system TAE—R_f 0.87 (mercurous nitrate spray, black; Zwikker's reagent, faint pink).
Gas Chromatography System GA—metharbital RI 1470.
High Performance Liquid Chromatography System HG—metharbital *k* 2.69, barbital*k* 1.11; system HH—metharbital*k* 1.99, barbital*k* 0.63; system HX—RI 435; system HY—RI 324.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—244 nm (A^1_1=433a); 1 mol/L sodium hydroxide (pH 13)—244 nm (A^1_1=458b).



Infrared Spectrum Principal peaks at wavenumbers 1655, 1699, 1755, 1275, 1205, 815 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 155, 170, 112, 169, 55, 82, 41, 39; barbital 156, 141, 55, 155, 98, 39, 82, 43.



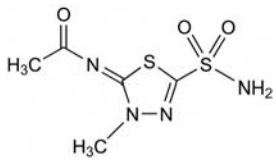
Quantification See under Amobarbital.
Disposition in the Body About 1% of a dose is excreted in the urine in 48 h as unchanged drug and about 10% as the active metabolite, barbital; the remainder is thought to be slowly excreted in the urine as barbital over a period of 2–3 weeks.
Therapeutic Concentration
Following daily oral doses of 300 mg for 14 days to 1 subject, metharbital reached a peak plasma concentration of 5 mg/L shortly after a dose, but was undetectable 8 h later when the plasma concentration of barbital was 26 mg/L [Butler, Waddell 1958].
Toxicity The estimated minimum lethal dose is 2 g.
Dose 100 to 300 mg daily.

Butler TC, Waddell WJ (1958). N-methylated derivatives of barbituric acid, hydantoin and oxazolidinedione used in the treatment of epilepsy. *Neurol Minneap* 8: 106–112.

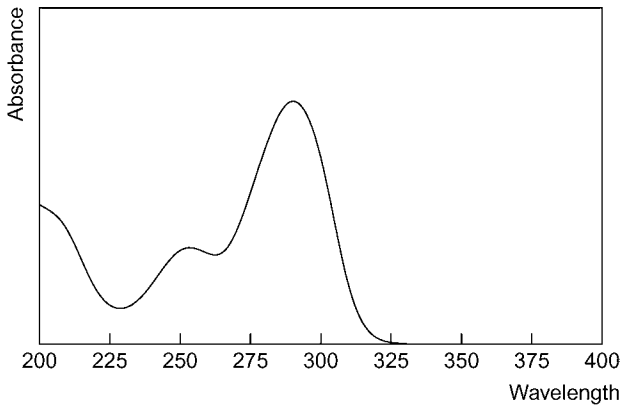
Methazolamide

Carbonic Anhydrase Inhibitor
$C_5H_8N_4O_3S_2$ = 236.3
CAS—554-57-4

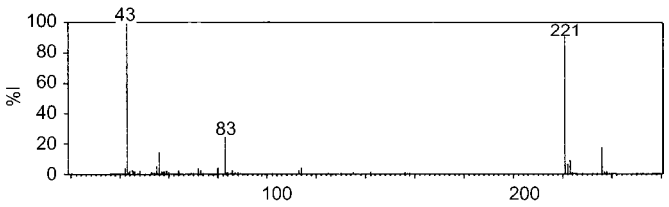
IUPAC Name *N*-(3-Methyl-5-sulfamoyl-1,3,4-thiadiazol-2-ylidene)acetamide
Synonym *N*-[5-(Aminosulfonyl)-3-methyl-1,3,4-thiadiazol-2(3*H*)-ylidene]-acetamide
Proprietary Names *GlaucTabs*; *MZM*; *Neptazane*.



Chemical Properties A white or faintly yellow, crystalline powder. Mp about 213°. Very slightly soluble in water and ethanol; slightly soluble in acetone; soluble in dimethylformamide. pK_a 7.3. Log *P* (ether/pH 7.4), −0.2.
Colour Test Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.00; system TE—R_f 0.19; system TAE—R_f 0.84; system TAJ—R_f 0.44; system TAK—R_f 0.15; system TAL—R_f 0.78 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2187.
High Performance Liquid Chromatography System HX—RI 304; system HY—RI 265.
Ultraviolet Spectrum Aqueous acid—255, 290 nm (A^1_1=396a); aqueous alkali—288 nm (A^1_1=568a).



Mass Spectrum Principal ions at *m/z* 43, 221, 83, 236, 56, 223, 222, 55.



Quantification

Blood **GC-MS** UV detection [Iyer, Taft 1998]. See Bayne *et al.* [1981].
Plasma **GC-MS** See Blood [Iyer, Taft 1998]. See Blood. Limit of detection, <1 µg/L[Bayne *et al.* 1981].
Urine **GC-MS** See Blood [Iyer, Taft 1998; Bayne *et al.* 1981].
Disposition in the Body Well absorbed after oral administration. About 15–20% of a dose may be excreted in the urine in 24 h, of which about half is unchanged drug.
Therapeutic Concentration
After a single oral dose of 50 mg to 1 subject, peak concentrations of 19.1 and 0.08 mg/L in blood and plasma respectively were reported at 3 h; the corresponding concentrations, 3 h after a dose of 150 mg to a different subject were 36.1 and 1.4 mg/L. Following oral doses of 100 mg three times a day to 1 subject, steady-state concentrations of about 40 mg/L and about 9.5 mg/L were reported for blood and plasma, respectively [Bayne *et al.* 1981].
Distribution in Blood Plasma : erythrocyte ratio appears to be concentration-dependent, saturation of the carbonic anhydrase in the erythrocytes occurring at about 40 mg/L.
Protein Binding About 55%.
Dose In the treatment of glaucoma, 100 to 300 mg daily.

Bayne WF *et al.* (1981). Time course and disposition of methazolamide in human plasma and red blood cells. *J Pharm Sci* 70: 75–81.

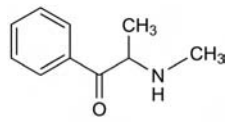
Methcathinone

Stimulant
$C_{10}H_{13}NO$ = 163.2
CAS—5650-44-2
IUPAC Name 2-(Methylamino)-1-phenylpropan-1-one
Synonyms 2-(Methylamino)-1-phenyl-1-propanone; α-methylaminopropiophenone; monomethylproprion.
Street Names Bathtub speed; cadillac express; catt; cosmos; ephedrone; gagers; gaggers; goob; jee cocktail; jeff; mulka; speed; The C; wild cat; wonder star.

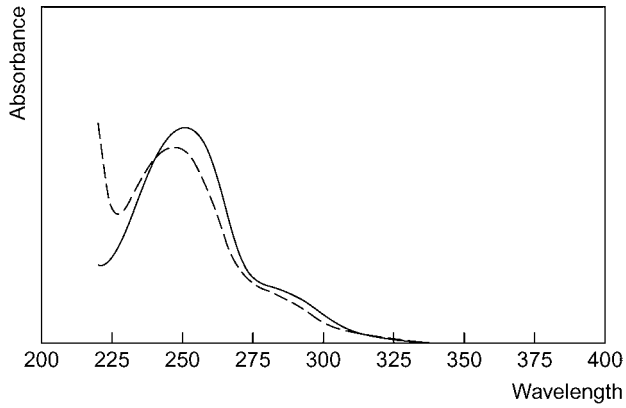


Chemical Properties Methcathinone is derived from (*S*)-(−)-cathinone, a natural compound found in young leaves of the khat shrub, *Catha edulis* (cathine). It is a white to off-white powder or colourless crystals. Mp 182° to 184°. Soluble in hydrochloric acid.

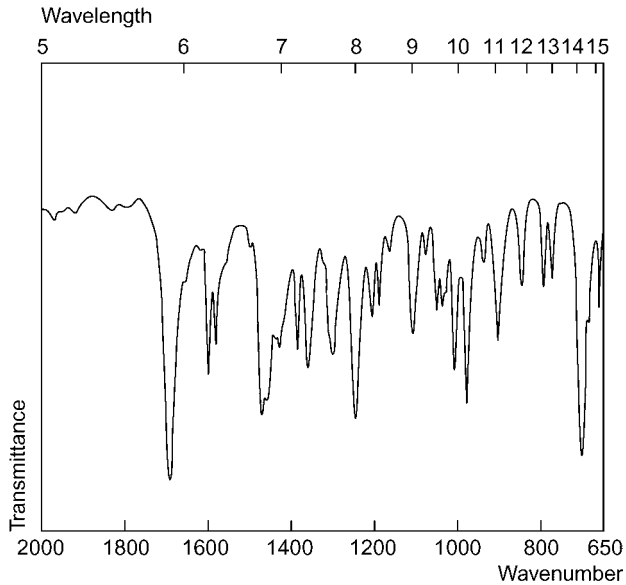
Methcathinone Hydrochloride

$C_{10}H_{13}NO,HCl$ = 199.7
CAS—49656-78-2
Synonym 2-(Methylamino)-1-phenyl-1-propanone hydrochloride
Chemical Properties Crystals from alcohol–acetone. Mp 176° to 177°. It is freely soluble in water and has a pungent taste.

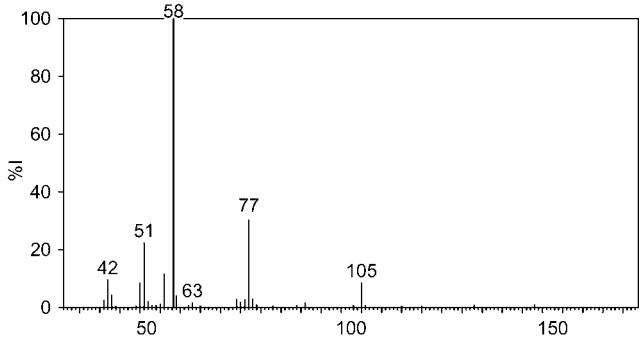
Colour Tests Chen's test—purple; cobalt thiocyanate (Scott's test)—faint blue; Lieberman's reagent—red/orange.
Gas Chromatography-Mass Spectrometry Column: methyl silicone HP1 (0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.9 mL/min. Temperature: 140°. Retention index: 1323 [Mills, Roberson 1993].
Ultraviolet Spectrum Aqueous acid (0.2 mol/L sulfuric acid)—251 nm; basic—247 nm.



Infrared Spectrum Principal peaks at wavenumbers 1691, 705, 1245, 1469 cm^{-1} (KBr pellet).



Mass Spectrum Principal peaks at *m/z* 58, 77, 51, 56, 42, 105, 50, 43.



Quantification

Plasma **LC-MS** Column: SCX (150 × 2.1 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate (pH 3) : acetonitrile (95 : 5 for 17 min to 70 : 30 at 20 min for 1 min to 95 : 5 at 27 min), flow rate 1.5 mL/min. ESI, MRM acquisition mode. Retention time: ≈7 min. Limit of quantification, 11.8 µg/L [Beyer *et al.* 2007].

Urine **GC-MS** Column: DB-5 (15 m × 0.25 mm i.d.). Temperature programme: 140° for 1 min to 220° at 20°/min for 0.5 min to 250° at 30°/min for 2.5 min. IS: amphetamine-d_6. SIM acquisition mode at *m/z* 308, 280, 262 and 105 for methcathinone; *m/z* 294, 266, 248 for cathinone; *m/z*: 298, 270 for IS. Retention time (all as 4-carboethoxyhexafluorobutyryl derivatives): methcathinone 4.56 min, cathinone 4.60 min, IS 3.88 min. Limit of quantification, 12.5 µg/L [Paul, Cole 2001].

HPLC Column: Separon C_{18} (5 µm). Mobile phase: 0.2 mol/L orthophosphoric acid : methanol: diethylamine (75 : 20 : 1). UV detection (λ = 210 nm and 250 nm) [Bodrina *et al.* 1994].

Hair **GC-MS** Column: DB-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.1 mL/min. Temperature programme: 90° for 3 min to 170° at 15°/min for 3 min to 210° at 25°/min for 1.5 min to 230° at 20°/min for 0.5 min to 300° at 35°/min for 0.5 min. EI ionisation mode at 70 eV, SIM acquisition mode. Limit of quantification, <80 pg/mg, limit of detection, 50 pg/mg [Kim *et al.* 2007]

LC-MS Column: LiChroCART Purospher 60 RP-18e (125 × 4 mm i.d., 5 mm i.d.). Mobile phase: acetonitrile with 0.1% formic acid : 0.1% formic acid (100 : 0 to 60 : 40 at 15 min to 100 : 0 at 15.2 min for 4.8 min), flow rate 1 mL/min. MSD, APCI, SIM acquisition mode. Retention time: 5.77 min. Limit of quantification, 0.3 ng/mg, limit of detection, 0.2 ng/mg [Stanaszek, Piekoszewski 2004].

Disposition in the Body The onset of effects occurs 10 min after intranasal administration of 80–250 mg methcathinone and lasts for 5–8 h. Both cathinone and methcathinone show activities similar to amfetamines.

Toxicity Dose-related neurotoxic and locomotor stimulant effects that are species and enantiomer dependent have been observed. Methcathinone shows a neurotoxic potential towards brain dopamine and/or serotonin neurones. Tolerance, craving and addiction have also been reported. The toxic dosage is estimated to be 80 to 250 mg by intranasal use.

Note For neurotoxic and pharmacologic studies of methcathinone in mice, see Sparago *et al.* [1996]; see also Glennon *et al.* [1987]. For occurrence of parkinsonism and dystonia following methcathinone, see Selikhova *et al.* [2008]. For occurrence of neurotoxicity following the ingestion of 'Russian cocktail', see Varlibas *et al.* [2009].

Dose Intranasal and IV routes, 500 to 1000 mg a day. Can be taken orally and by smoking.

Methdilazine

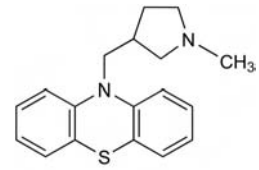
Antihistamine

$C_{18}H_{20}N_2S$ = 296.4

CAS—1982-37-2

IUPAC Name 10-[(1-Methyl-3-pyrrolidinyl)methyl]-10*H*-phenothiazine

Proprietary Names *Tacaryl* (chewable tablets); *Tacryl*.



Chemical Properties A light tan, crystalline powder. Mp 87° to 88°. Practically insoluble in water; soluble 1 in 2 of ethanol, 1 in 1 of chloroform and 1 in 8 of ether. pK_a 7.5. Log *P* (octanol/water), 5.2.

Methdilazine Hydrochloride

$C_{18}H_{20}N_2S$,HCl = 332.9

CAS—1229-35-2

Proprietary Names *Dilosyn*; *Tacaryl (syrup and tablets)*.

Chemical Properties A light tan, crystalline powder, which darkens on exposure to light. Mp 184° to 190°. Soluble 1 in 2 of water, 1 in 2 of ethanol and 1 in 6 of chloroform; practically insoluble in ether.

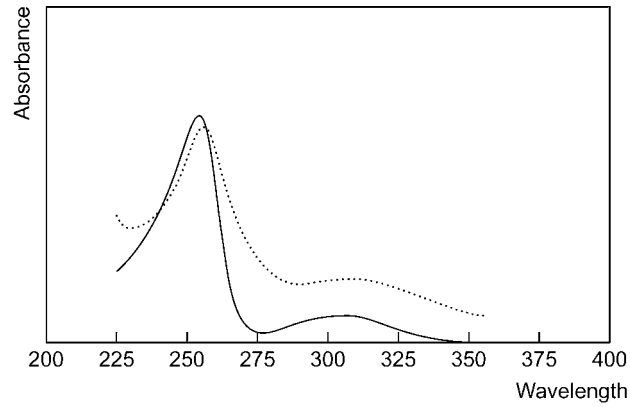
Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrest reagent—red-orange; FPN reagent—red; Liebermann's reagent—green-brown; Mandelin's test—green→violet; Marquis test—red-violet.

Thin-layer Chromatography System TA—R_f 0.29; system TB—R_f 0.32; system TC—R_f 0.15; system TE—R_f 0.63; system TL—R_f 0.06; system TAJ—R_f 0.12; system TAK—R_f 0.19; system TAL—R_f 0.72 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2467; system GF—RI 2920.

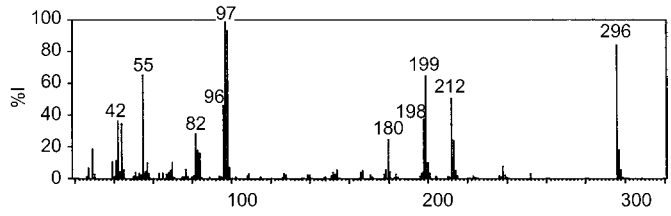
High Performance Liquid Chromatography System HA—*k* 6.0; system HAX—retention time 15.2 min; system HAY—retention time 6.7 min.

Ultraviolet Spectrum Aqueous acid—253 (A^1_1=982a), 302 nm; aqueous alkali—255, 308 nm.



Infrared Spectrum Principal peaks at wavenumbers 753, 1242, 1319, 1222, 1277, 1031 cm^{-1} (methdilazine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 97, 98, 296, 199, 55, 212, 96, 198.



Dose Usually 14.4 to 28.8 mg daily.

Methenamine

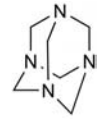
Antibacterial (Urinary)

$C_6H_{12}N_4$ = 140.2

CAS—100-97-0

Synonyms Aminoform; esammina; formine; hexamethylenamine; hexamethylenetetramine; hexamine; 1,3,5,7-tetraazatricyclo[3.3.1.1^{3,7}]decane; urotropine.

Proprietary Names *Antihydral*; *Uritone*; *Urotropina*.



Chemical Properties Colourless lustrous crystals or white crystalline powder. Mp 263°. Soluble 1 in 1.5 of water, 1 in 8 of ethanol (90%), 1 in 12 of chloroform and 1 in 320 of ether. Log *P* (octanol/water), −4.2.

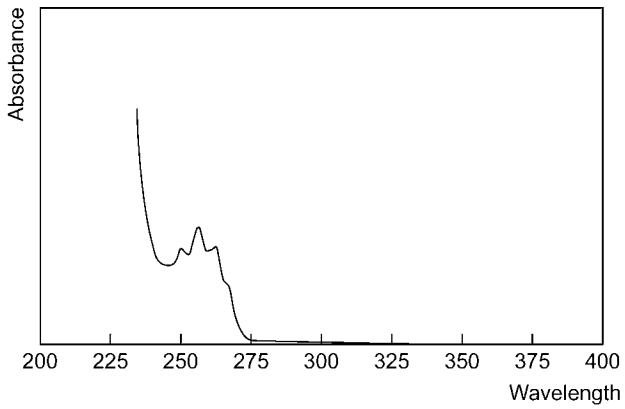
Methenamine Hippurate

$C_6H_{12}N_4,C_9H_9NO_3$ = 319.4
CAS—5714-73-8
Synonym Hexamine hippurate
Proprietary Names *Haiprex*; *Hiprex*; *Urex*; *Urotractan*; *Viapta*.
Chemical Properties A white crystalline powder. Mp 105° to 110°. Freely soluble in water and ethanol.

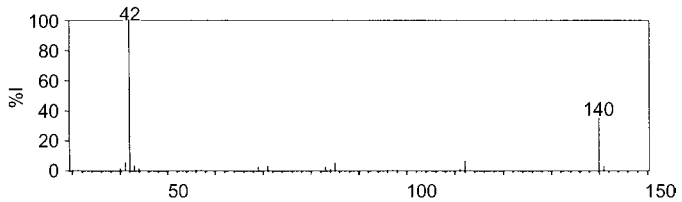
Methenamine Mandelate

$C_6H_{12}N_4,C_8H_8O_3$ = 292.3
CAS—587-23-5
Synonym Hexamine mandelate
Proprietary Names *Mandelamine*; *Purerin*; *Uromandelin*; *Uronamin*.
Chemical Properties A white crystalline powder. Mp 128° to 130°. Very soluble in water; soluble 1 in 10 of ethanol, 1 in 20 of chloroform and 1 in 350 of ether; slightly soluble in acetone.

Colour Test Mix 100 mg with an equal amount of salicylic acid and heat with 1 mL of sulfuric acid—a red colour is produced.
Thin-layer Chromatography System TA—R_f 0.30; system TB—R_f 0.04; system TC—R_f 0.13; system TL—R_f 0.03; system TAE—R_f 0.12; system TAF—R_f 0.12 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1210.
Ultraviolet Spectrum Aqueous acid—251, 257 (A^{1}_{1}=15.5b), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1232, 812, 671, 1010, 1044, 724 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 42, 140, 112, 41, 85, 43, 71, 141.



Quantification

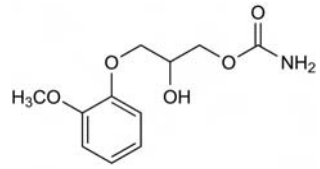
Serum **GC** Limit of detection, <5 mg/L [Nieminen *et al.* 1980].
Urine **Colorimetry** Methenamine and formaldehyde. Limit of detection, 25 mg/L for methenamine, 5 mg/L for formaldehyde [Gollamudi *et al.* 1979].
GC See Plasma [Nieminen *et al.* 1980].
Disposition in the Body Readily absorbed after oral administration and rapidly excreted unchanged in the urine. In acidic urine it is slowly hydrolysed, with the liberation of formaldehyde; this may also occur in the acid gastric secretions and 10 to 30% of a dose may be hydrolysed in the stomach.
Dose Usually 2 g of methenamine hippurate or 4 g of methenamine mandelate daily.

Gollamudi R *et al.* (1979). Simultaneous determination of methenamine and formaldehyde in the urine of humans after methenamine administration. *Biopharm Drug Dispos* 1: 27–36.
Nieminen AL *et al.* (1980). Determination of methenamine in biological samples by gas-liquid chromatography. *J Chromatogr* 181: 11–16.

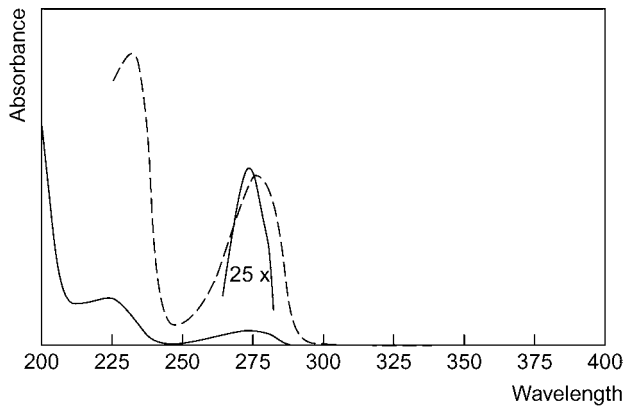
Methocarbamol

Muscle Relaxant
$C_{11}H_{15}NO_5$ = 241.2
CAS—532-03-6

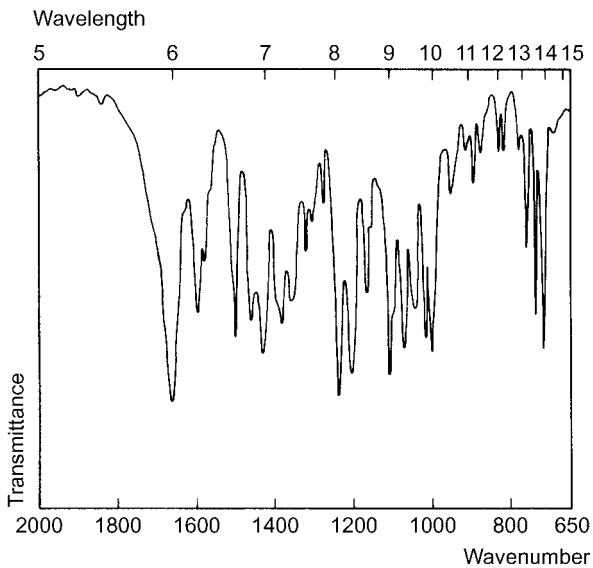
IUPAC Name [2-Hydroxy-3-(2-methoxyphenoxy)propyl] carbamate
Synonyms Guaifenesin carbamate; 3-(2-methoxyphenoxy)-1,2-propanediol 1-carbamate.
Proprietary Names *Delaxin*; *Labycarbol*; *Laxan*; *Lumirelax*; *Mebaxin*; *Musxan*; *Myosin*; *Myomethol*; *Ortoton*; *Robamol*; *Robaxin*; *Traumacut*. It is an ingredient of *Robaxisal*.



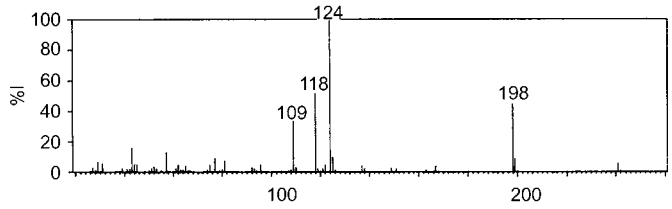
Chemical Properties A white powder. Mp about 94° to 90°. Soluble 1 in 40 of water; soluble in ethanol only with heating; sparingly soluble in chloroform; soluble in propylene glycol; practically insoluble in *n*-hexane. Log *P* (octanol/water), 0.6.
Colour Tests Liebermann's reagent—violet; Mandelin's test—green; Marquis test—blue-violet.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.00; system TD—R_f 0.07; system TE—R_f 0.47; system TF—R_f 0.23; system TAD—R_f 0.38; system TAE—R_f 0.83; system TAJ—R_f 0.41; system TAK—R_f 0.12; system TAL—R_f 0.72 (furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—methocarbamol RI 2050, methocarbamol -AC RI 2145, M (guaifenesin) RI 1620.
High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 345; system HY—RI 297; system HAX—retention time 5.0 min; system HAY—retention time 3.9 min.
Ultraviolet Spectrum Methanol—275 nm (A^{1}_{1}=101a).



Infrared Spectrum Principal peaks at wavenumbers 1667, 1248, 1119, 1215, 1010, 1080 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 124, 118, 198, 109, 43, 57, 125, 77.



Quantification

Blood **HPLC** UV detection [Sprague, Poklis 1980].
Plasma **HPLC** UV detection. Limit of detection, <1 mg/L [Weng *et al.* 1994].
Serum **Colorimetry** [Forist, Judy 1971].

Disposition in the Body Absorbed after oral administration. Metabolised by demethylation and *p*-hydroxylation followed by conjugation with glucuronic acid or sulfate. About 98% of a dose is excreted in the urine in 72 h, with <1% as unchanged drug and the remainder as free and conjugated metabolites; most of the excretion occurs in the first 8 h.

Therapeutic Concentration

Following a single oral dose of 2 g to 1 subject, a peak serum concentration of 25.8 mg/L was attained in 1 h [Forist, Judy 1971].

Toxicity

In a fatality due to ingestion of methocarbamol and alcohol, the following postmortem tissue concentrations were reported: blood, methocarbamol 525 mg/L, alcohol 1400 mg/L, salicylate 20 mg/L; urine, methocarbamol 575 mg/L [Kemal *et al.* 1982].

The following postmortem tissue concentrations of methocarbamol were reported in a fatality due to the ingestion of methocarbamol and ethanol: blood 257 mg/L, bile 927 mg/L. urine 255 mg/L, gastric content 3.7 g, liver 459 µg/g, kidney 83 µg/g; blood and urine ethanol concentrations were 1350 and 2490 mg/L respectively [Ferslew *et al.* 1990].

Half-life Plasma half-life, about 1 to 2 h.

Dose 4 to 6 g daily.

Ferslew KE *et al.* (1990). A fatal interaction of methocarbamol and ethanol in an accidental poisoning. *J Forensic Sci* 35: 477–482.
Forist AA, Judy RW (1971). Comparative pharmacokinetics of chlorphenesin carbamate and methocarbamol in man. *J Pharm Sci* 60: 1686–1688.

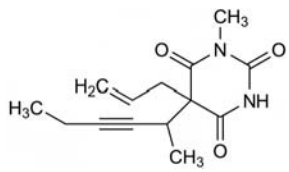
Weng N *et al.* (1994). Development and validation of a high-performance liquid chromatographic method for the determination of methocarbamol in human plasma. *J Chromatogr B Biomed Appl* 654: 287–292.

Methohexital

Anaesthetic, Barbiturate
$C_{14}H_{18}N_2O_3$ = 262.3
CAS—151-83-7; 18652-93-2

IUPAC Name 5-Hex-3-yn-2-yl-1-methyl-5-prop-2-enyl-1,3-diazinane-2,4,6-trione

Synonyms Methohexitone; 1-methyl-5-(1-methyl-2-pentynyl)-5-(2-propenyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione.



Chemical Properties A white to faintly yellowish-white, crystalline powder. Mp 92° to 96°. Very slightly soluble in water; slightly soluble in ethanol and chloroform. pK_a 8.3. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Methohexital Sodium

$C_{14}H_{17}N_2NaO_3$ = 284.3
CAS—309-36-4

Synonyms Enallynymalnatrium; sodium methohexitone.
Proprietary Names *Brevital Sodium*; *Brietal Sodium*.
Chemical Properties A white crystalline substance. Soluble in water.

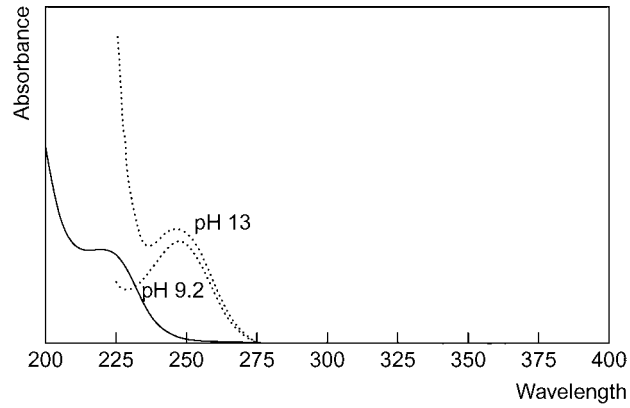
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—violet-brown/colourless.

Thin-layer Chromatography System TD—R_f 0.73; system TE—R_f 0.58; system TF—R_f 0.72; system TH—R_f 0.93; system TAD—R_f 0.71; system TAE—R_f 0.85 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, faint pink).

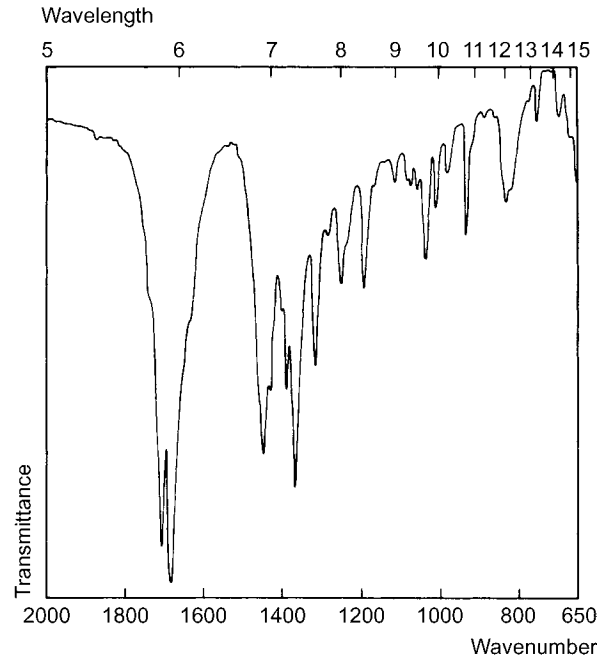
Gas Chromatography System GA—methohexital RI 1770, methohexital-Me RI 1735, M (OH-) RI 1880; system GB—methohexital RI 1827, methohexital-Me RI 1797; system GAJ—methohexital RRT 0.798 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HG—*k* 27.61; system HH—*k* 20.48; system HX—RI 503; system HY—RI 484.

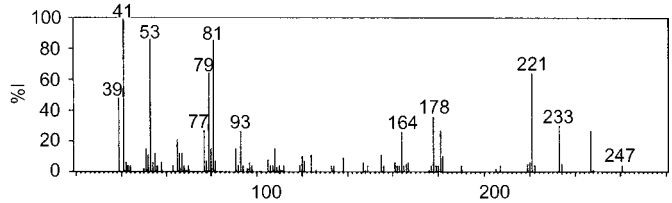
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—246 nm (A^1_1=276a); 1 mol/L sodium hydroxide (pH 13)—246 nm (A^1_1=308b).



Infrared Spectrum Principal peaks at wavenumbers 1680, 1709, 1316, 1193, 1253, 1040 cm^{-1} (methohexital sodium).



Mass Spectrum Principal ions at *m/z* 41, 81, 53, 221, 79, 39, 178, 233.



Quantification

Blood **GC** AFID. Methohexital and 4′-hydroxymethohexital. Limit of detection, 100 µg/L in blood [Heusler *et al.* 1981].
Plasma **GC** Limit of detection, 50 µg/L in plasma, see Blood [Heusler *et al.* 1981].
Serum **GC** NSD. Limit of detection, 6 µg/L [Le Normand *et al.* 1988].
See also under Amobarbital.

Disposition in the Body Methohexital has a very short duration of action. It rapidly enters the brain and upon redistribution is localised in body fat but to a lesser extent than thiopental. <1% of a dose is excreted unchanged in the urine in 24 h; the major metabolite is 4′-hydroxymethohexital.

Therapeutic Concentration

Following an IV dose of 2 mg/kg of methohexital to 6 subjects, venous blood concentrations of 3.9 to 8.6 mg/L were reported at 1 to 3 min [Sunshine *et al.* 1966].

After a slow IV infusion of 3 mg/kg of methohexital sodium over a period of 60 min to 1 subject, a peak plasma concentration of about 3 mg/L was reported [Breimer 1976].

Following a rectal dose of 25 mg/kg methohexital as a 1% or 10% solution, the mean plasma concentration in 85 children was 6.5 and 4.7 μg/L, respectively, at 20 min and 4.9 and 4.1 μg/L at 30 min [Khalil *et al.* 1990].

Toxicity The estimated minimum lethal dose is 1 g.

The following postmortem tissue concentrations were reported in a fatal case involving the IV self-administration of methohexital: blood 103 mg/L, kidney 45 μg/g, liver 41 μg/g, spleen 41 μg/g; alcohol was also found in the blood [Finkle B, personal communication, 1967].

In a fatality due to the injection of about 300 mg of methohexital, postmortem blood and liver concentrations of 2 mg/L and 17 μg/g, respectively, were reported [Ryall 1981].

Half-life Plasma half-life, about 1 to 2 h.

Volume of Distribution About 1 L/kg.

Clearance Plasma clearance, about 12 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, about 1.5.

Protein Binding About 73%.

Dose For induction of anaesthesia, 50 to 120 mg of methohexital sodium, by slow IV injection.

Methoprotryne

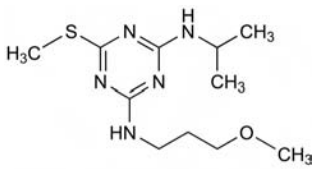
Herbicide

$C_{11}H_{21}N_5OS = 271.4$

CAS—841-06-5

IUPAC Name 4-*N*-(3-Methoxypropyl)-6-methylsulfanyl-2-*N*-propan-2-yl-1,3,5-triazine-2,4-diamine

Synonym 2-Isopropylamino-4-(3-methoxypropylamino)-6-methylthio-1,3,5-triazine

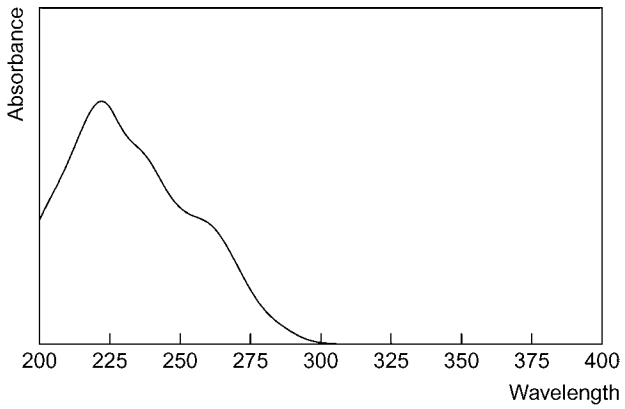


Chemical Properties A crystalline solid. Mp 68° to 70°. Soluble 1 in 3000 of water; soluble in most organic solvents. Log *P* (octanol/water), 2.8.

Thin-layer Chromatography System TA—R_f 0.74; system TX—R_f 0.19; system TY—R_f 0.11 (Dragendorff spray, positive).

Gas Chromatography System GA—RI 2098.

Ultraviolet Spectrum Principal peak at 225 nm.



Infrared Spectrum Principal peaks at wavenumbers 1538, 811, 1304, 1121, 1272, 1175 cm^{-1} (KBr disk).

Methoserpidine

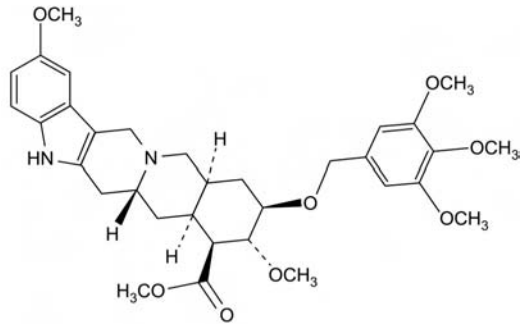
Antihypertensive

$C_{33}H_{40}N_2O_9 = 608.7$

CAS—865-04-3

Synonyms 10-Methoxydeserpidine; methyl 11-demethoxy-10-methoxy-18-*O*-(3,4,5-trimethoxybenzoyl)reserpate.

Proprietary Name *Decaserpyl*



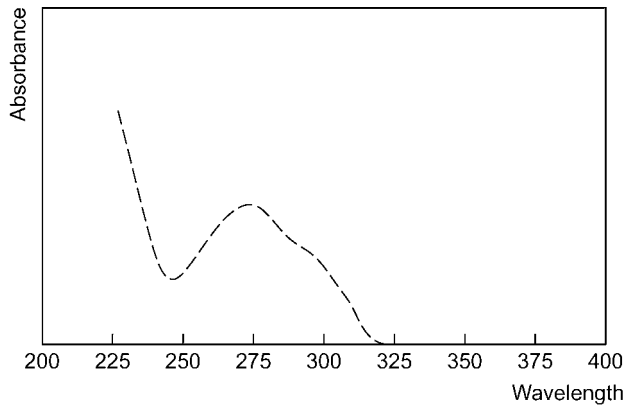
Chemical Properties A cream-coloured, hygroscopic, microcrystalline powder, which darkens on exposure to light. Mp about 171°, with decomposition. Practically insoluble in water; soluble 1 in 60 of ethanol, 1 in 5 of chloroform and 1 in 8 of dioxan.

Colour Tests Mandelin's test—grey-violet; Marquis test—grey.

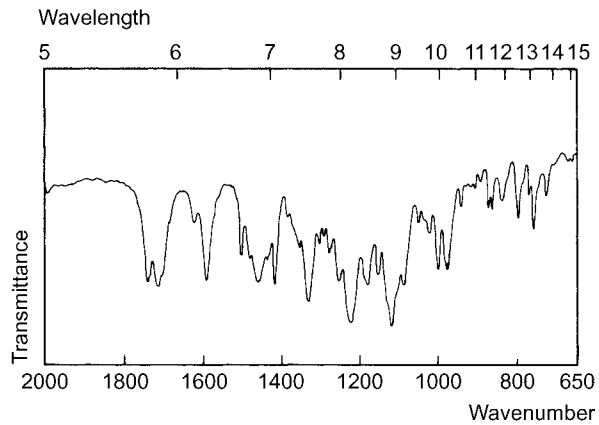
Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.04; system TC—R_f 0.77; system TL—R_f 0.64 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HA—*k* 0.5.

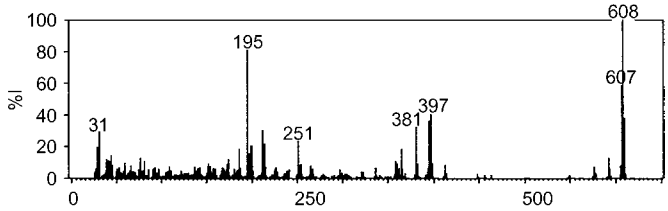
Ultraviolet Spectrum Dehydrated alcohol—273 nm (A_1^1=300a).



Infrared Spectrum Principal peaks at wavenumbers 1120, 1220, 1710, 1088, 1180, 1740 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 608, 195, 607, 397, 609, 395, 381, 396.



Dose 15 to 50 mg daily.

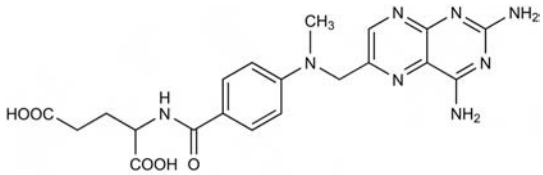
Methotrexate

Antineoplastic
$C_{20}H_{22}N_8O_5 = 454.4$
CAS—59-05-2

IUPAC Name *N*-[4-[[(2,4-Diamino-6-pteridinyl)methyl]methylamino]benzoyl]-L-glutamic acid

Synonyms Amethopterin; 4-amino-10-methylfolic acid; α-methopterin.

Proprietary Names *Abitrexate*; *Emthexat(e)*; *Farmitrexat*; *Folex*; *Lantarel*; *Ledertrexate*; *Maxtrex*; *Medsatrexate*; *Metex*; *Methoblastin(e)*; *Metrotex*; *Mexate*; *Novatrex*; *O-trexat*; *Rheumatrex*; *Rhodamer*; *Texate*; *Trexall*; *Trexan*; *Trexeron*; *Trixilem*; *Xaken*.



Chemical Properties A yellow to orange-brown, crystalline powder. Mp 182° to 189°. Practically insoluble in water, ethanol, chloroform and ether; very soluble in dilute solutions of alkali hydroxides and carbonates. pK_a 3.8, 4.8, 5.6. Log *P* (octanol/water), −1.8.

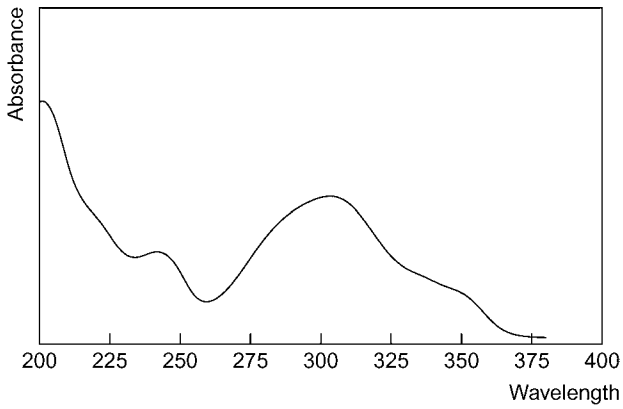
Caution Methotrexate is an irritant; avoid contact with skin and mucous membranes.

Colour Tests Mandelin's test—red; mercurous nitrate—black; Nessler's reagent—orange.

Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 292; system HAX—retention time 4.7 min; system HAY—retention time 2.9 min.

Ultraviolet Spectrum Aqueous acid—243 (A^1_1=372a), 307 nm (A^1_1=430a); aqueous alkali—258 (A^1_1=500a), 303 nm (A^1_1=500a).



Infrared Spectrum Principal peaks at wavenumbers 1600, 1511, 1634, 1305, 1200, 1538 cm^{-1} (Nujol mull).

Quantification

Plasma **HPLC** UV detection. Methotrexate and 7-hydroxymethotrexate. Limit of detection, 10 μg/L [Sparreboom *et al.* 1999]. Methotrexate and metabolites. Limit of detection, 0.1 nmol/L in plasma [Albertioni *et al.* 1995]. Comparison with fluorescence polarisation immunoassay [Najjar *et al.* 1992]. Radioimmunoassay See Serum [Aherne *et al.* 1977].

Ascitic Fluid **HPLC** See Plasma [Salamoun, Frantisek 1986].

Biological Fluids **HPLC** See Plasma [van Tellingen *et al.* 1989].

CSF **HPLC** See Plasma [Breithaupt *et al.* 1982].

Radioimmunoassay See Serum [Aherne *et al.* 1977].

Saliva **HPLC** Limit of detection, 0.1 nmol/L, see Plasma [Albertioni *et al.* 1995].

Disposition in the Body When given in low doses, it is rapidly absorbed after oral administration to give plasma concentrations equivalent to those obtained by IV administration; higher doses may be less well absorbed. It is distributed mainly in the extracellular spaces but a proportion penetrates cell membranes and is strongly bound to dihydrofolate reductase. Small amounts of methotrexate diffuse into the CSF, higher concentrations being achieved with high doses. The major metabolite appears to be 4-amino-10-methylpteroic acid; 7-hydroxymethotrexate has been detected after high doses; 7-hydroxy-4-amino-10-methylpteroic acid has also been reported to be a metabolite. About 50 to 95% of a dose is excreted unchanged in the urine in 24 h (dose-dependent); after oral administration, about 30% of a dose may be excreted as metabolites as a result of the action of intestinal bacteria prior to absorption; after IV administration, up to about 10% of a dose is excreted in the urine as metabolites and up to about 15% of a dose may be excreted in the bile.

Therapeutic Concentration

After single oral doses of 15 mg/m^2 to 10 fasting subjects (children), peak serum concentrations of 0.18 to 0.73 mg/L (mean 0.41) were attained in 1 to 2 h [Pinkerton *et al.* 1980].

In 89 children receiving weekly oral methotrexate (20 mg/m^2) and daily oral mercaptopurine (75 mg/m^2), peak plasma concentrations ranged from 0.21 to 3.1 μmol/L (mean 1.2) for methotrexate and from 0.13 to 2.3 μmol/L (mean 0.56) for mercaptopurine [Balis *et al.* 1998].

Low-dose oral methotrexate (7.5 or 15 mg weekly, divided into 3 doses given at 12-hour intervals) was given to 24 subjects. In the first week, peak plasma concentrations were 94 to 137 nmol/L (mean 117) 1 to 2 h after the third dose of 2.5 mg and 161 to 215 nmol/L (mean 172) 1 to 2 h after the third dose of 5 mg. In week 13, peak plasma concentrations 1 to 2 h after the third dose of 2.5 mg or 5 mg were 88 to 152 nmol/L (mean 95) and 142 to 200 nmol/L (mean 157) [Chladek *et al.* 2002].

Toxicity Toxic effects are usually associated with plasma concentrations >4.5 mg/L, 24 h after a dose, or 0.45 mg/L, 48 h after a dose.

Half-life Plasma half-life, about 4 to 10 h; a longer terminal elimination phase of 10 to 70 h (mean 27) has also been reported.

Volume of Distribution About 0.8 L/kg.

Distribution in Blood Plasma : whole blood ratio, 0.9.

Protein Binding Variously reported as 50 to 95%.

Note For reviews of the clinical pharmacokinetics of methotrexate, see Shen and Azarnoff [1978]; Balis *et al.* [1983]; and Wang and Fujimoto [1984].

Dose 10 to 25 mg weekly, orally.

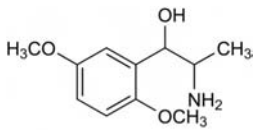
Methoxamine

Sympathomimetic
$C_{11}H_{17}NO_3 = 211.3$
CAS—390-28-3

IUPAC Name 2-Amino-1-(2,5-dimethoxyphenyl)propan-1-ol

Synonyms α-(1-Aminoethyl)-2,5-dimethoxybenzenemethanol; methoxamedrine.

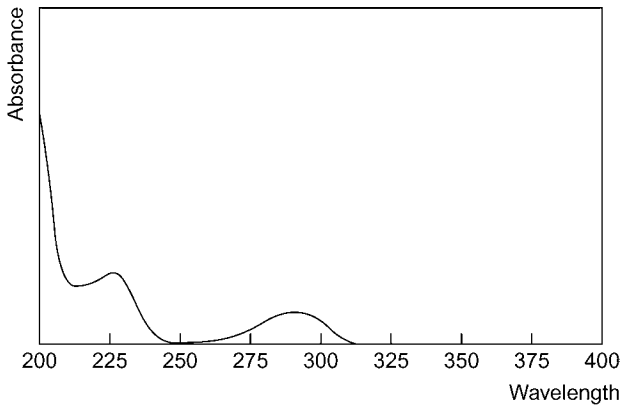


Chemical Properties pK_a 9.2 (25°). Log *P* (octanol/water), 0.4.

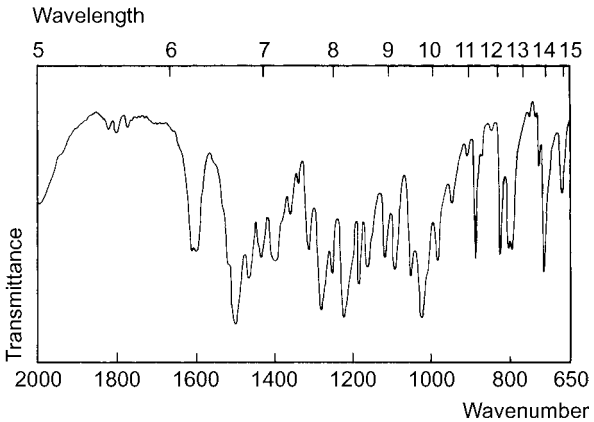
Methoxamine Hydrochloride

$C_{11}H_{17}NO_3$,HCl = 247.7
CAS—61-16-5
Proprietary Names *Vasoxine*; *Vasoxyl*.
Chemical Properties Colourless or white plate-like crystals or white crystalline powder. Mp 212° to 216°. Soluble 1 in 2.5 of water and 1 in 12 of ethanol; practically insoluble in benzene, chloroform and ether.

Colour Tests Mandelin's test—green-yellow; Marquis test—violet-brown→green.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.24; system TC—R_f 0.04; system TE—R_f 0.11; system TL—R_f 0.38; system TAE—R_f 0.12; system TAF—R_f 0.73; system TAJ—R_f 0.00; system TAK—R_f 0.12; system TAL—R_f 0.50 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1726.
High Performance Liquid Chromatography System HA—*k* 0.9; system HY—RI 228; system HAX—retention time 6.4 min; system HAY—retention time 3.6 min.
Ultraviolet Spectrum Aqueous acid—290 nm; water—290 nm (A_1^1=161a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1496, 1219, 1022, 1276, 1179, 1050 cm^{-1} (methoxamine hydrochloride, KBr disk).

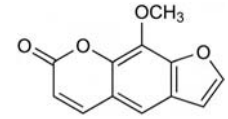


Mass Spectrum Principal ions at *m/z* 168, 137, 44, 139, 43, 152, 124, 167.
Dose 5 to 20 mg of methoxamine hydrochloride IM.

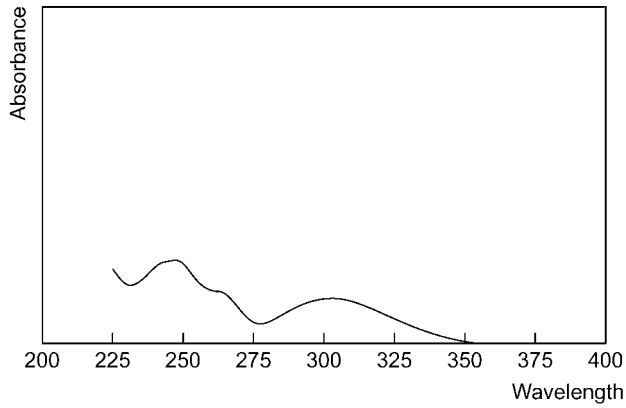
Methoxsalen

Pigmenting Agent
$C_{12}H_8O_4$ = 216.2
CAS—298-81-7

IUPAC Name 9-Methoxy-7*H*-furo[3,2-*g*][1]benzopyran-7-one
Synonyms Ammoidin; 8-methoxypsoralen; metoxaleno; xanthotoxin.
Proprietary Names *Deltasoralen*; *Dermox*; *Geroxsalen*; *Meladinina*; *Meladinine*; *Mopsoralen*; *Oxsoralen*; *Puvasoralen*; *Ultramop*; *Uvadex*.



Chemical Properties A constituent of the fruits of *Ammi majus*. White to cream-coloured fluffy crystals. Mp 143° to 148°. Practically insoluble in cold water; sparingly soluble in boiling water and ether; soluble in boiling ethanol, acetic acid, propylene glycol, benzene and acetone; freely soluble in chloroform. Log *P* (octanol/water), 2.1.
Thin-layer Chromatography System TA—R_f 0.82; system TB—R_f 0.13; system TE—R_f 0.76; system TF—R_f 0.58; system TAE—R_f 0.82; system TAJ—R_f 0.82; system TAK—R_f 0.68; system TAL—R_f 0.96.
Gas Chromatography System GA—RI 1980.
High Performance Liquid Chromatography System HX—RI 457; system HZ—retention time 5.2 min.
Ultraviolet Spectrum Aqueous acid—247, 304 nm.



Infrared Spectrum Principal peaks at wavenumbers 1705, 1150, 1100, 1580, 1020, 1000 cm^{-1} (Nujol mull).

Quantification

Plasma **GC-MS** SIM [Cracco *et al.* 1992].

HPLC Fluorescence detection. Limit of detection, about 0.4 μg/L [Vielhauer *et al.* 1995]. UV detection. Limit of detection, 15 μg/L [Kucova *et al.* 1993]. Limit of detection, 1.5 μg/L [Ketchum *et al.* 1990]. Limit of detection, 10 μg/L [Gasparro *et al.* 1988].

Disposition in the Body

Therapeutic Concentration

After oral administration of 0.4 to 0.6 mg methoxsalen to 8 subjects, peak serum concentrations averaged 420 ± 80 μg/L within 40 min; during extracorporeal photophoresis, the concentration in the photoactivation chamber (so-called buffy coat fraction) was 134 μg/L [Shephard *et al.* 1999].

Plasma concentrations of methoxsalen after administration via various routes to 8 subjects were as follows: about 175 to 300 μg/L at 1 to 4 h after 0.6 or 1 mg/kg orally; about 5.5 μg/L 2 h after topical administration of a 0.1% cream; and about 1.2 μg/L 3 h after topical administration of a 3 mg/L bath [Tegeder *et al.* 2002].

In 10 subjects given 3 oral doses of 0.46 to 0.56 mg/kg methoxsalen in a liquid formulation, peak serum levels were about 650 μg/L in the fasted state, about 200 μg/L after a low-fat breakfast, and about 150 μg/L after a fat-rich breakfast; food delayed the time to reach peak plasma levels (30 min in the fasted state vs 1.5 to 3 h following a fat-rich meal) [Bech-Thomsen *et al.* 1992].

Dose 20 mg daily; doses of up to 50 mg have been given.

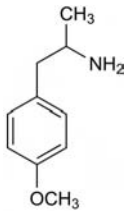
Methoxyamfetamine

Hallucinogen, Phenethylamine
$C_{10}H_{15}NO = 165.2$
CAS—23239-32-9

IUPAC Name 1-(4-Methoxyphenyl)propan-2-amine
Synonyms 4-MA; *p*-methoxyamphetamine; 4-methoxyamphetamine; 4-methoxy-α-methylbenzeneethanamine; α-methyl-4-methoxyphenethylamine; PMA. Usually presented as 'Ecstasy'.



Chemical Properties A colourless oil. Practically insoluble in water; soluble in chloroform and dilute acids.

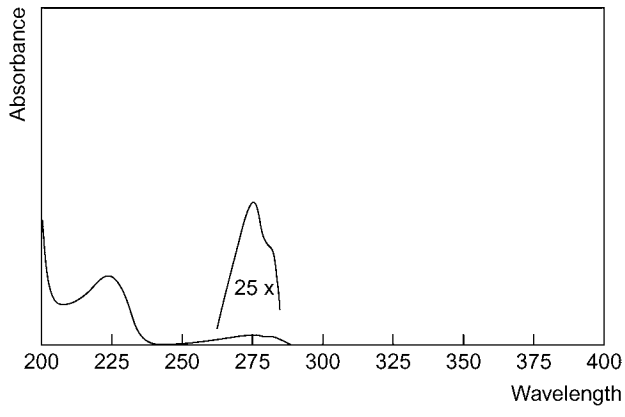
Methoxyamfetamine Hydrochloride

$C_{10}H_{15}NO,HCl = 201.7$
CAS—3706-26-1
IUPAC Name 1-(4-Methoxyphenyl)propan-2-amine hydrochloride
Chemical Properties White crystals. Soluble in water.

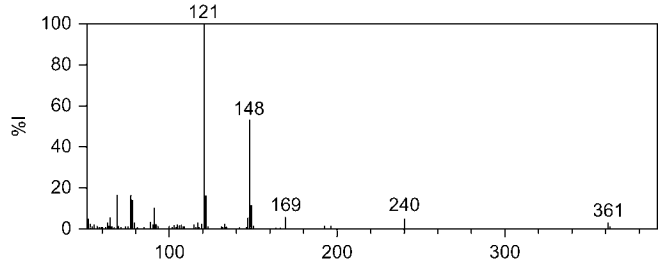
Colour Tests Mandelin's test—green; Marquis test—no colour change.
Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.23; system TC—R_f 0.77; system TE—R_f 0.43; system TL—R_f 0.69; system TAE—R_f 0.09; system TAF—R_f 0.74 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1412; system GB—RI 1410.
Gas-Chromatography-Mass Spectrometry Column: HP-5MS (15 m × 0.25 mm i.d., 0.25 μm). Column temperature: 60° for 2 min to 280° at 15°/min for 3 min. Injector and detector temperatures: 250° and 300°, respectively. Pentafluoropropionic anhydride derivative RT 9.0 min. [Felgate *et al.* 1998].
High Performance Liquid Chromatography System HB—*k* 14.95; system HX—RI 274; system HY—RI 228.

Columns: μBondapack C_{18} (300 × 3.9 mm i.d.) or Ultracarb 5 C_{18} (150 × 4.6 mm i.d.) or Hypersil 5 Phenyl (150 × 4.6 mm i.d.). Mobile phase: 0.05 mol/L pH 3.0 phosphate buffer : acetonitrile (6 : 1), flow rate 1.5 mL/min for μBondapack and Ultracarb columns and 1.2 mL/min for Hypersil column (all separate analyses). UV detection (λ = 254 and 280 nm). Retention time: *p*-methoxyamfetamine (PAM) 6.5 min (μBondapack) and 4.5 min (Ultracarb and Hypersil). [Noggle *et al.* 1989].

Ultraviolet Spectrum Aqueous acid—274 nm (A^{1}_{1} = 80b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1512, 1259, 1033, 808, 1190, 1623 cm^{-1} (methoxyamfetamine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 121, 148, 122, 149, 169, 240, 361.



Quantification

Blood **GC-MS** Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 60° for 2 min to 300° at 20°/min for 10 min. Scan mode. Limit of detection, 5–50 μg/L for PMA and other amfetamine-related drugs[Kudo *et al.* 2007].

LC-MS Column: Nucleodur Sphinx RP. Mobile phase: 10 mmol/L ammonium formate buffer : acetonitrile. PMA and other amfetamines. Limit of detection, 0.05–0.5 μg/L, limit of quantification, 2.5 μg/L [Fernández Mdel *et al.* 2009]. Column: phenyl type. Mobile phase: flow rate 0.3 mL/min. PMA and other amfetamine-related drugs [Mortier *et al.* 2002].

Urine **LC-MS** See Blood. Limit of quantification, 25 μg/L, limit of detection, 0.25–2.5 μg/L [Fernández Mdel *et al.* 2009]. See Blood [Mortier *et al.* 2002].

Hair **LC-MS** Column: LiChroCART Purospher 60 RP-18e (125 × 4 mm i.d., 5 mm). Mobile phase: acetonitrile : water both containing 0.1% formic acid (100 : 0 to 60 : 40 at 15 min to 100 : 0 at 15.2 min until 20 min), flow rate 1.0 mL/min. APCI, SIM acquisition mode. PMA and other amfetamines. Retention time: 7.35 min for PMA. Limit of detection, 0.20 μg/L for PMA [Stanaszek, Piekoszewski 2004].

Tissues **LC-MS** See Blood [Mortier *et al.* 2002].

Disposition in the Body Methoxyamfetamine is absorbed after oral administration. Approximately 80% of a dose is excreted in the urine in 24 h with up to 15% of the dose as unchanged drug, ~25% as free 4-hydroxyamfetamine, 50% as conjugated 4-hydroxyamfetamine, and 5% each as 4-hydroxynorephedrine and a conjugated *N*-oxidation product. The extent of *O*-demethylation appears to be genetically determined being decreased in poor metabolisers.

Toxicity Methoxyamfetamine is about 3 times as potent as methylenedioxyamfetamine and appears to be more toxic. At least 30 deaths worldwide have been reported caused by PMA toxicity, some involving other drugs. PMA can produce both CNS stimulation and hallucinogenic effects. Acute toxicity primarily results in hyperthermia but there may also be symptoms related to a 'serotonin syndrome' and some respiratory depression. Such symptoms may be produced at blood concentrations over 0.5 mg/L.

In 9 deaths from ingestion or IV administration of methoxyamfetamine, the following postmortem tissue concentrations were reported: blood 0.3–1.9 mg/L, bile 0.4–3 mg/L, liver 0.5–10.3 μg/g and urine 6–175 mg/L; alcohol was also detected in 4 cases [Cimbura 1974].

PMA concentrations in postmortem femoral blood ranged from 0.24–4.9 mg/L (mean 2.3 mg/L) in 6 deaths related to PMA poisoning. Corresponding liver concentrations ranged from 1.4–21 mg/kg (mean 8.9 mg/kg). Other amfetamines (including methamfetamine and MDMA) were detected in 5 of the 6 cases. All cases involved hyperthermia; in some cases rhabdomyolysis and haemorrhaging were also observed [Felgate *et al.* 1998]. See also Byard *et al.* [1998] and Ling *et al.* [2001].

In fatal PMA intoxication in Canada and the USA, PMA concentrations in postmortem blood were found to be 0.6 mg/L and 1.3 mg/L in 2 cases [Martin 2001] and 1.9 mg/L, 0.6 mg/L and 1.07 mg/L in 3 other cases [Kraner *et al.* 2001]. Other drugs of abuse were detected in 3 of these 5 cases.

In 3 deaths, levels of PMA were >0.3 mg/L and MDMA levels were >0.6 mg/L [Byard *et al.* 2002].

A 22-year-old man died after taking Ecstasy pills containing PMA and *p*-methoxymethylamfetamine (PMMA). Blood levels were 0.61 and 0.85 mg/L for PMA and PMMA, respectively [Becker *et al.* 2003].

Three cases of fatal intoxication with PMA and PMMA have been reported. Postmortem blood levels of PMA and PMMA, respectively, were 3.4 and 3.3 mg/kg (case 1) and 0.78 and 0.68 mg/kg (case 3). In case 2, death occurred 4 days after drug ingestion and only low levels of PMA were detected at postmortem [Johansen *et al.* 2003].

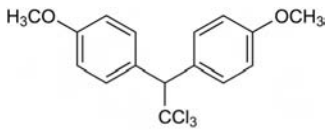
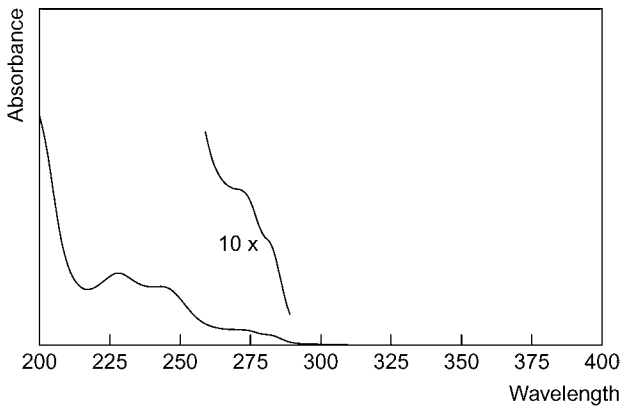
Methoxychlor

Insecticide
$C_{16}H_{15}Cl_3O_2$ = 345.7
CAS—72-43-5

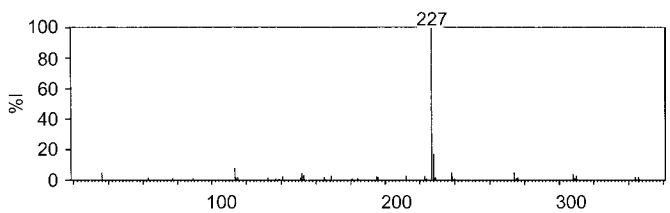
IUPAC Name 1-Methoxy-4-[2,2,2-trichloro-1-(4-methoxyphenyl)ethyl]benzene
Synonyms Dimethoxy-DT; DMDT; methoxy-DDT; 1,1′-(2,2,2-trichloroethylidene)bis[4-methoxybenzene].
Proprietary Name *Marlate*



Chemical Properties The technical product contains about 88% of methoxychlor and about 12% of related isomers. The pure *pp*′-isomer occurs as colourless crystals; the technical product is a grey powder. Mp 89°. Practically insoluble in water; soluble in ethanol and aromatic solvents; very soluble in ether. Log *P* (octanol/water), 5.1.
Colour Test Liebermann's reagent—black-violet.
Thin-layer Chromatography System TE—R_f 0.87; system TF—R_f 0.72; system TX—R_f 0.43; system TY—R_f 0.84; system TAA—R_f 0.65.
Gas Chromatography System GA—*op*′-methoxychlor RI 2417, methoxychlor RI 2445; system GK—*pp*′-methoxychlor RRT 1.46, *op*′-methoxychlor RRT 1.40 (both relative to caffeine).
High Performance Liquid Chromatography System HX—RI 900; system HAA—retention time 27.4 min.
Ultraviolet Spectrum Hexane—276 (A_1^1=100b), shoulder at 283 nm.



Mass Spectrum Principal ions at *m/z* 121, 227, 228, 114, 152, 122, 63, 165 (*op*′-methoxychlor); 227, 228, 114, 152, 212, 63, 169, 115 (*pp*′-methoxychlor).



Quantification
Serum **GC-MS** Methoxychlor and other pesticides [Dmitrovic *et al.* 2002].
Disposition in the Body Methoxychlor is less persistent than clofenotane. It is stored in the fat to a limited extent and disappears in 2 to 4 weeks after cessation of exposure. It is eliminated mainly in the faeces; small amounts are excreted in the urine.
Toxicity Methoxychlor is the least toxic of the chlorinated hydrocarbon insecticides. The maximum permissible atmospheric concentration is 10 mg/m^3 and the maximum permissible concentration in food is 14 µg/g.

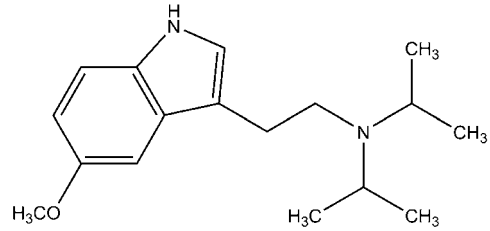
In a case of attempted suicide by ingestion of a product containing methoxychlor, a serum concentration of 0.67 mg/L was detected upon admission to hospital [Thompson, Vorster 2000].

Dmitrovic J *et al.* (2002). Analysis of pesticides and PCB congeners in serum by GC/MS with SPE sample cleanup. *Toxicol Lett* 134: 253–258.
Thompson TS, Vorster SJ (2000). Attempted suicide by ingestion of methoxychlor. *J Anal Toxicol* 24: 377–380.

5-Methoxy-*N*,*N*-diisopropyltryptamine

Hallucinogen
$C_{17}H_{26}N_2O$=274.4
CAS—4021-34-5

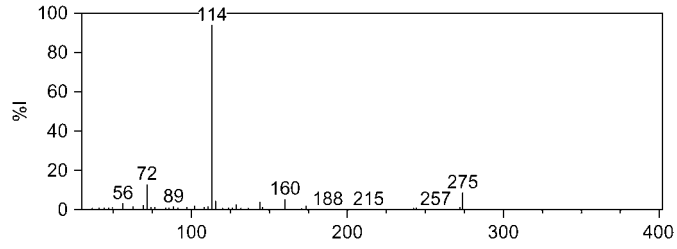
IUPAC Name *N*-[2-(5-Methoxy-1*H*-indol-3-yl)ethyl]-*N*-propan-2-ylpropan-2-amine
Synonyms 3-[2-(Diisopropylamino)ethyl]-5-methoxyindole; *N*,*N*-diisopropyl-5-methoxytryptamine; 5-MeO-DIPT; 5-methoxy-*N*,*N*-bis (1-methylethyl)-1*H*-indole-3-ethanamine.
Street Names Foxy Methoxy, Foxy.



5-Methoxy-*N*,*N*-diisopropyltryptamine Hydrochloride

$C_{17}H_{26}N_2O$,HCl = 310.9
CAS—2426-63-3
Chemical Properties White crystalline solid. Mp 180° to 181°. Log *P* (octanol/water), 3.73 [ACD 2007].

Colour Tests Ehrlich's reagent—purple→blue; Marquis test—yellow→black.
Infrared Spectrum Principal peaks at wavenumbers 731, 809, 826, 931, 1035, 1064 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 114, 72, 275, 160, 56, 89, 188, 215 [Meatherall, Sharma 2003].



Quantification
Blood **GC-MS** Column: HP-1MS fused silica capillary 100% dimethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 2 min to 300° at 20°/min for 5 min. SIM acquisition mode. Limit of detection, 1 µg/L [Ishida *et al.* 2005].

LC-MS Column: Luna phenylhexyl (100 × 2.1 mm i.d., 3 µm). Mobile phase: 20 mmol/L ammonium formate (pH 4.3) : acetonitrile (75 : 25 for 1 min to 60 : 40 at 3 min until 7 min), flow rate 300 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 10 µg/L [Vorce, Sklerov 2004].
Plasma **GC-MS** Column: HP-5MS (19 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 90° for 1 min to 300° at 15°/min for 5 min. EI ionisation at 70 eV. Limit of quantification not reported [de Boer *et al.* 2001].
Urine **GC-MS** See Blood. Limit of detection, 5 µg/L [Ishida *et al.* 2005].

LC-MS Column: Semi-micro L-column ODS (150 × 1.5 mm i.d.). Mobile phase: methanol : 10 mmol/L ammonium formate (pH 3.5; 25 : 75 to 40 : 60 in 5 min), flow rate 0.1 mL/min. ESI, full scan mode, SIM acquisition mode. Limit of detection, 3 µg/L for 5-MeO-DIPT, 5-MeO-*N*-isopropyltryptamine (5-MeO-NIPT), 5-OH-

M

DIPT, and 30 μg/L for 6-OH-5-MeO-DIPT [Kamata *et al.* 2006]. See Blood. Limit of detection, 5 μg/L [Vorce, Sklerov 2004].

Other **GC-MS** Microsomes. Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: 0.6 mL/min. Temperature programme: 50° for 3 min to 310° at 40°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Theobald, Maurer 2007].

Disposition in the Body Metabolised via *O*-demethylation of the side chain to 5-OH-DIPT (major metabolite) followed by part conjugation to form its sulfate and glucuronide. 5-OH-DIPT undergoes further hydroxylation to form 5,6-$(OH)_2$-DIPT, which can then form 6-OH-5-MeO-DIPT (major metabolite) through methylation. This is also achieved by direct hydroxylation of 5-MeO-DIPT. 6-OH-5-MeO-DIPT is then conjugated to its sulfate and glucuronide. Another pathway is through *N*-deisopropylation to 5-MeO-*N*-isopropyltryptamine. Other possible metabolites include 5-methoxyindoleacetic acid and 5-hydroxyindoleacetic acid, formed by oxidative deamination. However, these may not be as useful for forensic or clinical purposes since they are known to be present at low concentrations in the urine of healthy humans [Kamata *et al.* 2006].

Toxicity 5-Methoxy-DIPT has CNS activity and can produce some euphoria, visual or auditory distortions, and hallucinations [Shulgin, Carter 1980].

A 5-MeO-DIPT urine level of 229 μg/L was found in an individual who had admitted to use of α-methyltryptamine (AMT) prior to submitting the sample [Vorce, Sklerov 2004].

A 23-year-old Caucasian male who had ingested a capsule containing 5-MeO-DIPT had serum and urine concentrations of 0.14 mg/L and 1.6 mg/L, respectively, for the drug and a urinary concentration of 0.17 mg/L for the 5-methoxyindoleacetic acid metabolite [Wilson *et al.* 2005].

A 21-year-old Caucasian male who had ingested a tablet containing 5-MeO-DIPT had a urine concentration of 1.7 mg/L for the drug and a concentration of 1.3 mg/L for the 5-methoxyidoleacetic acid metabolite [Meatherall, Sharma 2003].

In a fatal poisoning with 5-MeO-DIPT, the drug and 2 of its metabolites, 5-OH-DIPT and 5-MeO-NIPT, were identified by LC-MS. The concentrations of 5-MeO-DIPT, 5-OH-DIPT and 5-MeO-NIPT were 0.412, 0.327 and 0.02 mg/L, respectively, in blood and 1.67, 27.0 and 0.32 mg/L, respectively, in urine [Tanaka *et al.* 2006].

5-Methoxy-*N*,*N*-dimethyltryptamine

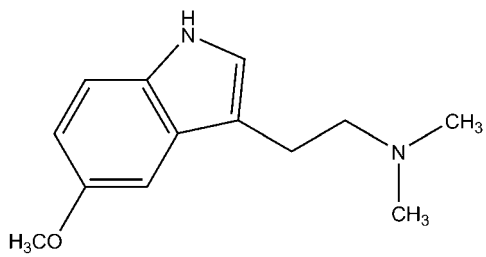
Hallucinogen

$C_{13}H_{18}N_2O$ = 218.3

CAS—1019-45-0

IUPAC Name 2-(5-Methoxy-1*H*-indol-3-yl)-*N*,*N*-dimethylethanamine

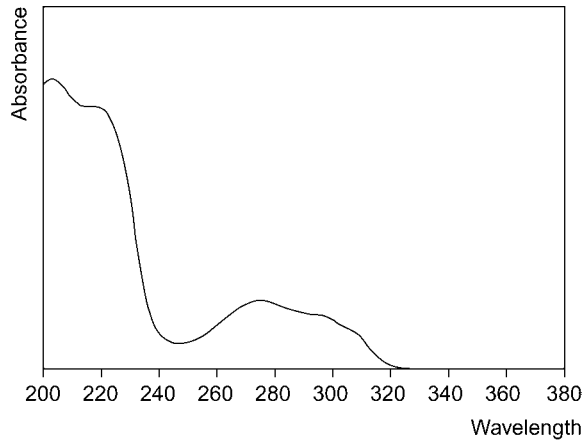
Synonyms CT 4334; 5-MeO-DMT; methoxybutofenin; methylbufotenine.



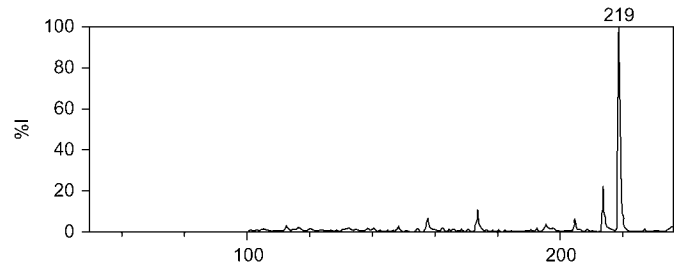
Chemical Properties Solid. Mp 69° to 70°. Log *P* (octanol/water), 2.02 [Meylan, Howard 1995]. Urine samples could be stored at 2 to 8° for up to 7 days or up to a month at -20° [Pomilio *et al.* 1999].

Colour Test Ehrlich's test—purple→blue; Marquis test—yellow→black.

Ultraviolet Spectrum Aqueous acid—203, 217, 275 nm.



Mass Spectrum Principal ions at *m/z* 58, 160, 218, 117, 154, 130, 42, 89.



Quantification

Blood **LC-MS** Column: XTerra MS-C_{18} (100 × 3.0 mm, 3.5 μm). Mobile phase: 0.02 mol/L ammonium formate : acetonitrile (75 : 25), flow rate 0.4 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 10 μg/L, limit of detection, 5 μg/L [Sklerov *et al.* 2005].

Urine **GC-MS** Column: SPB-1 fused silica capillary (30 m × 0.20 mm i.d.). Carrier gas: He. Temperature programme: 60° for 1 min to 290° at 10°/min for 5 min. Limit of detection not reported [Pomilio *et al.* 1999].

LC-MS See Blood [Sklerov *et al.* 2005]. Column: Brownlee O Spheri-5 RP-18 (100 × 1.0 mm i.d., 5 μm). Mobile phase: methanol : water with 0.2% formic acid (50 : 50), flow rate 40 μL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.1 μg/L [Forsstrom *et al.* 2001].

Bile **LC-MS** See Blood [Sklerov *et al.* 2005].

Gastric Contents **LC-MS** See Blood [Sklerov *et al.* 2005].

Brain **LC-MS** See Blood [Sklerov *et al.* 2005].

Kidney **LC-MS** See Blood [Sklerov *et al.* 2005].

Liver **LC-MS** See Blood [Sklerov *et al.* 2005].

Other **LC-MS** Frog Skin Secretions. Column: Luna C_{18} (2) (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05% trifluroacetic acid : water–acetonitrile–trifluroacetic acid (20 : 80 : 0.05; 100 : 0 to 0 : 100 over 240 min), flow rate 0.5 mL/min. ESI, positive ion mode. Limit of detection not reported [McClean *et al.* 2002].

Note For a study of the characterisation and determination of indole alkaloids in frog skin secretions, see McClean *et al.* [2002]. For information on the human intranasal, sublingual and oral pharmacology of 5-MeO-DMT, see Ott [2001].

Toxicity

A 25-year-old white male ingested a preparation from a South American tree bark, 'ooasca' and 4 h later he ingested tryptamines. He went to sleep and was found dead the following morning. The toxicological findings are in the table overleaf.

The medical examiner ruled cause of death was hallucinogenic amine intoxication and manner of death was undetermined [Sklerov *et al.* 2005].

Forsstrom T *et al.* (2001). Determination of potentially hallucinogenic *N*-dimethylated indoleamines in human urine by HPLC/ESI-MS-MS. *Scand J Clin Lab Invest* 61: 547–556.

Methoxyflurane

Anaesthetic (General)
$C_3H_4Cl_2F_2O$ = 165.0
CAS—76-38-0

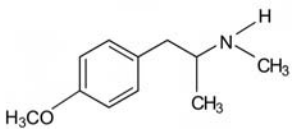
IUPAC Name 2,2-Dichloro-1,1-difluoro-1-methoxyethane
Proprietary Names *Metofane*; *Penthrane*; *Pentrane*.
Chemical Properties A clear, almost colourless, non-flammable mobile liquid. Mass per mL 1.423 to 1.427 g. Bp 103° to 108°. Methoxyflurane (B.P.) contains butylated hydroxytoluene 0.01% w/w. Soluble 1 in 500 of water; miscible with ethanol, chloroform and ether. Log *P* (octanol/water), 2.2.
Gas Chromatography System GA—RI 701; system GI—retention time 17.6 min.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1315, 1063, 1136, 833, 1204, 1234 cm^{-1}.
Quantification
Blood **GC** FID [Cole *et al.* 1975]. FID. Limit of detection, 10 mg/L [Jones *et al.* 1972].
Dose For maintenance of anaesthesia, 0.2 to 0.5% of the vapour by inhalation.

Cole WJ *et al.* (1975). A method for the gas chromatographic analysis of inhalation anaesthetics in whole blood by direct injection into a simple precolumn device. *Br J Anaesth* 47: 1043–1047.
Jones PL *et al.* (1972). A technique for the analysis of methoxyflurane in blood by gas chromatography. *Br J Anaesth* 44: 124–130.

Methoxymetamfetamine

5-HT Receptor Releasing Agent
$C_{11}H_{17}NO$ = 179.3

IUPAC Name (α*S*)-*N*,α-Dimethyl-4-methoxy-benzeneethanamine
Synonyms 4-Methoxymethylamphetamine; 4-methoxy-*N*-methylamphetamine; *p*-methoxymethylamphetamine; 1-(4-methoxyphenyl)-2-aminopropane; 2-methylamino-1-(*p*-methoxyphenyl)propane; PMMA; 4-MMA. Usually presented as 'ecstasy'.



Chemical Properties A white powder. Mp 177° to 178°.
Colour Test Marquis test—no colour change.
Gas Chromatography Column: OV-1 (12 m × 0.31 mm i.d., 0.52 µm). Temperature programme: 70° to 150° at 15°/min then from 150° to 250° at 25°/min. MS detection. Retention time: within 7 min [Noggle *et al.* 1989].
High Performance Liquid Chromatography Columns: C_{18} µBondapak (300 × 3.9 mm i.d.); or C_{18} Ultracarb 5 (150 × 4.6 mm i.d.); or phenyl Hypersil 5 (150 × 4.6 mm i.d.). Mobile phase: 0.05 mol/L phosphate buffer (pH 3.0) : acetonitrile (6:1), flow rate 1.5 mL/min for µBondapak and Ultracarb columns and 1.2 mL/min for Hypersil column (all separate analyses). UV detection (λ=254 and 280 nm). Retention time: 8.0 min (µBondapak) and 5.0 min (Ultracarb and Hypersil) [Noggle *et al.* 1989].
Ultraviolet Spectrum Aqueous acid (0.1 mol/L sulfuric acid)—274 nm.
Mass Spectrum Principal ions at *m/z* 58, 121, 78, 91, 106, 148, 134, 164.
Disposition in the Body
Toxicity There are limited data regarding non-fatal and fatal PMMA intoxication. However, a few deaths related to PMMA toxicity have been reported in Europe, which also involved other amfetamine derivatives. PMMA can produce both CNS stimulation and hallucinogenic effects. Like PMA, acute PMMA toxicity can result in hyperthermia and possibly 'serotonin syndrome' related symptoms and some respiratory depression.

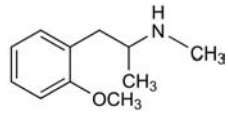
A PMMA concentration of 1.51 mg/L was measured in the postmortem blood of a 17-year-old male who felt ill when dancing. 3,4-Methylenedioxyethylamfetamine (MDEA) and 3,4-methylenedioxyamfetamine (MDA) were also detected in the blood (2.00 mg/L and 0.30 mg/L, respectively) along with ethanol (200 mg/L) [Lora-Tamayo *et al.* 1997].

Lora-Tamayo C *et al.* (1997). Amphetamine derivative related deaths. *Forensic Sci Int* 85: 149–157.
Noggle FT *et al.* (1989). *J Chromatogr Sci* 27: 607–611.

Methoxyphenamine

Sympathomimetic
$C_{11}H_{17}NO$ = 179.3
CAS—93-30-1

IUPAC Name 1-(2-Methoxyphenyl)-*N*-methylpropan-2-amine
Synonyms Methoxiphenadrin; 2-methoxy-*N*,α-dimethylbenzeneethanamine; mexyphamine.

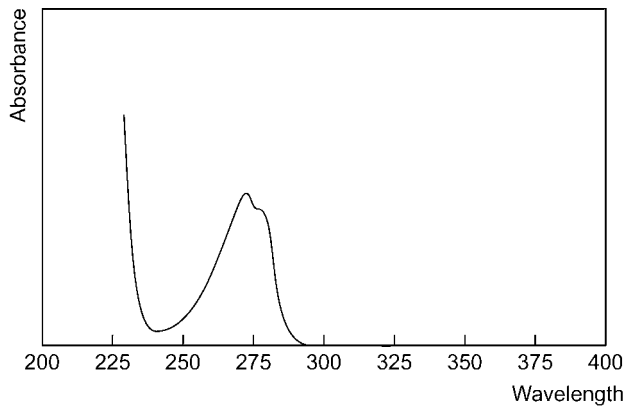


Chemical Properties An oil. pK_a 10.1. Log *P* (octanol/water), 2.3.

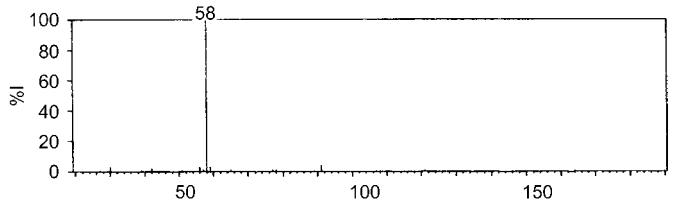
Methoxyphenamine Hydrochloride

$C_{11}H_{17}NO,HCl$ = 215.7
CAS—5588-10-3

Synonyms Methoxiphenadrin hydrochloride; mexyphamine hydrochloride.
Proprietary Names *Orthoxine*; *Proasma*. It is an ingredient of *Asmeton*, *Casacol*, *Cheracap*, *Orthoxicol* and *Sedagripe*.
Chemical Properties White crystals or powder. Mp 129° to 131° (crystals from ether and alcohol). Freely soluble in water, ethanol and chloroform; slightly soluble in ether and benzene.
Colour Tests Mandelin's test—blue-green; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.23; system TB—R_f 0.26; system TC—R_f 0.04; system TE—R_f 0.32; system TL—R_f 0.02; system TAE—R_f 0.07; system TAJ—R_f 0.05; system TAK—R_f 0.20; system TAL—R_f 0.64 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1361; system GB—RI 1416; system GC—RI 1670.
High Performance Liquid Chromatography System HA—*k* 1.7; system HB—*k* 32.17; system HX—RI 303.
Ultraviolet Spectrum Aqueous acid—271 nm (A^1_1=92a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1236, 749, 1047, 1125, 1026, 1175 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 58, 91, 59, 56, 30, 42, 121, 78.



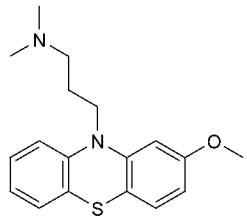
Quantification
Urine **GC** ECD. Methoxyphenamine enantiomers and metabolites [Srinivas *et al.* 1989].
Beard Hair **GC-MS** [Nakahara *et al.* 1993].
Disposition in the Body Readily absorbed after oral administration. Metabolites identified in urine include the *N*-desmethyl, *O*-desmethyl and 5-hydroxy derivatives and their glucuronide and/or sulfate conjugates. Unchanged drug is also excreted in the urine.
Toxicity The estimated minimum lethal dose for children up to 2 years of age is 200 mg and for adults is 2 g.
Dose 50 to 100 mg of methoxyphenamine hydrochloride every 4 h.

Nakahara Y *et al.* (1993). Hair analysis for drugs of abuse. VI. The excretion of methoxyphenamine and methamphetamine into beards of human subjects. *Forensic Sci Int* 63: 109–119.
Srinivas NR *et al.* (1989). Enantioselective gas chromatographic assays with electron-capture detection for methoxyphenamine and its three primary metabolites in human urine. *J Chromatogr* 487: 61–72.

Methoxypromazine

Tranquilliser
$C_{18}H_{22}N_2OS = 314.5$
CAS—61-01-8

IUPAC Name 3-(2-methoxyphenothiazin-10-yl)-*N,N*-dimethylpropan-1-amine
Synonyms 10-(3-Dimethylaminopropyl)-2-methoxyphenothiazine; methopromazine; RP 4632.



Methoxypromazine Maleate

Proprietary Name *Tentone*
Chemical Properties A crystalline powder. Soluble 1 in 330 of water: very slightly soluble in ethanol; insoluble in ether; soluble in chloroform. Methoxypromazine is extracted by organic solvents from aqueous alkaline solutions; hydrolysis of biological material is required in order to improve the yield.

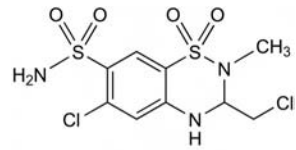
Colour Tests sulfuric acid–formaldehyde—purple (limit of detection, 0.1 µg); ammonium molybdate—purple (limit of detection, 0.1 µg); ammonium vanadate—purple (limit of detection: 0.5 µg); Vitali's test—purple flash→brown/brown/yellow (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.39; system T3—R_f 0.74; system T4—R_f 0.58; system T6—R_f 0.67 (location reagent acidified iodoplatinate spray, positive reaction for systems T1, T3, T4; for T6, the spot may be converted on the plate to the sulfoxide, Rf 0.35; location of both spots under ultraviolet light).
Ultraviolet Spectrum Aqueous acid (0.05 mol/L sulfuric acid)—250 (E1%, 1 cm 571), 278 nm (E1%, 1 cm 64) and 303 nm (E1%, 1 cm 95).
Infrared Spectrum Principle peaks at wavenumbers: A 1470, B 1356, C 748 or 1152 or 1582 (methoxypromazine maleate, KBr disc).
Disposition in the Body
Toxicity The acute lethal dose in humans of the phenothiazine derivatives appears to be in the range 15–150 mg/kg, although severe toxic symptoms have occurred with doses of less than 1 mg/kg.
Dose Up to 500 mg daily.

Methyclothiazide

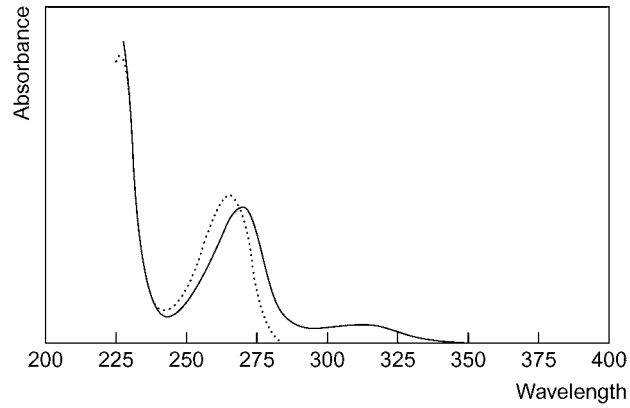
Diuretic
$C_9H_{11}Cl_2N_3O_4S_2 = 360.2$
CAS—135-07-9

IUPAC Name 6-Chloro-3-(chloromethyl)-3,4-dihydro-2-methyl-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide

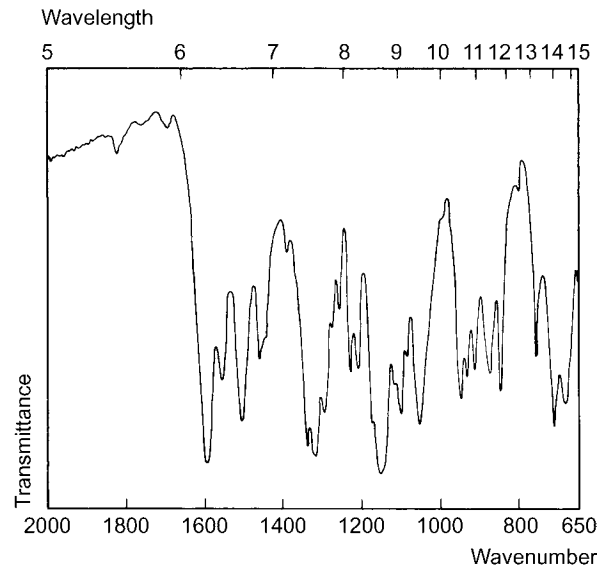
Proprietary Names *Aquatensen*; *Duretic*; *Enduron*; *Naturon*. It is an ingredient of *Enduronil*, *Enduronyl* and *Isobar*.



Chemical Properties A white crystalline powder. Mp 216°. Almost insoluble in water, chloroform and benzene; soluble 1 in about 90 of ethanol; very soluble in acetone and pyridine; soluble in solutions of alkali hydroxides and carbonates. pK_a 9.4. Log *P* (octanol/water), 1.4.
Colour Tests Koppanyi–Zwikker test—violet; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.87; system TD—R_f 0.19; system TE—R_f 0.53; system TF—R_f 0.50; system TAD—R_f 0.27; system TAJ—R_f 0.30; system TAK—R_f 0.08; system TAL—R_f 0.69.
Gas Chromatography System GA—methyclothiazide, not eluted; system GX—methyclothiazide-Me_3, retention time 9.9 min.
High Performance Liquid Chromatography System HN—*k* 3.82; system HY—RI 364; system HAA—retention time 15.4 min.
Ultraviolet Spectrum Aqueous acid—270 (A^1_1=525b), 314 nm; aqueous alkali—264, 300 nm.



Infrared Spectrum Principal peaks at wavenumbers 1158, 1595, 715, 1063, 1515, 1300 cm^{-1} (KBr disk).



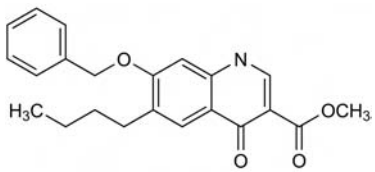
Mass Spectrum Principal ions at *m/z* 310, 64, 36, 312, 42, 43, 62, 63.
Quantification
Plasma **HPLC** UV detection. Limit of detection, 1.5 µg/L [Hartman *et al.* 1981].
Dose 2.5 to 10 mg daily.

Hartman CA *et al.* (1981). Determination of methyclothiazide in human plasma by high-performance liquid chromatography. *J Chromatogr* 226: 510–513.

Methyl Benzoquate

Coccidiostat (Veterinary)
$C_{22}H_{23}NO_4$ = 365.4
CAS—13997-19-8

IUPAC Name Methyl 6-butyl-1,4-dihydro-4-oxo-7-(phenylmethoxy)-3-quinolinecarboxylate
Synonym Nequinate
Proprietary Name *Statyl*



Chemical Properties A white or creamy-white, amorphous powder. Mp 287° to 288°. Practically insoluble in water; very slightly soluble in ethanol, chloroform and methanol. Log *P* (octanol/water), 6.6.
Colour Tests Liebermann's reagent—red-orange; Mandelin's test—brown; Marquis test—red-brown; sulfuric acid—yellow.
Ultraviolet Spectrum Methanolic acid—261 nm (A_1^1=1955a).
Infrared Spectrum Principal peaks at wavenumbers 1621, 1689, 1250, 1089, 1211, 1550 cm^{-1} (KBr disk).

Methyl Bromide

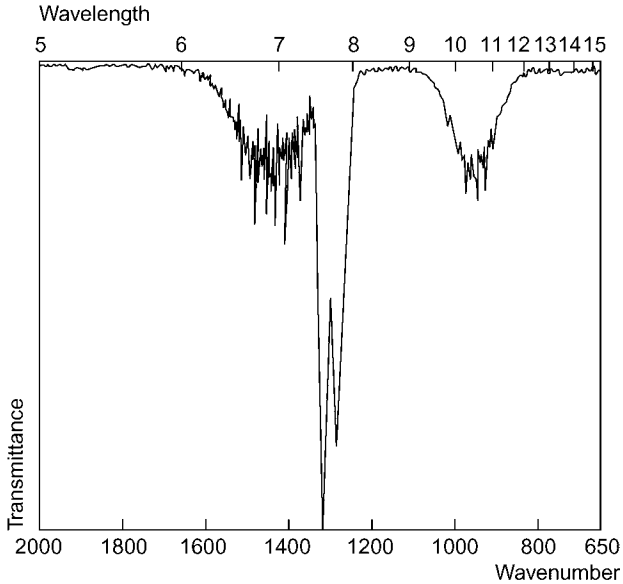
Insect Fumigant
CH_3Br = 94.9
CAS—74-83-9

IUPAC Name Bromomethane
Synonyms MB; MeBr.
Proprietary Names *Brom-o-Gas*; *Celfume*; *Embafume*; *Haltox*; *Methogas*; *Profume*; *Terr-o-Gas*; *Zytox*.

Chemical Properties A colourless gas or liquid. Mp −93.7° and Bp 3.56°. Soluble in water (1.75 g/100 g solution) and most organic solvents. Log *P* (octanol/water), 1.19.

Crystal Hydrate
$CH_3Br,2OH_2O$ = 375.3
Chemical Properties Freely soluble in alcohol, chloroform, ether, carbon disulfide, carbon tetrachloride and benzene.

Infrared Spectrum Principal peaks at wavenumbers 1319, 1295, 622, 594 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 94, 96, 15, 79, 81, 93, 95, 14.

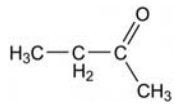
Quantification
Urine **GC** Limit of detection, 0.4 mg/L [Koga *et al.* 1991].
Disposition in the Body Methyl bromide is readily absorbed through the skin and lung alveoli. It is excreted through the lungs unchanged but a significant amount can also be excreted in urine and faeces, after metabolic decomposition. It is decomposed to a bromide ion and methanol which can be detected in blood, stomach fluids, mucus and tissue. Organic bromides have also been detected, when the bromide ion reacts with the molecular carbons of the biomolecules.
Toxicity
A 6 mg/L dose for 10 to 20 h or 30 mg/L for 1.5 h is associated with fatalities. The allowed daily intake is 1.0 mg/kg (as the bromide ion).
A newborn infant died 12 to 13 h after exposure to methyl bromide which was used as a fumigant in the neighbouring house and had leaked through the sewage. The concentration of bromide ions in the infant's blood was 170 mg/L. The parents had also suffered from clinical intoxication as a result of the leakage. Bromide ions were found in their blood at concentrations of 130 and 110 mg/L [Langard *et al.* 1996].
Half-life Approximately 12 days.

Koga M *et al.* (1991). Determination of bromide ion concentration in urine using a head-space gas chromatography and an ion chromatography–biological monitoring for methyl bromide exposure. *J UOEH* 13(1): 19–24.
Langard S *et al.* (1996). Fatal accident resulting from methyl bromide poisoning after fumigation of a neighbouring house; leakage through sewage pipes. *J Appl Toxicol* 16(5): 445–448.

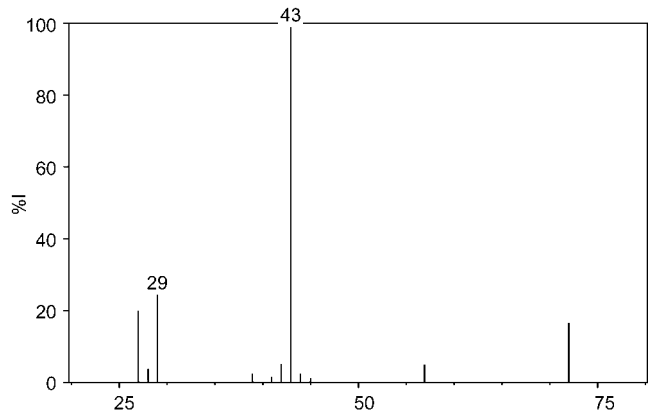
Methyl Ethyl Ketone

Solvent
C_4H_8O = 72.1
CAS—78-93-3

IUPAC Name 2-Butanone
Synonym Ethyl methyl ketone



Chemical Properties A flammable liquid. Bp 80°. Soluble 1 in about 4 of water, less soluble at higher temperatures; miscible with benzene, ethanol and ether. pK_a 14.7 (25°). Log *P* (octanol/water), 0.3.
Gas Chromatography System GA—RI 579; system GI—retention time 7.3 min.
Mass Spectrum Principal ions at *m/z* 43, 29, 27, 72, 57, 42, 44, 41.



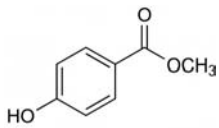
Quantification
Urine **GC** FID Limit of detection, about 4 µg/L [Chou *et al.* 1999]. Limit of detection, about 6 µg/L [Michitsuji *et al.* 1992]. Methyl ethyl ketone and its metabolites. Limits of detection, 0.1 to 1.4 mg/L [Kezic, Monster 1988].

Chou JS *et al.* (1999). Detection of methyl ethyl ketone in urine using headspace solid phase microextraction and gas chromatography. *J Occup Environ Med* 41: 1042–1047.
Kezic S, Monster AC (1988). Determination of methyl ethyl ketone and its metabolites in urine using capillary gas chromatography. *J Chromatogr* 428: 275–280.
Michitsuji H *et al.* (1992). [Determination of acetone, methanol, and methyl ethyl ketone in urine using head-space gas chromatography (HS.GC)]. *Sangyo Igaku* 34: 243–252.

Methyl Hydroxybenzoate

Preservative
$C_8H_8O_3$ = 152.1
CAS—99-76-3

IUPAC Name Methyl 4-hydroxybenzoate
Synonyms Metagin; methyl parahydroxybenzoate; methylis oxybenzoas; methylparaben.
Proprietary Names *Methyl Chemosept*; *Methyl Parasept*; *Nipagin M*; *Tegosept M*.

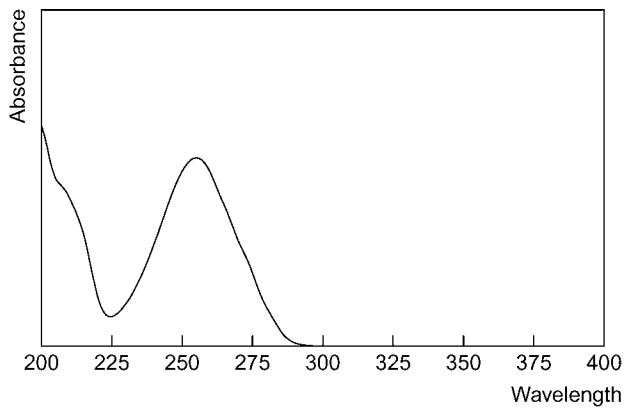


Chemical Properties Colourless crystals or a fine, white, crystalline powder. Mp 131°. Soluble 1 in 400 to 1 in 500 of water, 1 in 20 of boiling water, 1 in 3 to 1 in 3.5 of ethanol, 1 in 40 of chloroform and 1 in 10 of ether. pK_a 8.4 (22°). Log *P* (octanol/water), 2.0.

Sodium Methyl Hydroxybenzoate

$C_8H_7NaO_3$ = 174.1
CAS—5026-62-0
Synonyms Sodium methylparaben; soluble methyl hydroxybenzoate.
Proprietary Name *Nipagin M Sodium*
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 2 of water and 1 in 50 of ethanol.

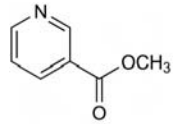
Thin-layer Chromatography System TA—R_f 0.95; system TD—R_f 0.62; system TE—R_f 0.44; system TF—R_f 0.65; system TAD—R_f 0.55; system TAE—R_f 0.81; system TAJ—R_f 0.61; system TAK—R_f 0.52; system TAL—R_f 0.91.
Gas Chromatography System GA—methyl hydroxybenzoate RI 1432; M (OH-)-AC RI 1570; M (methoxy-) RI 1480; M (*p*-hydroxyhippuric acid)-Me RI 1820.
High Performance Liquid Chromatography System HZ—retention time 3.2 min.
Ultraviolet Spectrum Ethanol—257 nm (A^1_1=1075a).



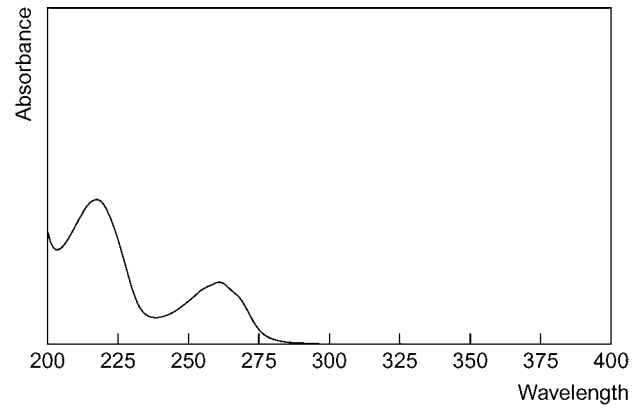
Mass Spectrum Principal ions at *m/z* 121, 152, 40, 93, 65.

Methyl Nicotinate

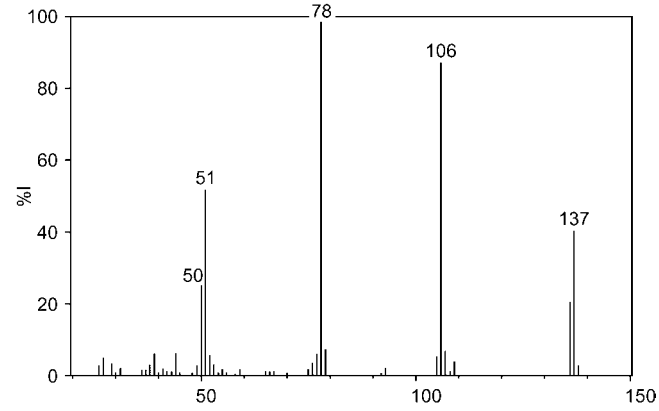
Vasodilator (Topical)
$C_7H_7NO_2$ = 137.1
CAS—93-60-7
IUPAC Name Methyl 3-pyridinecarboxylate
Proprietary Names *Pickles Chilblain Cream*; *Vas*. It is an ingredient of *Algipan*, *Arthricare*, *Cremalgin*, *Deep Heat Spray*, *Dubam*, *Fiery Jack*, *Musterole*, *Ralgex*, *Red Oil* and *Transvasin*.



Chemical Properties White crystals or crystalline powder; it darkens to a reddish colour on storage. Mp 39°. Soluble 1 in 0.7 of water and ethanol, 1 in 0.4 of chloroform and 1 in 1 of ether; soluble in benzene. pK_a 3.1 (22°). Log *P* (octanol/water), 0.8.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.37; system TC—R_f 0.66; system TE—R_f 0.72; system TL—R_f 0.59; system TAE—R_f 0.74; system TAF—R_f 0.77.
Gas Chromatography System GA—RI 1100.
Ultraviolet Spectrum Water—264 nm (A^1_1=230b).



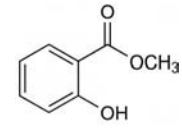
Infrared Spectrum Principal peaks at wavenumbers 1282, 1718, 1111, 741, 1022, 703 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 78, 106, 51, 137, 50, 136, 107, 79.



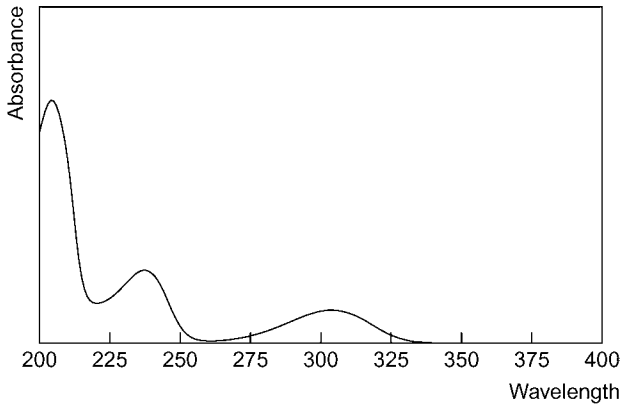
Use Topically in a concentration of 1%.

Methyl Salicylate

Analgesic
$C_8H_8O_3$ = 152.1
CAS—119-36-8
IUPAC Name Methyl 2-hydroxybenzoate
Synonym Wintergreen oil
Proprietary Names It is an ingredient of many proprietary preparations—see Sweetman [2009].



Chemical Properties A colourless or pale yellow liquid. Relative density 1.182 to 1.187. Bp about 221°, with some decomposition. Refractive index 1.535 to 1.538. Slightly soluble in water; soluble in chloroform and ether; miscible with ethanol (90%) and with most organic solvents. pK_a 9.9 (20°). Log *P* (octanol/water), 2.6.
Thin-layer Chromatography System TA—R_f 0.96; system TE—R_f 0.84; system TF—R_f 0.68; system TAF—R_f 0.90; system TAJ—R_f 0.95; system TAK—R_f 0.86.
Gas Chromatography System GA—methyl salicylate RI 1195, salicylic acid RI 1308; system GB—methyl salicylate RI 1228; system GL—methyl salicylate RI 1210.
High Performance Liquid Chromatography System HD—methyl salicylate *k* 3.9, salicylic acid *k* 0.7; system HX—RI 480; system HY—RI 449.
Ultraviolet Spectrum Ethanol—238 (A^1_1=581a), 306 nm (A^1_1=280a).



Infrared Spectrum Principal peaks at wavenumbers 1680, 705, 1310, 1220, 760, 1255 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 120, 92, 152, 121, 65, 64, 93, 63; salicylic acid 120, 92, 138, 64, 39, 63, 121, 65.
Disposition in the Body Poorly absorbed through intact skin; absorbed after oral ingestion. It is incompletely hydrolysed to salicylic acid.
Therapeutic Concentration
Following application of 5 g of an ointment containing 12.5% methyl salicylate twice daily for 4 days to 12 subjects, serum levels of 0.31 to 0.91 mg/L were reported within 1 h of the first application and peak levels of 2 to 6 mg/L were observed following the seventh application on day 4 [Morra *et al.* 1996.]
Toxicity Methyl salicylate is more toxic than salicylic acid. Deaths have occurred in children after ingestion of as little as 4 mL and doses of 30 mL are usually fatal in adults.
In a fatality due to the ingestion of about 120 mL of methyl salicylate, postmortem salicylic acid concentrations were: blood 615 mg/L and liver 455 µg/g [Ryall 1974].
Use Topically in liniments and ointments or in undiluted form.

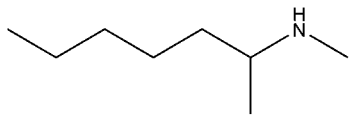
Methylaminoheptane

Sympathomimetic
$C_8H_{19}N = 129.2$
IUPAC Name *N*-Methylheptan-2-amine
Synonyms *N*,1-Dimethylhexylamine; 2-heptylmethylamine; 2-methylaminoheptane.



Chemical Properties Oily liquid. Bp 155°. Methylaminoheptane is extracted by organic solvents from aqueous alkaline solutions.

Methylaminoheptane Hydrochloride

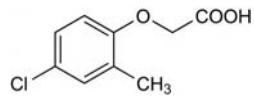
$C_8H_{19}N,HCl = 165.7$
Proprietary Names *Neosupranol*; *Oenethyl*; *Pacamine*.
Chemical Properties A crystalline solid. Readily soluble in water.

Quantification **LC** Column: Pirkle covalent (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: hexane : 2-propanol : acetonitrile (97 : 3 : 0.5) or carbon dioxide : 2-propanol (90 : 10), flow rate 2.0 mL/min. DAD (λ = 234 nm). Retention time: 1.20 and 0.89 min in each mobile phase, respectively. Limit of detection not reported [Macaudiere *et al.* 1986].
Disposition in the Body
Toxicity In rats the LD_{50} (oral) is 538 mg/kg.
Dose Usually up to 100 mg IM. Ruben [1950] concluded that *d*-desoxyephedrine was better than methylaminoheptane as a prophylactic versus hypotension in spinal anaesthesia.

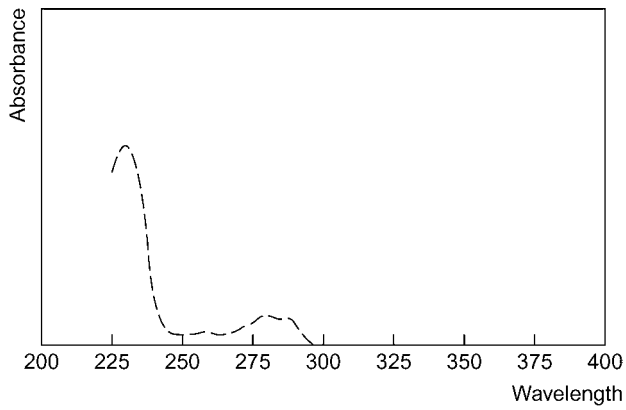
Macaudiere P *et al.* (1986). Resolution of enantiomeric amides on a Pirkle-type chiral stationary phase. A comparison of subcritical fluid and liquid chromatographic approaches. *J Chromatogr* 371: 177–193.
Ruben JE (1950). Evaluation of oenethyl (2-methyl-aminoheptane) as a vasopressor substance in spinal anesthesia. *Curr Res Anesth Analg* 29: 57–59.

Methylchlorophenoxyacetic Acid

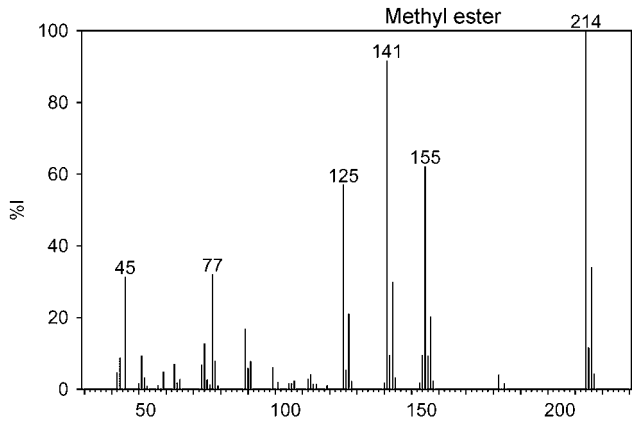
Herbicide
$C_9H_9ClO_3 = 200.6$
CAS—94-74-6
IUPAC Name (4-Chloro-2-methylphenoxy)acetic acid
Synonym MCPA



Chemical Properties A white crystalline solid. Mp pure compound, 118° to 119°; technical product, 100° to 115°. Practically insoluble in water; soluble 1 in 160 of ethanol and 1 in 80 of ether.
Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TD—R_f 0.09; system TE—R_f 0.05; system TF—R_f 0.11; system TX—R_f 0.00; system TY—R_f 0.00; system TAB—R_f 0.04; system TAC—R_f 0.02; system TAD—R_f 0.15.
Gas Chromatography Methylchlorophenoxyacetic acid methyl ester: system GK—RRT 0.54(relative to caffeine).
Ultraviolet Spectrum Methanol—280 (A_1^1=80a), 287 nm.



Infrared Spectrum Principal peaks at wavenumbers 1247, 1198, 1748, 1499, 1143, 806 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 214, 141, 155, 125, 46, 77, 89, 143 (methylchlorophenoxyacetic acid methyl ester).



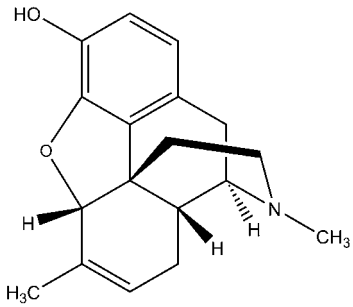
Disposition in the Body
Toxicity
After intentional ingestion of methylchlorophenoxyacetic acid, a man suffered burning in his mouth, spasmodic pain in the extremities and a severe hypotensive crisis; a plasma concentration of 546 mg/L was reported 2 h after ingestion, which rapidly declined to 6 mg/L following forced diuresis and alkalinisation of the urine on day 4 [Schmoldt *et al.* 1997].

Schmoldt A *et al.* (1997). Massive ingestion of the herbicide 2-methyl-4-chlorophenoxyacetic acid (MCPA). *J Toxicol Clin Toxicol* 35: 405–408.

Methyldesorphine

Narcotic
$C_{18}H_{20}NO_2 = 282.4$
CAS—16008-36-9

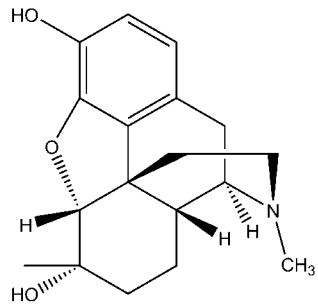
Synonyms 6,7-Dehydro-4,5-epoxy-3-hydroxy-*N*,6-dimethylmorphinan; MK 57.



Chemical Properties Methyldesorphine is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve the yield.
Colour Tests Ammonium molybdate test—black-purple→greenish-brown (limit of detection, 0.1 µg); ammonium vanadate test—brown (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—dull purple (limit of detection, 0.1 µg); Vitali's test—yellow/yellow/orange (limit of detection, 0.25 µg).
Gas Chromatography System G2/225—retention time 0.81 (relative to codeine).
Ultraviolet Spectrum 0.1 N sulfuric acid—283 nm (E1%, 1cm 42) and inflexion at about 278 nm (E1%, 1 cm 40).

Methyldihydromorphine

Narcotic
$C_{18}H_{23}NO_3 = 301.4$
Synonym Methydromorphine



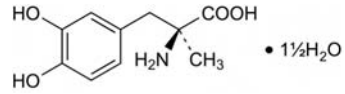
Chemical Properties Methyldihydromorphine is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve the yield.
Colour Tests Ammonium molybdate test—violet-blue→green (limit of detection, 0.1 µg); ammonium vandate test—grey-purple→brown (limit of detection, 0.5 µg); sulfuric acid-formaldehyde test—purple (limit of detection, 0.1 µg); Vitali's test—yellow/yellow/orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.28 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.00 (relative to codeine).
Disposition in the Body
Therapeutic Concentration
Methyldihydromorphine produces fewer adverse effects in morphine addicts than morphine. The intensity of abstinence after withdrawal is quite mild [Fraser, Isbell 1950].

Fraser HF, Isbell H (1950). Addiction liabilities of morphinan, 6-methyldihydromorphine and dihydrocodeinone. *J Pharmacol Exp Ther* 100: 128–135.

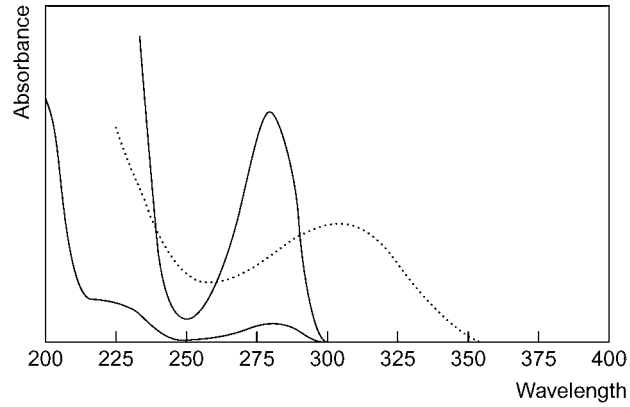
Methyldopa

Antihypertensive
$C_{10}H_{13}NO_4,1½H_2O = 238.2$
CAS—555-30-6 (anhydrous); 41372-08-1 (sesquihydrate)
IUPAC Name 2-Amino-3-(3,4-dihydroxyphenyl)-2-methylpropanoic acid
Synonyms Alpha-methyldopa; 3-hydroxy-α-methyl-L-tyrosine sesquihydrate; methyldopum hydratum; metildopa.

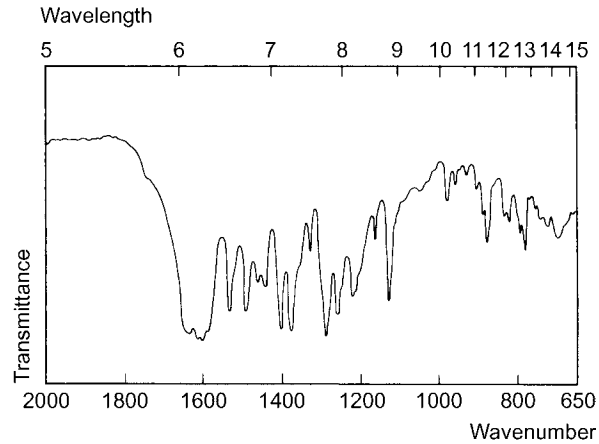
Proprietary Names *Aldomet*; *Aldometil*; *Aldomin*; *Aldopren*; *Amender*; *Cardin*; *Dopamet*; *Dopegyt*; *Hipten*; *Hydopa*; *Isomet*; *Medimet-250*; *Medomet*; *Medopren*; *Meldopa*; *MetalphaNovo-Medopa*; *Nudopa*; *Nu-Medopa*; *Presinol*; *Prodop*; *Pulsoton*; *Selm*; *Sembrina*; *Tenzone*.



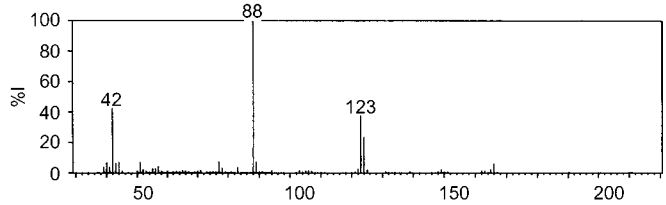
Chemical Properties Colourless crystals or a white to yellowish-white, fine powder. Mp about 310°. Soluble 1 in 100 of water, 1 in 400 of ethanol and 1 in 0.5 of dilute hydrochloric acid; practically insoluble in chloroform and ether. pK_a 2.2 (-COOH), 9.2 (-OH), 10.6 (-NH_2), 12.0 (-OH) (25°). Log *P* (octanol/water), −1.8.
Colour Tests Ammoniacal silver nitrate—red-brown/black; ferric chloride—green; Folin-Ciocalteu reagent—blue; Mandelin's test—orange; Marquis test—yellow→violet; methanolic potassium hydroxide—yellow→orange; Nessler's reagent—black; potassium dichromate (method 1)—green→brown (30 s).
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.02; system TL—R_f 0.01; system TAE—R_f 0.60; system TAF—R_f 0.75; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.06 (mercuric chloride–diphenylcarbazone reagent, white-blue; acidified potassium permanganate solution, positive; van Urk reagent, violet).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 69; system HZ—retention time 1.4 min; system HAA—retention time 3.0 min; system HAX—retention time 4.1 min; system HAY—retention time 2.8 min.
Ultraviolet Spectrum Aqueous acid—279 nm (A^1_1=130a); aqueous alkali—302 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 1288, 1261, 1530, 1123, 1219 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 88, 42, 123, 124, 89, 77, 51, 44.



Quantification

Plasma **Spectrofluorimetry** Limit of detection, 100 µg/L [Kim, Koda 1977].

HPLC Fluorescence detection. Limit of detection, <10 µg/L [Rona *et al.* 1996]. Electrode coulometric detection. Methyldopa and its metabolite [Lucarelli *et al.* 1991]. Electrochemical detection. Limit of detection, 50 µg/L [Dilger *et al.* 1987]. Electrochemical detection [Hoskins, Holliday 1982].

HPLC-MS Limit of detection, <20 µg/L [Oliveira *et al.* 2002].

Urine **Spectrofluorimetry** See Plasma [Kim, Koda 1977].

HPLC See Plasma [Lucarelli *et al.* 1991]. Electrochemical detection. Limit of detection, 5 mg/L [Kochak, Mason 1981].

Breast Milk **HPLC** See Plasma [Hoskins, Holliday 1982].

Disposition in the Body Poorly absorbed after oral administration. It is mainly excreted as unchanged drug and as the mono-*O*-sulfate conjugate. After oral dosage, about 40% of the dose is excreted in the urine in 48 h, of which about 40% is the conjugate. A considerable amount of unchanged drug is eliminated in the faeces. After IV administration, the amount of conjugate excreted is much less than after oral dosage; a total of 52 to 82% of an IV dose is excreted in the urine in 36 h, only about 2% of which is the conjugate. Other metabolites and their conjugates which have been identified in the urine in small amounts (each <5% of the dose) include 3-*O*-methyl-α-methyldopa, α-methyldopamine, 3-*O*-methyl-α-methyldopamine and 3,4-dihydroxyphenylacetone.

Methyldopa is a metabolite of methyldopate.

Therapeutic Concentration In plasma, usually in the range 1 to 5 mg/L.

After a single oral dose of 750 mg administered to 12 subjects, mean peak plasma concentrations of 2.6 mg/L of unchanged drug and 1.3 mg/L of the conjugate were attained in 3 h. An IV infusion of 250 mg given over 90 min to 12 subjects produced, at the end of the infusion period, a mean peak plasma concentration of 7.5 mg/L; no conjugate was found in the plasma [Kwan *et al.* 1976].

Toxicity

In a fatality involving the ingestion of methyldopa, postmortem blood and urine concentrations of 9 and 1400 mg/L, respectively, were reported [Tamminen, Alha 1970].

Half-life Plasma half-life, about 2 h; a longer terminal elimination half-life has also been reported.

Volume of Distribution About 0.6 L/kg.

Clearance Plasma clearance, about 3 mL/min/kg.

Protein Binding <20%.

Note For a review of the pharmacokinetics of methyldopa, see Myhre *et al.* [1982].

Dose The equivalent of 0.5 to 3 g of anhydrous methyldopa daily.

Methyldopate

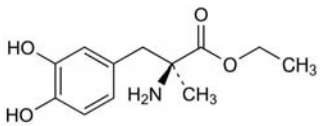
Antihypertensive

$C_{12}H_{17}NO_4$ = 239.3

CAS—2544-09-4

IUPAC Name Ethyl (2*S*)-2-amino-3-(3,4-dihydroxyphenyl)-2-methylpropanoate

Synonym 3-Hydroxy-α-methyl-L-tyrosine ethyl ester



Methyldopate Hydrochloride

$C_{12}H_{17}NO_4$,HCl = 275.7

CAS—2508-79-4

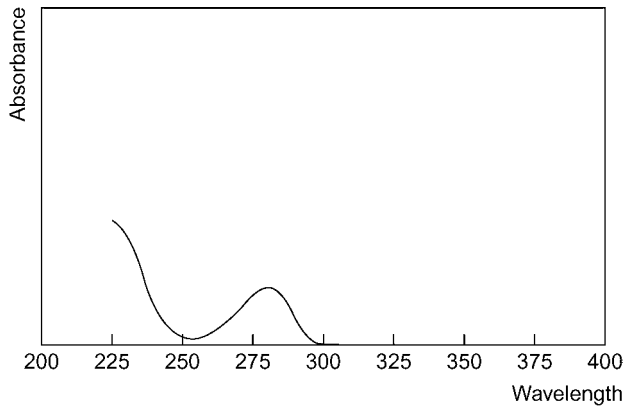
Proprietary Name *Aldomet (injection)*

Chemical Properties A white crystalline powder. Soluble 1 in 1 of water, 1 in 3 of ethanol and 1 in 2 of methanol; slightly soluble in chloroform; practically insoluble in ether.

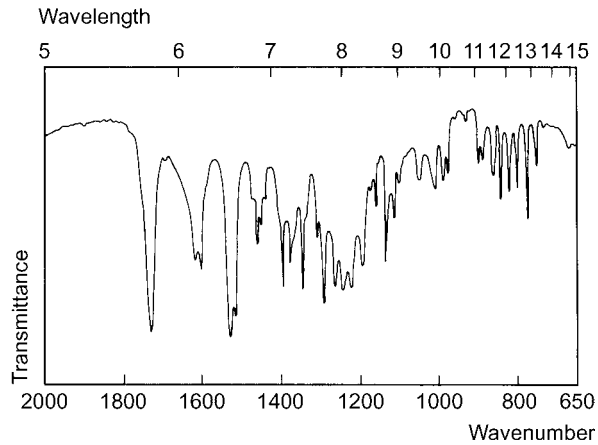
Colour Tests Ammoniacal silver nitrate—orange-brown/orange-brown; ferric chloride—green; Folin-Ciocalteu reagent—blue; Mandelin's test—orange; Marquis test—yellow→violet; methanolic potassium hydroxide—blue→orange; Nessler's reagent—black; potassium dichromate (method 1)—green→brown (30 s).

Thin-layer Chromatography System TA—R_f 0.65 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=115a).



Infrared Spectrum Principal peaks at wavenumbers 1527, 1726, 1516, 1290, 1240, 1215 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** Electrochemical detection [Hoskins, Holliday 1982].

Breast Milk **HPLC** See Plasma [Hoskins, Holliday 1982].

Disposition in the Body Metabolised by de-esterification to methyldopa; a small amount of sulfate conjugation also occurs.

Therapeutic Concentration

After an IV dose of 250 mg to 5 subjects, peak plasma concentrations of 0.8 to 2.2 mg/L (mean 1.6) of free and esterified methyldopa, and 1.0 to 2.2 mg/L (mean 1.5) of conjugated methyldopa were attained in about 1 h [Saavedra *et al.* 1975].

Half-life Plasma half-life, about 4 h.

Volume of Distribution About 2 L/kg.

Dose Usually 250 to 500 mg of methyldopate hydrochloride, by IV infusion, every 6 h.

Hoskins JA, Holliday SB (1982). Determination of alpha-methyldopa and methyldopate in human breast milk and plasma by ion-exchange chromatography using electrochemical detection. *J Chromatogr* 230: 162–167.

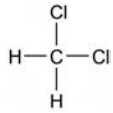
Methylene Chloride

Solvent

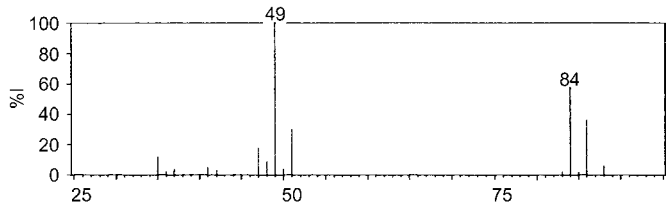
CH_2Cl_2 = 84.93

CAS—75-09-2

IUPAC Name Dichloromethane



Chemical Properties Dichloromethane A clear, colourless, volatile liquid. Mass per mL about 1.32 g. Bp 39° to 41°. Soluble 1 in 50 of water; miscible with ethanol and ether. Log *P* (octanol/water), 1.2.
Gas Chromatography System GA—RI 515; system GI—retention time 1.9 min.
Mass Spectrum Principal ions at *m/z* 49, 84, 86, 51, 47, 35, 88, 41.



Quantification
Blood **GC** FID. Methylene chloride and chloroform. Limit of detection, 0.3 mg/L in blood [Seno *et al.* 1999].
Urine **GC** Limit of detection, 0.2 mg/L in urine, see Blood [Seno *et al.* 1999].

Disposition in the Body
Toxicity Methylene chloride is widely used in paint strippers and several non-fatal and fatal cases of accidental inhalation have been reported. The maximum permissible atmospheric concentration is 200 ppm and the temporary estimated acceptable daily intake is up to 500 µg/kg.

The following tissue concentrations were reported in a fatality due to accidental methylene chloride poisoning: blood 252 mg/L, brain 75 µg/g, heart 30 µg/g [Kim *et al.* 1996].

Blood concentrations collected at autopsy in 2 cases of fatal methylene chloride poisoning were 572 and 601 mg/L; air concentrations a few hours after discovery of the bodies were up to 168 000 ppm [Manno *et al.* 1992].

The following postmortem tissue concentrations were reported in a 47-year-old factory worker who died while making an inventory of the annual stock of methylene chloride contained in several tanks, one of which overflowed: blood 150 mg/L, urine 2.0 mg/L, gastric content 5.6 mg/L, brain 122 µg/g, fat 99 µg/g, liver 44 µg/g, lung 20 µg/g, kidney 15 µg/g [Goulle *et al.* 1999].

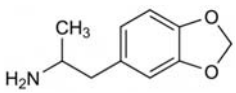
Methylenedioxyamfetamine

Hallucinogen
$C_{10}H_{13}NO_2$ = 179.2
CAS—4764-17-4

IUPAC Name 1-(1,3-Benzodioxol-5-yl)propan-2-amine
Synonyms MDA; α-methyl-1,3-benzodioxole-5-ethanamine; methylenedioxyamphetamine; *N*-methyl-3,4-methylenedioxyamfetamine; tenamfetamine; SKF-5.



Chemical Properties Almost colourless oil. pK_a 9.67 (25°). Log *P* (octanol/water), 1.64.

Methylenedioxyamfetamine Hydrochloride
$C_{10}H_{13}NO_2$,HCl = 215.7
CAS—6292-91-7

Colour Tests Liebermann's reagent—black; Mandelin's test—green→blue; Marquis test—blue-black; sulfuric acid—violet.
Thin-layer Chromatography System TA—R_f 0.39; system TB—R_f 0.18; system TC—R_f 0.12; system TE—R_f 0.42; system TL—R_f 0.17; system TAE—R_f 0.10; system TAF—R_f 0.76 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—MDA RI 1480, MDA-TFA RI 1615, MDA-PFP RI 1605, MDA-AC RI 1860, art (formyl) RI 1520; system GB—MDA RI 1512, art (formyl) RI 1689.

HPLC Limit of detection, <1 μg/L (0.1 μg/g) [Tagliaro *et al.* 1999].

Other **HPLC** Biological Tissues. See Blood [Michel *et al.* 1993].

Disposition in the Body

Toxicity The estimated lethal dose is 0.5 g.

A 21-year–old man was found dead in bed 7 h after being last seen in a 'normal' state. *Temazepam* tablets as well as 2 types of white tablets were found by his bedside. Toxicological analysis revealed the presence of the following drugs:

	Blood (mg/L)	*Stomach contents (mg/L)*	*Urine*
Amfetamine	0.256	<0.1	Present
MDA	8.5	299	Present
MDMA	2.1	96	Present
MDEA	3.5	324	Present

MDMA, methylenedioxymetamfetamine; MDEA, methylenedioxyethylamfetamine. [Forrest *et al.* 1994].

In 5 fatalities due to the ingestion of methylenedioxyamfetamine, the following postmortem tissue concentrations were reported: blood 6–26 mg/L (mean 14, 5 cases), bile 5–9 mg/L (mean 6, 3 cases), liver 8–17 μg/g (mean 11, 3 cases), urine 46–160 mg/L (mean 102, 3 cases) [Cimbura 1972].

In a fatality in which death occurred shortly after the ingestion of methylenedioxyamfetamine, the following postmortem concentrations were reported: blood 2.3 mg/L, bile 7 mg/L, liver 11 μg/g, urine 175 mg/L [Lukaszewski 1979].

Stout PR *et al.* (2002). Rapid simultaneous determination of amphetamine, methamphetamine, 3,4-methylenedioxyamphetamine, 3,4-methylenedioxymethamphetamine, and 3,4-methylenedioxyethylamphetamine in urine by solid-phase extraction and GC-MS: a method optimized for high-volume laboratories. *J Anal Toxicol* 26: 253–261.

Tagliaro F *et al.* (1999). High sensitivity simultaneous determination in hair of the major constituents of ecstasy (3,4-methylenedioxymethamphetamine, 3,4-methylenedioxyamphetamine and 3,4-methylene-dioxyethylamphetamine) by high-performance liquid chromatography with direct fluorescence detection. *J Chromatogr B Biomed Sci Appl* 723(1–2): 195–202.

Ugland HG *et al.* (1999). Automated determination of 'Ecstasy' and amphetamines in urine by SPME and capillary gas chromatography after propylchloroformate derivatisation. *J Pharm Biomed Anal* 19(3-4): 463–475.

Weinmann W *et al.* (2000). Automated solid-phase extraction and two-step derivatisation for simultaneous analysis of basic illicit drugs in serum by GC/MS. *Int, J Legal Med* 113: 229–235.

Methylenedioxymetamfetamine

Hallucinogen, Phenethylamine, Stimulant

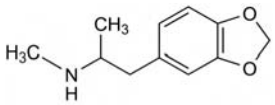
$C_{11}H_{15}NO_2 = 193.2$

CAS—42542-10-9

IUPAC Name 1-(1,3-Benzodioxol-5-yl)-*N*-methylpropan-2-amine

Synonyms (2-Benzol[1,3] dioxol-5-yl-1-methyl-ethyl)-methyl-amine; *N*,α-dimethyl-1,3,benzodioxole-5-ethanamine; MDMA; 3,4-methylenedioxymethamfetamine; 3,4-methylenedioxymethylamphetamine; *N*-methyl-3,4-methylenedioxyphenylisopropylamine.

Street Names A bean; Adam; Apples; Baby slits; Brownies; Burgers; Chocolate chips; Clarity; Crowns; Dennis the Menace; Diamond Whites; Disco biscuits; Doctor; Doves; E; Ecstasy; Elaine; Essence; Euphoria; Love doves; Lovers Speed; M, M; MDM; Mitsubishis; Mitsies; New Yorkers; Roll; Rhubarb, Custards; Stacy; Tangos; X; XTC.



Chemical Properties A viscous, colourless oil. Bp 100° to 110°. pK_a (pH 9.0) (benzene) 9.41, (hexane) 8.69, (ethyl acetate) 8.84. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].

Methylenedioxymetamfetamine Hydrochloride

$C_{11}H_{15}NO_2$,HCl = 229.75

CAS—64057-70-1

IUPAC Name 1-(1,3-Benzodioxol-5-yl)-*N*-methylpropan-2-amine hydrochloride

Chemical Properties A white to off-white crystalline powder with a bitter taste. Mp 147° to 148° for crystals from propan-2-ol/*n*-hexane, 152° to 153°for crystals from propan-2-ol/ether.

Colour Test Marquis reagent—black with dark purple halo.

Thin-layer Chromatography System TA—R_f 0.33; system TB—R_f 0.24; system TE—R_f 0.39; system TF—R_f 0.20; system TAE—R_f 0.08; system TAJ—R_f 0.03; system TAK—R_f 0.17; system TAL—R_f 0.57.

Gas Chromatography System GA—RI 1585, methylenedioxyamfetamine (MDA) RI 1480, MDMA-TFA RI 1720, MDMA-PFP RI 1830, MDMA-TMS RI 1710, MDMA-AC RI 2140; system GB—RI 1572, MDA RI 1512; system GAK—RT 8.7 min; system GAD—RT 10.9 min.

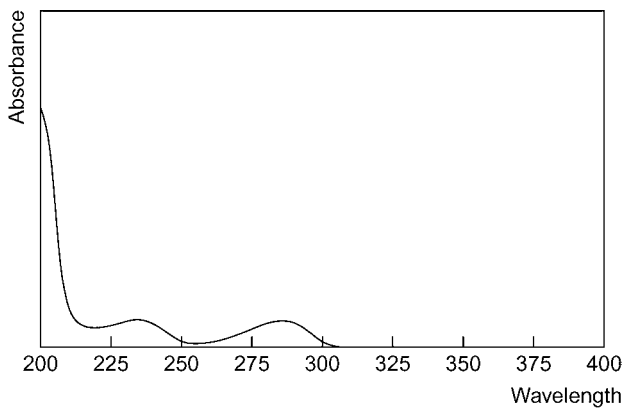
Column: 3% OV-1 Chromosorb WHP 80/100 mesh (1.2 m × 100 mm (4 ft × 4 in) i.d.). Column temperature: 200°. Carrier gas: N_2, 32 mL/min. FID. RI: 1559 [Mills, Roberson 1993].

High Performance Liquid Chromatography System HX—RI 278; system HY—RI 252; system HZ—RT 2.2 min; system HAA—RT 9.1 min; system HBC—RT 2.42 min; system HBD—RT 5.31 min.

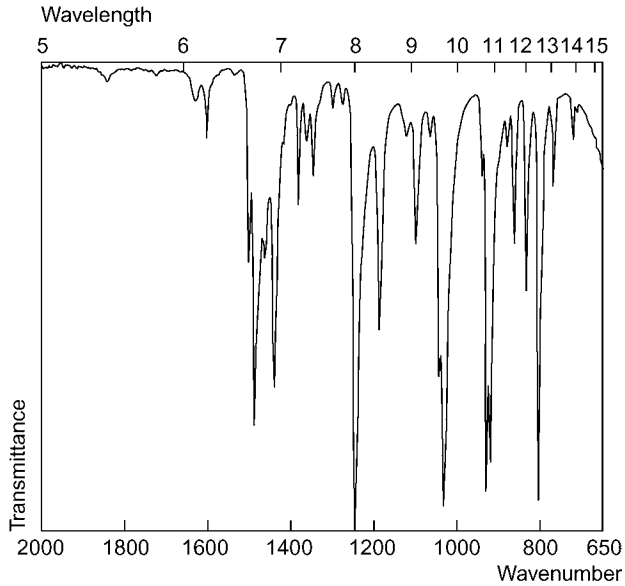
Column: ODS Hypersil Si-10 (300 × 4.0 mm i.d., 10 μm). Mobile phase: methanol with 1% ammonium hydroxide : methylene chloride (10 : 90), flow rate 2 mL/min. UV detection (λ = 254 nm). Retention time: 4.4 min [Mills, Roberson 1993].

Column: Zorbax CN (150 × 4.6 mm i.d., 5 m). Mobile phase: methanol: 0.1 mol/L acetate buffer (pH 4.56, 50 : 50). UV detection (λ = 280 and 284 nm). Retention time: 6.69 min for MDMA and 5.83 min for MDA [Garrett *et al.* 1991].

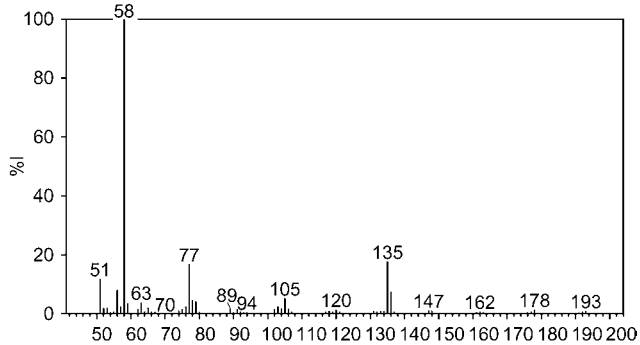
Ultraviolet Spectrum Aqueous acid (0.2 mol/L sulfuric acid)—234, 285 nm; (0.025 mol/L sulfuric acid)—198, 234.5, 282.5 nm; (0.1 mol/L ammonium formate, pH 3)—285; basic—232, 285 nm.



Infrared Spectrum Principal peaks at wavenumber 1033, 930, 805, 1489, 1442, 1189.2 cm^{-1} (hydrochloride)



Mass Spectrum Principal peaks at *m/z* 58, 77, 135, 51, 105, 63, 89, 178.



Quantification

Blood **GC-MS** Column: HP-5MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 60° for 1 min to 220° at 20°/min. EI ionisation, SIM acquisition mode. Retention time: 7.14 min. Limit of detection not reported [Gunn *et al.* 2010]. SIM acquisition mode. MDMA, MDA and other amfetamines [Rasmussen *et al.* 2006]. Column: HP-5 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 60° for 2 min to 250° at 20°/min for 5 min. SIM acquisition mode. Limit of quantification, 3.59 µg/g, limit of detection, 1.19 µg/g [Gentili *et al.* 2002]. Column: HP 5MS capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 50 kPa. Temperature programme: 60° for 1 min to 140° at 15°/min to 212° at 30°/min for 3 min to 285°. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 10.48 min. Limit of quantification, 10 µg/L for MDMA and 3,4-methylenedioxy-*N*-ethylamphetanime (MDEA) and 50 µg/L for MDA, limit of detection, 0.5–0.8 µg/L for MDMA, MDA and other amfetamines [Marquet *et al.* 1997].

HPLC Column: ODS. Mobile phase: 10 mmol/L citric acid: 20 mmol/L sodium hydrogen phosphate buffer (pH 4.0) : acetoxime (50 : 45 : 5). Fluorescence detection. Limit of detection, 0.36–0.83 µg/L for MDMA and MDA [Tomita *et al.* 2006]. Column: C_{18} BDS Hypersil (100 × 2.1 mm i.d., 3 µm). Mobile phase: 0.1 mol/L ammonium acetate-methanol-acetonitrile (90 : 10 : 10) : methanol-acetonitrile-water (45 : 45 : 10, 100 : 0 for 6 min to 30 : 70 in 14 min), flow rate 1 mL/min. I.S. 3,4 methylenedioxyphenyl-*N*-methyl propylamine (MDMPA). Fluorescence detection (λ_{ex} = 288 nm, λ_{em} = 324 nm). Retention time: 14.1 min for MDMA, 13.1 min for MDA, 15.1 min for MDEA and 17.1 min for IS Limit of quantification, 2 µg/L, limit of detection, 0.8 µg/L for MDMA, MDA and MDEA [Clauwaert *et al.* 2000]. Column: Whatman (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L sodium acetate (pH 4.25) : methanol (10 : 3), flow rate 0.8 mL/min. Electrochemical detection. Limit of detection, 1 µg/L for MDMA, MDA and MDE [Michel *et al.* 1993].

LC-MS Column: Agilent HPLC 1100 with Varian Pursuit 3 C_{18} (100 × 3 mm i.d., 3 µm). Mobile phase: methanol : ammonium formate. MRM acquisition mode, positive ion mode. Limit of quantification, 0.0005–0.01 mg/kg for MDMA, MDA and other drugs of abuse [Bjork *et al.* 2010]. Column: Nucleodur Sphinx RP. Mobile phase: 10 mmol/L ammonium formate buffer : acetonitrile. Limit of quantification, 2.5 µg/L, limit of detection, 0.05–0.5 µg/L for MDMA, MDA and other amfetamines [Fernández Mdel *et al.* 2009]. Column: BEH C_{18} (50 × 2.1 mm i.d.). Mobile phase: aqueous pyrrolidine : methanol (52 : 48), flow rate 0.4 mL/min. ESI, positive ion mode. Retention time: 2.04 min. Limit of detection not reported [Apollonio *et al.* 2006].

Note For a review of methods published between 2002 and 2007 for the determination of MDMA, MDA, other amfetamines and drugs of abuse in blood, see Kraemer, Paul [2007].

Plasma **GC** Column: Ultra-2 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° for 2 min to 100° at 30°/min to 200° at 20°/min to 280° at 25°/min. NPD. Limit of quantification, 5.3 µg/L, limit of detection, 1.6 µg/L [Ortuño *et al.* 1999].

GC-MS Column: VF-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 300° at 15°/min for 10 min. EI ionisation, SIM acquisition mode. Retention time: 8.7 min. Limit of quantification, 5 µg/L, limit of detection, 2 µg/L for MDMA, MDA and related drugs [da Silva *et al.* 2010]. See Blood [Gunn *et al.* 2010]. Column: Zorbax 300-SCX (150 × 2.1 mm i.d., 5 µm). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (70 : 30). ESI, positive ion mode. Limit of detection not reported [Mueller *et al.* 2009]. Column: ZB-50 (30 m × 0.32 mm i.d., 0.25 µm). Temperature programme: 70° to 150° at 35°/min for 0.5 min to 195° at 10°/min for 0.11 min to 100° at 50°/min to 275° at 800°/min to 190° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 2.5 µg/L, limit of detection, 0.5 µg/L [Kolbrich *et al.* 2008a]. Column: HP-5MS (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° to 250° at 10°/min to 310° at 30°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, 5 µg/L [Peters *et al.* 2003a; Peters *et al.* 2003b; Peters *et al.* 2005]. Column: 5% phenylmethylsiloxane (12 m × 0.22 mm i.d., 0.33 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 150° for 1 min to 290° at 20°/min for 7 min. EI ionisation, SIM acquisition mode. Limit of quantification, 7.3 µg/L for (*R*)-MDMA and 9.3 µg/L for (*S*)-MDMA, limit of detection, 2.4 µg/L for (*R*)-MDMA and 3.1 µg/L for (*S*)-MDMA [Pizarro *et al.* 2002; Pizarro *et al.* 2003].

HPLC See Blood [Tomita *et al.* 2006]. UV and fluorescence detection. Limit of detection, 25 µg/L for MDMA and MDE and 10 µg/L for MDA [Herráez-Hernández *et al.* 2001]. Column: ODS Hypersil C_{18} (130 mm). Mobile phase: methanol : 0.1 mol/L acetate buffer (pH 4.54 50 : 50), flow rate 0.7 mL/min. UV detection (λ = 280 nm). Limit of detection, 3.68 µg/L for MDMA and 2.0 µg/L for MDA [Garrett *et al.* 1991].

LC-MS Column: C_{18} Alltima (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L formic acid (10 : 90 for 2 min to 25 : 75 in 16 min to 35 : 65 in 0.1 min to 100 : 0 in 12 min), flow rate 1.0 mL/min. MRM acquisition mode, positive ion mode. Limit of quantification, 1.8 µg/L, limit of detection, 0.9 µg/L [Sergi *et al.* 2009]. Column: CAPCELL PAK SCX UG 80 (250 × 4.6 mm i.d.). Mobile phase: 25 mmol/L ammonium acetate (pH 4.0) : acetonitrile (3 : 7), flow rate 0.2 mL/min. ESI, SRM acquisition mode. Limit of detection, 50 µg/L [Kuwayama *et al.* 2008]. Column: Hypersil BDS-C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (75 : 25), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, <2 µg/L for MDMA, MDA and other amfetamines [Wood *et al.* 2003].

Serum **GC-MS** See Blood [Gunn *et al.* 2010]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 1 min to 200° at 20°/min to 240° at 5°/min to 310° at 30°/min for 6 min. EI ionisation, SIM acquisition mode. Limit of quantification, 10.4 µg/L [Weinmann *et al.* 2000].

HPLC See Blood [Clauwaert *et al.* 2000].

Urine **TLC** Fluorescence detection (250 to 400 nm). Limit of detection, 50 ng for MDMA, MDA and other amfetamines [Kato *et al.* 2008].

GC Limit of detection, 20 µg/L for MDMA and MDA [Wang *et al.* 2008]. Column: AT-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° for 1 min to 280° at 20°/min for 5 min. FID. Limit of detection, 35 µg/L [Raikos *et al.* 2003]. NPD. Limit of detection, 47 µg/L for MDMA, MDA and other metabolites [Ortuño *et al.* 1999]. Column: SPB-1 polymethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature: 180°. Limit of detection, 5 µg/L for MDMA and MDEA and 15 µg/L for MDA [Ugland *et al.* 1999].

GC-MS SIM acquisition mode. Limit of quantification, 3.5 µg/L for MDMA, MDA and related drugs [da Silva *et al.* 2010]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 127 kPa. Temperature programme: 70° for 1 min to 300° at 20°/min for 2 min. EI ionisation at 70 eV. Limit of detection, 5 µg/L for MDMA and 10 µg/L for MDA [Nakamoto *et al.* 2010]. Column: Varian VF-5ht (30 m × 0.25 mm i.d., 0.10 µm). Temperature programme:150° to 270° at 10°/min. EI ionisation, full scan mode. Limit of quantification, 0.1 mg/L, limit of detection, 0.1 mg/L [Brown *et al.* 2007]. Column: DB-35MS (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.0 psi. Temperature programme: 70° for 2 min to 160° at 20°/min for 2 min to 200° at 15°/min to 300° for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 µg/L, limit of detection, 10 µg/L for MDMA, MDA and other metabolites [Pirnay *et al.* 2006]. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L for MDMA, MDA and other amfetamines [Maresová *et al.* 2006]. See Blood [Gentili *et al.* 2002]. See Plasma [Pizarro *et al.* 2002; Pizarro *et al.* 2003]. See also Centini *et al.* [1996], Dallakian *et al.* [1996], de Boer *et al.* [1997], Gan *et al.* [1991], Hensley, Cody [1999], Jurado *et al.* [2000], Klette *et al.* [2005], Namera *et al.* [2002], Paul *et al.* [2004], Pellegrini *et al.* [2002] and Stout *et al.* [2002].

HPLC Column: Genesis C8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 2.5) containing 0.3% TEA (12 : 88). Fluorometric detection [Bugamelli *et al.* 2006]. UV detection. Limit of detection, 5.3–84 ng for MDMA, MDA and other amfetamines [Soares *et al.* 2004]. See Plasma [Herráez-Hernández *et al.* 2001]. See Blood. Limit of quantification, 0.1 mg/L, limit of detection, 2.5 µg/L for MDMA, MDA and MDEA [Clauwaert *et al.* 2000]

LC-MS See Blood. Limit of quantification, 25 µg/L, limit of detection, 0.25–2.5 µg/L for MDMA, MDA and other amfetamines [Fernández Mdel *et al.* 2009].

Column: C_{18} (100 × 2 mm i.d., 3 μm). Mobile phase: acetonitrile : 25 mmol/L formic acid (91 : 9 for 5 min to 80 : 20 in 4 min to 0 : 100 in 3 min to 91 : 9 for 5 min), flow rate 0.3 mL/min. ESI, SRM acquisition mode. Limit of quantification, 26 μg/L, limit of detection, 8 μg/L [Andersson *et al.* 2008]. Column: CAPCELL PAK C_{18} MG-II (150 × 2 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium formate (pH 4.0) : acetonitrile. MRM acquisition mode. Limit of detection, <1.95 μg/L for MDMA, MDA and other amfetamines and metabolites [Kim *et al.* 2008]. Column: Atlantis dC_{18} (20 × 2.1 mm i.d., 3 μm). Mobile phase: acetonitrile : ammonium formate buffer (pH 3.0, 0 : 100 to 10 : 90 in 2 min for 1.5 min to 100 : 0 in 1 min to 0 : 100 in 0.5 min). ESI, SRM acquisition mode. Limit of quantification, 1 μg/L for MDMA and 2 μg/L for MDA, limit of detection, 0.2 μg/L for MDMA and 1 μg/L for MDA [Concheiro *et al.* 2007a; Concheiro *et al.* 2007b]. Column: ODS (150 × 1.5 mm i.d., 5 μm). Mobile phase: methanol : 10 mmol/L ammonium formate buffer (pH 3.5, 15 : 85 to 35 : 65 over 25 min). ESI, CID. Limit of detection, 5 nmol/L [Shima *et al.* 2007]. See Plasma [Kuwayama *et al.* 2008]. See Hair [Wu *et al.* 2001]. See also Chèze *et al.* [2007], Jenkins *et al.* [2004] and Wu, Fuh [2005].

CE Column: fused silica (245/230 mm effective/paced length, 75 μm). Mobile phase: 20 mmol/L sodium phosphate buffer : acetonitrile (80 : 20). Limit of quantification, 12 μg/L, limit of detection, 5–15 μg/L for MDMA, MDA and other drugs of abuse [Aturki *et al.* 2009]. Column: monolithic capillary (245/336 mm effective/total length, 75 μm i.d.). Limit of quantification, 7.5 mg/L, limit of detection, 1 mg/L for MDMA and metabolites [Choodum *et al.* 2009].

Note For a comparison of a range of immunoassays for MDMA, MDA and other amfetamines, see Verstraete, Heyden [2005] or Hsu *et al.* [2003].

Bile **LC-MS** See Plasma [Kuwayama *et al.* 2008].

Oral Fluid **GC-MS** Column: Agilent HP-5MS (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 70° to 170° at 25°/min for 0.2 min to 195° at 5°/min for 0.5 min to 300° at 30°/min for 1 min. SIM acquisition mode. Limit of quantification, 5 μg/L, limit of detection, 2.5 μg/L [Scheidweiler, Huestis 2006]. See Blood [Gentili *et al.* 2002].

LC-MS See Sergi *et al.* [2009] and Wood *et al.* [2003]

Note For a review of the determination of MDMA, MDA and other 'Ecstasy' components in oral fluid, sweat and hair, see Kintz, Samyn [1999]. For the analysis of MDMA and its metabolites in oral fluid and correlation with plasma levels, see Navarro *et al.* [2001].

Vitreous Humour **HPLC** See Blood [Clauwaert *et al.* 2000]

Sweat See Oral Fluid [Kintz, Samyn 1999].

Hair **GC-MS** Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.1 mL/min. Temperature programme: 90° for 0.5 min to 150° at 25°/min to 230° at 15°/min for 1.0 min to 300° at 40°/min for 1.3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.05 ng/mg, limit of detection, 0.011 μg/g [Kim *et al.* 2010]. Limit of quantification, 0.24–0.46 μg/g, limit of detection, 0.07–0.14 μg/g for MDMA, MDA and other amfetamines [Johansen, Jornil 2009]. Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 210° at 10°/min for 3 min. EI ionisation, SIM acquisition mode. Retention time: 11.7 min. Limit of quantification, 50 ng/g, limit of detection, 20 ng/g for MDMA, MDA and other amfetamines [Meng *et al.* 2009]. Column: HP-5MS 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 0.2 min to 280° at 20°/min for 3 min. EI ionisation, SIM acquisition mode. Retention time: 4.98 min. Limit of quantification, 0.05 ng/mg, limit of detection, 0.03 μg/g [Wu *et al.* 2008a; Wu *et al.* 2008b]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 2 min to 220° at 20°/min to 260° at 5°/min to 305° at 30°/min. NCI. Limit of detection, 0.002 ng/mg [Martins *et al.* 2007]. See Blood [Gentili *et al.* 2002]. See also Kim *et al.* [2007], Kintz *et al.* [1995], Martins *et al.* [2006], Pujadas *et al.* [2003], Röhrich, Kauert [1997], Skender *et al.* [2002], Villamor *et al.* [2005] and Zhu *et al.* [2007].

HPLC Column: CAPCELL PAK C_{18} UG120 (250 × 1.5 mm i.d., 5 μm). Mobile phase: 20 mmol/L imidazole-nitric acid buffer (pH 7.0) : acetonitrile : tetrahydrofuran (51.5 : 45 : 3.5), flow rate 0.1 mL/min. Electrochemical detection. Limit of quantification, 10 ng/mg, limit of detection, 3 ng/mg [Nakamura *et al.* 2007]. Column: Daisopak SP-120-5-ODS-BP (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : water (30 : 40 : 30), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 325 nm, λ_{em} = 430 nm). Limit of detection, 0.2 ng/mg [Kaddoumi *et al.* 2004]. Column: reversed phase (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L potassium phosphate (pH 3) : acetonitrile (82 : 18). Fluorescence detection (λ_{ex} = 285 nm, λ_{em} = 320 nm). Limit of detection, <1 μg/L for MDMA, MDA and MDEA [Tagliaro *et al.* 1999].

LC-MS Column: Synergi Polar (150 × 2 mm i.d., 4 μm). Mobile phase: 0.01% acetic acid: methanol (50 : 50), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 μg/g, limit of detection, 0.1 μg/g for MDMA, MDA and other amfetamines [**Tabernero *et al.* 2009**]. Column: Supelcosil LC-CN (33 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : 50 mmol/L ammonium acetate (15 : 85), flow rate 0.4 mL/min. ESI, SIM acquisition mode. Limit of detection, 8–56 ng/L for MDMA and related drugs [Wu *et al.* 2001].

CE-MS Column: uncoated fused silica capillary (100 cm total length, 75 μm). ESI, SIM acquisition mode. Limit of quantification, 0.04 ng/mg, limit of detection, 002 ng/mg [Gottardo *et al.* 2007].

Note For a comparison of CE and GC-MS for the analysis of MDMA, see Fang *et al.* [2002].

Disposition in the Body MDMA is absorbed into the bloodstream after ingestion and excreted in urine, the majority of the dose being unchanged (65% within 3 days). Metabolism occurs by a number of routes: *N*-demethylation of the parent compound to MDA (7%) with further *O*-demethylation to 3,4-dihydroxymetamfetamine (HHMA) and 3,4-dihydroxyamfetamine (HHA). Both HHMA and HHA are subsequently *O*-methylated by catechol-*O*-methyltransferase (COMT) mainly to 4-hydroxy-3-methoxymetamfetamine (HMMA) and 4-hydroxy-3-methoxyamfetamine (HMA). These 4 metabolites are excreted in the urine as the conjugated glucuronide or sulfate metabolites.

Therapeutic Concentration

After the administration of a single oral dose of 1.5 mg/kg body weight MDMA to 2 patients, plasma and urine samples were collected over periods of 9 and 22 h, respectively. Peak plasma concentrations of MDMA and MDA were 331 μg/L after 2 h and 15 μg/L after 6.3 h, respectively. Peak concentrations of 28.1 μg/L MDMA in urine appeared after 21.5 h. Up to 2.3 μg/L MDA, 35.1 μg/L HMMA and 2.1 μg/L HMA were measured within 16 to 21.5 h, also in urine [Helmlin *et al.* 1996]

Eight healthy male volunteers, aged between 21 and 31 years, were given a 75 mg dose of MDMA. Mean peak plasma concentration was 0.13 mg/L after 1.8 h. Mean peak plasma concentrations of MDA were 7.8 μg/L approximately 5 h after administration [de la Torre *et al.* 2000].

In a double-blind, randomised study, 17 healthy subjects were given single oral doses of 1.0 mg/kg MDMA, 1.6 mg/kg MDMA or placebo. Peak plasma levels of MDMA were ≈163 and 292 μg/L after the low and high doses, respectively. Peak plasma levels of MDA were 8.4 and 13.8 μg/L following the low and high doses of MDMA, respectively. Mean half-lives of MDMA and MDA were 7–8 h and 10.5–12.5 h, respectively [Kolbrich *et al.* 2008b]

In a further study, 30.2–34.3% of urinary excretion was found to occur in the first 24 h following single 1.0 or 1.6 mg/kg doses of MDMA [Abraham *et al.* 2009].

Toxicity Fatalities with doses of 300 mg have been reported. Risk of adverse reaction is high but the pattern is varied. Severe acute toxic effects and morbidity are noted. MDMA is capable of causing severe toxicity and the pattern of acute toxicity reflects the circumstances in which it is misused. Circumstances associated with ingestion and direct effects of the drug are thought to influence toxicity. The amount of MDMA ingested is difficult to determine because the concentration in tablets is unknown and it may be mixed with other substances. A lethal toxic reference concentration of 0.4–0.8 mg/L has been noted, although some overdose cases report concentrations ten times this amount without fatality.

An 18-year-old man ingested 3 tablets and collapsed. He was unconscious on the floor for 60 min and died 2.5 h after admission to hospital. A plasma concentration of 0.36 mg/L MDMA was detected [Henry *et al.* 1992].

A 16-year-old woman ingested 1tablet and suffered from seizures and experienced hallucinations. The MDMA plasma concentration was 0.424 mg/L. She died 36 h after admission to hospital [Henry *et al.* 1992].

A 21-year-old woman ingested an unknown number of tablets and suffered from hyperactivity leading to convulsions and repeated seizures. Plasma concentration of MDMA was 0.11 mg/L. She underwent a liver transplant after 4 days but died after 18 days [Henry *et al.* 1992].

An 18-year-old man ingested 3 tablets and suffered from seizures and sweating. The MDMA concentration was 1.26 mg/L in plasma. He died 6.5 h after admission [Henry *et al.* 1992].

A 23-year-old man ingested 3 tablets and suffered from convulsions and agitation. The MDMA plasma concentration was 0.2 mg/L. He was hospitalised for 33 days [Henry *et al.* 1992].

A 19-year-old woman ingested 2 tablets and suffered from vomiting, watery diarrhoea and was in a coma. Plasma concentrations were MDMA 0.24 mg/L, MDA 0.02 mg/L and amfetamine 0.02 mg/L. She recovered [Henry *et al.* 1992].

A report of a traffic fatality in a 29-year-old man attributed the cause of death to the use of MDMA. Concentrations of MDMA were: blood 2.32 mg/L (clotted blood) and 2.14 mg/L (sodium fluoride–potassium oxalate antocoagulated blood), vitreous humour 1.11 mg/L and urine 118.8 mg/L. Levels of MDA were <0.25 mg/L in blood and vitreous humour and 3.86 mg/L in urine [Crifasi, Long 1996].

Following a fatal poisoning with MDMA, postmortem blood levels of (*S*)-MDMA and (*R*)-MDMA were 1.3 and 1.6 mg/L, respectively. Levels of (*S*)- and (*R*)-MDA were 0.8 mg/L [Moore *et al.* 1996].

A 30-year-old man was admitted to hospital after taking 50 ecstasy tablets, 10 oxazepam tablets (10 mg) and 5 units of alcohol over a period of 4 to 5 h. Presenting features were unconciousness, apnoea and convulsions. Toxicological analysis revealed the following MDMA and MDA concentrations:

Time after ingestion (h)	*Sample*	*MDMA (mg/L)*		*MDA (mg/L)*	
		R-(−)	*S-(+)*	*R-(−)*	*S-(+)*
4	Urine	44	42	nd	0.4
	Gastric lavage	70	72	nd	nd
36	Urine	36	17	3	7
60	Urine	18	10	5	4
	Serum	0.8	0.2	nd	nd

The individual recovered after a few days without sequelae [Ramcharan *et al.* 1998].

M

Twelve hours after ingesting a maximum of 40 ecstasy tablets, a 19-year-old man was admitted to an intensive care unit. Toxicological analysis revealed the following MDMA concentrations:

Time after ingestion (h)	*Serum MDMA (mg/L)*	*Urine MDMA (mg/L)*
13	4.3	630
24	1.4	180
30	0.75	105

The individual recovered after a few days without sequelae [Regenthal *et al.* 1999].

A 28-year-old man was found unconscious in a bar. A postmortem examination was carried out roughly 28 h later, which revealed the following MDMA and MDA concentrations:

Sample	*MDMA*	*MDA*
Subclavian blood (mg/L)	3.5	0.09
Femoral blood (mg/L)	3.1	0.093
Serum (subclavian blood) (mg/L)	4.2	0.1
Vitreous humour (mg/L)	3.4	0.06
Urine (mg/L)	170.9	4
Bile (mg/L)	14.2	0.32
Liver (μg/g)	26.2	1.203
Stomach content (μg/g)	118.1	0.448
Spleen (μg/g)	10	0.264
Brain (frontal lobe) (μg/g)	17.4	0.296
Brain (parietal lobe) (μg/g)	17.1	0.362
Brainstem (μg/g)	13.2	0.22
Cerebellum (μg/g)	11.7	0.225

Cotinine, caffeine and trace amounts of benzoylecgonine were also detected [De Letter *et al.* 2002].

A 19-year-old woman died after taking ecstasy tablets. Blood levels of MDMA were 3.8 mg/L and traces of MDA were also found [Libiseller *et al.* 2005].

A 17-year-old man died after ingestion of ecstasy. Postmortem levels were highest in the stomach (835.97 μg/g) and kidney (801.14 μg/g). Lowest levels were found in the liver (22.26 μg/g) [Dordevic, Tomasevic 2007].

MDMA and MDA blood levels of 1.42 mg/L and 0.17 mg/L, respectively, were found at postmortem following fatal ecstasy poisoning in a 22-year-old man. Hair levels of 8.74–15.51 μg/g in 2 cm strands of hair confirmed chronic drug use [Klys *et al.* 2007].

A 14-month-old infant who swallowed a portion of an ecstasy tablet had a generalised convulsion 40 min after ingestion. He presented with hyperthermia, hypertension, ventricular extrasystoles, tachypnoea and mydriasis. Urine amfetamine levels were greater than 16 mg/L 5 h later and the serum level of MDMA was 0.591 mg/L at 8 h. He recovered after general supportive measures and IV benzodiazepines [Melian *et al.* 2004].

In another case of MDMA intoxication in an infant after accidental ingestion, MDMA and HMMA levels in the infant's hydrolysed urine were 11.7 and 34.4 mg/L, respectively [Garcia-Algar *et al.* 2005].

For other reports of ecstasy poisoning in young children, see Boucher *et al.* [2009] and Cassidy *et al.* [2009]. For other studies of MDMA and MDA distribution following fatalities associated with MDMA, see Dams *et al.* [2003], De Letter *et al.* [2004], [2007], Liu *et al.* [2006] and Valtier *et al.* [2007]. For an overview of ecstasy-related fatalities, see Schifano [2004]; for a review of MDMA deaths in New York City, see Gill *et al.* [2002]; for reviews of deaths in the UK associated with ecstasy use, see Schifano *et al.* [2003]; Schifano [2004]; and Schifano *et al.* [2006]; for a review of MDMA-related deaths in Taiwan, see Lin *et al.* [2009]; for a report on MDMA and driving impairment, see Logan, Couper [2001], see also Brookhuis *et al.* [2004], Kuypers *et al.* [2006], Lamers *et al.* [2003] and Moeller, Hartung [1997].

Half-life ≈6–7 h.

Clearance The mean total clearance of MDMA for a 75 mg dose is 86.9 L/h.

Protein Binding ≈65%

Note For methods of analysis and ecstasy tablet profiling, see Bonadio *et al.* [2009], Cheng *et al.* [2003], Choodum *et al.* [2009], Gimeno *et al.* [2002], Inoue *et al.* [2009], Marquis *et al.* [2008], Milliet *et al.* [2009], Parrott [2004], Rashed *et al.* [2000], Sherlock *et al.* [1999], Shetab Boushehri *et al.* [2009], Tanner-Smith [2006] and Vogels *et al.* [2009]. For a review of the history, neurochemistry and toxicology of ecstasy, see Rochester, Kirchner [1999]; see also Maurer [1996], Ricaurte *et al.* [2000] and Rogers *et al.* [2009].

Dose The usual dose is between 80 and 200 mg (more often 100 to 150 mg).

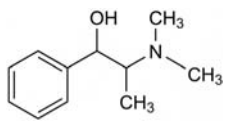
Methylephedrine

Sympathomimetic
$C_{11}H_{17}NO = 179.3$
CAS—552-79-4

IUPAC Name (1*R*,2*S*)-2-(Dimethylamino)-1-phenylpropan-1-ol
Synonyms α-[1-(Dimethylamino)ethyl]benzenemethanol; L-methylephedrine; L-*N*-methylephedrine.



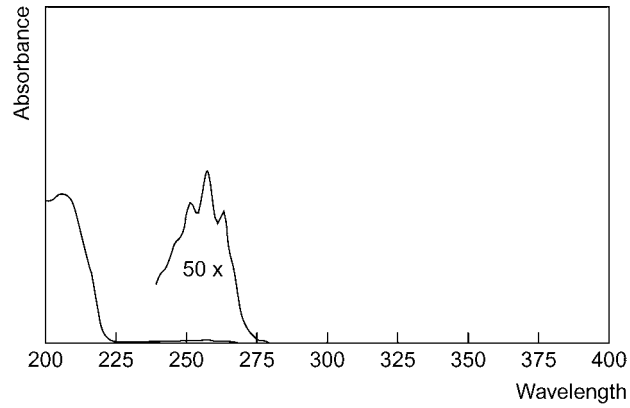
Chemical Properties Soluble in chloroform and ether. pK_a 9.3 (25°). Log *P* (octanol/water), 0.9.

Methylephedrine Hydrochloride

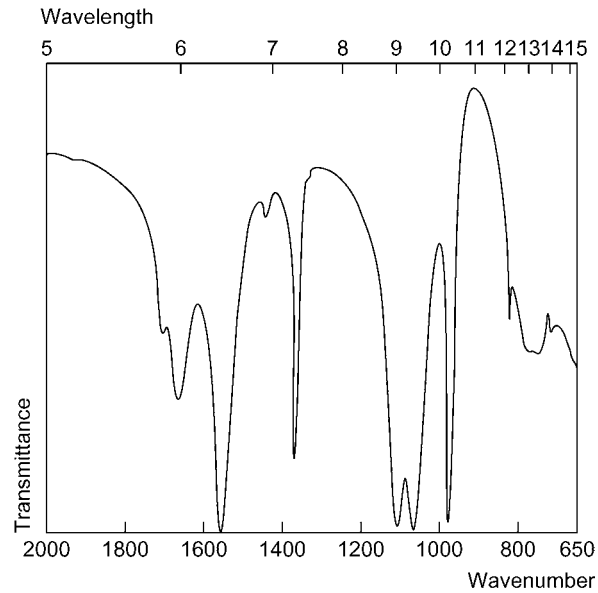
$C_{11}H_{17}NO,HCl = 215.7$
CAS—38455-90-2
Proprietary Names It is an ingredient of *Coughmin*, *Hustazol-C*, *Ilvico*, *Methorcon*, *Tossamine* plus *Tussoretardin*.
Chemical Properties A white crystalline powder. Mp 207° to 208° (crystals from acetone). Freely soluble in water; soluble in ethanol; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.32; system TE—R_f 0.35; system TAE—R_f 0.12 (acidified iodoplatinate solution, positive).

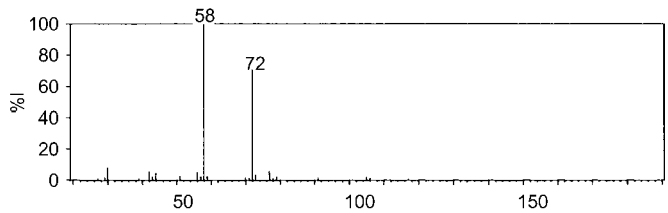
Gas Chromatography System GA—methylephedrine RI 1405; ephedrine RI 1365; system GB—methylephedrine RI 1451; ephedrine RI 1410; system GC—methylephedrine RI 1480; ephedrine RI 1467.
High Performance Liquid Chromatography System HA—methylephedrine *k* 2.3; ephedrine 1.0; system HC—methylephedrine *k* 1.83; ephedrine 1.79.
Ultraviolet Spectrum Aqueous acid—251, 257 ($A_1^1 = 11a$), 263 nm (see below).



Infrared Spectrum Principal peaks at wavenumbers 742, 1039, 702, 1052, 990, 1162 cm^{-1} (KBr disk, see below).



Mass Spectrum Principal ions at *m*/*z* (methylephedrine) 58, 72, 30, 77, 56, 44, 42, 73; (ephedrine) 58, 146, 56, 105, 77, 42, 106, 40.



Quantification

Blood **GC** Column: DB-5 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. NPD. Retention time: 5 min. Limit of detection not reported [Kunsman *et al.* 1998]. Column: DB-5 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 280° at 20°/min for 6 min. NPD. Limit of detection not reported [Levine *et al.* 1993].
Urine **GC** Column: Rtx-5 amine cross-linked 5% diphenylpolysiloxane-95% dimethylpolysiloxane (15 m × 0.25 mm i.d., 1.0 µm). Carrier gas: He. Temperature programme: 100° to 105° at 0.5°/min to 118° at 2°/min to 280° at

0°/min for 2 min. NPD. Retention time: 17.2 min. Limit of detection, 4 mg/L [Van Eenoo *et al.* 2001]. See Blood [Kunsman *et al.* 1998].

GC-MS Column: TC-1 cross-linked methyl silicone (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 4 psi. Temperature programme: 60° or 100° for 0.5 min to 280° at 20°/min or 10°/min, respectively. Limit of detection, 500 μg/L [Nakahara, Kikura 1997].

HPLC Column: Spherisorb ODS 1 (150 × 4.6 mm i.d., 5 μm). Mobile phase: tetraethylammonium phosphate : methanol (pH 2.8; 98 : 2), flow rate 1.0 mL/min. UV detection (λ = 214 nm). Retention time: 6.1 min. Limit of quantification, 2.5 mg/L, limit of detection, 0.5 mg/L [van der Merwe *et al.* 1994]. Column: LiChrospher 60 RP Select B (125 × 4 mm i.d., 5 μm). Mobile phase: 200 mmol/L phosphate buffer : 150 mmol/L TEA (pH 5.5), flow rate 1.3 mL/min. UV detection (λ = 215 nm). Limit of detection, 0.5 mg/L [Imaz *et al.* 1993];

***Hair* GC-MS** See Urine. Limit of detection, 0.1 ng/mg [Nakahara, Kikura 1997].

Disposition in the Body Methylephedrine is absorbed after oral administration. Approximately 32% of a dose is excreted in the urine unchanged and 8% is excreted as the demethylated metabolite ephedrine; the rate of excretion is dependent on the urinary pH [Inoue, Suzuki 1990].

Toxicity Although methylephedrine is not available in the USA, it was identified in 15 cases received by the Armed Forces Institute of Pathology, Rockville, Maryland. Blood methylephedrine concentrations ranged from <0.05 to 0.28 mg/L while the mean methylephedrine urine concentration was 1.6 mg/L (range 0.15–6.8 mg/L). As no evidence suggested that methylephedrine was present at toxic concentrations, it appears that blood methylephedrine concentrations of <0.3 mg/L are not associated with significant toxicity [Kunsman *et al.* 1998].

A 19-year-old white man was found dead in his family's home. Postmortem examination revealed the following drug concentrations (mg/L): methylephedrine 5.6, dihydrocodeine 4.7, chlorphenamine 2.6, salicylate 150.0 and verapamil 6.0. Concentrations in the liver were 6.7, 25, 8.9, –, and 130 mg/kg, respectively. Methylephedrine, dihydrocodeine and chlorphenamine appear in an over-the-counter cold medication in Japan under the trade name Bron. The cause of death was multiple drug intoxication [Levine *et al.* 1993].

Note For a study of the metabolism of methylephedrine in rat and man see Inoue, Suzuki [1990].

Dose Up to 200 mg methylephedrine hydrochloride has been given daily in divided doses.

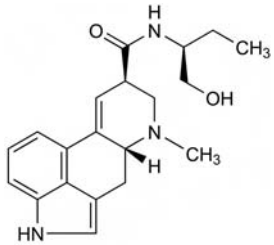
Methylergometrine

Uterine Stimulant

$C_{20}H_{25}N_3O_2$ = 339.4

CAS—113-42-8

Synonyms (8β)-9,10-Didehydro-*N*-[(1*S*)-1-(hydroxymethyl)propyl]-6-methylergoline-8-carboxamide; methylergobasine; methylergonovine.



Chemical Properties Crystals. Mp 172°, with decomposition. Sparingly soluble in water; freely soluble in ethanol and acetone. pK_a 6.7 (24°). Log *P* (octanol/water), 1.0.

Methylergometrine Maleate

$C_{20}H_{25}N_3O_2,C_4H_4O_4$ = 455.5

CAS—57432-61-8

Proprietary Names *Basofortina*; *Ergotyl*; *Metenerin*; *Methergin(e)*; *Methylergobrevin*; *Metrine*; *Nathergen*; *Ryegonovin*; *Spametrin-M*.

Chemical Properties A white or pinkish-tan, crystalline powder, which darkens on exposure to light. Mp 185° to 195°, with decomposition. Soluble 1 in 200 of water and 1 in 140 of ethanol giving a blue fluorescence; very slightly soluble in chloroform and ether.

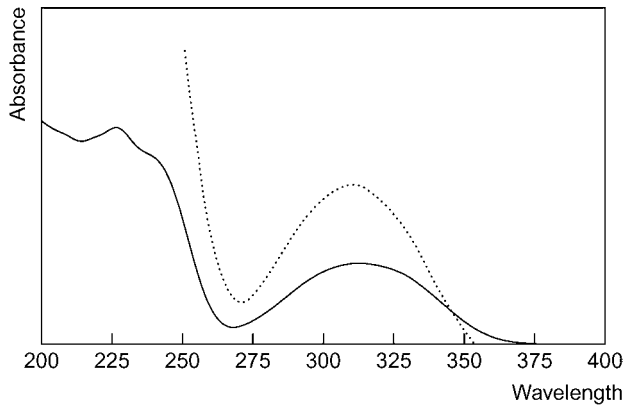
Colour Tests Mandelin's test—violet-brown; Marquis test—grey-brown.

Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.00; system TC—R_f 0.14; system TE—R_f 0.41; system TL—R_f 0.12; system TM—R_f 0.31; system TAE—R_f 0.69 (van Urk reagent, blue).

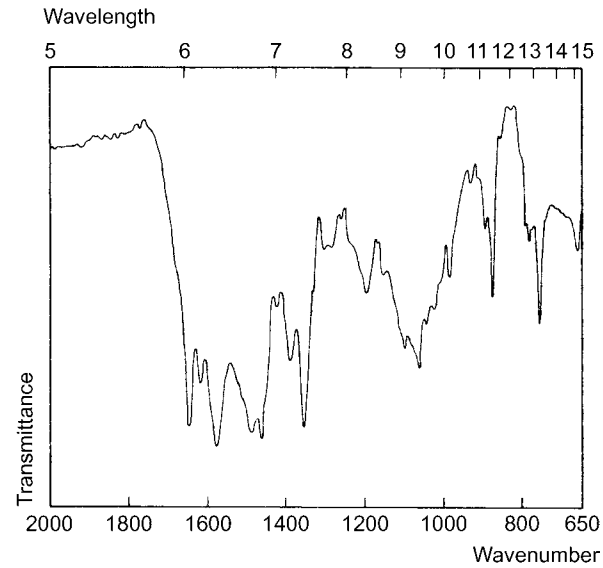
Gas Chromatography System GA—not eluted.

High Performance Liquid Chromatography System HA—*k* 0.4; system HP—*k* 0.83; system HX—RI 320; system HZ—retention time 2.1 min.

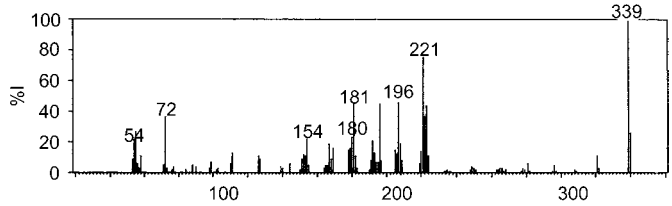
Ultraviolet Spectrum Aqueous acid—313 nm (A_1^1=255a); aqueous alkali—310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1580, 1490, 1650, 1620, 1065, 1103 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 339, 221, 196, 181, 207, 223, 222, 72.



Quantification

***Plasma* HPLC** Fluorescence detection. Methylergometrine and ergotamine. Limit of detection, 100 ng/L [Edlund 1981].

***Serum* HPLC** See Plasma [Edlund 1981].

Disposition in the Body Rapidly absorbed after oral administration. About 2 to 3% of a dose is excreted in the urine as unchanged drug in 24 h.

Therapeutic Concentration

After a single oral dose of 0.25 mg to 6 subjects, peak plasma concentrations of about 0.003 mg/L were attained in 0.5 h [Mantyla *et al.* 1978].

Half-life Plasma half-life, about 2 h.

Volume of Distribution About 0.5 L/kg.
Protein Binding About 35%.
Dose 0.375 to 1 mg of methylergometrine maleate daily, for up to 7 days.

Edlund PO (1981). Determination of ergot alkaloids in plasma by high-performance liquid chromatography and fluorescence detection. *J Chromatogr* 226: 107–115.

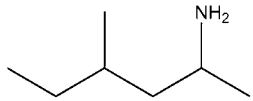
Methylhexaneamine

α-Adrenoceptor Agonist
$C_7H_{17}N$ = 115.2
CAS—105-41-9

IUPAC Name 4-Methylhexan-2-amine
Synonyms 2-Amino-4-methylhexane; 1,3-dimethylamylamine; 1,3-dimethylpentylamine; methylhexamine; 4-methyl-2-hexaneamine.



Proprietary Names *Forthan*; *Forthane*.
Chemical Properties A colourless-to-pale yellow liquid with an amine odour. Bp 130° to 135° [Council on Pharmacy and Chemistry of the American Medical Association 1950]. Slightly soluble in water; very soluble in ethanol, ether and chloroform. Methylhexaneamine is volatile and may be isolated by distillation.
Disposition in the Body
Toxicity Excessive use of methylhexaneamine inhalers may produce headache, nervousness, mental overactivity, and tremors. The estimated minimum lethal dose in children up to 2 years is 200 mg.
Dose As the carbonate equivalent to 250 mg of base, it is used in inhalers for the temporary relief of nasal congestion [Council on Pharmacy and Chemistry of the American Medical Association 1950].

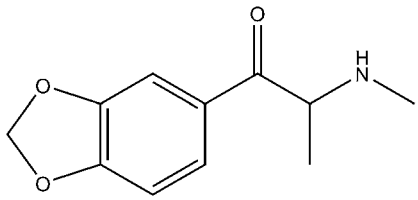
Council on Pharmacy and Chemistry of the American Medical Association NEW and nonofficial remedies: methylhexamine; forthane. *J Am Med Assoc* 143: 1156.

M

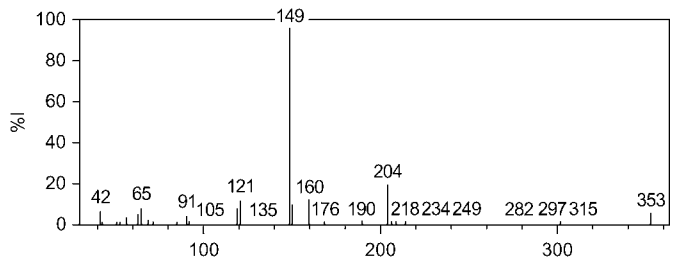
Methylone

Cathinone Derivative, Phenethylamine, Stimulant
$C_{11}H_{13}NO_3$ = 207.2
CAS—186028-79-5 (racemic); 191916-41-3 (*S*-form)

IUPAC Name 2-Methylamino-1-(3,4-methylenedioxyphenyl)propan-1-one
Synonyms bk-MDMA; explosion; M1; MDMCAT; 3,4-methylenedioxymethcathinone.
Note The name Methylone is also a trademarked brand name for an injectable form of methylprednisolone.



Chemical Properties Cathinone analogue of MDMA (3,4-methylenedioxymethamphetamine). Mp 226° to 228° from diethyl ether [Dal Cason *et al.* 1997]; also reported as 225° with decomposition [Kikura-Hanajiri *et al.* 2007].
High-Performance Liquid Chromatography Column: C_{18} (100 × 4.0 mm i.d., 3 µm). Mobile phase: acetonitrile : 0.01 mmol/L acetic acid buffer (pH 4.25). DAD. Retention times: methylone 5.4 min, 5-methoxy-*N*-methyl,*N*-isopropyl tryptamine 10.0 min. Limit of quantification not reported [Shimizu *et al.* 2007].
Mass Spectrum Principal ions at *m/z* 149, 204, 121, 160 (pentafluoropropionyl derivative).



Quantification
Urine **GC-MS** Column: DB-5MS fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 3.0 mL/min. Temperature programme: 80° for 2 min to 320° at 15°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of quantification not reported [Kamata *et al.* 2006].

LC-MS Column: L-column C_{18} (150 × 1.5 mm i.d.). Mobile phase: methanol : 10 mmol/L ammonium formate buffer (pH 3.5, 5 : 95 to 40 : 60 over 30 min). ESI, positive ion mode, SIM acquisition mode. Limit of detection, methylone 2.5 µg/L, 3,4-methylenedioxycathinone (MDC) 25 µg/L, 4-hydroxy-3-methoxymethcathinone (HMMC) 10 µg/L, 3-hydroxy-4methoxymethcathinone (3-OH-4-MeO-MC) 5 µg/L [Kamata *et al.* 2006].
Other **GC-MS** Rat Hair and Plasma Samples. Column: DB35-MS fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 280° at 10°/min for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 13.2 min (pentafluoropropionyl derivative). Limit of quantification, 5 ng/mg in hair and 10 µg/L in plasma [Kikura-Hanajiri *et al.* 2007].
Disposition in the Body In humans and rats, the major metabolic pathways include *N*-demethylation to methylenedioxycathinone, and demethylation followed by *O*-methylation of the 3- or 4-OH group to HMMC or 3-OH-4-MeO-MC. Following administration of 5 mg/kg of methylone to rats, ~26% of the dose was excreted as HMMC within 48 h with <3% excreted unchanged.
Toxicity

A 27-year-old Japanese man was taken seriously ill 30 min after the ingestion of 200 mg of drug powder purchased from the Internet, thought to be pure methylone. Analysis of the remaining powder revealed a composition of 60% methylone and 38% 5-MeO-MIPT (5-methoxy-*N*-methyl,*N*-isopropyl tryptamine). Body fluids were not submitted for analysis. He was discharged the following day without any known sequelae [Shimizu *et al.* 2007].

A 19-year-old Japanese man was taken to the emergency department with strong dementia following the ingestion of methylone (dosage unclear). Urine levels of total methylone, HMMC and 3-OH-4-MeO-MC were reported as 48, 170, and 74 µg/L, respectively. 3,4-Methylenedioxycathinone (MDC) was also detected but not quantified [Kamata *et al.* 2006].

Note Studies on animals have found a methylone hair: plasma ratio of 0.55 [Kikura-Hanajiri *et al.* 2007].
Dose Reported as 150 to 200 mg orally, and 50 to 150 mg IV.

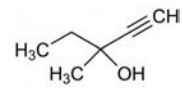
Methylpentynol

Hypnotic, Sedative
$C_6H_{10}O$ = 98.14
CAS—77-75-8

IUPAC Name 3-Methyl-1-pentyn-3-ol
Synonyms Meparfynol; methylparafynol.
Proprietary Names *Allotopral*; *Oblivon*.

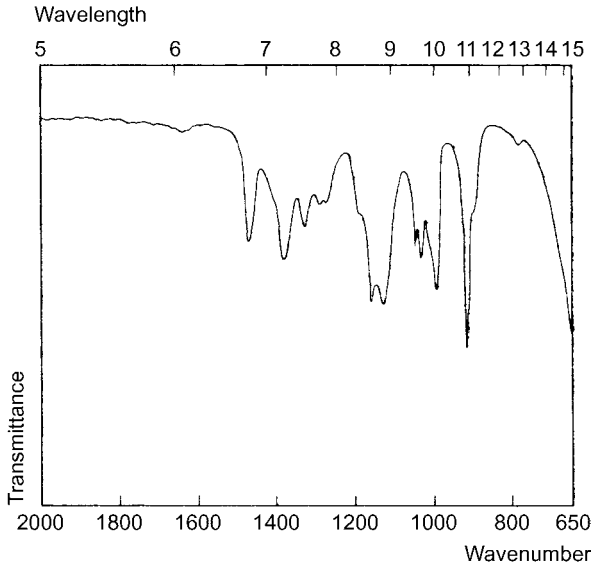


Chemical Properties A colourless or pale yellow liquid. Mass per mL 0.865 to 0.873 g. Bp about 120°. Refractive index, at 20°, 1.430 to 1.432. Soluble 1 in 10 of water; soluble in ether; miscible with organic solvents. Log *P* (octanol/water), 0.9.

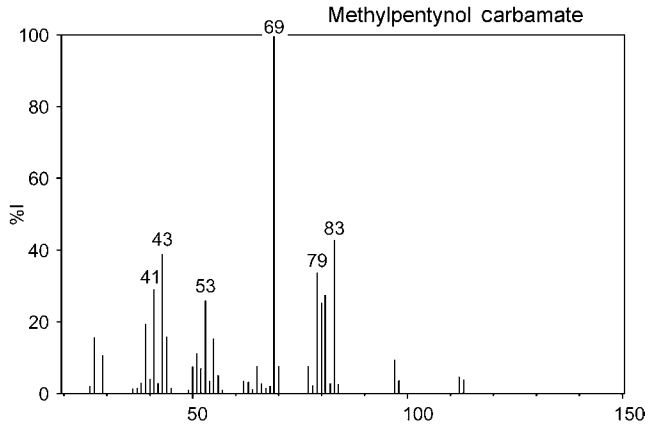
Methylpentynol Carbamate

$C_7H_{11}NO_2$ = 141.2
CAS—302-66-9
Synonym Mepentamate
Proprietary Names *Oblivon C*; *N-Oblivon*.
Chemical Properties A white powder. Mp 53° to 56°. Soluble 1 in <200 of water, 1 in 1 of ethanol and 1 in 2 of chloroform.

Thin-layer Chromatography Methylpentynol carbamate: system TD—R_f 0.49; system TE—R_f 0.74; system TF—R_f 0.62; system TAD—R_f 0.57 (furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 715; system GI—retention time 20.1 min.
Infrared Spectrum Principal peaks at wavenumbers 917, 1126, 1156, 995, 1030, 1050 cm^{-1} (thin film).



Mass Spectrum Principal ions at *m/z* 69, 83, 43, 79, 41, 81, 53, 80 (methylpentynol carbamate).



Quantification
Serum **GC** FID. Methylpentynol [Grove, Martin 1977].
Urine **GC** 4-Hydroxymethylpentynol, see Serum [Grove, Martin 1977].
Disposition in the Body Absorbed after oral administration. It is almost completely metabolised with <1% being excreted in the urine as unchanged drug in 7 days; higher amounts of unchanged drug may be excreted after large doses. The major metabolite is the *N*-glucuronide which accounts for about 80% of the dose; the 4-hydroxy metabolite accounts for about 13% of a dose.
Toxicity A fatality has been reported after a dose of 5 g although recoveries have occurred after ingestion of up to 10 g. Repeated medication may cause toxic reactions in the liver and skin.

A liver concentration of 1100 µg/g and a urine concentration of 410 mg/L were reported in one fatal poisoning case [Jackson JV. 1967].

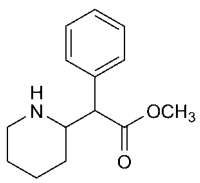
Dose 0.5 to 1 g daily.

Grove J, Martin BK (1977). Gas-liquid chromatography of methylpentynol carbamate and its metabolite 3-methylpentyne-3,4-diol. *J Chromatogr* 133: 267–272.
Jackson JV. (1967). Personal communication on file.

Methylphenidate

CNS Stimulant, Treatment of ADHD
$C_{14}H_{19}NO_2$=33.3
CAS—113-45-1

IUPAC Name Methyl 2-phenyl-2-piperidin-2-ylacetate
Synonyms Methylphenidan; methyl phenidate; methyl phenidylacetate; α-phenyl-2-piperidineacetic acid methyl ester.

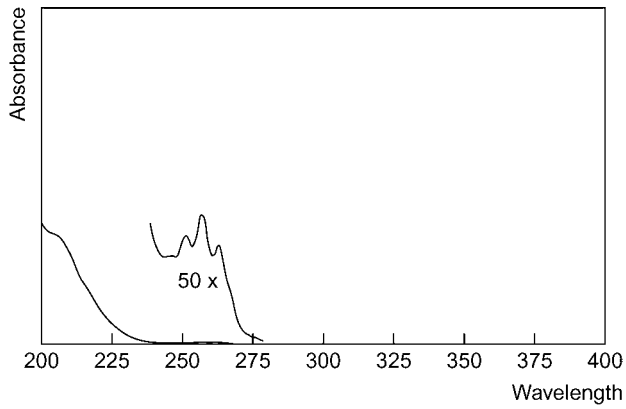


Chemical Properties Crystals. Mp 74° to 75°. Practically insoluble in water and petroleum ether; soluble in ethanol, ethyl acetate, and ether. pK_a 0.8 [Schubert 1970], 8.8. Log *P* (octanol/water), 0.2. Extraction yield (chlorobutane), 0.75 [Demme *et al.* 2005]. Stable in plasma through 3 freeze-thaw cycles [Modi *et al.* 2000]. Methylphenidate undergoes hydrolysis in pooled plasma and buffer solution. Methylphenidate is stable in processed samples at 4° for 10 days [Lin *et al.* 1999].

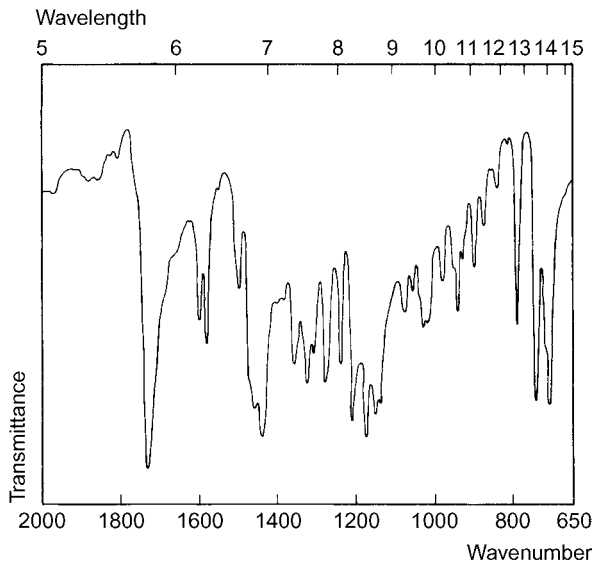
Methylphenidate Hydrochloride

$C_{14}H_{19}NO_2$,HCl = 269.8
CAS—298-59-9
Synonym Ciba 4311b
Proprietary Names *Attenta*; *Centedrin*; *Concerta*; *Equasym*; *Focalin*; *Metadate*; *Methidate*; *Methylin*; *Riphenidate*; *Ritalin(a)*; *Ritaline*; *Rubifen*.
Chemical Properties Fine, white, crystalline powder or acicular crystals. Mp 224° to 226°. Soluble in water, alcohol and chloroform.

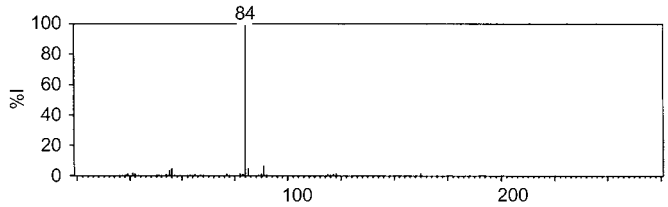
Colour Test Liebermann's reagent—orange.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.35; system TC—R_f 0.41; system TE—R_f 0.66; system TL—R_f 0.23; system TAE—R_f 0.40; system TAF—R_f 0.70; system TAJ—R_f 0.11; system TAK—R_f 0.04; system TAL—R_f 0.70 (acidified iodoplatinate solution—positive; acidified potassium permanganate—positive; Dragendorff spray—positive; ninhydrin spray—positive).
Gas Chromatography System GA—methylphenidate RI 1725, methylphenidate-AC RI 2085, methylphenidate-trifluroacetic acid RI 1730; system GB—methylphenidate RI 1793; system GC—methylphenidate RI 2200; system GF—methylphenidate RI 1935.
High Performance Liquid Chromatography System HA—*k* 1.7; system HC—*k* 0.36; system HY—RI 277; system HAX—retention time 8.6 min; system HAY—retention time 4.7 min.
Ultraviolet Spectrum Aqueous acid—251, 257 (A^1_1 = 9.0a), 264 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1735, 1175, 1210, 1150, 705, 740 cm^{-1} (methylphenidate hydrochloride, KCl disk).



Mass Spectrum Principal ions at *m/z* 84, 91, 85, 56, 55, 150, 41, 118 (no peaks above 150).



Quantification

Blood **GC** Column: 2% Hi Eff 3A on Gas Chrom Q 100/120 mesh (150 × 3 mm i.d.). Carrier gas: N_2, 75 mL/min. Temperature programme: 140°. FID. Limit of detection, 1 mg/L [Schubert 1970].

LC-MS Zorbax SB-Phenyl (75 × 4.6 mm i.d., 3.5 µm). ESI. Limit of quantification, 1.0 µg/L [Markowitz *et al.* 1999].

Plasma **GC** Column: OV-225 (30 m × 0.33 mm i.d.). Carrier gas: Ar:CH_4, 1 mL/min. Temperature programme: 175° for 1 min to 260° at 7°/min for 5 min. ECD. Limit of detection, 0.28 µg/L [Srinivas *et al.* 1990]. Column: 1.5% OV-7/1.5% OV-210 on 60/80 mesh Chromosorb AW-DMCS (1.83 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 220° for 1 min to 250° at 2°/min for 5 min. NPD or FID. Limit of detection, 0.43 µg/L [Lim *et al.* 1986]. Column: 3% SP-2250-DB on 100/120 Supelcoport (1.83 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 170°. NPD. Limit of detection, 1 µg/L [Potts *et al.* 1984]. Column: 3% OV-1 on 80/100 mesh Gas Chrom Q (2m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 190°. CI, SIM acquisition mode. Retention time: 2.5 min. Limit of detection, 0.05 µg/L [Iden, Hungund 1979]. Column: 3% OV-1 on Gas Chrom Q 100/120 mesh (1.83 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 180°. NPFID. Retention time: 3.72 min. Limit of detection, 1 µg/L [Hungund *et al.* 1978].

GC-MS Column: DB5 capillary. Carrier gas: CH_4, 0.5 Torr. Temperature programme: 100° for 0.2 min to 275° at 18°/min for 6 min. NCI. Limit of quantification, 0.75 µg/L [Lin *et al.* 1999]; limit of quantification, ~0.15 µg/L [Leis *et al.* 2000]. Column: 1.5% OV-7/1.5% OV-210 on Chromosorb W AW DMCS 80/100 mesh (1 m × 2.6 mm i.d.). Carrier gas: He, 37 mL/min. Temperature programme: 240°. CI, SIM acquisition mode. Limit of detection, 0.04 µg/L [Aoyama *et al.* 1990]. Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 50 cm/s. Temperature programme: 215°. EI ionisation at 30 eV. Retention time: 1.85 min. Limit of detection, 1 µg/L [Patrick, Jarvi 1990]. Column: 2% OV-17 on Chromosorb W AWDMCS 80/100 mesh (1 m× 2 mm i.d.). Carrier gas: He, 35 mL/min. Temperature programme: 220°. CI. Retention time: 1.5 min. Limit of detection, 0.5 ng [Nakajima *et al.* 1986]. Column: 3% SP-2100 on 80/100 mesh Supelcoport (2 m × 2 mm i.d.). Carrier gas: He, 15 mL/min. Temperature programme: 185°. EI ionisation at 70 eV. Limit of detection, 0.5 µg/L [Patrick *et al.* 1985]. Column: 3% OV-1 on Gas Chrom-Q 100/120 (6′ × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature programme: 165°. EI ionisation at 70 eV. Limit of detection, 1.5 µg/L [Milberg *et al.* 1975].

HPLC Column: Phenomenex Luna C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (73 : 27), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 460 nm). Retention time: 10.6 min. Limit of quantification, 1 µg/L [Zhu *et al.* 2007]. Column: chiral AGP (150 × 4.0 mm i.d.). Mobile phase: 0.4% acetic acid containing 0.1% DMOA (pH 3.4), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Limit of quantification, 25 mg/L [Zhang *et al.* 2003].

LC-MS Column: Thermo Electron Hipersil Gold (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (80 : 20 for 3 min to 50 : 50 within 9 min to 80 : 20 within 6 min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 1.0 µg/L, limit of detection, 0.31 µg/LL [Marchei *et al.* 2009]. Column: Chirobiotic V (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05% trifluoroammonium acetate, flow rate 1.0 mL/min. Limit of quantification, 0.075 µg/L [Tuerck *et al.* 2007]. Column: Inertsil C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. SSI, positive ion mode, full scan mode. Retention time: 6.5 min. Limit of quantification, 0.2 mg/L, limit of detection, 0.12 mg/L [Shinozuka *et al.* 2006].

Serum **HPLC** Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: 20 mmol/L potassium phosphate buffer (pH 3.5) : acetonitrile (80 : 20), flow rate 1.6 mL/min. UV detection (λ = 192 nm). Limit of detection, 20 µg/L [Soldin *et al.* 1979a]. Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: 20 mmol/L potassium phosphate buffer (pH 3.8) : acetonitrile (93 : 7), flow rate 2.0 mL/min. UV detection (λ = 192 nm). Limit of detection, 25 µg/L for ritalinic acid [Soldin *et al.* 1979b].

GC-MS Column: 3% OV 22 on Chromosorb W 80/100 mesh (2.0 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 210°. SIM acquisition mode. Retention time: 3.4 min. Limit of detection, 1.0 µg/L [Chan *et al.* 1980].

Urine **GC** Column: CP-Sil 8 CB and CP-Sil 5 CB (25 m × 0.32 mm i.d.). Carrier gas: N_2, 1.3 mL/min. Temperature programme: 120° to 155° at 1.5° for 1 min to 280° at 30°/min for 10 min. NPD. Limit of detection, 50 µg/L for ritalin [Vu-Duc, Vernay 1992]. See Plasma. Limit of detection, 2.16 µg/L [Lim *et al.* 1986]. Column: 3% OV-17 Gas Chrom Q 100/120 (6′ × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 195°. FID. Retention time: 1.5 min. Limit of detection, ≥1.0 mg/L for ritalinic acic [Allen, Sedgwick 1984]. Column: 2.5% OV-225 Chromosorb W-HP 80/100 mesh (2 m × 2.0 mm i.d.). Carrier gas: N_2, 30 mL/min. NPD. Limit of detection not reported [Van Boven, Daenens 1979]. Column: 3% OV-17 on Gas-Chrom W 80/100 mesh (1.22 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 140° for 2 min to 270° at 16°/min for 4 min. AFID. Limit of detection, 30 µg/L [Dugal *et al.* 1978]. Column: glass (1.8 m × 2.0 mm [6′ × 0.08"] i.d.). Carrier gas: N_2, 25–30 mL/min. Temperature programme: 170°. FID. Limit of detection, 1.25 mg/L [Wells *et al.* 1974]. See Blood [Schubert 1970].

GC-MS Column: 5% phenylmethylpolysiloxane DB-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 50 cm/s. Temperature programme: 250°. EI ionisation at 70 eV. Limit of quantification, 10 µg/L [LeVasseur *et al.* 2008]. Column: J & W DB-17 MS (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° for 1 min to 200° at 10°/min to 280° at 25°/min for 5 min. EI ionisation, positive ion mode, SIR acquisition mode. Limit of detection, <0.5 nmol/L [Eichhorst *et al.* 2004]. Column: Ultra2 HP crosslinked 5% diphenylpolysiloxane 95% dimethylpolysiloxane (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° to 290° at 20°/min for 4 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [Solans *et al.* 1994]. See Plasma. Limit of detection, 1 µg/L [Aoyama *et al.* 1990]. See Plasma. Limit of detection, 2 µg/L [Milberg *et al.* 1975].

LC-MS See Plasma. Limit of quantification, 0.5 µg/L, limit of detection, 0.14 µg/L [Marchei *et al.* 2009].

Oral Fluid **LC-MS** See Plasma. Limit of quantification, 0.5 µg/L, limit of detection, 0.15 µg/L [Marchei *et al.* 2009].

Hair **LC-MS** Column: Thermo Electron-Hypersil Gold (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (80 : 20 for 3 min to 50 : 50 in 9 min to 80 : 20 in 6 min. ESI, SIM acquisition mode. Limit of quantification, 0.15 nm/mg, limit of detection, 0.05 ng/mg [Marchei *et al.* 2008].

Liver **LC-MS** See Blood [Markowitz *et al.* 1999].

Sweat **LC-MS** See Plasma. Limit of quantification, 1.0 µg/L, limit of detection, 0.3 µg/L [Marchei *et al.* 2009].

Disposition in the Body

Readily absorbed after oral administration. The rate but not the amount absorbed is increased by the presence of food in the stomach. Approximately 80% of a dose is excreted in the urine in 24 h, of which 60–80% is ritalinic acid [Faraj *et al.* 1974] and 5–12% is 6-oxo-α-phenylpiperidine-2-acetic acid; only a small amount is excreted as unchanged drug. There has been no evidence of methylphenidate as a substrate for CYP2D6 [DeVane *et al.* 2000].

Therapeutic Concentration

Following a single oral dose of 20 mg to 2 subjects, peak plasma concentrations of 0.013 and 0.058 mg/L were attained in 3 h; ritalinic acid concentrations averaged 0.22 mg/L at the same time [Milberg *et al.* 1975].

A healthy volunteer was administered 0.25 mg/kg methylphenidate. The maximal plasma concentrations of methylphenidate and ritalinic acid were 6.4 and 350 µg/L, respectively, reached within 1 h of administration. The concentration of methylphenidate decreased rapidly while ritalinic acid decreased slowly and was 21 µg/L at 24 h [Nakajima *et al.* 1986].

When a healthy adult volunteer was administered a single oral dose of 40 mg racemic methylphenidate hydrochloride, the following pharmacokinetic parameters were measured:

Compound	*Enantiomer*	t_{max} *(h)*	C_{max} *(µg/L)*
Methylphenidate	*d*	2.0	11.71
	l	2.0	1.97
Ritalinic acid	*d*	3.0	80.71
	l	3.0	178.6

[Srinivas *et al.* 1990].

Following oral doses of 10 to 30 mg daily, administered to four hyperkinetic children, peak plasma concentrations of 0.008 to 0.023 mg/L (mean 0.018) were reported [Hungund *et al.* 1979].

Thirty-five healthy subjects (22 male, 13 female) were given methylphenidate hydrochloride in single oral doses of 18, 36, or 54 mg, in the form of one, two, or three 18 mg OROS (oral, osmotic, controlled-release) systems. Mean peak plasma concentrations of (+)-methylphenidate and (−)-methylphenidate, respectively, were 3.87 and 0.095 µg/L (at 7.9 and 7.1 h) after the 18 mg dose, 7.28 and 0.17 µg/L (at 7.5 and 7.0 h) after the 36 mg dose, and 10.6 and 0.36 µg/L (at 7.2 and 6.1 h) after the 54 mg dose. Corresponding mean peak plasma concentrations of (+)-ritalinic acid and (+)-ritalinic acid were 53 and 69 µg/L (at 8.8 and 8.1 h) after the 18 mg dose, 105 and 132 µg/L (at 8.8 and 7.6 h) after the 36 mg dose, and 155 and 192 µg/L (at 8.5 and 7.8 h) after the 54 mg dose [Modi *et al.* 2000].

Nineteen subjects (10 male, 9 female) were administered either Ritalin LA 20 mg or Concerta 18 mg. The mean maximum plasma concentration for each formulation was 9.9 and 5.9 µg/L, reached at 5.5 and 6 h respectively [Markowitz *et al.* 2003].

Following the administration of 5, 10, 20, 30, and 40 mg (+)-methylphenidate to 25 healthy volunteers, the maximum plasma concentrations were 3.25, 6.05, 12.6, 18.5, and 25.2 µg/L, respectively [Tuerck *et al.* 2007].

Following a single oral dose of 0.3 mg/kg racemic methylphenidate to a healthy female volunteer, the plasma concentrations ranged from 2.04 to 15.72 µg/L over 10 h, with the maximum occurring at ~2 h [Zhu *et al.* 2007].

M

A poor metaboliser of methylphenidate excreted nearly 70 times more (+)-methylphenidate and 5 time more (+)-methylphenidate compared with the mean values for normal metabolisers [LeVasseur *et al.* 2008].

Note For a study comparing the pharmacokinetics of different formulations in children, see Quinn *et al.* [2007] and for the pharmacokinetics of the oral osmotic-controlled extended-release formulation, see Parasrampuria *et al.* [2007] or Reiz *et al.* [2008]. Food caused a significant increase in extent of absorption but had no effect on the rate of absorption of methylphenidate [Midha *et al.* 2001]. For a bioequivalence study of 2 methylphenidate preparations, see Meyer *et al.* [2000]

Toxicity The estimated minimum lethal dose for adults is 2 g but few instances of serious toxicity from overdosage have been reported. Abuse and dependence of the amfetamine type is not uncommon.

In 2 suicide victims who had overdosed on methylphenidate (co-ingested with ethanol), the following concentrations were reported at postmortem (mg/L or μg/g):

	Methylphenidate	*Ritalinic acid*	*Ethylphenidate*
CASE 1			
Peripheral blood	0.310	2.8	0.008
CASE 2			
Peripheral blood	1.6	2.0	0.001
Liver	0.310	1.2	0.0016

[Markowitz *et al.* 1999].

A 19-year-old white male snorted methylphenidate. At postmortem, however, methylphenidate was not detectable in the blood sample, although the concentration of ritalinic acid was 0.24 mg/L in the postmortem sample and 0.4 mg/L in the admission blood sample [Massello, Carpenter 1999].

The following postmortem tissue concentrations were reported in an accidental overdose fatality involving the intravenous injection of crushed methylphenidate tablets: blood 2.8 mg/L, bile 5.7 mg/L, kidney 3.0 μg/g, liver 2.1 μg/g, stomach contents 1.6 mg (total); other drugs were not detected [Levine *et al.* 1986].

Urine methylphenidate concentrations of 0.8–40 mg/L (mean 16) were reported in 6 arrested drivers who showed signs of drowsiness or hyperactivity [Schubert 1970].

Note For a case of fatal pulmonary hypertension from the IV injection of methylphenidate tablets, see Lewman [1972]; for a case of hepatotoxicity, see Goodman [1972]; for a case of methylphenidate interacting with risperidone, see Hollis and Thompson [2007]; for a case of orofacial and extremity dyskinesia in a 6.5-year-old child, see Balázs *et al.* [2007]. For a review of 113 methylphenidate exposures, see Foley *et al.* [2000], and in preschool children, see Bailey *et al.* [2005]. For a case of a 45-year-old abusing 700 mg methylphenidate over a 3-day period, see Coetzee *et al.* [2002].

Bioavailability Approximately 30% (11–51%) because it undergoes extensive first-pass metabolism.

Half-life Plasma half-life, ~2 h, ritalinic acid ~8 h.

Volume of Distribution Approximately 2.6 L/kg.

Clearance Plasma, ~6.5 mg/min/kg.

Protein Binding Approximately 15%.

Note For a review of the pharmacokinetics and clinical effectiveness of methylphenidate, see Kimko *et al.* [1999] and for a review of its toxicity and abuse, see Klein-Schwartz [2002] or Scharman *et al.* [2007].

Dose Usually up to 60 mg of methylphenidate hydrochloride daily.

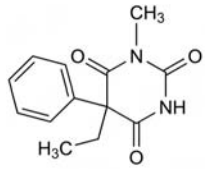
Methylphenobarbital

Sedative, Barbiturate

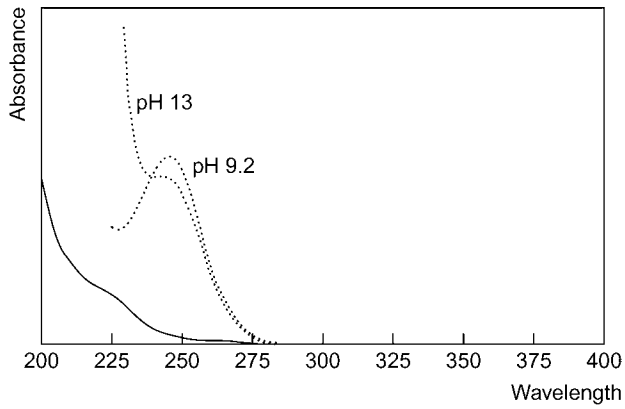
$C_{13}H_{14}N_2O_3$ = 246.3

CAS—115-38-8

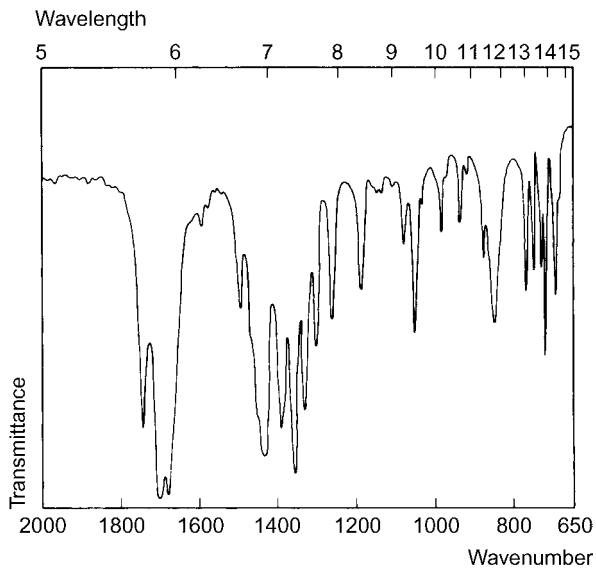
IUPAC Name 5-Ethyl-1-methyl-5-phenyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione
Synonyms Enphenemalum; mephobarbital; methylphenobarbitone; phemitone.
Proprietary Names *Mebaral*; *Prominal*.



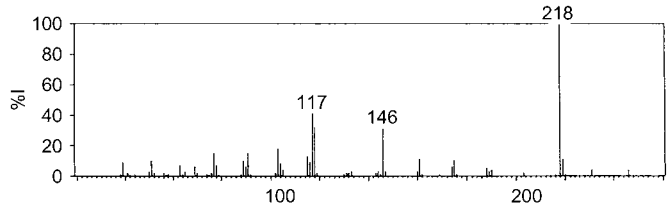
Chemical Properties Colourless crystals or white crystalline powder. Mp 176°. Slightly soluble in cold water, freely soluble in hot water; soluble 1 in 240 of ethanol, 1 in 40 of chloroform and 1 in 200 of ether; soluble in solutions of ammonia, alkali hydroxides and carbonates. pK_a 7.8 (20°). Log *P* (octanol/water), 1.8.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.70; system TE—R_f 0.41; system TF—R_f 0.67; system TH—R_f 0.72; system TAD—R_f 0.70; system TAE—R_f 0.86 (mercurous nitrate spray, black; Zwikker's reagent, faint pink).
Gas Chromatography System GA—methylphenobarbital RI 1890, phenobarbital RI 1953, methylphenobarbital-Me RI 1855, M (OH-) RI 2370, M (OH-methoxy-) RI 2310, M (nor-OH-) RI 2295; system GB—methylphenobarbital RI 2222; system GAJ—methylphenobarbital RRT 1.000.
High Performance Liquid Chromatography System HG—*k* 7.27; system HH—*k* 3.84; system HX—RI 435; system HY—RI 395; system HZ—retention time 4.6 min.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—244 nm (A_1^1=355c); 1 mol/L sodium hydroxide (pH 13)—243 nm (A_1^1=329b).



Infrared Spectrum Principal peaks at wavenumbers 1707, 1684, 1754, 720, 1298, 1050 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 218, 117, 118, 146, 103, 77, 91, 115; phenobarbital 204, 117, 146, 161, 77, 103, 115, 118.



Quantification
Plasma **GC** FID. Methylphenobarbital and phenobarbital [Hooper *et al.* 1975].
GC-MS Methylphenobarbital and phenobarbital. Limit of detection, 20 µg/L for both compounds [Hooper *et al.* 1981].
Serum **GC** See Plasma [Hooper *et al.* 1975].
HPLC Methylphenobarbital, phenobarbital and other anticonvulsants. UV detection. Limit of detection, 500 µg/L [Kabra *et al.* 1978].
Urine **HPLC** UV detection. Phenobarbital, *p*-hydroxyphenobarbital and *p*-hydroxymethylphenobarbital. Limit of detection, 500 µg/L for each compound [Kunze *et al.* 1981].
See Amobarbital.
Disposition in the Body Incompletely absorbed after oral administration. Metabolised by *N*-demethylation to the active metabolite, phenobarbital, and by *p*-hydroxylation. Over a period of 10 days, <2% of a dose is excreted in the urine as unchanged drug, about 30 to 35% is excreted as *p*-hydroxymethylphenobarbital both free and conjugated, and up to 10% may be excreted as phenobarbital. Small amounts of *p*-hydroxyphenobarbital, 5-ethyl-5-(4-hydroxy-3-methoxyphenyl)barbituric acid and 5-ethyl-5-(4-hydroxy-3-methoxyphenyl)-1-methylbarbituric acid have also been detected in the urine.
Therapeutic Concentration
Following a single oral dose of 800 mg to 2 subjects, peak plasma concentrations of about 3 mg/L were attained in 3 to 6 h; peak phenobarbital plasma concentrations of 2 to 3 mg/L were attained in 4 to 6 days [Hooper *et al.* 1981].
Following daily oral doses of 60 to 600 mg to 11 subjects, steady-state plasma concentrations of 0.2 to 1.7 mg/L (mean 0.9) of methylphenobarbital and 4 to 32 mg/L (mean 15) of phenobarbital were reported [Kupferberg, Longacre-Shaw 1979].
Toxicity The estimated minimum lethal dose is 2 g.
Bioavailability About 70%.
Half-life Plasma half-life, methylphenobarbital about 50 to 60 h, phenobarbital about 100 h.
Volume of Distribution About 2 to 3 L/kg.
Clearance Plasma clearance, about 0.5 mL/min/kg.
Protein Binding About 40 to 60%.
Dose 90 to 600 mg daily.

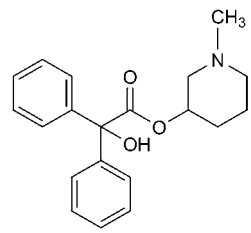
Methylpiperidyl Benzilate

Hallucinogen
$C_{20}H_{23}NO_3$ = 25.4
CAS—3321-80-0
Synonym 1-Methyl-3-piperidyl benzilate



Chemical Properties A clear liquid. Practically insoluble in water; soluble in chloroform and most organic solvents.

Methylpiperidyl Benzilate Hydrochloride

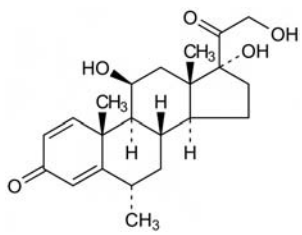
Chemical Properties A white powder. Mp 212° to 218°, with decomposition. Soluble in water; practically insoluble in chloroform.

Colour Tests Liebermann's reagent—brown; Mandelin's test—orange→brown→green; Marquis test—orange→green→blue; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.30; system TC—R_f 0.58; system TE—R_f 0.73; system TL R_f 0.33; system TAE—R_f 0.58; system TAF—R_f 0.50 (acidified iodoplatinate solution—positive).
High Performance Liquid Chromatography System HX—RI 377.
Ultraviolet Spectrum Aqueous acid—251 (a_1^1 = 18b), 257 nm (A_1^1 = 20b).
Infrared Spectrum Principal peaks at wavenumbers 1734, 1195, 965, 685, 1160, 720 cm^{-1} (methylpiperidyl benzilate hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 97, 105, 77, 183, 84, 36, 42, 51.

Methylprednisolone

Corticosteroid
$C_{22}H_{30}O_5$ = 374.5
CAS—83-43-2

IUPAC Name (6*S*,8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-Dihydroxy-17-(2-hydroxyacetyl)-6,10,13-trimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[*a*]phenanthren-3-one
Synonyms 6α-Methylprednisolone; (6α,11β)-11,17,21-trihydroxy-6-methylpregna-1,4-diene-3,20-dione.
Proprietary Names *Esametone*; *Firmacort*; *Medrol*; *Medrone*; *Metilpren*; *Metisona*; *Metypred*; *Metysolon*; *Radilem*; *Urbason*.



Chemical Properties A white crystalline powder. Mp about 228° to 237°. A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 100 of dehydrated alcohol; slightly soluble in acetone and chloroform; very slightly soluble in ether; sparingly soluble in dioxan and methanol. Log *P* (octanol/water), 1.8.

Methylprednisolone Acetate

$C_{24}H_{32}O_6$ = 416.5
CAS—53-36-1
Synonym 6α-Methylprednisolone 21-acetate
Proprietary Names *Adlone*; *Depoject*; *depMedalone*; *Depo Moderin*; *Depomedrate*; *Depo-Medrol*; *Depo-Medrone*; *Depo-Nisolone*; *Depopred*; *D-Med*; *Duralone*; *Medralone*; *Medrate*; *Medrone*; *Metypred*; *M-Prednisol*; *Solsolona*.
Chemical Properties A white crystalline powder. Mp 205° to 208°. Practically insoluble in water; sparingly soluble in ethanol and acetone; soluble 1 in 250 of chloroform and 1 in 1500 of ether; soluble in dioxan.

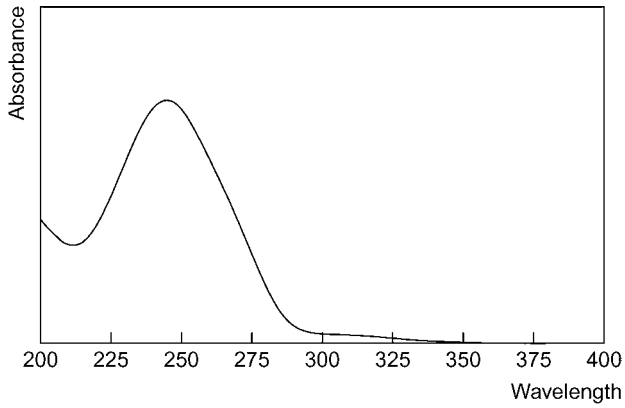
Methylprednisolone Hemisuccinate

$C_{26}H_{34}O_8$ = 474.5
CAS—2921-57-5
Synonym Methylprednisolone hydrogen succinate
Proprietary Name *Asmacortone*
Chemical Properties A white hygroscopic solid. Very slightly soluble in water; freely soluble in ethanol; soluble in acetone.

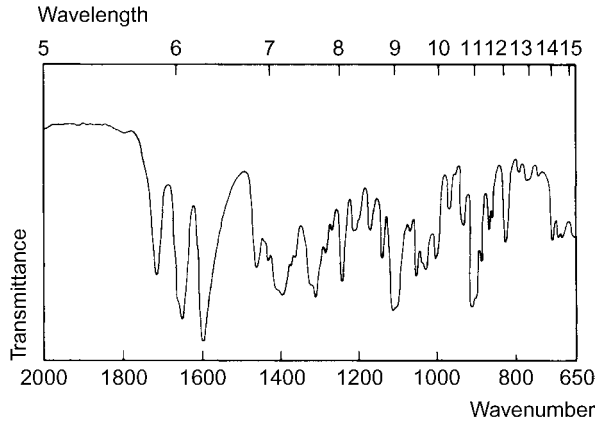
Methylprednisolone Sodium Succinate

$C_{26}H_{33}NaO_8$ = 496.5
CAS—2375-03-3
Synonym Sodium 6α-Methylprednisolone 21-Succinate
Proprietary Names *A-methapred*; *Emmetipi*; *Firmacort*; *Metypred*; *Metypresol*; *Solu-Medrol*; *Solu-Medrone*; *Solu-Moderin*; *Urbason*.
Chemical Properties A white, hygroscopic, amorphous powder. Soluble 1 in 1.5 of water and 1 in 12 of ethanol; practically insoluble in chloroform and ether; very slightly soluble in acetone.

Thin-layer Chromatography System TA—R_f 0.87; system TB—R_f 0.00; system TE—R_f 0.41; system TF—R_f 0.27; system TP—R_f 0.23; system TQ—R_f 0.80; system TR—R_f 0.03; system TS—R_f 0.00; system TAE—R_f 0.87; system TAJ—R_f 0.31; system TAK—R_f 0.13; system TAL—R_f 0.78; system TAM—R_f 0.56.
High Performance Liquid Chromatography System HT—*k* 7.5; system HX—RI 426; system HY—RI 390; system HAA—retention time 18.9 min.
Ultraviolet Spectrum Dehydrated alcohol—240 nm (A_1^1=400a).



Infrared Spectrum Principal peaks at wavenumbers 1595, 1650, 1114, 914, 1313, 1248 cm^{-1} (KBr disk).



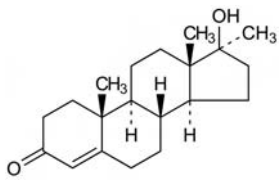
Quantification
Plasma **HPLC** UV detection. Limit of detection, about 7 µg/L [Shah *et al.* 1987].
Urine **GC-MS** Methylprednisolone and its metabolites [Rodchenkov *et al.* 1987].
HPLC UV detection. Limit of detection, about 8 µg/L [Shah, Weber 1989].
Dose Usually 4 to 48 mg daily.

Rodchenkov GM *et al.* (1987). Determination of methylprednisolone metabolites in human urine by gas chromatography-mass spectrometry. *J Chromatogr* 423: 15–22.
Shah JA, Weber DJ (1989). Simultaneous determination of methylprednisolone and methylprednisolone 21-[8-[methyl-(2-sulfoethyl)amino]-8-oxooctanoate] sodium salt in human urine by high-performance liquid chromatography with ultraviolet detection. *J Chromatogr* 496: 245–254.
Shah JA *et al.* (1987). High-performance liquid chromatographic determination of methylprednisolone and methylprednisolone 21-[8-[methyl-(2-sulfoethyl)amino]-8-oxoctanoate] sodium salt in human plasma. *J Chromatogr* 414: 1–10.

Methyltestosterone

Androgen
$C_{20}H_{30}O_2$ = 302.5
CAS—58-18-4

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-10,13,17-trimethyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[*a*]phenanthren-3-one
Synonym (17β)-17-Hydroxy-17-methylandrost-4-en-3-one
Proprietary Names *Android*; *Metandren*; *Neohombreol M*; *Oreton Methyl*; *Testotonic B*; *Testovis*; *Testred*; *Virilon*. It is an ingredient of *Prowess*, *Estratest*and *Menogen*.



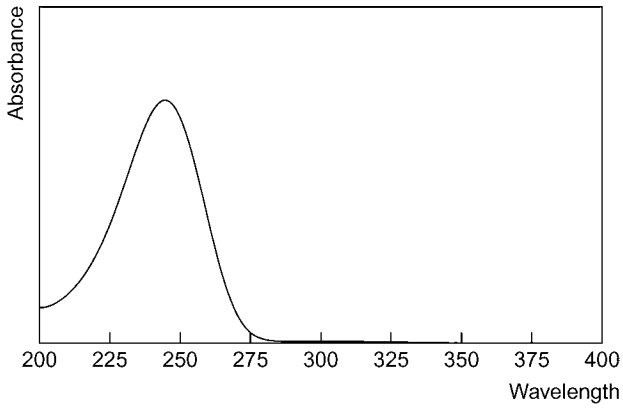
Chemical Properties A white or slightly yellowish-white, slightly hygroscopic, crystalline powder. Mp 162° to 168°. A solution in ethanol is dextrorotatory. Practically insoluble in water; soluble 1 in 5 of ethanol; freely soluble in chloroform; soluble in ether. Log *P* (octanol/water), 3.4.
Thin-layer Chromatography System TA—R_f 0.89; system TB—R_f 0.17; system TE—R_f 0.73; system TF—R_f 0.47; system TP—R_f 0.70; system TQ—R_f 0.16; system TR—R_f 0.91; system TS—R_f 0.71; system TAE—R_f 0.86; system TAF—R_f

0.86; system TAJ—R_f 0.60; system TAK—R_f 0.65; system TAL—R_f 0.92; system TAM—R_f 0.92.

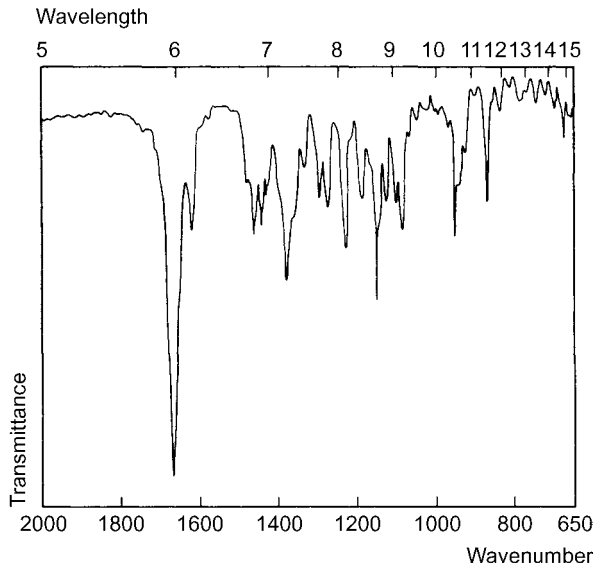
Gas Chromatography System GA—methyltestosterone RI 2645, methyltestosterone-AC RI 2770, methyltestosterone-TMS RI 2590, methyltestosterone enol-TMS_2 RI 2665; system GAG—RRT 1.05(relative to testosterone); system GAI—urinary metabolite: 17α-methyl-5β, (α)-androstan-3α,17β-diolRRT 0.925 (relative to 17α-methyl-5α-androstan-3β,17β-diol); system GAR—methyltestosterone retention time 13.1 min.

High Performance Liquid Chromatography System HY—RI 587; system HATb—RRT 1.27 (relative to testosterone); system HAR—RRT 1.17 (relative to testosterone).

Ultraviolet Spectrum Ethanol—241 nm (A_1^1=540a).



Infrared Spectrum Principal peaks at wavenumbers 1660, 1160, 1239, 950, 1612, 1090 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 302, 124, 43, 91, 79, 121, 105, 122.

Quantification

Plasma **Spectrofluorimetry** Limit of detection, 1 µg/L [Alkalay *et al.* 1972].

Serum **Spectrofluorimetry** See Plasma [Alkalay *et al.* 1972].

Dose 5 to 80 mg daily, orally; up to 200 mg daily has been given.

Alkalay D *et al.* (1972). Spectrophotofluorometric determination of methyltestosterone in plasma or serum. *J Pharm Sci* 61: 1746–1749.

Methylthioamfetamine

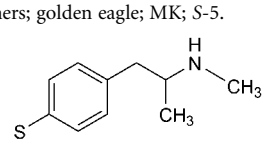
5-HT Receptor Releasing Agent

$C_{10}H_{15}NS$=181.3

CAS—14116-06-4

Synonyms *p*-Methylthioamphetamine; *p*-methylthioisopropylamine; MTA; 4-MTA.

Street Names Flatliners; golden eagle; MK; *S*-5.



Chemical Properties A white to off-white powder. Extraction yield (chlorobutane), 0.6 [Demme *et al.* 2005].

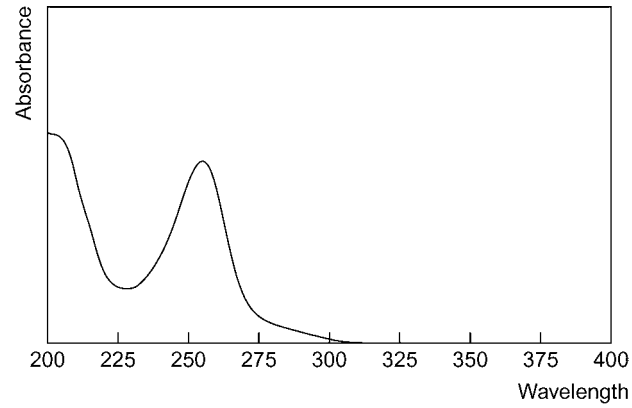
Colour Tests Marquis test—no colour change; cobalt thiocyanate (Scott's test)—blue.

Gas Chromatography Column: DB5 (25 m × 0.32 mm i.d., 0.52 µm). Temperature: 140°. NPD. Retention time: 4.26 min [Elliott 2000].

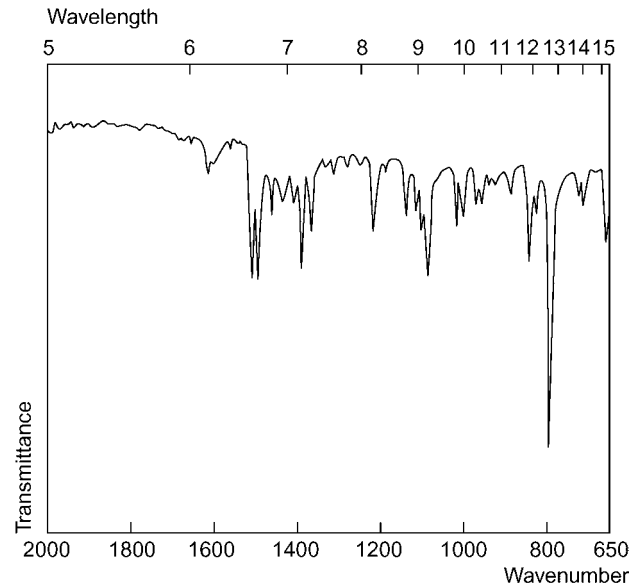
Gas Chromatography-Mass Spectrometry Column: HP Ultra-1 (12 m × 0.22 mm i.d., 0.25 µm). Temperature programme: 100° to 280° at 10°/min. MSD. Retention time: 5.11 min [Poortman, Lock 1999].

Column: DB-1 (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 150° for 1 min, to 250° at 8°/min, to 320° at 6°/min. Retention time: 4.96 min [Poortman, Lock 1999].

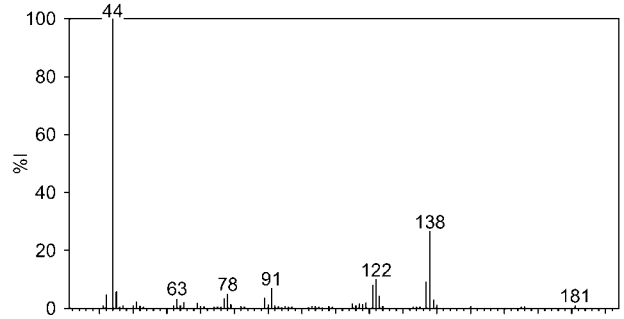
Ultraviolet Spectrum Aqueous acid (acetonitrile)—205, 255 nm; (0.025 mol/L sulfuric acid)—255 nm.



Infrared Spectrum Principal peaks at wavenumbers 793, 1080, 1492, 1508, 1385, 843 cm^{-1} (hydrochloride).



Mass Spectrum Principal ions at *m/z* 44, 138, 122, 137, 121, 91, 78, 45.



Quantification

Blood **HPLC** Column: Spherisorb S5OD/CN (150 × 4.6 mm i.d., 0.25 µm). Mobile phase: acetonitrile : 1.0 mol/L triethylammonium phosphate buffer

(pH 3.0; 20 : 80), flow rate 2 mL/min. I.S.: fenfluramine. DAD (λ = 205 and 595 nm). Retention time: MTA, 2.57 min; I.S., 5.37 min. Limit of detection, 0.5 mg/L [Elliott 2000].

Urine **HPLC** See Blood [Elliott 2000].

Disposition in the Body

Toxicity 4-MTA is thought to be responsible for at least 8 deaths worldwide (mainly in Europe) on its own or in association with other drugs. Toxic symptoms may include 'serotonin syndrome', convulsions, and respiratory depression. Such symptoms may be produced at plasma concentrations over 1 mg/L. A blood concentration over 4 mg/L could indicate an overdose or at least excessive usage.

The postmortem of a male (22 years old and in previously good health) that implicated 3,4-methylenedioxymethamfetamine (MDMA) poisoning actually revealed the presence of 4-MTA in femoral blood, perimortem blood, and urine at concentrations of 4.6 mg/L, 4.2 mg/L, and 87.2 mg/L, respectively. This was the first reported death involving 4-MTA in the United Kingdom and the first case involving 4-MTA alone [Elliott 2000].

A 27-year-old male died suddenly after a collapse and an intensive resuscitation attempt. Postmortem toxicological analysis revealed the following 4-MTA concentrations: femoral vein blood 5.23 mg/L, urine 95.5 mg/L, vitreous humour 1.31 mg/L, bile 36.4 mg/L, liver 30.8 mg/kg, spleen 4.10 mg/kg, and frontal lobe 31.7 mg/kg. MDMA was also found, but at much lower concentrations, and the cause of death was attributed to poisoning with 4-MTA [Decaestecker *et al.* 2001].

Note For a case report on the analytical profile of 4-MTA, see Poortman and Lock [1999].

Methylthiouracil

Antithyroid Agent

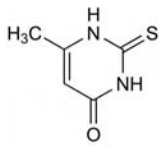
$C_5H_6N_2OS$ = 142.2

CAS—56-04-2

IUPAC Name 6-Methyl-2-sulfanylidene-1*H*-pyrimidin-4-one

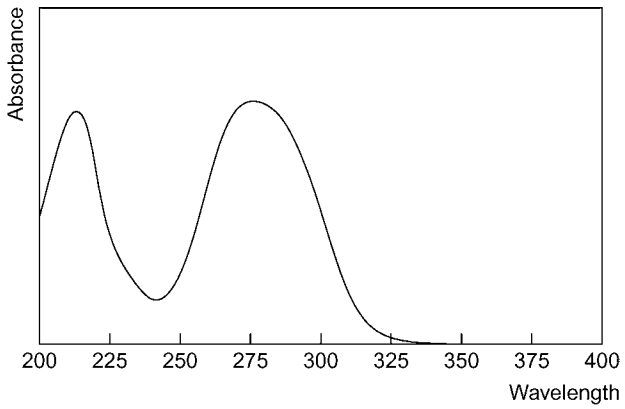
Synonym 2,3-Dihydro-6-methyl-2-thioxo-4(1*H*)-pyrimidinone

Proprietary Names *Alkiron*; *Antibason*; *Basecil*; *Basethyrin*; *Methiacil*; *Methicil*; *Methiocil*; *Muracil*; *Prostrumyl*; *Strumacil*; *Thimecil*; *Thyreostat*.



Chemical Properties A white crystalline powder. Mp 326° to 331°, with decomposition. Soluble 1 in 2000 of water, 1 in 150 of boiling water and 1 in 800 of ethanol; slightly soluble in acetone; very slightly soluble in ether; practically insoluble in benzene and chloroform; freely soluble in solutions of ammonium hydroxide and sodium hydroxide. pK_a 8.2 (20°). Log *P* (octanol/water), 1.4.

Ultraviolet Spectrum Aqueous acid—276 nm (A^1_1=1190b); aqueous alkali—256 nm (A^1_1=850b).



Infrared Spectrum Principal peaks at wavenumbers 1645, 1170, 1564, 1198, 850, 1240 cm^{-1}.

Dose Initially, 200 to 400 mg daily; maintenance, 50 to 150 mg daily.

5-Methyltryptamine

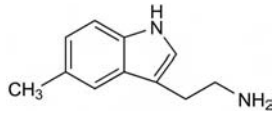
Hallucinogen

$C_{11}H_{14}N_2$ = 174.2

CAS—1821-47-2

IUPAC Name 2-(5-Methyl-1*H*-indol-3-yl)ethanamine

Synonyms 3-(2-Aminoethyl)-5-methylindole; 5-methyl-3-(aminoethyl)indole.



5-Methyltryptamine Hydrochloride

$C_{11}H_{14}N_2$,HCl = 210.7

CAS—1010-95-3

IUPAC Name 2-(5-Methyl-1*H*-indol-3-yl)ethanamine hydrochloride

Chemical Properties Light brown powder. Mp 289° to 292°.

Colour Tests Mandelin's test—green-orange; Marquis test—orange to brown; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.56 (acidified iodoplatinate solution—positive).

Gas Chromatography System GA—RI 1795.

Infrared Spectrum Principal peaks at wavenumbers 800, 1515, 1612, 1587, 1234, 1315 cm^{-1} (5-methyltryptamine hydrochloride, KBr disk).

α-Methyltryptamine

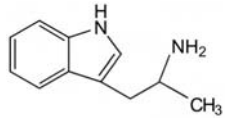
Hallucinogen

$C_{11}H_{14}N_2$ = 174.2

CAS—299-26-3

IUPAC Name 1-(1*H*-Indol-3-yl)propan-2-amine

Synonym 3-(2-Aminopropyl)indole



Chemical Properties White crystalline powder. Mp 98° to 99°. Soluble in chloroform and dilute acetic acid.

Colour Tests Mandelin's test—green→orange; Marquis test—orange→brown; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.58 (Acidified iodoplatinate solution, positive).

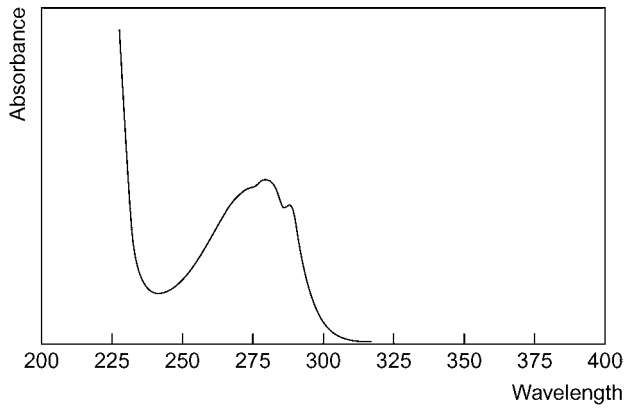
Gas Chromatography System GA—RI 1740.

Gas Chromatography-Mass Spectrometry Column: HP-5MS cross-linked 5% phenylpolysiloxane 95% dimethylpolysiloxane (30 m × 0.25 μm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 250° at 15°/min for 5 min. EI ionisation at 70 eV. Retention time: 11 min. Limit of detection, 12–15 mg/L [Wang *et al.* 2008].

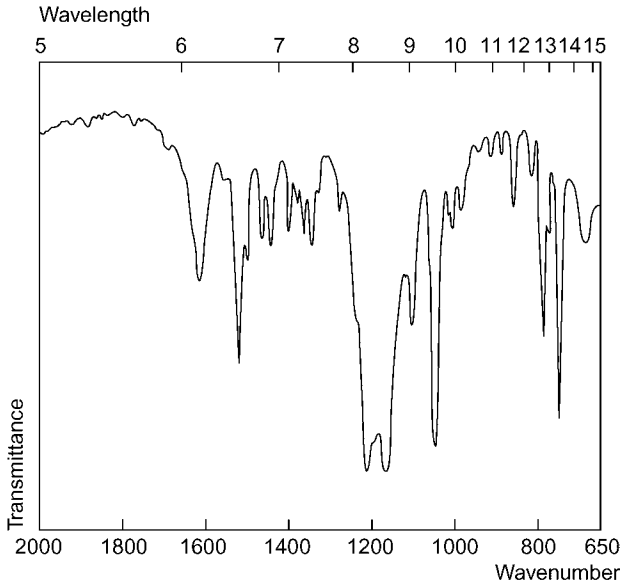
High Performance Liquid Chromatography Column: Cosmosil $5C_{18}$-MS (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1% formic acid (pH 2.5) : acetonitrile (90 : 10 to 62 : 38 at 20 min to 55 : 45 at 22 min to 40 : 60 at 32 min), flow rate 1.0 mL/miin. UV detection (λ= 280 nm). Retention time: ~19 min. Limit of detection, 0.4–0.5 mg/L [Wang *et al.* 2008].

Capillary Electrophoresis Capillary: total/effective length 67/80 cm, 50 μm). Running buffer: 75 mmol/L SDS and 50 mmol/L sodium dihydrogen phosphate in acetonitrile : methanol: water (5 : 30 : 65, pH 2.2). Sweeping-MEKC. Limit of detection, 5-8 μg/L [Wang *et al.* 2008].

Ultraviolet Spectrum Aqueous acid—279, 288 nm.



Infrared Spectrum Principal peaks at wavenumbers 1215, 1170, 1050, 750, 1520, 790 cm^{-1} (α-methyltryptamine esilate, KBr disk).



Quantification

Blood **GC** Column: DB-1 100% dimethylpolysiloxane or DB-17 50% phenylmethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 50° for 1 min to 190° at 20°/min for 1 min to 300° at 5°/min for 30 min. NPD. Limit of detection not reported [Boland *et al.* 2005].

GC-MS Column: capillary (16.5 m × 0.25 mm i.d., 0.3 µm). Temperature programme: 65° for 0.5 min to 290° at 15°/min. MSD, SIM acquisition mode. Limit of detection not reported [Boland *et al.* 2005]. Column: HP-1ms 100% dimethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 2 min to 300° at 20°/min for 5 min. SIM acquisition mode. Retention time: 12.5 min. Limit of detection, 1 µg/L [Ishida *et al.* 2005]. Column: ZB-1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 10°/min to 300° at 60°/min. SIM acquisition mode. Limit of detection, 25 µg/L [Vorce, Sklerov 2004].

Serum **GC** See Blood [Boland *et al.* 2005].

GC-MS See Blood [Boland *et al.* 2005].

Urine **GC-MS** See Blood. Limit of detection, 5 µg/L [Ishida *et al.* 2005].

LC-MS Column: Phenomenex (100 × 2.1 mm i.d., 3 µm). Mobile phase: 20 mmol/L ammonium formate (pH 4.3) : acetonitrile (75 : 25 for 1 min to 60 : 40 in 3 min for 7 min), flow rate 300 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 5 µg/L [Vorce, Sklerov 2004].

Stomach Contents **GC** See Blood [Boland *et al.* 2005].

GC-MS See Blood [Boland *et al.* 2005].

Brain **GC** See Blood [Boland *et al.* 2005].

GC-MS See Blood [Boland *et al.* 2005].

Liver **GC** See Blood [Boland *et al.* 2005].

GC-MS See Blood [Boland *et al.* 2005].

Other **GC-MS** Rat Urine. Column: J&W DB-5 ms (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 280° at 15°/min. EI ionisation at 70 eV. Limit of detection not reported [Kanamori *et al.* 2008].

Disposition in the Body

Toxicity

The following concentrations of α-methyltryptamine were measured at postmortem in 2 cases:

Specimen	*Case 1*	*Case 2*
Iliac vein blood	2.0 mg/L	
Gastric contents	9.6 mg total	
Liver	24.7 mg/kg	
Brain	7.8 mg/kg	
Serum	ND	1.5 mg/L

ND, not determined. [Boland *et al.* 2005]

N-Methyltryptamine

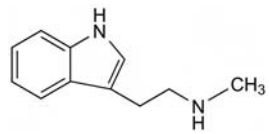
Hallucinogen

$C_{11}H_{14}N_2 = 174.2$

CAS—61-49-4

IUPAC Name 2-(1*H*-Indol-3-yl)-*N*-methylethanamine

Synonym 3-(2-Methylaminoethyl)indole

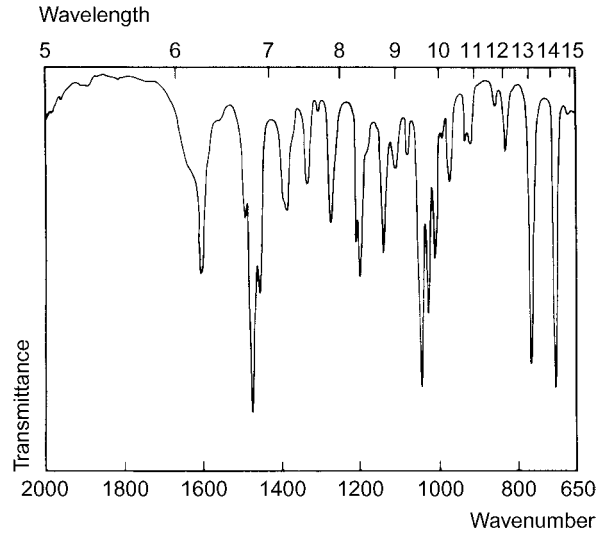


Colour Tests Marquis test—orange; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.18 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1770.

Infrared Spectrum Principal peaks at wavenumbers 700, 1040, 762, 1025, 1605, 1200 cm^{-1} (KBr disk).



Quantification

Urine **GC-MS** Column: SE-30 (36 m × 0.33 mm i.d.). Carrier gas: He, 2 mL/min. Temperature: 180°. CI, SIM acquisition mode. Limit of detection, 0.1 µg/L [Walker *et al.* 1984].

LC-MS Column: Brownlee O Spheri-5 RP-18 (100 × 1.0 mm i.d., 5 µm). Mobile phase: methanol : water (50 : 50) with 0.2% formic acid, flow rate 40 µL/min. ESI, MRM acquisition mode. Limit of detection, 0.05 µg/L [Forsström *et al.* 2001].

Forsström T *et al.* (2001). Determination of potentially hallucinogenic *N*-dimethylated indoleamines in human urine by HPLC/ESI-MS-MS. *Scand J Clin Lab Invest* 61: 547–556.

Walker RW *et al.* (1984). Capillary column gas–liquid chromatography selected ion monitoring assay for [^{13}C, ^{15}N]*N*-methyltryptamine in human urine: failure to detect conversion of [$^{13}C^{15}N$] tryptamine in schizophrenia patients. *J Chromatogr* 289: 223–229.

Methyprylon

Hypnotic

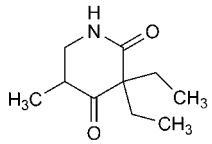
$C_{10}H_{17}NO_2 = 83.2$

CAS—125-64-4

IUPAC Name 3,3-Diethyl-5-methylpiperidine-2,4-dione

Synonym Methyprylone

Proprietary Names *3,3-Diethyl-5-methyl-2,4-piperidinedione*; *Dimerin*; *Noctan*; *Noludar*.



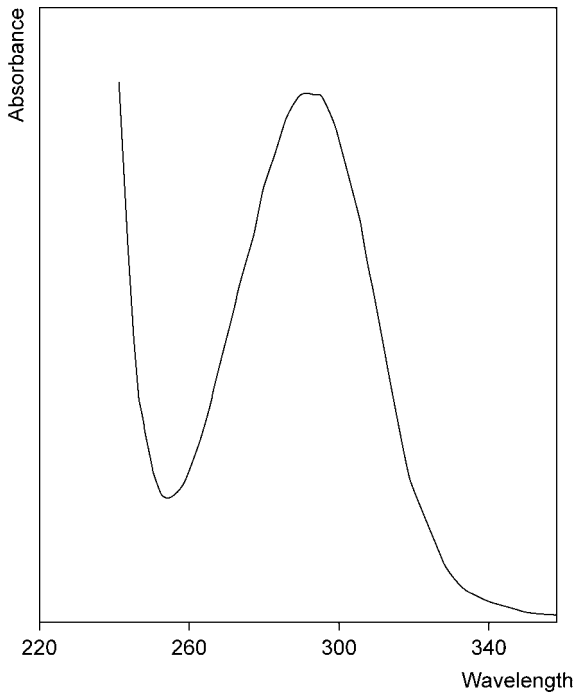
Chemical Properties A white crystalline powder. Mp 74° to 77°. Soluble 1 in 14 of water, 1 in 0.7 of ethanol, 1 in 0.6 of chloroform, and 1 in 3.5 of ether. pK_a 12.0. Log *P* (octanol/water), 0.8.

Thin-layer Chromatography System TA—R_f 0.58; system TD—R_f 0.31; system TE—R_f 0.63; system TF—R_f 0.25; system TAD—R_f 0.55; system TAE—R_f 0.78 (acidified potassium permanganate solution, positive).

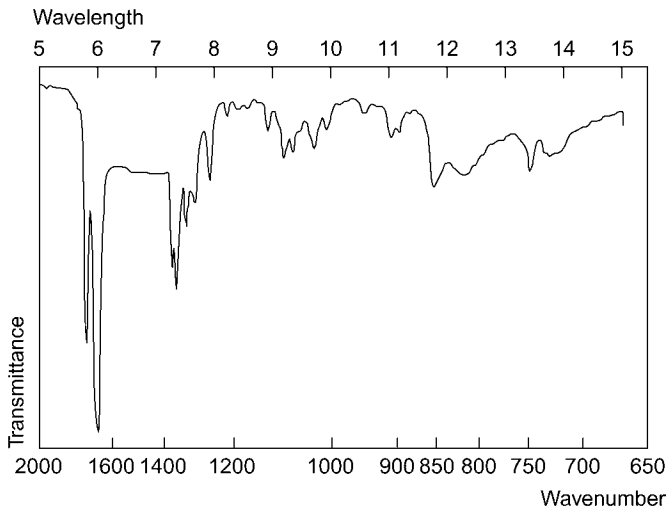
Gas Chromatography System GA—methyprylon RI 1527, M (OH-)-H_2O RI 1540, M (oxo-) RI 1870; methyprylon enol-AC RI 1610; system GB—methyprylon RI 1581, M (OH-)-H_2O RI 1601, M (oxo-) RI 1870; system GF—RI 2090.

High Performance Liquid Chromatography System HX—RI 347; system HY—RI 302.

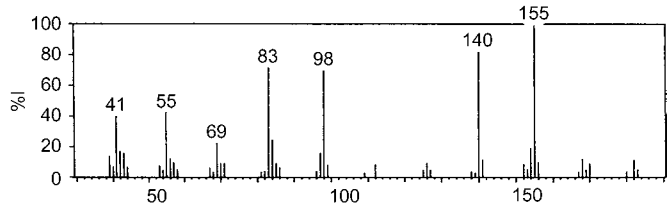
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1660, 1693, 1085, 1310, 750, 869 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 155, 140, 83, 98, 55, 41, 84, 69.



Quantification

Blood **GC** Column: 3% OV-17 on Gas Chrom Q 80/100 mesh. Carrier gas: N_2, 10 mL/min. FID. Limit of detection, 1 µg/mL [Bridges, Peat 1979]. Column: Superox 4 (50 m × 0.5 mm i.d.). Carrier gas: H_2, 5 mL/min. Temperature: 200°. FID. Limit of detection not reported [Van Boven, Sunshine 1979]. Column: 3% CHDMS (150 cm × 3 mm i.d.) on 60/80 mesh AW-DMCS Chromosorb W. Carrier gas: N_2, 25 mL/min. Temperature: 205° or Column: 2% OV-17 (1.5 m × 3 mm i.d.) on 60/80 mesh AW-DMCS Gas Chrom Q. Carrier gas: N_2, 25 mL/min. Temperature: 175°. FID. Retention time: 0.27 and 0.64 for each column, respectively. Limit of detection not reported [Dickson 1974].

Plasma **GC** See Blood [Bridges, Peat 1979].

HPLC Column: C_{18} (250 × 4.5 mm i.d., 5 µm). Mobile phase: water : acetonitrile : methanol (30 : 18 : 2), flow rate 1.2 mL/min. UV detection (λ = 306 nm for 8.5 min, 204 nm thereafter). Retention time: 10.0 min. Limit of detection, 0.1 mg/L [Contos *et al.* 1991]. Column: µPorasil (300 × 3.9 mm i.d., 10 µm). Mobile phase: hexane : tetrahydrofuran : methanol (72 : 6 : 2), flow rate 2.0 mL/min. UV detection (λ = 214 nm). Retention time: ~10 min. Limit of detection, 0.1 mg/L [Pankaskie, Brooks 1983].

Serum **GC** Column: 3% cyclohexane–dimethylpolyester of pyruvic acid on Chrom WHP 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 22 mL/min. Temperature programme: 180° to 235° at 10°/min. Retention time: 0.77. Limit of detection, 0.2 mg/L [Anweiler *et al.* 1976]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (900 × 2 mm i.d.). Carrier gas: N_2, 45 mL/min. Temperature programme: 140° to 240° at 20°/min. Limit of detection not reported [Shipe, Savory 1975].

HPLC Column: µBondapak C_{18} (300 × 4.0 mm i.d.). Mobile phase: acetonitrile : phosphate buffer (21.5 : 78.5), flow rate 3.0 mL/min. UV detection (λ = 195 nm). Retention time: 4.0 min. Limit of detection, 1 mg/L [Kabra *et al.* 1981].

Urine **GC** See Blood [Van Boven, Sunshine 1979]. See Blood [Bridges, Peat 1979; See Blood Dickson 1974]; see Serum [Shipe, Savory 1975].

Tissues **GC** See Blood [Van Boven, Sunshine 1979].

Disposition in the Body Absorbed after oral administration. The principal metabolites are 2,4-dioxo-3,3-diethyl-5-methyltetrahydropyridine (methylpersedon), which is active; 6-oxomethyprylon; 5-hydroxymethyprylon; and 5-carboxymethyprylon. Approximately 60% of a dose is excreted in the urine in 24 h, as free and conjugated metabolites together with 3% of the dose as unchanged drug.

Therapeutic Concentration In plasma, usually in the range 10–20 mg/L.

Following a single oral dose of 300 mg to 10 subjects, peak plasma concentrations of 3.51–8.38 mg/L (mean 5.62) were obtained in 1.03–2.17 h (mean 1.59) [Gwilt *et al.* 1985].

Following a single oral dose of 650 mg to 6 subjects, peak plasma concentrations averaging 10.2 mg/L were attained in 2 h [Randall *et al.* 1956].

Toxicity Prolonged use of methyprylon may lead to dependence of the barbiturate–alcohol type. Numerous cases of overdose have been reported but there have been few fatalities; death has occurred after the ingestion of 6 g but at least 2 recoveries following doses of 30 g have been reported. Plasma concentrations of 12 to 75 to 128 mg/L have been associated with toxic effects and concentrations >50 mg/L may be lethal.

In one fatality attributed to methyprylon overdose, the following postmortem tissue concentrations (mg/L or µg/g) were reported:

	Blood	*Brain*	*Kidney*	*Liver*	*Spleen*	*Urine*
Methyprylon	158	176	87	90	121	61
Methylpersedon	36	73	21	40	29	123
5-Hydroxymethyprylon	–	–	–	–	–	16
5-Carboxymethyprylon	2	–	10	7	16	80
6-Oxomethyprylon	16	18	9	8	3	68

[Van Boven, Sunshine 1979].

A 33-year-old woman was admitted to hospital following the ingestion of an unknown quantity of methyprylon. Her blood concentration of methyprylon was 142 mg/L 25 min after admission. The decline in concentration appeared to follow non-linear kinetics at concentrations >30 mg/L and first-order kinetics at concentrations below, with an apparent terminal half-life of 4.4 h. She made a full recovery [Contos *et al.* 1991].

In 4 cases of fatal overdose, the following tissue disposition was reported: blood 53–66 mg/L (mean 59), kidney 10–108 µg/g (mean 62), liver 62–260 µg/g (mean 118), urine 17–166 mg/L (mean 86) [Baselt 2008].

Half-life Plasma half-life following a single oral dose is ~4 h, increasing to ~50 h in acute intoxication.
Dose 200 to 400 mg, as a hypnotic.

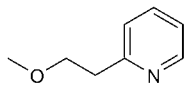
Methyridine

Anthelmintic (Veterinary)
$C_8H_{11}NO$ = 137.2
CAS—114-91-0

IUPAC Name 2-(2-Methoxyethyl)pyridine
Synonym Metyridine
Proprietary Names *Mintic*; *Promintic*.

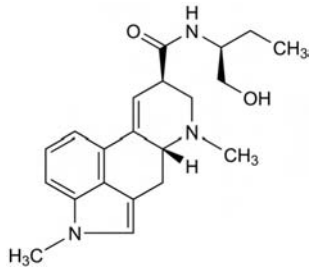


Chemical Properties A colourless or pale yellow to pale brown liquid which should be stored in airtight containers protected from light. Miscible with water and ethanol. Methyridine is extracted by organic solvents from aqueous alkaline solutions.
Thin-layer Chromatography System T1—R_f 0.65 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G5—retention time 1.09 (2.18 relative to barbital).
Ultraviolet Spectrum Cyclohexane—256 ($A_1^1$780) and 262 nm (A_1^1 770).
Disposition in the Body Methyridine is rapidly absorbed into the bloodstream and distributed throughout the tissues. It may be absorbed through the skin.
Toxicity Twice the therapeutic dose may cause death from respiratory depression, except in birds where the margin of safety is much greater. Because methyridine is absorbed from the skin, any spillage should be washed off at once with cold water.
Dose Usually 200 mg/kg. Maximum dose: cattle, 54 g; sheep and goats, 9 g.

Methysergide

Antimigraine
$C_{21}H_{27}N_3O_2$ = 353.5
CAS—361-37-5

IUPAC Name (8β)-9,10-Didehydro-*N*-[(1*S*)-1-(hydroxymethyl)propyl]-1,6-dimethylergoline-8-carboxamide



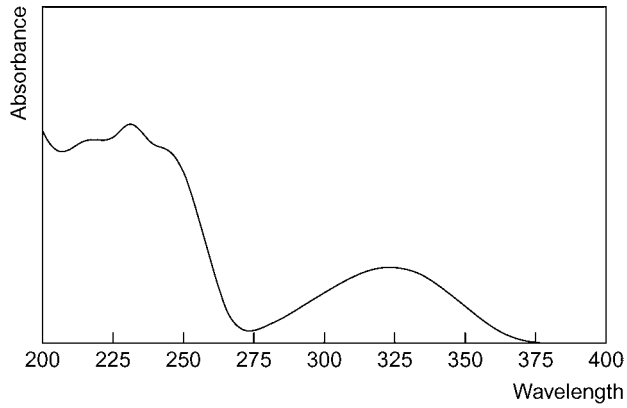
Chemical Properties Crystals. Mp 194° to 196°. pK_a 6.6 (24°). Log *P* (octanol/water), 1.6.

Methysergide Maleate

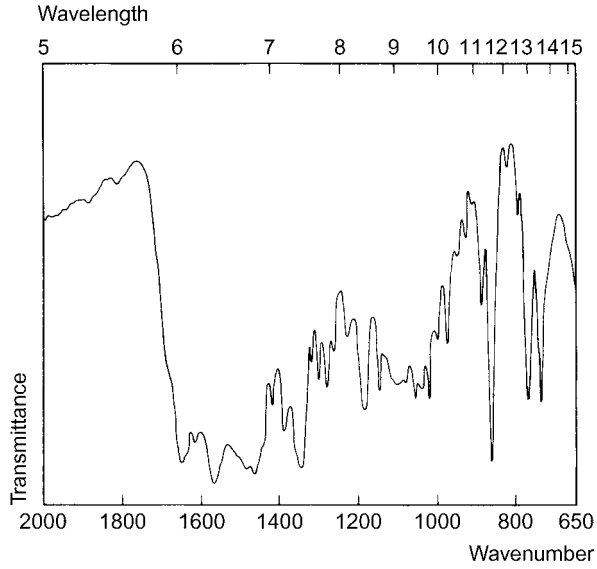
$C_{21}H_{27}N_3O_2,C_4H_4O_4$ = 469.5
CAS—129-49-7

Synonym 1-Methyl-D-lysergic acid butanolamide maleate
Proprietary Names *Deseril(a)*; *Désernil*; *Sansert*.
Chemical Properties A white to yellowish-white or reddish-white, crystalline powder. Soluble 1 in 500 of water, 1 in 165 of ethanol and 1 in 125 of methanol; practically insoluble in chloroform and ether.

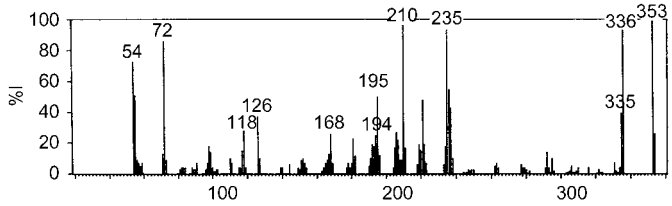
Colour Tests *p*-Dimethylaminobenzaldehyde—violet; Mandelin's test—brown; Marquis test—grey.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.01; system TC—R_f 0.21; system TE—R_f 0.45; system TL—R_f 0.15; system TM—R_f 0.33; system TAJ—R_f 0.23; system TAK—R_f 0.04; system TAL—R_f 0.66 (van Urk reagent, blue).
Gas Chromatography System GA—RI 3089.
High Performance Liquid Chromatography System HA—*k* 0.4; system HP—*k* 2.33; system HZ—retention time 2.4 min.
Ultraviolet Spectrum Aqueous acid—230, 322 nm (A_1^1=223a); aqueous alkali—243, 320 nm.



Infrared Spectrum Principal peaks at wavenumbers 1566, 1650, 863, 1615, 1190, 740 cm^{-1} (methysergide maleate, KBr disk).



Mass Spectrum Principal ions at *m/z* 353, 210, 235, 336, 72, 54, 236, 195.

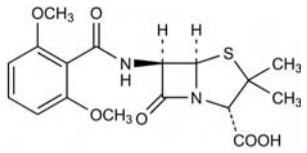


Dose The equivalent of 2 to 6 mg of methysergide daily.

Meticillin

Antibiotic
$C_{17}H_{20}N_2O_6S$ = 380.4
CAS—61-32-5

IUPAC Name (2*S*,5*R*,6*R*)-6-[(2,6-Dimethoxybenzoyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid
Synonyms Dimethoxyphenecillin; dimethoxyphenyl penicillin.

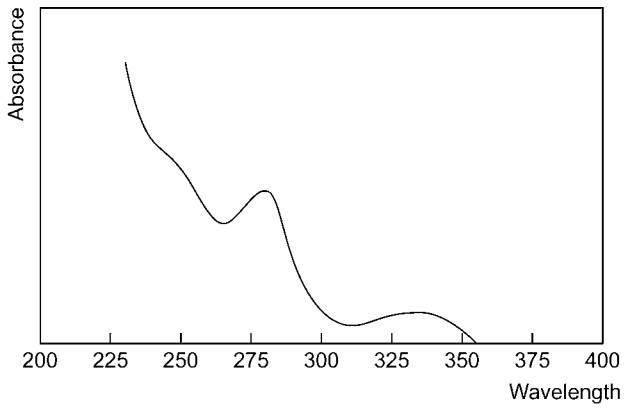


Chemical Properties pK_a 2.8 (25°). Log *P* (octanol/water), 1.2.

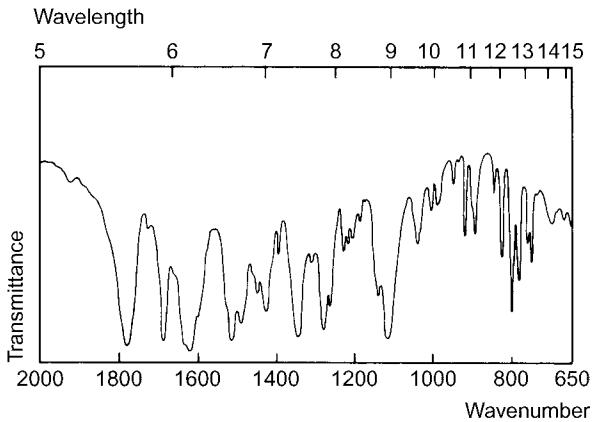
Meticillin Sodium

$C_{17}H_{19}N_2NaO_6S,H_2O$ = 420.4
CAS—132-92-3 (anhydrous); 7246-14-2 (monohydrate)
Synonym Meticillinum natricum
Proprietary Names *Azapen*; *Belfacillin*; *Celbenin*; *Celpillina*; *Cinopenil*; *Flabelline*; *Pénistaph*; *Staficyn*; *Staphcillin*.
Chemical Properties A fine white crystalline powder. Mp 196° to 197°, with decomposition. Soluble 1 in 0.6 of water and 1 in 35 of ethanol; slightly soluble in chloroform; practically insoluble in ether; freely soluble in methanol.

Ultraviolet Spectrum Water—280 nm (A_1^1=61a).



Infrared Spectrum Principal peaks at wavenumbers 1607, 1766, 1673, 1500, 1093, 1260 cm^{-1} (meticillin sodium, KBr disk).

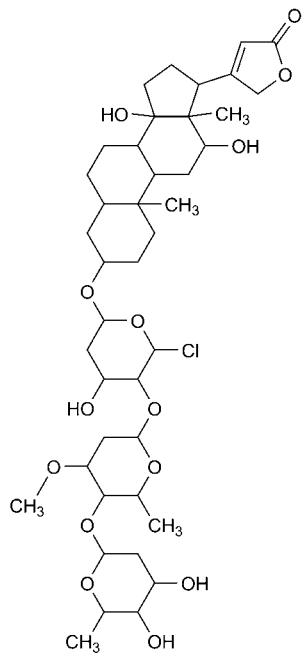


Dose Up to 12 g of meticillin sodium daily, by slow IV injection.

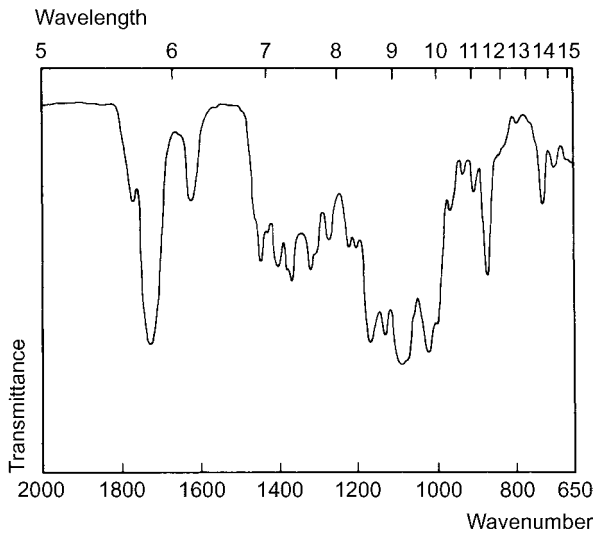
Metildigoxin

Cardiac Glycoside
$C_{42}H_{66}O_{14}$ = 95.0
CAS—30685-43-9

IUPAC Name 3-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*)-12,14-Dihydroxy-3-[(2*R*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-5-methoxy-6-methyloxan-2-yl]oxy-6-methyloxan-2-yl]oxy-6-methyloxan-2-yl]oxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[*a*]phenanthren-17-yl]-2*H*-furan-5-one
Synonyms Medigoxin; β-methyl digoxin; β-methyldigoxin; 3β,12β,14β-trihydroxy-5β-card-20(22)-enolide-3-(4‴-*O*-methyltridigitoxoside).
Proprietary Names *Cardiolan*; *Lanirapid*; *Lanitop*; *Miopat*.



Chemical Properties A white crystalline powder. Mp 227° to 231°. Very slightly soluble in water; soluble in ethanol and chloroform. Log *P* (octanol/water), 1.8 [Hansch *et al.* 1995].
Infrared Spectrum Principal peaks at wavenumbers 1085, 1014, 1730, 1163, 1130, 864 cm^{-1} (KBr disk).



Quantification

Note For a radioimmunoassay in plasma, see Garrett and Hinderling [1977].
Disposition in the Body Rapidly and almost completely absorbed after oral administration. Metabolised by demethylation to digoxin and by hydrolysis to the bis- and monoglycosides. Approximately 75% of a dose is excreted in the urine over a period of several days, with ~25–30% being excreted in the first 24 h. Of the material excreted in the urine, ~30–50% is unchanged drug, 15% consists of conjugated bis- and monoglycosides, and the remainder is digoxin. Approximately 15–30% of a dose is eliminated in the faeces over a period of 7 days.
Therapeutic Concentration
Following a single oral dose of 0.4 mg to 17 subjects, a mean peak plasma concentration of 0.003 mg/L was attained in ~1 h. Following daily oral doses of

0.15–0.2 mg to 18 subjects, steady-state plasma concentrations of 0.6–2.0 μg/L (mean 1.0) were reported [Boerner *et al.* 1976].

Toxicity

In a fatality in which death occurred ~1 h after ingestion of a metildigoxin/medigoxin overdose, the following postmortem tissue concentrations of glycosides were reported: blood 0.075 mg/L, bile 2.4 mg/L, kidney 0.237 μg/g, liver 0.047 μg/g, left ventricular myocardium 0.14 μg/g, right ventricular myocardium 0.16 μg/g, urine 0.91 mg/L [Rietbrock *et al.* 1978].

Half-life Plasma half-life, 40 to 70 h.

Volume of Distribution Approximately 6 to 10 L/kg.

Clearance Plasma clearance, ~2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.1.

Protein Binding Approximately 10–30%.

Dose For rapid digitalisation, 600 μg daily for 2 to 4 days; maintenance, 200 to 300 μg daily.

Metindizate

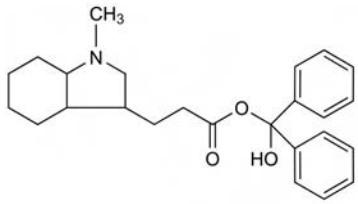
Antispasmodic (Veterinary)

$C_{25}H_{31}NO_3 = 393.5$

CAS—15687-33-9

IUPAC Name 2-(1-Methyl-2,3,3*a*,4,5,6,7,7*a*-octahydroindol-3-yl)ethyl 2-hydroxy-2,2-diphenylacetate

Synonym 2-(1-Methylperhydroindol-3-yl)ethyl benzilate



Metindizate Hydrochloride

$C_{25}H_{31}NO_3,HCl = 430.0$

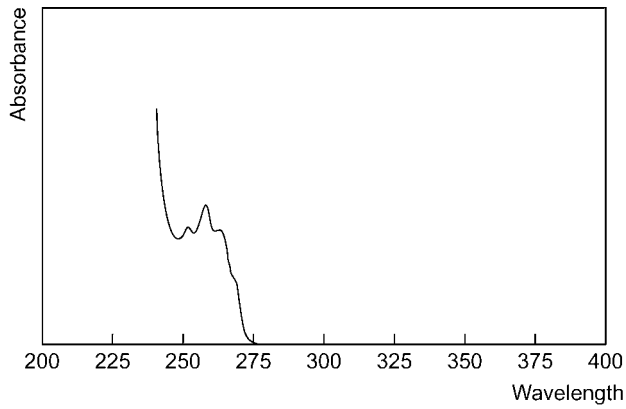
Proprietary Name It is an ingredient of *Isaverin*.

Chemical Properties A fine, white, crystalline powder. Mp 159° to 160°. Freely soluble in water and ethanol; practically insoluble in chloroform and ether.

Colour Tests Liebermann's reagent—orange→brown; Mandelin's test—brown; Marquis test—orange→green; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.36 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—251, 257 nm (A^{1}_{1}=10.3b).



Infrared Spectrum Principal peaks at wavenumbers 1739, 1238, 1227, 702, 1058, 1093 cm^{-1} (KBr disk).

Metipranolol

β-*Adrenoceptor Antagonist*

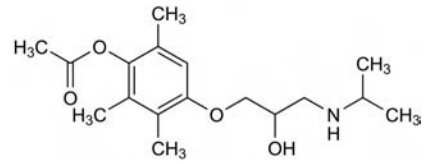
$C_{17}H_{27}NO_4 = 309.4$

CAS—22664-55-7

IUPAC Name 4-[2-Hydroxy-3-[(1-methylethyl)amino]propoxy]-2,3,6-trimethylphenol 1-acetate

Synonyms Methypranolum; trimepranol.

Proprietary Names *Betamann*; *Betanol*; *Beta-Ophtiole*; *Disorat*; *Glauline*; *Glausyn*; *OptiPranolol*; *Turoptin*.



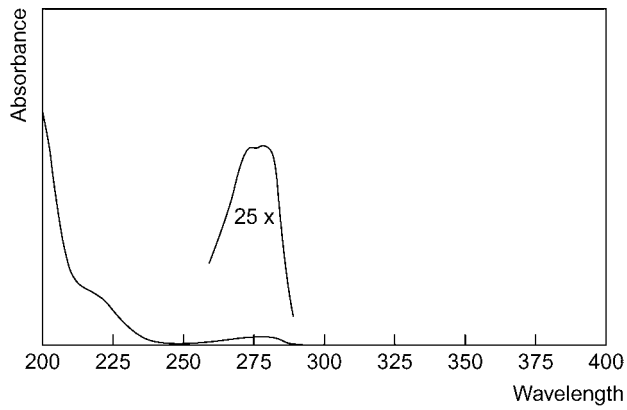
Chemical Properties A white crystalline powder. Mp 105° to 109°. Practically insoluble in water; freely soluble in ethanol, chloroform and benzene; slightly soluble in ether. Log *P* (octanol/water), 2.7.

Thin-layer Chromatography System TB—R_f 0.08; system TE—R_f 0.47; system TF—R_f 0.00; system TAE—R_f 0.21.

Gas Chromatography System GA—metipranolol RI 2241, metipranolol-AC RI 2260, M (desamino-OH-)-AC_2 RI 2240, M art (phenol)-AC RI 1610; system GB—metipranolol RI 2320.

High Performance Liquid Chromatography System HX—RI 379; system HZ—retention time 3.5 min.

Ultraviolet Spectrum Aqueous acid—278 nm (A^{1}_{1}=44b).



Quantification

Plasma **HPLC** Electrochemical detection. Desacetylmetipranolol. Limit of detection, 2 μg/L [Tkaczykova, Safarik 1989]. Metipranolol and other topically applied beta blockers. Limits of detection, 4 to 27 μg/L [Tracqui *et al.* 1988].

Urine **HPLC** See Plasma [Tracqui *et al.* 1988].

Disposition in the Body Readily absorbed after oral administration and rapidly metabolised to the active metabolite, desacetylmetipranolol. About 20% of a dose is excreted in the urine as unchanged drug.

Therapeutic Concentration

After a single oral dose of 40 mg to 13 subjects, peak plasma concentrations of the desacetyl metabolite of 0.034 to 0.214 mg/L (mean 0.14) were attained in about 1 h. Oral administration of 20 mg twice daily to 6 subjects, produced mean steady-state plasma concentrations (desacetyl derivative) of 0.06 to 0.08 mg/L determined on the 6th to 8th day; considerable intersubject variation was reported [Mayer 1980].

Following administration of metipranolol 40 mg to 6 subjects as either a conventional- or a controlled-release preparation, mean peak plasma concentrations of 22 μg/L (at 1 h) and 11 μg/L (at 3 h), respectively, were reported [Lapka *et al.* 1990].

Half-life Plasma half-life, desacetylmetipranolol about 2 to 4 h but there is considerable intersubject variation.

Dose Metipranolol has been given in doses of 10 to 120 mg daily.

Lapka R *et al.* (1990). Pharmacokinetics and pharmacodynamics of conventional and controlled-release formulations of metipranolol in man. *Eur J Clin Pharmacol* 38: 243–247.

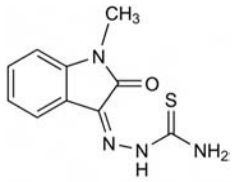
Tracqui A *et al.* (1988). A specific HPLC method for determination of beta-blockers topically used in ophthalmological diseases. *Forensic Sci Int* 38: 37–41.

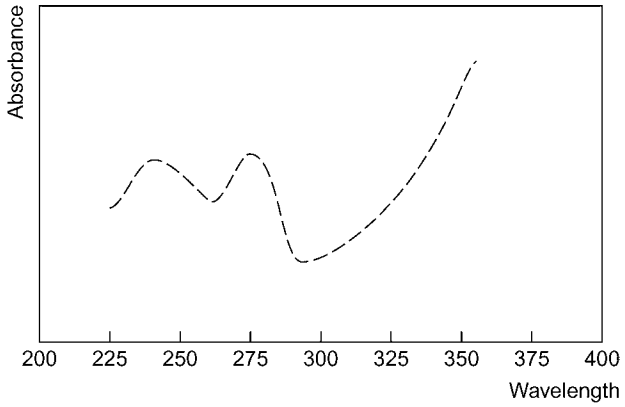
Metisazone

Antiviral
$C_{10}H_{10}N_4OS$ = 234.3
CAS—1910-68-5

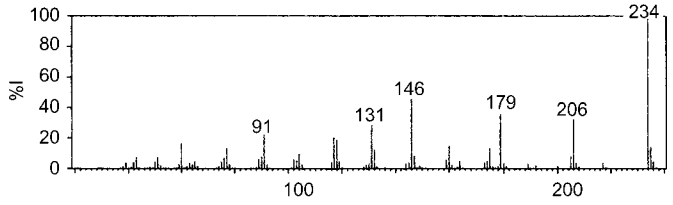
IUPAC Name [(*Z*)-(1-Methyl-2-oxoindol-3-ylidene)amino]thiourea
Synonyms 2-(1,2-Dihydro-1-methyl-2-oxo-3*H*-indol-3-ylidene)-hydrazinecarbothioamide; *N*-methylisatin β-thiosemicarbazone; methisazone.
Proprietary Names *Marboran*; *Viruzona*.



Chemical Properties A very fine, orange-yellow powder. Mp about 248°, with decomposition. Practically insoluble in water; soluble 1 in 25 of acetone and 1 in 800 of chloroform; soluble in warm dilute solutions of alkali hydroxides. Log *P* (octanol/water), 1.0.
Colour Tests Mandelin's test—violet→yellow; palladium chloride—yellow→orange→brown.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.03; system TC—R_f 0.68; system TL—R_f 0.69 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Ethanol—241, 274 nm (A^1_1=588b).



Infrared Spectrum Principal peaks at wavenumbers 1605, 1493, 1097, 1673, 1040, 826 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 234, 146, 179, 206, 131, 91, 117, 118.

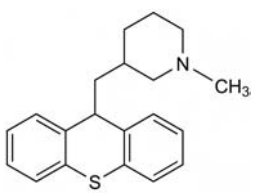


Dose Usually 6 g daily (prophylactic dose).

Metixene

Anticholinergic
$C_{20}H_{23}NS$ = 309.5
CAS—4969-02-2

IUPAC Name 1-Methyl-3-(9*H*-thioxanthen-9-ylmethyl)piperidine
Synonym Methixene

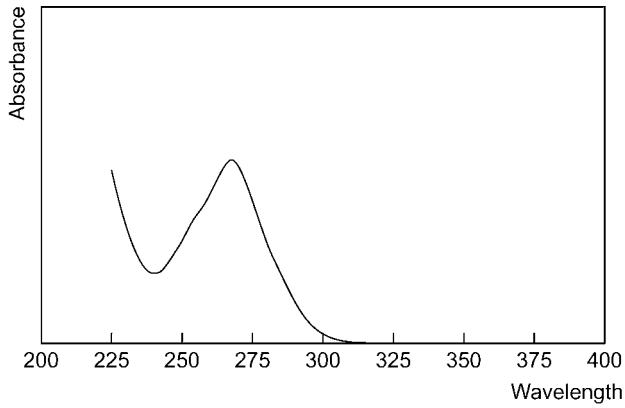


Chemical Properties A pale yellow viscous liquid. Insoluble in water. Log *P* (octanol/water), 5.7. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

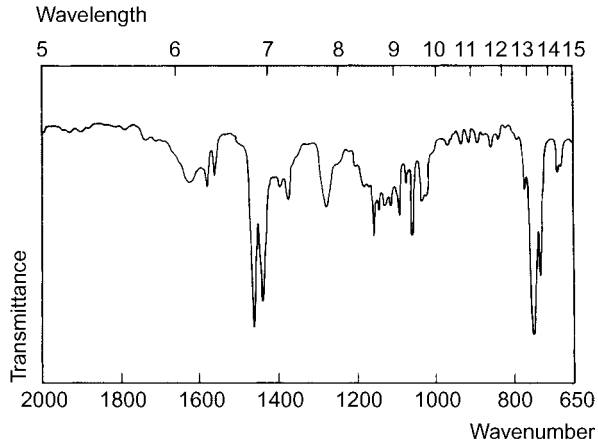
Metixene Hydrochloride

$C_{20}H_{23}NS,HCl$ = 345.9
CAS—1553-34-0 (anhydrous); 7081-40-5 (monohydrate)
Synonyms Methixene hydrochloride; metixeni hydrochloridum; NSC-78194; SJ-1977.
Proprietary Names *Metixen*; *Tremaril*; *Tremarit*; *Tremonil*; *Tremoquil*; *Trest*.
Chemical Properties A white crystalline powder. Mp about 216°. Soluble in water, ethanol and chloroform.

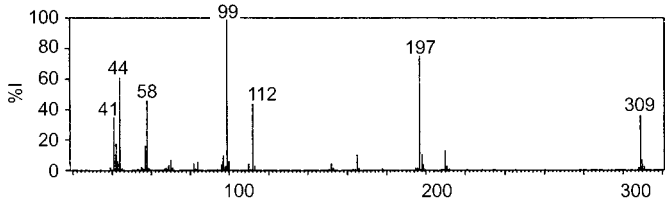
Colour Tests Formaldehyde-sulfuric acid—orange; Liebermann's reagent—red-orange; Mandelin's test—orange; sulfuric acid—orange (fluoresces under UV light).
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.45; system TC—R_f 0.25; system TE—R_f 0.61; system TL—R_f 0.12; system TAE—R_f 0.21; system TAJ—R_f 0.16; system TAK—R_f 0.22; system TAL—R_f 0.73 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2480; system GB—RI 2592; system GF—RI 2895.
High Performance Liquid Chromatography System HA—*k* 3.6; system HX—RI 451.
Ultraviolet Spectrum Aqueous acid—268 nm (A^1_1=324a).



Infrared Spectrum Principal peaks at wavenumbers 750, 729, 1052, 1162, 1086, 1280 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 99, 197, 44, 58, 112, 309, 41, 42.



Disposition in the Body Absorbed after oral administration. It is excreted in the urine, partly unchanged, partly as its two isomeric sulfoxides, and partly as the stereoisomeric sulfoxides of *N*-demethylated metixene.
Dose 7.5 to 60 mg of metixene hydrochloride daily in divided doses.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

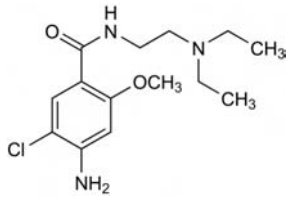
Metoclopramide

Antiemetic

$C_{14}H_{22}ClN_3O_2$ = 299.8

CAS—364-62-5

IUPAC Name 4-Amino-5-chloro-*N*-(2-diethylaminoethyl)-2-methoxybenzamide



Chemical Properties A white crystalline powder. Mp 146.5° to 148.0°. Practically insoluble in water; soluble 1 in 45 of ethanol and 1 in 15 of chloroform. pK_a 9.3 (25°). Log *P* (octanol/water), 2.6. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Metoclopramide Hydrochloride

$C_{14}H_{22}ClN_3O_2,HCl,H_2O$ = 354.3

CAS—7232-21-5 (anhydrous); 54143-57-6 (monohydrate)

IUPAC Name 4-Amino-5-chloro-*N*-(2-diethylaminoethyl)-2-methoxybenzamide dihydrochloride

Synonyms AHR-3070-C; DEL-1267; metoclopramidi hydrochloridum; MK-745.

Proprietary Names *Anausin*; *Clopra*; *Gastrobid Continus*; *Gastroflux*; *Gastromax*; *Intensol*; *Maxeran*; *Maxolon*; *Metalon*; *Metamide*; *Metopram*; *Mygdalon*; *Octamide*; *Parmid*; *Paspertin*; *Primperan*; *Reclomide*; *Reglan*. It is an ingredient of *Migramax*; *Migravess*; *Paramax*.

Chemical Properties A white crystalline powder. Mp 182.5° to 184.0°. Soluble 1 in 0.7 of water, 1 in 3 of ethanol, and 1 in 55 of chloroform; practically insoluble in ether.

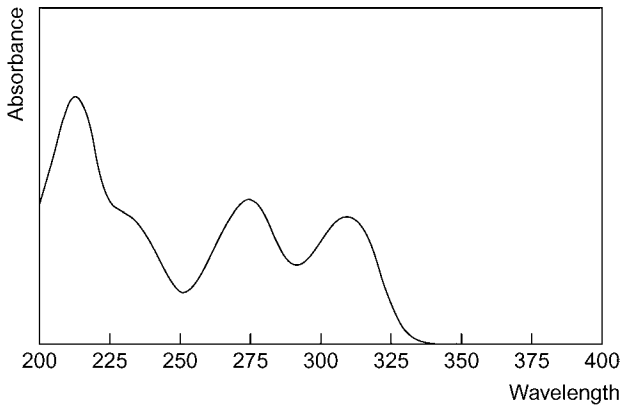
Colour Tests Coniferyl alcohol—orange; Liebermann's reagent—yellow; Mandelin's test—brown.

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.01; system TC—R_f 0.07; system TE—R_f 0.51; system TL—R_f 0.13; system TAE—R_f 0.17 (acidified iodoplatinate solution, positive).

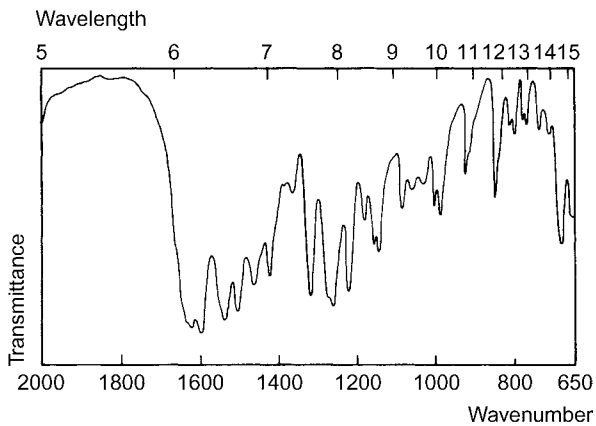
Gas Chromatography System GA—metoclopramide RI 2620, metoclopramide-AC RI 2735, M (desethyl-) RI 2095, M (desethyl-)-AC_2 RI 2900.

High Performance Liquid Chromatography System HA—*k* 5.0; system HX—RI 324; system HY—RI 263; system HZ—RT 2.6 min; system HAA—RT 9.9 min; system HAX—RT 7.9 min; system HAY—RT 4.3 min.

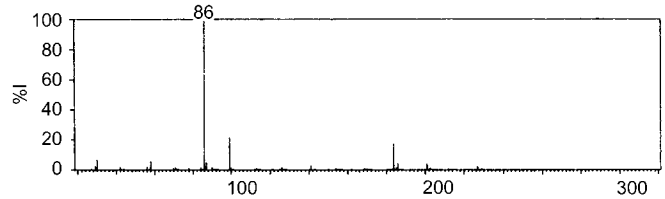
Ultraviolet Spectrum Aqueous acid—273 (A^1_1 = 467b), 309 nm.



Infrared Spectrum Principal peaks at wavenumbers 1590, 1614, 1530, 1496, 1254, 1311 cm^{-1} (metoclopramide hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 184, 58, 30, 87, 201, 186.



Quantification

Plasma **GC** Column: SE-54 fused silica capillary (25 m × 0.31 mm, 0.15 µm). Carrier gas: H_2, 1.0 mL/min. Temperature: 235°. ECD. Retention time: 3.2 min. Limit of detection, 4 µg/L [Riggs *et al.* 1983]. Column: 3% OV-101 on DMCS treated Gas Chrom Q 80/100 mesh (1.2 m × 2 mm i.d.). Carrier gas: N_2, 37 mL/min. Temperature: 200°. ECD. Limit of detection, 5 µg/L [Ross-Lee *et al.* 1980].

HLPC Column: C_{18}. Electrochemical detection [Chmielewska *et al.* 2006]. Column: Spherisorb CN (250 × 4.55 mm i.d., 5 µm). Mobile phase: 0.02 mol/L potassium dihydrogen phosphate (pH 3.0) : acetonitrile (60 : 40), flow rate 2.0 mL/min. UV detection (λ = 275 nm). Retention time: 4.6 min. Limit of quantification, 5 µg/L, limit of detection, 3 µg/L [Buss *et al.* 1990]. Column: Supelcosil LC-18-DB (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.03 mol/L acetic acid-acetonitrile (75 : 25) : TEA (1 L:500 µL), flow rate 1.3–1.5 mL/min. Fluorescence detection (λ_{ex} = 307 nm, λ_{em} = 380 nm). Limit of detection, 1.5 µg/L [Albani *et al.* 1987]. Column: cyanopropyl CN (100 × 8 mm i.d., 4 µm). Mobile phase: 35% acetonitrile : 1% SDS in 0.61 mol/L sodium acetate (pH 5.0), flow rate 1.0 mL/min. UV detection (λ = 275 nm). Retention time: 7.8 min. Limit of detection, 2 µg/L [Takahashi *et al.* 1987]. Column: Nucleosil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 1% acetic acid-acetonitrile (32 : 68) : methanol (3.7 : 1), flow rate 1.5 mL/min. UV detection (λ = 273 nm). Limit of detection, 8 µg/L [Bishop-Freudling, Vergin 1983].

LC-MS Column Atlantis HILIC silica. Mobile phase: acetonitrile : 100 mmol/L ammonium formate (pH 6.5, 85 : 15). ESI, SIM acquisition mode [Lee *et al.* 2009].

Serum **HPLC** Limit of detection, 1.2 µg/L [Javanbakht *et al.* 2009]. Column: TSkgel Super-ODS. Limit of detection, 0.5 µg/L [Chiba *et al.* 2003]. Column: C (18). Mobile phase: methanol : phosphate buffer (pH 3.0, 30 : 70). Electrochemical Detection. Limit of quantification, 2 µg/L [Lamparczyk *et al.* 2001]. Column: Spherisorb 5 ODS (100 × 3 mm i.d.). Mobile phase: acetonitrile : 2% TEA (pH 5.5), flow rate 0.7 mL/min. UV detection (λ = 310 nm). Limit of detection, 2 µg/L [Fairhead *et al.* 1989]. Column: Micro-Pak Si-5 (300 × 4 mm i.d.). Mobile phase: dichloromethane : methanol : 1 mol/L diethylamine (89 : 10 : 1), flow rate 1.0 mL/min. UV detection (λ = 308 nm). Limit of detection, 15 nmol/L [Popovic 1984]. See Plasma [Chmielewska *et al.* 2006].

Urine **HPLC** See Serum. Limit of detection, 3 µg/L [Javanbakht *et al.* 2009]. See Plasma [Albani *et al.* 1987; Takahashi *et al.* 1987]. See Serum. Limit of detection, 3 µmol/L [Popovic 1984].

Bile **HPLC** See Plasma [Takahashi *et al.* 1987].

Oral Fluid **HPLC** See Serum [Popovic 1984].

Disposition in the Body Metoclopramide is rapidly and almost completely absorbed after oral administration. Up to ~60% of an oral dose undergoes first-pass metabolism but there is considerable intersubject variation. Metoclopramide crosses the blood–brain barrier. It crosses the placenta and concentrations in fetal plasma may be 60–70% of those in maternal plasma. It is found in breast milk in concentrations that may be higher than those in plasma. Up to ~80% of a dose is excreted in the urine in 24 h, with ~10–20% as unchanged drug, up to 50% as conjugated metoclopramide (mainly the *N*-4-sulfate), and a small amount as 2-(4-amino-5-chloro-2-methoxybenzamido)acetic acid. Approximately 5% of a dose is excreted in the faeces via the bile.

Therapeutic Concentration

After a single oral dose of 10 mg given to 6 subjects, peak plasma concentrations of 0.04–0.06 mg/L (mean 0.05) were attained in 0.5–2 h; following IV administration of 10 mg to 6 subjects, plasma concentrations of 0.07–0.13 mg/L were reported after 5 min [Ross-Lee *et al.* 1981].

The mean plasma concentration at the end of an infusion of metoclopramide in 14 patients was 1.01 mg/L in those patients in whom the dose had been adjusted to individual pharmacokinetic parameters (mean loading dose 2.22 mg/kg, mean maintenance dose 1.96 mg/kg/4 h) and 0.54 mg/L in those patients in whom the dose had been adjusted as usual to body weight (mean loading dose 1.40 mg/kg, mean maintenance dose 0.52 mg/kg/4 h) [Brechot *et al.* 1991].

Following SC administration of metoclopamide 10 mg every 6 h for 3 days to 10 patients with gastroparesis, a peak plasma concentration of 0.0997 mg/L was attained 30 min after the last dose; at 60 min, the concentration was 0.0939 mg/L [McCallum *et al.* 1991].

In neonates, steady-state metoclopramide levels just before and 1 h after administration were 91.6 and 87.4 µg/L, respectively. There was a negative correlation between minimum plasma levels and gestational age [Vauzelle-Kervroedan *et al.* 1997].

Toxicity Ingestion by adults of up to 0.8 g without serious adverse effects has been reported.

In a 25-year-old female who died 4 days after ingesting metoclopramide and diltiazem with suicidal intent, the blood levels 1 h after admission to hospital were 4.4 mg/L metoclopramide and 8.49 mg/L diltiazem [Beno, Nemeth 1991].

For a report of metoclopramide poisoning in children, see Low, Goel [980].

Bioavailability Approximately 75%, with a wide intersubject variation of 30–100%.

Half-life Plasma half-life, 4–6 h, increased in renal impairment.
Volume of Distribution Approximately 3.5 L/kg but there is considerable inter-subject variation.
Clearance Plasma clearance, 7–17 mL/min/kg (mean 11).
Distribution in Blood Plasma : whole blood ratio, 0.93.
Protein Binding ~40%.
Note For reviews of metoclopramide, see Bateman [1983], Harrington *et al.* [1983], Kearns *et al.* [1998], Lauritsen *et al.* [1990] and Rotmensch *et al.* [1997].

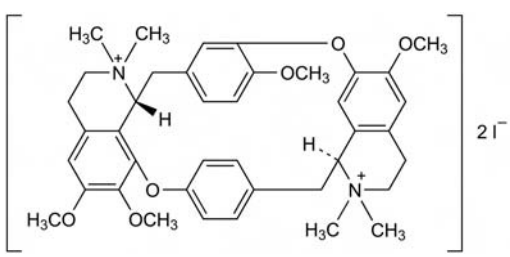
Metocurine Iodide

Muscle Relaxant
$C_{40}H_{48}I_2N_2O_6 = 906.6$
CAS—5152-30-7 (metocurine); 7601-55-0 (iodide)

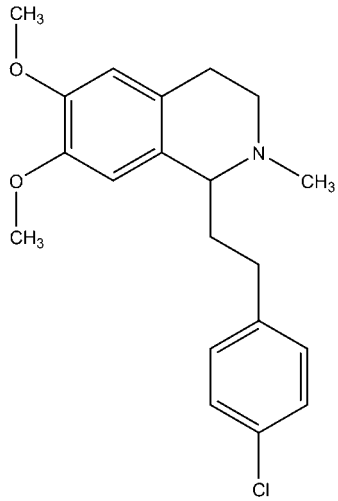
Synonyms Dimethyl tubocurarine iodide; dimethyltubocurarine iodide; 6,6′,7′,12′-tetramethoxy-2,2,2′,2′-tetramethyltubocuraranium diiodide.
Note The name dimethyltubocurarine iodide was based on the old empirical formula for tubocurarine.
Proprietary Name *Metubine Iodide*



Chemical Properties A white to pale yellow, crystalline powder. When heated to 257° to 267°, it decomposes with the evolution of gas. Soluble 1 in 400 of water; very slightly soluble in ethanol; practically insoluble in benzene, chloroform and ether; slightly soluble in dilute acids and alkalis.
Colour Tests Aromaticity (method 2)—yellow/orange; nitric acid, cold gives a brown colour.
Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=74b).
Infrared Spectrum Principal peaks at wavenumbers 1510, 1220, 1265, 1280, 1125, 1240 cm^{-1} (KBr disk).
Disposition in the Body About 50% of a dose is excreted in the urine unchanged in 48 h, and about 2% of the dose is excreted in the bile in the same period.
Half-life Plasma half-life, about 3 to 4 h.
Volume of Distribution About 0.4 L/kg.
Clearance Plasma clearance, about 1.3 mL/min/kg.
Protein Binding About 35%.
Dose Initially, 1.5 to 8 mg intravenously.

Metofoline

Analgesic
$C_{20}H_{24}ClNO_2 = 345.9$
IUPAC Name 1-[2-(4-chlorophenyl)ethyl]-6,7-dimethoxy-2-methyl-3,4-dihydro-1*H*-isoquinoline
Synonyms 1-*p*-Chlorophenethyl-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methylisoquinoline; methopholine; Ro 4-1778.



Chemical Properties Metofoline is extracted by organic solvents from aqueous alkaline solutions.

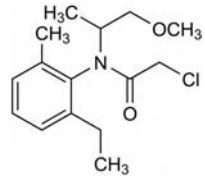
Metofoline Hydrochloride
Proprietary Name *Versidyne*

Colour Tests Ammonium molybdate test—dull green (limit of detection, 1.0 µg); ammonium vanadate test—pale green (limit of detection, 1.0 µg); sulphuric acid-formaldehyde test—pale yellow (limit of detection, 1.0 µg); Vitali's test—yellow/yellow/yellow (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.57 (location reagent acidified iodoplatinate spray, positive reaction).
Disposition in the Body
Toxicity It has been reported to have a depressive effect on respiration. Tests in former opiate addicts have shown that metofoline has substantially fewer addiction-producing properties than morphine and codeine, and even fewer than dextropropoxyphene.
Dose Up to 240 mg daily.

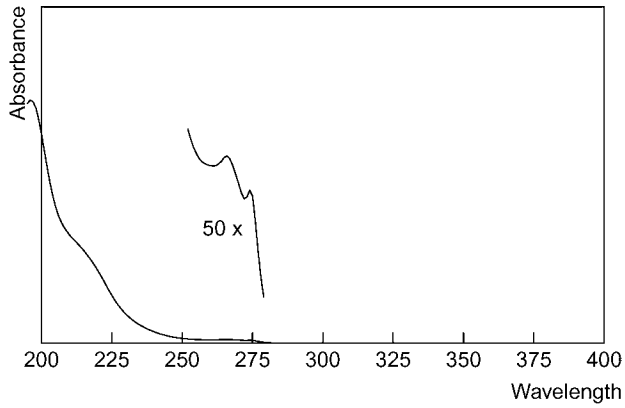
Metolachlor

Herbicide
$C_{15}H_{22}ClNO_2 = 283.8$
CAS—51218-45-2

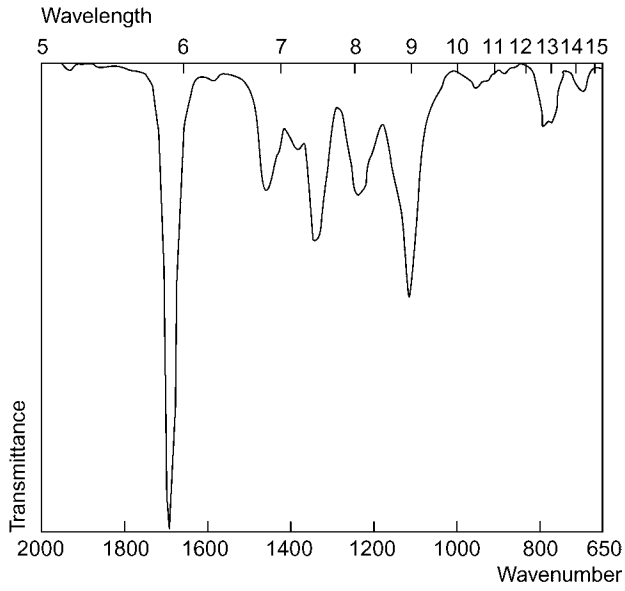
IUPAC Name 2-Chloro-*N*-(2-ethyl-6-methylphenyl)-*N*-(2-methoxy-1-methylethyl)acetamide
Synonyms CGA 24705; matelilachlor; metolachlore.
Proprietary Names *Bicep*; *Codal*; *Cotoran multi*; *Dual*; *Ontrack*; *Pace*; *Pennant*; *Pimagram*; *Primextra*.



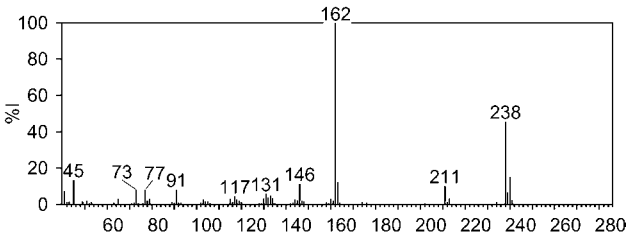
Chemical Properties An off-white to colourless liquid at room temperature. Bp 100°. Formulations are opaque white to tan in colour. It is soluble in water (530 ppm at 20°) and miscible with benzene, dichloromethane, hexane, methanol, octanol, xylene, toluene, dimethylformamide, ethylene dichloride and cyclohexane; insoluble in ethylene glycol and propylene glycol. Log *P* (octanol/water), 3.13.
High Performance Liquid Chromatography System HY—RI 562.
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1691, 1113, 1342, 1346, 1237, 1458 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 162, 238, 45, 146, 240, 163, 91, 77.

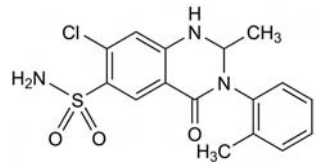


Disposition in the Body Metolachlor is quickly broken down into its metabolites after ingestion. It is totally eliminated via urine and faeces. Metolachlor is not detected in urine, faeces or tissues.

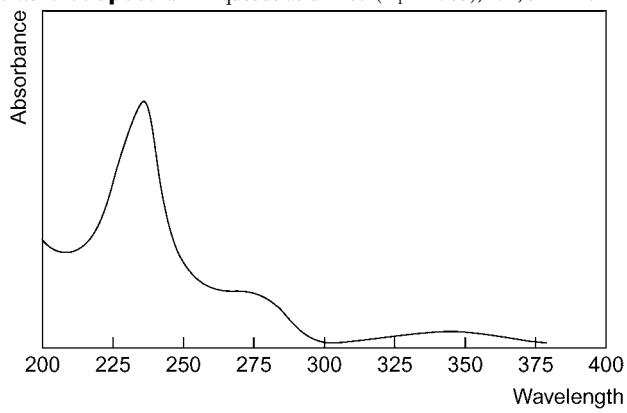
Toxicity Metolachlor is toxic by ingestion, although less so than other herbicides.

Metolazone

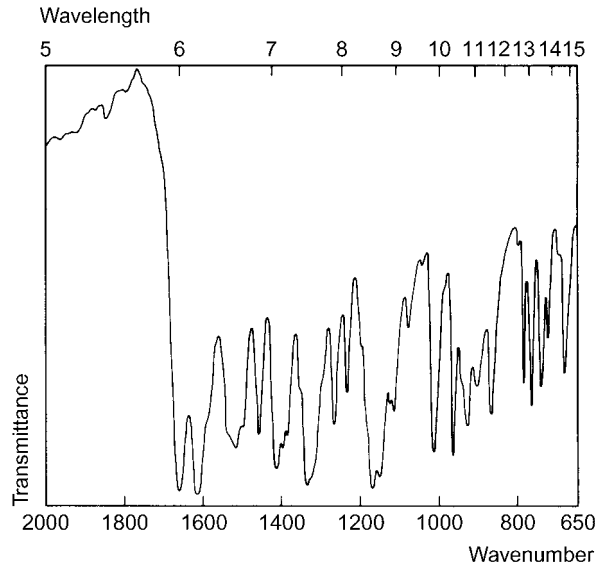
Diuretic
$C_{16}H_{16}ClN_3O_3S$ = 365.8
CAS—17560-51-9
IUPAC Name 7-Chloro-1,2,3,4-tetrahydro-2-methyl-3-(2-methylphenyl)-4-oxo-6-quinazoline sulfonamide
Proprietary Names *Birobin*; *Diondel*; *Diulo*; *Metenix*; *Mykrox*; *Xuret*; *Zaroxolyn(e)*.



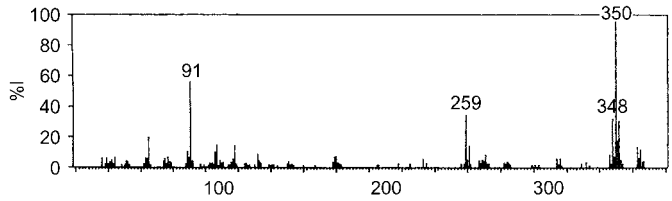
Chemical Properties Colourless crystals. It may occur in two polymorphic forms which melt at 227°. Sparingly soluble in water; more soluble in alkalis and organic solvents. pK_a 9.7. Log *P* (octanol/water), 1.8.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—orange→green-brown; methanolic potassium hydroxide—yellow; sulfuric acid—yellow.
Thin-layer Chromatography System TD—R_f 0.23; system TE—R_f 0.57; system TF—R_f 0.51; system TAD—R_f 0.33; system TAJ—R_f 0.34; system TAK—R_f 0.08; system TAL—R_f 0.75; system TAM—R_f 0.75.
Gas Chromatography System GA—metolazone, not eluted; metolazone-Me_3 RI 3910.
High Performance Liquid Chromatography System HN—*k* 4.89; system HY—RI 371.
Ultraviolet Spectrum Aqueous acid—237 (A^1_1=1470b), 271, 344 nm.



Infrared Spectrum Principal peaks at wavenumbers 1610, 1660, 1165, 1145, 962, 1012 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 350, 91, 259, 352, 348, 65, 351, 107.



Quantification

Blood **HPLC** UV detection. Limit of detection, 1 µg/L [Farthing *et al.* 1994].

Plasma **HPLC** See Blood [Farthing *et al.* 1994]. UV detection. Limit of detection, 2 µg/L [Brodie *et al.* 1981]. Fluorescence detection. Limit of detection, 1 µg/L [Vose *et al.* 1981].

Urine **GC-MS** Metolazone and other diuretics. Limits of detection, 10 to 50 µg/L [Lisi *et al.* 1992].

HPLC Fluorescence detection [Farthing *et al.* 1990]. Limit of detection, 5 µg/L, see Plasma [Vose *et al.* 1981].

Disposition in the Body Metolazone is incompletely but fairly readily absorbed after oral administration. About 80% of a dose is excreted in the urine as unchanged drug in 48 h; about 10% is excreted in the bile.

Therapeutic Concentration

After a single oral dose of 2.5 mg given to 3 subjects, a mean peak plasma concentration of about 0.01 mg/L was attained in 5 h [Tilstone *et al.* 1974].

Half-life Plasma half-life, about 18 h.

Volume of Distribution About 1.6 L/kg.

Clearance Plasma clearance, about 1.4 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.84.

Protein Binding 95%.

Dose Usually 2.5 to 10 mg daily; maximum of 80 mg daily.

Vose CW *et al.* (1981). Quantitation of metolazone in plasma and urine by high-performance liquid chromatography with fluorescence detection. *J Chromatogr* 222: 311–315.

Metomidate

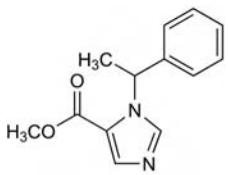
Sedative (Veterinary)

$C_{13}H_{14}N_2O_2 = 230.3$

CAS—5377-20-8

IUPAC Name Methyl 3-(1-phenylethyl)imidazole-4-carboxylate

Synonyms Methoxymol; methomidate; 1-(1-phenylethyl)-1*H*-imidazole-5-carboxylic acid methyl ester.



Chemical Properties Log *P* (octanol/water), 2.6.

Metomidate Hydrochloride

$C_{13}H_{14}N_2O_2$,HCl = 266.7

CAS—35944-74-2

Proprietary Name *Hypnodil*

Chemical Properties An off-white crystalline powder. Mp about 172°. Very soluble in water.

Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.71; system TAE—R_f 0.77; system TAF—R_f 0.81; system TL—R_f 0.48; system TB—R_f 0.23; system TC—R_f 0.65; system TE—R_f 0.74 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 424.

Ultraviolet Spectrum Water—240 nm (A^1_1=408b).

Infrared Spectrum Principal peaks at wavenumbers 1730, 1230, 725, 770, 1288, 1200 cm^{-1} (metomidate hydrochloride, KBr disk).

Metopimazine

Antiemetic

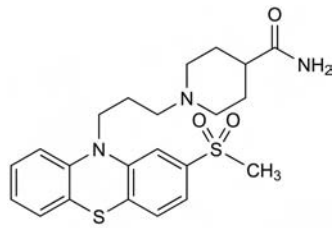
$C_{22}H_{27}N_3O_3S_2 = 445.6$

CAS—14008-44-7

IUPAC Name 1-[3-[2-(Methylsulfonyl)-10*H*-phenothiazin-10-yl]propyl]-4-piperidinecarboxamide

Synonyms Exp-999; RP-9965.

Proprietary Name *Vogalene*



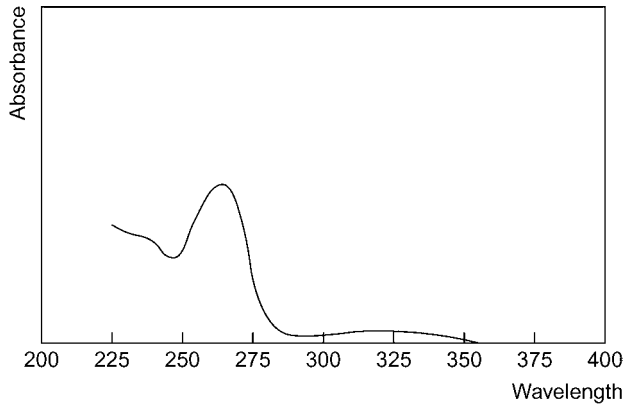
Chemical Properties A white crystalline powder. Mp 170° to 171°. Soluble in chloroform and dilute acetic acid. Log *P* (octanol/water), 2.4.

Colour Tests Formaldehyde-sulfuric acid—red; Forrest reagent—brown; FPN reagent—orange; Mandelin's test—green; Marquis test—red; sulfuric acid—red.

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.00; system TC—R_f 0.11; system TL—R_f 0.12 (acidified iodoplatinate solution, positive).

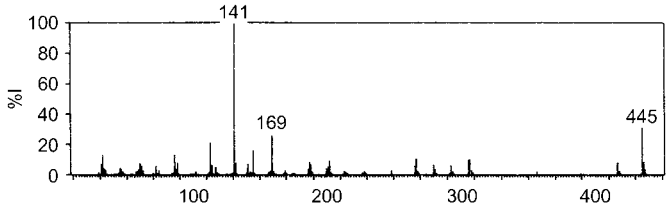
High Performance Liquid Chromatography System HA—*k* 1.4.

Ultraviolet Spectrum Aqueous acid—264 (A^1_1=922b), 310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1150, 1310, 750, 1665, 1102, 1248 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 141, 445, 169, 123, 155, 96, 42, 317.



Quantification

Serum **HPLC** Fluorescence detection. Metopimazine and its acid metabolite [Angelo *et al.* 1989].

Disposition in the Body

Therapeutic Concentration

Administration of a single oral 20 or 50 mg dose of metopimazine before food in 6 subjects produced median peak plasma concentrations of 43 or 83 µg/L at 52 and 60 min, respectively. When the same doses were administered postprandially, the corresponding values were 22 or 51 µg/L, both at 90 min [Herrstedt *et al.* 1990].

Six subjects were given 40 mg of metopimazine either as a single microenema or as a single oral dose or were given 10 mg metopimazine as a 60 min continuous IV infusion. The median peak plasma concentration was 59 µg/L (range 28 to 182) 53 min (25 to 90) after oral administration, 128 µg/L (69 to 218) 10 min (10 to 10) after rectal administration and 108 µg/L (74 to 193) 60 min (45 to 60) after IV administration [Herrstedt *et al.* 1996].

Metopimazine 20, 30, 40, 50 or 60 mg was given orally every 4 h for 11 doses to 36 subjects. For the 50 mg dose, median peak plasma concentrations of 115, 108, 96, 183 and 109 µg/L were obtained at 1.5, 12, 24, 36 and 48 h after the first dose, respectively; the corresponding values for the 60 mg dose were 73, 52, 105, 96 and 70 µg/L. 6 doses of 30 mg were found to be safe [Herrstedt *et al.* 1997].

Dose 5 to 15 mg daily.

Angelo HR *et al.* (1989). High-performance liquid chromatographic method with fluorescence detection for the simultaneous determination of metopimazine and its acid metabolite in serum. *J Chromatogr* 496: 472–477.

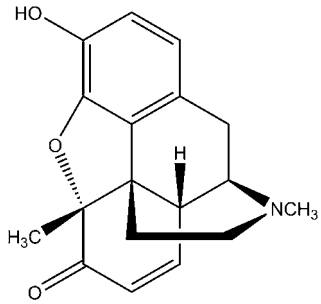
Metopon

Narcotic Analgesic
$C_{18}H_{21}NO_3 = 299.4$
CAS—143-52-2

Synonyms (5α)-4,5-Epoxy-3-hydroxy-5,17-dimethylmorphinan-6-one; 4,5-epoxy-3-hydroxy-*N*,5-dimethyl-6-oxomorphinan; methyldihydromorphinone.



Chemical Properties Needles from alcohol. Mp 243° to 245°. Slightly soluble in organic solvents. Metopon is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve yield.

Metopon Hydrochloride

$C_{18}H_{21}NO_3$,HCl = 335.8
CAS—124-92-5

Chemical Properties Crystals from alcohol. Mp 315° to 318°. Freely soluble in water, sparingly soluble in alcohol, slightly soluble in chloroform, very slightly soluble in ether, insoluble in benzene [Council on Pharmacy and Chemistry of the American Medical Association 1951; O'Neil *et al.* 2006].

Colour Tests Ammonium molybdate test—blue-violet→blue→green (limit of detection, 0.1 µg); ammonium vanadate test—dull purple (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—purple (limit of detection, 0.5 µg); Vitali's test—yellow/yellow/orange (limit of detection, 0.25 µg).
Thin-layer Chromatography System T10—R_f 0.25 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.00 (relative to codeine).
Ultraviolet Spectrum Ethanol—285 nm; aqueous acid (0.1 N sulfuric acid)—280 nm with an inflexion at 225 nm.
Disposition in the Body
Toxicity Metopon is about 3 times as potent an analgesic as morphine after parenteral administration, and has a similar duration of action [Sargent, May 1970]. The estimated minimum lethal dose is 100 mg. In mice the LD_{50} (SC) is 25 mg/kg.
Dose Usually up to 6 mg.

Council on Pharmacy and Chemistry of the American Medical Association (1951). NEW and nonofficial remedies: metopon hydrochloride. *J Am Med Assoc* 145: 486.
O'Neil MJ *et al.* (2006). *The Merck Index: An Encyclopedia of Chemicals, Drugs and Biologicals*, 14 edn. Whitehouse Station, NJ: Merck & Co., Inc.

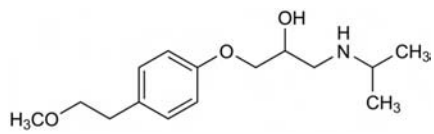
Metoprolol

β-*Adrenoceptor Antagonist, Antianginal, Antiarrhythmic, Antihypertensive*
$C_{15}H_{25}NO_3 = 267.4$
CAS—37350-58-6

IUPAC Name (±)-1-[4-(2-Methoxyethyl)phenoxy]-3-[(1-methylethyl)amino]-2-propanol



Chemical Properties pK_a 9.7. Log *P* (octanol/water), 1.9. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005]. Plasma samples were stable for at least 8 h at ambient temperature (20–30°), at -20° for 1 month and in the autosampler at 10° for more than 24 h. Stable for at least 3 freeze-thaw cycles [Gowda *et al.* 2007].

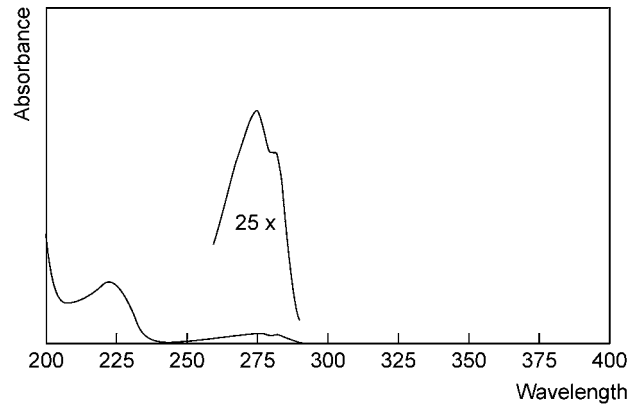
Metoprolol Succinate

$(C_{15}H_{25}NO_3)_2,C_4H_6O_4 = 652.8$
CAS—98418-47-4
Proprietary Names *Selo-Zok*; *Toprol-XL*.

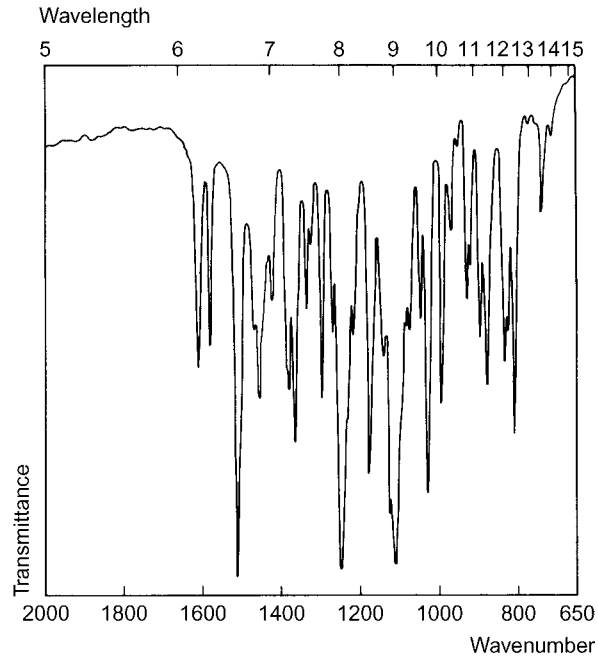
Metoprolol Tartrate

$(C_{15}H_{25}NO_3)_2,C_4H_6O_6 = 684.8$
CAS—56392-17-7
Synonyms CGP-2175E; H-93/26; metoprololi tartras.
Proprietary Names *Abralene*; *Azumetop*; *Beloc*; *Betaloc*; *Betazok*; *Jeprolol*; *Lanoc*; *Lopresor*; *Lopressor*; *Mepranix*; *Meprolol*; *Meto*; *Metocor*; *Metolol*; *Nu-Metop*; *Seloken*; *Toprol XL*. It is an ingredient of *Co-Betaloc*, *Logimax*, *Logroton*, *Lopresor HCT*.
Chemical Properties A white crystalline powder. Mp ~120°. Very soluble in water; soluble in ethanol and chloroform; practically insoluble in ether.

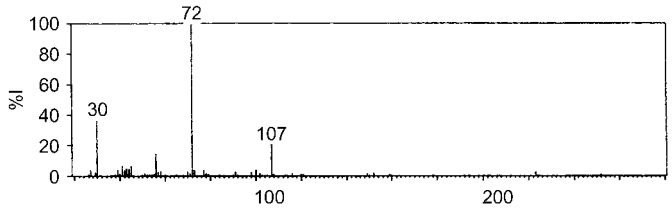
Colour Tests Liebermann's reagent—pink-brown; Mandelin's test—pink-brown; Marquis test—pink.
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.10; system TC—R_f 0.08; system TE—R_f 0.44; system TL—R_f 0.09; system TAE—R_f 0.20; system TAF—R_f 0.74; system TAJ—R_f 0.02; system TAK—R_f 0.12; system TAL—R_f 0.70.
Gas Chromatography System GA—metoprolol RI 2035, M (OH-)(-AC_3) RI 2730, M (*O*-desmethyl-)(-AC_3) RI 2620; system GB—RI 2090.
High Performance Liquid Chromatography System HA—*k* 1.3; system HX—RI 326; system HY—RI 272; system HZ—RT 2.5 min; system HAA—RT 10.7 min; system HAX—RT 7.1 min; system HAY—RT 4.1 min.
Ultraviolet Spectrum Aqueous acid—274 (A^1_1= 52a), 280 nm (inflexion).



Infrared Spectrum Principal peaks at wavenumbers 1510, 1245, 1108, 1028, 1175, 810 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 30, 107, 56, 45, 41, 44, 43.



Quantification

Blood **GC-MS** Column: DB-1 (25 m × 0.2 mm i.d., 0.25 μm). Carrier gas: He, 0.6 mL/min. Temperature programme: 140° for 2.5 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.01 mg/L [Black *et al.* 1996].

Plasma **GC** Column: HP methyl silicone (12 m × 0.22 mm i.d., 0.33 μm). Carrier gas: He, 60 mL/min. Temperature programme: 200° to 300° at 3°/min. FID. Limit of detection, 50 μg/L [Quaglio *et al.* 1993]. Column: OV7 phenyl methyl silicone with 20% phenyl silicone on HP Chrom W AW DMCS 100/120 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 190° for 3 min to 270° at 3°/min. FID. Limit of detection, 100 μg/L [Quaglio *et al.* 1992]. Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (0.5 m × 4 mm i.d.). Carrier gas: Ar, 230 mL/min. Temperature: 200°. ECD. Limit of detection, 3 μg/L [Kinney 1981]. Column; 3% OV-1 on Gas-Chrom Q 100/120 mesh (6 ft × 2 mm i.d.). Carrier gas: CH_4 : Ar (5 : 95). Temperature programme: 165° to 180°. ECD. Limit of detection, 6 μg/L [Quarterman *et al.* 1980].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. EI ionisation at 70 eV. Limit of quantification, 15 μg/L. Limit of detection, 5 μg/L [Yilmaz *et al.* 2009]. See GC. EI ionisation at 70 eV. Limit of detection, 10 μg/L [Quaglio *et al.* 1993]. Column: 3% OV-101 on Gas Chrom Q 120/140 mesh (2 m × 2 mm i.d.). Carrier gas: He, 15 mL/min. Temperature: 180°. EI ionisaton at 70 eV. Limit of detection, 300 μg/L [Ervik *et al.* 1981].

HPLC Column: MSpak GF-310 4B (50 × 4.6 mm i.d., 6 μm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 at 4 min for 5.5 min to 100 : 0 for 5.5 min), flow rate 0.55 mL/min. DAD (λ = 260 nm). Limit of quantification, 10 μg/L. Limit of detection, 1–3 μg/L [Umezawa *et al.* 2008]. Column: C4/E (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.02 mol/L phosphate buffer (pH 3.0) : acetonitrile: tetrahydrofuran (850 : 130 : 20) with 0.24 g 1-octane sulfonic acid, flow rate 1.9 mL/min. Fluorescence detection (λ_{ex} = 225 nm, λ_{em} = 310 nm). Limit of quantification, 1.0 μg/L [Mistry *et al.* 1998]. Column: Whatman silica (25 cm, 5 μm). Mobile phase: hexane : chloroform : methanol (85 : 14 : 1), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 220 nm, no emission filter). Limit of detection, 5 μg/L [Bhatti, Foster 1992]. Column: Chiralcel OD (250 × 4.6 mm i.d.). Mobile phase: 0.1% diethylamine, 200–1500 mg/L water, 4–10% of propan-1-ol and hexane, flow rate 0.25–1.75 mL/min. Limit of detection, 10 nmol/L [Balmer *et al.* 1991]. Column: Chiralcel OD (25 cm × 0.46 mm i.d.). Mobile phase: hexane : ethanol: *N,N*-diethylamine (95 : 5 : 0.1), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 220 nm, λ_{em} = 320 nm). Limit of detection, 4 μg/L [Herring *et al.* 1991].

See also Pautler, Jusko [1982].

LC-MS Column: Venusil MP-C_{18}.(100 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 10 mmol/L ammonium acetate : formic acid (pH 3.4, 50 : 50 : 0.05), flow rate of 0.8 mL/min. ESI, MRM acquisition mode. Limit of quantification, 3 μg/L [Gao *et al.* 2010]. Column: Chirobiotic T (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : acetic acid : ammonia (100/0.15/0.15). ESI, SRM acquisition mode. Limit of quantification, 0.5 μg/L [Jensen *et al.* 2008]. Column: C_8. (50 × 3 mm i.d., 3 μm). Mobile phase: 10 mmol/L ammonium formate : methanol (3 : 97), flow rate 1.0 mL/min. ESI, MRM acquisition mode. Limit of quantification, 5 μg/L, limit of detection, 1 μg/L [Gowda *et al.* 2007]. Column: CAPCELL PAK C_{18} (50 × 2.0 mm, 5 μm). Mobile phase: acetonitrile : water (5 : 95 to 50 : 50 over 3.5 min to 95: over 0.5 min to 5 : 95 over 0.5 min for 3 min), both containing 0.02% formic acid, flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 3.2 min. Limit of quantification, 5 μg/L [Li *et al.* 2007].

Urine **GC** See Plasma [Kinney 1981]. See Plasma. Temperature: 185° [Quarterman *et al.* 1980].

GC-MS Column: HP-5 (14 m × 0.2 mm i.d., 0.33 μm). Temperature programme: 30° for 2 min to 220° at 15°/min for 1 min to 260° at 5°/min to 320° at 15°/min for 3 min. Limit of detection, 30 μg/L [Hartonen, Riekkola 1996]. See Blood [Black *et al.* 1996]. See Plasma [Ervik *et al.* 1981].

HPLC Column: LiChroCART RP-18 (250 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile: methanol : 0.05% trifluoroacetic acid in water. DAD (λ = 200–450 nm). Limit of quantification, 0.24 mg/L, limit of detection, 0.08 mg/L [Baranowska *et al.* 2009]. Column: Reversed-phase LiChroCART Purospher C_{18}e (125 mm × 3 mm, 5 μm). Spectrophotometric and fluorometric detection [Baranowska, Wilczek 2009]. Column: Chiracel OD (250 × 4.6 mm i.d.). Mobile phase: *n*-hexane : ethanol : propan-2-ol : diethylamine (85 : 7.5 : 7.5 : 0.05), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 276 nm, λ_{em} = 309 nm). Limit of quantification, 25 μg/L [Kim *et al.* 2000]. Column: Reversed-phase Nova-Pak C_{18} (100 × 5 mm i.d., 4 μm). Mobile phase: acetonitrile : methanol : TEA : phosphate buffer (pH 3.0; 9 : 1 : 90), flow rate 1.4 mL/min. Fluorescence detection (λ_{ex} = 229 nm, λ_{em} = 309 nm). Limit of detection, 1 μg/L [Chiu *et al.* 1997]. Column: Bondapak C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile : water (40 : 60), 5 μmol/L potassium dihydrogen phosphate/dipotassium hydrogen phosphate (pH 6.5), flow rate 1.3 mL/min. Electrochemical detection. Limit of quantification, 400 ppb [Maguregui *et al.* 1995]. See Plasma [Balmer *et al.* 1991]. See also Li *et al.* [1995] and Xie, Zhou [1995].

Note For a review of HPLC methods for enantioselective analysis of metoprolol and other β-blockers, see Egginger *et al.* [1993].

Disposition in the Body Metoprolol is well absorbed after oral administration; although the bioavailibity is low because of extensive first-pass metabolism. It crosses the blood–brain barrier and placental barrier; it is also excreted into breast milk. Approximately 95% of a dose is excreted in the urine within 48 h, with ~65% of the dose as the inactive metabolite, 4-(2-hydroxy-3-isopropylaminopropoxy) phenylacetic acid, and ~10% as a further inactive metabolite, 2-hydroxy-3-[4-(2-methoxyethyl)phenoxy]propionic acid. Two active metabolites, α-hydroxymetoprolol and *O*-desmethylmetoprolol, are also excreted in the urine in amounts equivalent to ~10% and <1% of the dose, respectively. Up to ~10% of a dose is excreted as unchanged drug.

Therapeutic Concentration

Following a single oral dose of 100 mg, given to 6 subjects, peak plasma concentrations of 0.03–0.28 mg/L (mean, 0.13) were attained in ~2.5 h [Kirch *et al.* 1983].

Following a single oral dose of 100 mg to 8 subjects, a mean peak plasma concentration of metoprolol of 0.12 mg/L was attained in 2–3 h; the α-hydroxy metabolite reached a mean peak of 0.07 mg/L in ~3 h. After repeated administration of 100 mg every 12 h, the mean peak plasma concentrations on the 8th day were 0.19 mg/L for metoprolol and 0.07 mg/for the α-hydroxy metabolite. The concentration of the metabolite appears to be increased in elderly subjects [Quarterman *et al.* 1981].

In 20 subjects receiving 100 mg metoprolol tartate twice daily for a total of 9 doses by mouth, the reported peak plasma concentration of (*S*)-metoprolol was 0.0855 mg/L in men and 0.146 mg/L in women, and that of (*R*)-metoprolol was 0.0672 mg/L in men and 0.124 mg/L in women; peak concentrations occurred at 1.3 h in men and 1.6 h in women [Luzier *et al.* 1999].

Toxicity

In a fatal overdose of metoprolol, the following postmortem tissue concentrations of the active (*S*)-isomer were reported: blood, 33 mg/L, liver 224 μg/g and stomach contents 56 mg/61 g. Concentrations of the (*R*)-isomer were blood 33 mg/L, liver 222 μg/g and stomach contents 55 mg/61 g [Mozayani *et al.* 1995].

The following postmortem concentrations were reported in a death from an intentional overdose of metoptolol: blood 19.8 mg/L, bile 83.1 mg/L, urine 1.6 mg/L and vitreous humour 15.1 mg/L; a blood ethanol concentration of 0.25 g/100 mL was also found [Rohrig *et al.* 1987].

In a fatality caused by the deliberate ingestion of metoprolol, the following postmortem tissue concentrations were reported: blood 4.7 mg/L, bile 254 mg/L, kidney 7.1 μg/g, liver 6.3 μg/g and urine 194 mg/L [Stajic *et al.* 1984].

In a fatality caused by metoprolol and salicylate, the following postmortem tissue concentrations were reported: metoprolol in blood 56 mg/L, bile 276 mg/L and liver 230 μg/g; salicylate in blood 220 mg/L [Holzbecher *et al.* 1982].

Bioavailability Approximately 40–50% (~70% after modified-release preparations).

Half-life Plasma half-life, metoprolol 3–4 h in fast hydroxylators and ~7 h in slow hydroxylators; α-hydroxymetoprolol 4 to 12 h (mean, 6).

Volume of Distribution ~4 L/kg.

Clearance Plasma clearance, ~15 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.77.

Protein Binding ~11%.

Note For a review of the clinical pharmacokinetics of metoprolol, see Regardh, Johnsson [1980] and for a review of controlled-release metoprolol, see Kendall *et al.* [1991].

Dose In hypertension 100 to 400 mg of metoprolol tartrate daily.

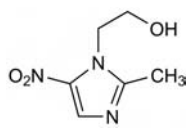
Metronidazole

Antiprotozoal, Antibacterial
$C_6H_9N_3O_3$ = 171.2
CAS—443-48-1

IUPAC Name 2-Methyl-5-nitroimidazole-1-ethanol
Synonyms Bayer 5630; RP-8823.
Proprietary Names *Anabact*; *Elyzol*; *Flagyl*; *Metizol*; *Metro*; *Metrocream*; *Metrogel*; *Metrogyl*; *Metrolyl*; *Metrotop*; *Metrozol(e)*; *Metryl*; *Norit(r)ate*; *Norzol*; *Protostat*; *Rozex*; *Trichozole*; *Vaginyl*; *Zadstat*; *Zidoval*; *Zyomet*. It is an ingredient of *Entamizole*, *Helidac* and *HeliMet*.



Chemical Properties A white to pale yellow crystalline powder or crystals. It darkens on exposure to light. Mp 158° to 160°. Soluble 1 in 100 of water, 1 in 200 of ethanol and 1 in 250 of chloroform; soluble in dilute acids; slightly soluble in ether. pK_a 2.5. Log *P* (octanol/buffer pH 7.4), −0.1.
Colour Test Methanolic potassium hydroxide—red.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.02; system TC—R_f 0.36; system TE—R_f 0.46; system TL—R_f 0.40; system TAD—R_f 0.32; system TAE—R_f 0.75; system TAF—R_f 0.70; system TAJ—R_f 0.32; system TAK—R_f 0.14; system TAL—R_f 0.75 (acidified potassium permanganate solution, positive).

Vaginal Tissue **HPLC** UV detection. Limit of detection, ~100 ng/g [Venkateshwaran, Stewart 1995].

Disposition in the Body Metronidazole is readily and almost completely absorbed after oral administration and is widely distributed in the body. It is metabolised by oxidation to 2-hydroxymethylmetronidazole and 2-methyl-5-nitroimidazol-1-acetic acid, and by conjugation with glucuronic acid. About 70–80% of a dose is excreted in the urine in 48 h with <10% of the dose as unchanged drug, up to 10% as conjugated metronidazole, about 27% as 2-hydroxymethylmetronidazole, 10% as the conjugated 2-hydroxymethyl metabolite, and 20% as the acid metabolite.

Therapeutic Concentration

Following a single oral dose of 400 mg to 7 subjects, peak plasma concentrations of 4.5–11.6 (mean 6.9) mg/L were attained in about 2 h; a mean peak plasma concentration of 1.6 mg/L of 2-hydroxymethylmetronidazole was attained in about 8 h [Jensen, Gugler 1983].

Fifty-four subjects given IV metronidazole, 500 mg every 8 h, had mean peak and trough plasma concentrations of 28.9 and 18.0 mg/L, respectively. Mean peak and trough concentrations of the hydroxy metabolite were 6.6 and 4.2 mg/L [Ti *et al.* 1996].

Toxicity

In a fatality attributed to an alcohol/metronidazole interaction, blood levels of 1620 mg/L alcohol, 46 mg/L acetaldehyde and 0.42 mg/L metronidazole were found [Cina *et al.* 1996].

Half-life Plasma half-life, about 8 h.

Volume of Distribution About 0.5–1 L/kg.

Clearance Plasma clearance, about 1 mL/min/kg.

Protein Binding <20%.

Note For a review of the pharmacokinetics of metronidazole, see Ralph [1983].

Dose Up to 2.4 g daily for 10 days.

Metyrapone

Diagnostic Agent (Pituitary Function)

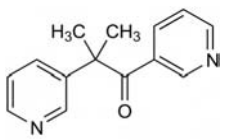
$C_{14}H_{14}N_2O$ = 226.3

CAS—54-36-4

IUPAC Name 2-Methyl-1,2-di-3-pyridyl-1-propanone

Synonym Methopyrapone; Su-4885.

Proprietary Name *Metopiron(e)*



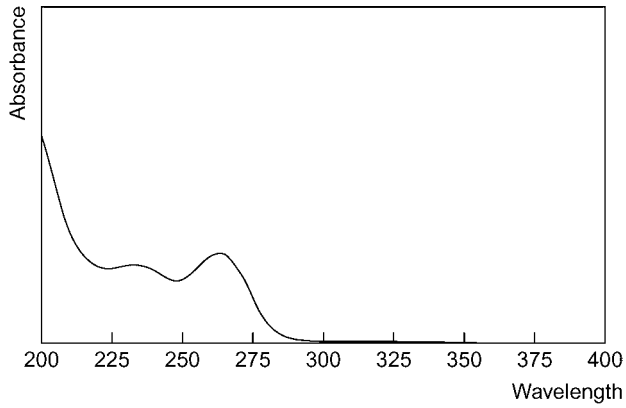
Chemical Properties A white to light amber, fine, crystalline powder which darkens on exposure to light. Mp 50° to 53°. Soluble 1 in 100 of water, 1 in 3 of ethanol and chloroform; soluble in methanol. Log *P* (octanol/water), 1.9.

Colour Test Cyanogen bromide—orange.

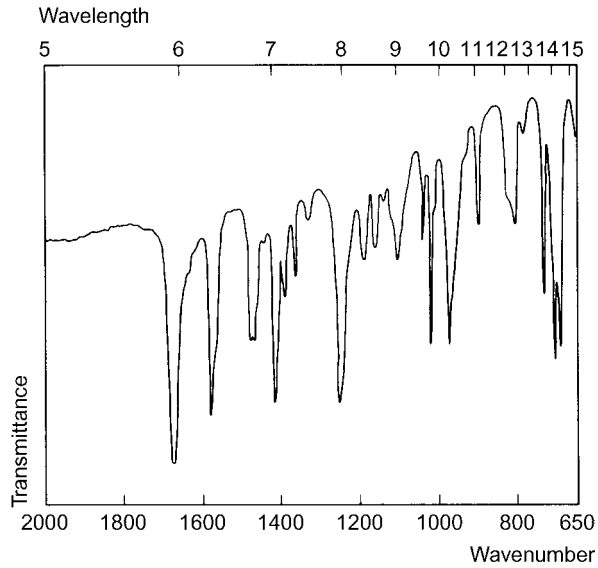
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.16; system TC—R_f 0.58; system TE—R_f 0.64; system TL—R_f 0.41; system TAE—R_f 0.66 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1860.

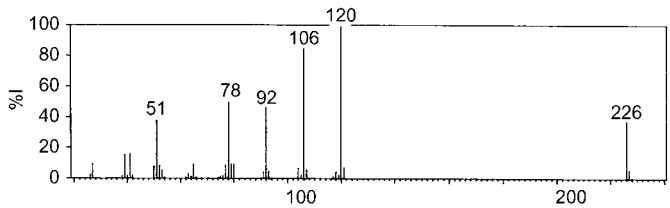
Ultraviolet Spectrum Aqueous acid—260 (A^{1}_{1}=500a), 233 nm.



Infrared Spectrum Principal peaks at wavenumbers 1672, 1578, 1255, 714, 699, 970 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 120, 106, 78, 92, 51, 226, 41, 39.



Quantification

Plasma **Colorimetry** Limit of detection, 5 mg/L for metyrapone, 2 mg/L for 1-hydroxymetyrapone [Szeberenyi *et al.* 1969].

Spectrofluorimetry [Meikle *et al.* 1969].

HPLC UV detection. Metyrapone and its enantiomeric metyrapol metabolites. Limit of detection, 0.045 mg/L [Cassiano *et al.* 2002].

Urine **GC** FID. Metyrapone and 1-hydroxymetyrapone [Hannah, Sprunt 1969].

Tissues **Colorimetry** See Plasma [Szeberenyi *et al.* 1969].

Disposition in the Body Metyrapone is metabolised by reduction to the 1-hydroxy derivative which is active. It is excreted in the urine mainly as the glucuronide conjugates of 1-hydroxymetyrapone and metyrapone. About 50% of a dose is excreted in the urine in 3 days.

Dose Up to 4.5 g daily.

Cassiano NM *et al.* (2002). Determination of the plasma levels of metyrapone and its enantiomeric metyrapol metabolites by direct plasma injection and multidimensional achiral-chiral chromatography. *Chirality* 14: 731–735.

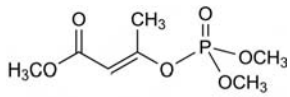
Mevinphos

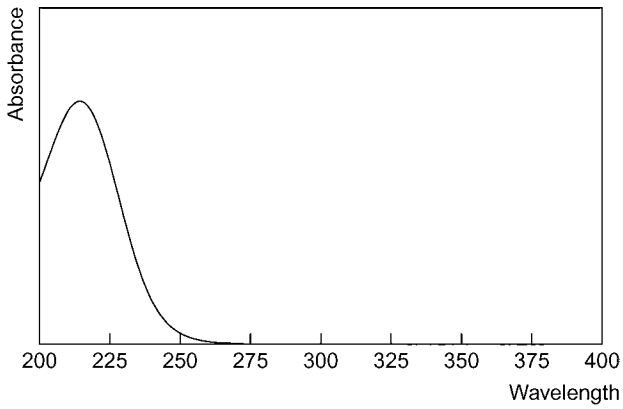
Insecticide
$C_7H_{13}O_6P$ = 224.1
CAS—7786-34-7

IUPAC Name Methyl (*E*)-3-dimethoxyphosphoryloxybut-2-enoate
Synonym 3-[(Dimethoxyphosphinyl)oxy]-2-butenoic acid methyl ester
Proprietary Name *Phosdrin*

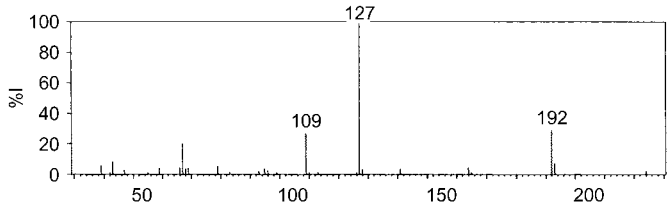


(*E*)- isomer

Chemical Properties The technical product is a pale yellow to orange liquid. Miscible with water, ethanol, acetone, benzene, carbon tetrachloride, toluene, xylene and chloroform; soluble 1 in 20 of carbon disulfide; practically insoluble in hexane. Log *P* (octanol/water), 0.1. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].
Colour Test Phosphorus test—yellow.
Thin-layer Chromatography System TE—R_f 0.75; system TW—R_f 0.23; system TX—R_f 0.12; system TY—R_f 0.10; system TAB—R_f 0.03; system TAC—R_f 0.02; system TAE—R_f 0.86.
Gas Chromatography System GA—RI 1450; system GK—RRT 0.50(relative to caffeine).
High Performance Liquid Chromatography System HAO—*k* 1.37; system HAP—*k* 0.45.
Ultraviolet Spectrum Principal peak at 215 nm.



Mass Spectrum Principal ions at *m/z* 127, 192, 109, 67, 43, 193, 39, 79.



Quantification
Blood **GC-MS** Mevinphos and other organophosphorus pesticides. Limits of detection, 0.01 to 0.3 µg/g [Musshoff *et al.* 2002].
Fluids **GC** AFID [Lewin, Love 1974].
Postmortem Tissues **GC** See Fluids [Lewin, Love 1974].

Disposition in the Body
Toxicity Mevinphos is extremely toxic by inhalation, ingestion or percutaneous absorption and the estimated lethal dose is <500 mg. The maximum permissible atmospheric concentration is 0.1 mg/m^3.

The following postmortem tissue concentrations were reported in a fatality due to the ingestion of mevinphos: blood 360 mg/L, brain 3 µg/g, kidney 20 µg/g, liver 240 µg/g, skeletal muscle 86 µg/g, urine 8 mg/L; alcohol was detected in blood and urine at concentrations of 1250 mg/L and 1550 mg/L, respectively; death occurred within 45 min of ingestion [Lewin, Love 1974].

A 66-year-old man died about 1 min after ingesting 28 g of mevinphos [Lokan, James 1983].

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

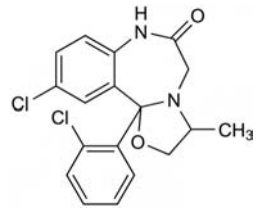
Mexazolam

Anxiolytic
$C_{18}H_{16}Cl_2N_2O_2$ = 363.2
CAS—31868-18-5

IUPAC Name 10-Chloro-11b-(2-chlorophenyl)-2,3,7,11b-tetrahydro-3-methyloxazolo-[3,2-d][1,4]-benzodiazepin-6(5*H*)-one
Synonyms CS-386; methylcloxazolam.
Proprietary Name *Melex*

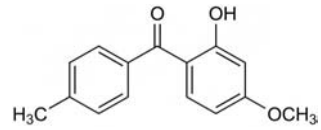


Chemical Properties Crystalline powder. Mp 172° to 175°. pK_a 6.7.
Thin-layer Chromatography System TE—R_f 0.78; system TF—R_f 0.55; system TAE—R_f 0.86.
Gas Chromatography System GA—RI 2600.
High Performance Liquid Chromatography System HX—RI 345.
Ultraviolet Spectrum Aqueous acid—241, 290, 373 nm; ethanol—244 nm; aqueous alkali—244 nm.
Infrared Spectrum Principal peaks at wavenumbers 1661, 1400, 1204, 1470, 1300, 1078 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 251, 70, 253, 28, 41, 42, 139, 18.

Mexenone

Sunscreen Agent
$C_{15}H_{14}O_3$ = 242.3
CAS—1641-17-4

IUPAC Name (2-Hydroxy-4-methoxyphenyl)(4-methylphenyl)methanone
Synonym Benzophenone-10
Proprietary Name It is an ingredient of *Uvistat*.



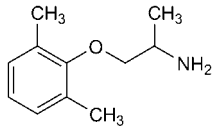
Chemical Properties A pale yellow crystalline powder. Mp 99° to 102°. Practically insoluble in water; soluble 1 in 70 of ethanol and 1 in 7 of acetone. Log *P* (octanol/water), 4.1.
Ultraviolet Spectrum Methanol—243 (A^1_1=353b), 287 (A^1_1=640a), 325 nm (A^1_1=440b).
Infrared Spectrum Principal peaks at wavenumbers 1260, 1598, 1637, 1211, 1613, 920 cm^{-1} (KBr disk).
Use Topically in a concentration of 4% in a cream or a solid basis.

Mexiletine

Antiarrhythmic
$C_{11}H_{17}NO$=179.3
CAS—31828-71-4

IUPAC Name 1-(2,6-Dimethylphenoxy)propan-2-amine

Synonym 1-(2,6-Dimethylphenoxy)-2-propanamine



Chemical Properties Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Mexiletine Hydrochloride

$C_{11}H_{17}NO,HCl$=215.7
CAS—5370-01-4
Proprietary Name *Mexitil*
Chemical Properties A white crystalline powder. Mp 198° to 204°. Soluble 1 in 2 of water, 1 in 3 of ethanol and 1 in 30 of chloroform; practically insoluble in ether. pK_a 9.06 [Katagiri *et al.* 1991], 8.5 [Labbé, Turgeon 1999], 8.4 [Kelly *et al.* 1981]. Log *P* (octanol/water), 2.2. Stock solutions in methanol were stable at –2 0° for 4 weeks. Plasma samples were stable at 4° for 24 h, at room temperature for 24 h, and after 3 freeze-thaw cycles [Li *et al.* 2007]. Serum samples were stable for 10 months at –2 5° [Paczkowski *et al.* 1992].

Colour Tests Liebermann's reagent—brown; Mandelin's test—brown-orange; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.17; system TC—R_f 0.04; system TE—R_f 0.55; system TAE—R_f 0.25; system TAF—R_f 0.78; system TAG—R_f 0.09.

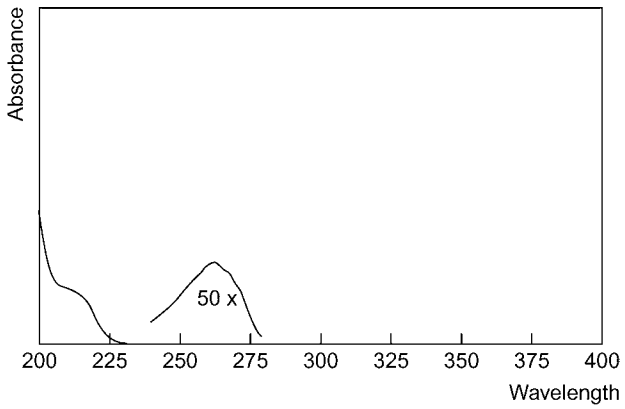
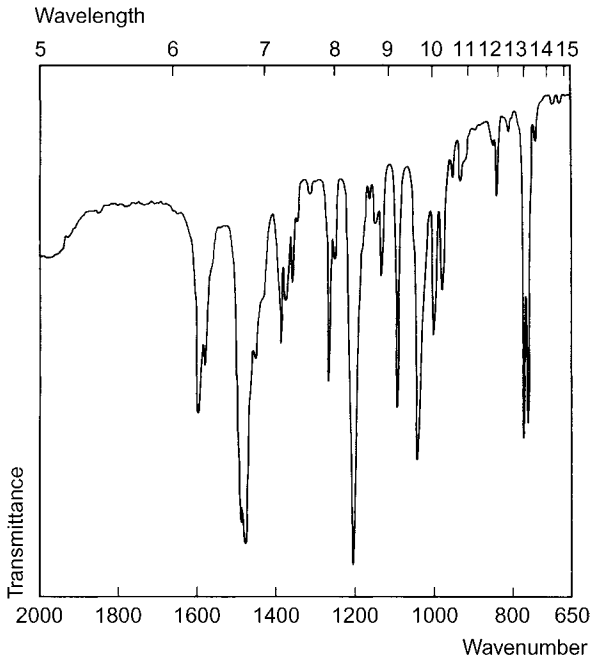
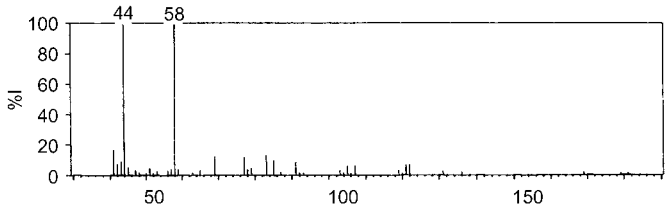
Ultraviolet Spectrum Aqueous acid—260 nm (A_1^1 = 14a).



Infrared Spectrum Principal peaks at wavenumbers 1200, 1040, 770, 760, 1595, 1090 cm^{-1} (mexiletine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 44, 41, 83, 77, 69, 85, 43.



Quantification

Blood **GC** Column: HP-5 cross-linked 5% phenylmethyl silicone fused silica (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 30°/min to 260° at 10°/min to 300° at 20°/min for 8 min. Limit of detection not reported [Kempton *et al.* 1994]. Column: Restek RTX-50 (15 m). Temperature programme: 100° to 300° at 20°/min. FID. Limit of detection, 3.4 mg/L [Rohrig, Harty 1994]. Column: Spherisorb S5W silica (125 × 5 mm i.d.). Mobile phase: methanol : 2,2,4-trimethylpentane (80 : 20) containing 1 mmol/L (+)-10-camphorsulfonic acid, flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 200 nm). Retention time: 0.61. Limit of detection, 50 µg/L [Bhamra *et al.* 1984]. Column: 1.5% Carbowax 20M and 5% potassium hydroxide on Supelcoport 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 130°. AFID. Limit of detection, 5 µg/L [Smith, Meffin 1980].

Plasma **GC** Column: 1.5% OV-1 on 80/100 mesh Shimalite W 201D (1.5 m × 3 mm i.d). Carrier gas: N_2, 40 mL/min. Temperature: 180°. FID. Limit of detection, 20 ng/mL [Ji *et al.* 1993]. Column: 3% OV-17 on 80/100 mesh Gas-Chrom Q (200 × 2.5 mm i.d.). Carrier gas: Ar : CH_4 (90 : 10), 25 mL/min. Temperature: 150°. ECD. Limit of detection, 20 µg/L for mexiletine, 7 µg/L for 2′-hydroxymethyl metabolite[Pachecus *et al.* 1982]. Column: 3% OV-17 on Gas Chrom Q 80/100 mesh (1.68 m × 4 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 160°. NPD. Retention time: 4.0 min. Limit of detection, 5.0 µg/L [Pilling *et al.* 1982]. Column: 3% OV-17 on Gas Chrom Q 80/100 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 150°. FID. Limit of detection, 50 µg/L [Chan *et al.* 1980]. See Blood [Smith, Meffin 1980]. See also Bradbrook *et al.* [1977], Frydman *et al.* [1978], Holt *et al.* [1979], Kelly *et al.* [1973], Willox, Singh [1976].

GC-MS Column: Supelco SPB-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 30 mL/min. Temperature programme: 100° for 0.5 min to 280° at 25°/min for 2.0 min. SIM acquisition mode. Retention time: 6.3 min. Limit of quantification, 0.1 µg/L [Minnigh *et al.* 1994]. Column: 5% Carbowax 20 M/5% KOH on Chromosorb WHP 100/120 mesh (2 m × 2 mm i.d.). Temperature: 155°. FID. Retention time: 4.3 min. Limit of detection, 0.03 mg/L [Kacprowicz 1982].

HPLC Column: Lichrospher RP-18 (125 × 4.0 mm i.d., 5 µm). Mobile phase: propan-2-ol : acetonitrile: 0.05 N acetate buffer (pH 5.5; 22 : 10 : 68 or 25 : 10 : 65), flow rate 1 or 1.5 mL/min. Fluorescence detection (λ_{ex} = 350 nm, λ_{em} = 455 nm). Retention time: 17.7 and 19.2 for (*S*)- and (*R*)-enantiomers, respectively. Limit of quantification, 10 µg/L for *p*-hydroxymexiletine enantiomers [Lanchote *et al.* 1997]. Column: Chiralcel OJ (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : ethanol (7.1 : 2.9), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 340 nm). Limit of detection, 1 µg/L [Lanchote *et al.* 1996]. Column: Chiralpak AD (250 × 4.6 mm i.d.). Mobile phase: hexane : ethanol (94 : 6 for 15 min to 75 : 25 at 15.1 min), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 350 nm, λ_{em} = 444 nm). Limit of detection not reported [Fieger, Wainer 1993]. Column: Apex C_{18} ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L sodium acetate (pH 7.3; 65 : 35), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 350 nm, λ_{em} = 445 nm). Limit of detection, 1.5 µg/L [Abolfathi *et al.* 1992]. Column: Spherisorb hexyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen phosphate (pH 4.0; 40 : 60), flow rate 1.5mL/min. UV detection (λ = 210 nm). Limit of quantification, 0.05 mg/L [Verbesselt *et al.* 1991]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : acetonitrile : water (50 : 20 : 30), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 338 nm, λ_{em} = 455 nm). Limit of quantification, 0.05 mg/L [Contreras de Condado *et al.* 1990]. Column: C_8 RAC II (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 0.5 mol/L dipotassium hydrogen phosphate (380 : 610 : 10), flow rate 70 mL/h. UV detection (λ = 214 nm). Retention time: 6.1 min. Limit of detection, 0.02 ng/L [Paczkowski *et al.* 1989].

LC-MS Column: Capcell Pak C_{18} (50 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water both containing 0.02% formic acid (5 : 95 to 50 : 50 at 3.5 min to 95 : 5 in 0.5 min to 5 : 95 in 0.5 min for 3 min), flow rate 0.3 mL/min. TIS, positive ion mode. Retention time: 4.1 min. Limit of quantification, 10 µg/L [Li *et al.* 2007].

Serum **GC** Column: 5% OV-1 on Chromosorb W A W DMCS 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature programme: 150°. FID. Limit of detection, 25 µg/L [Marko 1987]. Column: 2% OV-101 Chromosorb W-HP 100/120 mesh (0.6 m × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature programme: 130° for 1 min to 170° at 30°/min for 1 min to 240° at 30°/min for

M

4 min. NPD. Limit of detection, 0.25 mg/L [Vasiliades *et al.* 1984]. Column: 10% Apiezon L-2% potassium hydroxide on 80/100 mesh (2.1 m × 4.0 mm i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 195°. FID. Retention time: 0.73. Limit of detection, 0.1 mg/L [Holt *et al.* 1979].

GC-MS Column: Ultra-1 (25 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 195° for 5 min to 300° at 20°/min for 3 min. CI, SIM acquisition mode. Limit of detection, 0.1 mg/L [Dasgupta *et al.* 1998; Dasgupta, Yousef 1998].

HPLC Column: Pirkle 1-A phenylglycine (250 × 4.6 mm i.d., 5 µm). Mobile phase: propan-2-ol : chloroform : hexane (7 : 15 : 78), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 270 nm, λ_{em} = 420 nm). Limit of quantification, 2.5 µg/L; limit of detection, 0.5 µg/L [Kowk *et al.* 1994]. Column: Supelcosil LC8-DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol: 0.5 mol/L potassium dihydrogen phosphate : water (120 : 40 : 6 : 334), flow rate 1.2 mL/min. UV detection (λ = 203 nm). Limit of detection, 2 µg/L [Paczkowski *et al.* 1992]. Column: Shim-Pack CLC-ODS M (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L tris(hydroxymethyl)aminomethane (pH 9.0) : ethanol : propan-2-ol (55 : 35 : 10), flow rate 1.0 mL/min. Fluorometric detection (λ_{ex} = 397 nm, λ_{em} = 479 nm). Retention time: 14.0 min. Limit of detection, 0.005 mg/L [Shibata *et al.* 1991]. Column: NovaPak cyano HP (100 × 5 mm i.d.). Mobile phase: 5 mmol/L acetate buffer containing 0.05% TEA: acetonitrile (pH 6.0; 90 : 10), flow rate 1.5 mL/min. UV detection (λ = 210 nm). Retention time: ~1.1. Limit of detection, 0.7 mg/L [vasBinder, Annesley 1991].Column: Hypersil CPS (CN) reversed phase (250 × 4.6 mm i.d., 5 µm). Mobile phase: 973.5 mL water with 25 mL PIC B-8 low UV reagent, 1 mL butylamine and 0.5 mL PIC D-4 reagent : acetonitrile (95 : 5), flow rate 2.0 mL/min. UV detection (λ = 215 nm). Limit of quantification, 0.05 mg/L [Krämer *et al.* 1989]. See also Elfving *et al.* [1981], Farid and White [1983], Filipek *et al.* [1988], Grech-Bélanger *et al.* [1984], and Paczkowski *et al.* [1989].

Urine **GC** Column: heptakis (6-*O*-*tert*-butyl-dimethylsilyl-2,3-di-*O*-methyl)-β-cyclodextrin 50% in polysiloxan OV1701 (25 m × 0.25 mm i.d., 0.125 µm). Carrier gas: He, 40 mL/min. Temperature programme: 120° for 1 min to 175° at 1°/min. FID. Retention time: 32 min. Limit of detection, 0.1 mg/L [Knoche *et al.* 1996]. See Plasma. Limit of detection, 1.0 mg/L [Pilling *et al.* 1982]. See Plasma [Chan *et al.* 1980]. Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (2 m × 0.64 cm o.d.). Carrier gas: N_2, 60 cm^3/min. Temperature: 160°. Limit of detection, 5 µg/L [Beckett, Chidomere 1977]. Column: 1% cyclohexane dimethanol succinate on 100/120 mesh Gas-Chrom Q (3 m × 4 mm i.d.). Carrier gas: CH_4:Ar (5 : 95), 45 mL/min. Temperature programme: 180°. Retention time, 3.3 min. Limit of detection, 2 mg/L [Willox, Singh 1976]. Column: 3% cyclohexane dimethanol succinate 100/120 Gas-Chrom Q (120 × 0.62 cm [4′ × 0.25"] o.d.). Carrier gas: He, 70 mL/min. Temperature programme: 220°. FID. Retention time: 3.1 min. Limit of detection, <10 µg/L [Kelly *et al.* 1973].

GC-MS Column: HP capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, scan mode. Limit of detection not reported [Maurer 1990].

HPLC See Plasma [Fieger, Wainer 1993]. Column: Pirkle type 1A (25 × 0.46 mm i.d., 5 µm). Mobile phase: propan-2-ol : *n*-hexane (5.5 : 94.5), flow rate 1.4 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 340 nm). Limit of detection, 5 µg/L [McErlane *et al.* 1987]. See Plasma [Breithaupt, Wilfling 1982].

Bile **GC** See Urine [Willox, Singh 1976].

CSF **HPLC** See Plasma [Breithaupt, Wilfling 1982].

Liver Microsomes **HPLC** Column: XL ODS (75 × 4.6 mm i.d., 3 µm). Mobile phase: 10 mmol/L potassium phosphate buffer (pH 4.2) : methanol : acetonitrile (90 : 5 : 5), flow rate 0.75 mL/min to 7 min to 1.5 mL/min at 9 min decreased from 20 min to 0.75 mL/min at 22 min. Fluorescence detection (λ_{ex} = 270 nm, λ_{em} = 312 nm). Limit of detection, 0.35 nmol/L for hydroxymethylmexilitene and 0.08 nmol/mL for *p*-hydroxymexilitene [Broly *et al.* 1988].

Disposition in the Body Readily absorbed after oral administration; bioavailability 80–90%. It is extensively metabolised; the major metabolites are the 4′-hydroxy and 2′-hydroxymethyl derivatives, which may be further metabolised by deamination to the corresponding alcohols. The rate and extent of renal excretion is dependent on the urinary pH. Under normal conditions, up to ~20% of a dose may be excreted in the urine as unchanged drug in 24 h, but this may be increased to ~50% if the urinary pH is maintained at ~5. CYP1A2 seems to be implicated in the *N*-oxidation of mexiletine [Labbé, Turgeon 1999] while non-CYP2D6-dependent metabolic pathways seem to be responsible for the metabolism of mexilitene in humans [Abolfathi *et al.* 1993]. See also [Senda *et al.* 2001].

Therapeutic Concentration In plasma, usually in the range 0.5–2 mg/L.

With an oral dose of 200 mg, peak plasma concentrations of 1–2 µg/mL occur 30–60 min following ingestion and decline to ~100 µg/L after 24 h [Willox, Singh 1976].

A 45-year-old was administered a 250 mg IV dose (3.5 mg/kg) of mexiletine hydrochloride. The half-life was 7.9 h, the elimination constant was $-0.087\ h^{-1}$, and the central volume of distribution was 386.1. Following administration of a 300 mg oral dose (4.0 mg/kg) of mexiletine hydrochloride, the half-life was 14.9 h and the elimination constant was $-0.046\ h^{-1}$ [Frydman *et al.* 1978].

Following a single oral dose of 400 mg to 6 subjects, peak plasma concentrations of 0.65–0.94 mg/L (mean 0.77) were attained in ~2 h [Haselbarth *et al.* 1981].

Following daily oral doses of 450 mg to 10 subjects, steady-state plasma concentrations of 0.75–2.18 mg/L (mean 1.6) were reported [Ohashi *et al.* 1984].

A healthy young volunteer was administered a single oral dose of 200 mg racemic mexilitene hydrochloride. The peak plasma concentrations of ~250 and 290 µg/L were reached after 4 h for *S*(+) and *R*(−)-mexilitene, respectively [Grech-Bélanger *et al.* 1985].

Ten healthy subjects were administered a single oral dose of 400 mg mexilitene. Peak mexilitene serum concentrations were observed at 3 h and ranged from 0.552–0.925 mg/L (mean 0.686 mg/L). Disappearance of the drug was realatively slow from all subjects and the drug was still detectable at 24 h with concentrations ranging from 0.082–0.174 mg/L. The first detectable levels for hydroxymethylmexiletine and *p*-hydroxymexiletine were observed 1 h after the dose. The peak serum concentrations for both metabolites were observed between 4 and 6 h and ranged from 0.385–0.690 mg/L for hydroxymethylmexiletine and from 0.06–0.225 mg/L for *p*-hydroxymexiletine [Paczkowski *et al.* 1990].

A 62-year-old female was administered chronic oral therapy with 200 mg racemic-mexiletine 3 times a day. The mean pharmacokinetic parameters were as follows:

Parameter	*p-Hydroxymexiletine*		*Hydroxymethylmexiletine*	
	(S)	*(R)*	*(S)*	*(R)*
C_{max} (µg/L)	63.5	73.0	29.0	50.3
t_{max} (h)	5	5	4	4

[Lanchote *et al.* 1997].

In 5 subjects with painful alcoholic neuropathy, the minimum effective oral dose of mexiletine was 300 mg daily, with an effective plasma concentration of 0.66 mg/L (± 0.15) [Nishiyama, Sakuta 1995].

Note For a study of the pharmacokinetics of mexiletine in patients with acute myocardial infarction, see Pentikäinen *et al.* [1984]; in renal failure, see Wang *et al.* [1985]. For pharmacokinetic parameters in combination with cimetidine and ranitidine, see Brockmeyer *et al.* [1989].

Toxicity

In a fatality from mexiletine overdose, postmortem blood and liver concentrations of 44.3 mg/L and 636 µg/g, respectively, were reported [Blackmore, Osselton 1982].

A 26-year-old male was found dead. Postmortem mexiletine concentrations were as follows:

Specimen	*Concentration (mg/L or mg/kg)*
Heart blood	38
Subclavian blood	14
Urine	370
Bile	440
Vitreous humour	17
Liver	190
Kidney	170
Stomach contents	2.9

[Kempton *et al.* 1994].

In a fatality involving mexiletine, tissue distribution was as follows: heart blood 44.8 mg/L, femoral blood 10.0 mg/L, brain 84 µg/g, vitreous humour 8.6 mg/L, liver 171.6 µg/g, gastric contents 1464 mg [Rohrig, Harty 1994].

A 41-year-old woman survived after ingesting up to 1.8 g mexiletine in a suicide attempt; her serum level was 20 mg/L [Nelson, Hoffman 1994].

Bioavailability 88% [Wulf 1983].

Half-life There is considerable intersubject variation and the plasma half-life appears to vary with the urinary pH; it is usually in the range 7–25 h (mean 11 h in normal subjects, increased in subjects with arrhythmias).

Volume of Distribution Approximately 8 L/kg, but there is considerable intersubject variation.

Clearance Plasma clearance, ~7 mL/min/kg with considerable intersubject variation. Milk : plasma ratio of 0.8 to 1.9, with a mean of 1.45 ± 0.3 [Wulf 1983].

Protein Binding Approximately 70% [Labbé, Turgeon 1999]

Note For a review of mexiletine, see Wulf [1983] and Labbé and Turgeon [1999].

Dose 0.6 to 1 g of mexiletine hydrochloride daily.

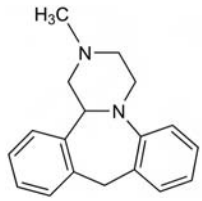
Mianserin

Antidepressant

$C_{18}H_{20}N_2 = 264.4$

CAS—24219-97-4

IUPAC Name 1,2,3,4,10,14*b*-Hexahydro-2-methyldibenzo[*c*,*f*]-pyrazino[1,2-*a*] azepine



Chemical Properties Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Mianserin Hydrochloride

$C_{18}H_{20}N_2,HCl = 300.8$

CAS—21535-47-7

Synonyms Mianserini hydrochloridum; Org-GB-94.

Proprietary Names *Athymil*; *Bolvidon*; *Bonserin*; *Hopacem*; *Lantanon*; *Lerivon*; *Lumin*; *Miabene*; *Mianeurin*; *Miaxan*; *Norval*; *Prisma*; *Tolmin*; *Tolvin*; *Tolvon*. The name Norval was formerly applied to a preparation containing docusate sodium.

Chemical Properties White crystals or crystalline powder. Mp 282° to 284°. Soluble 1 in 50 of water, 1 in 100 of ethanol, and 1 in 20 of chloroform.

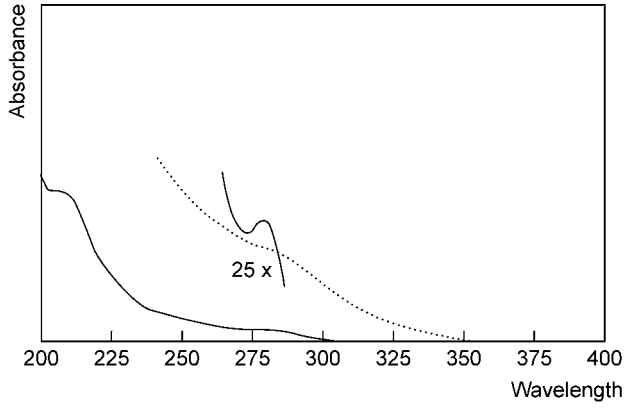
Colour Test Liebermann's reagent—violet; Mandelin's test—violet

Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.39; system TC—R_f 0.58; system TE—R_f 0.68; system TL—R_f 0.23; system TAE—R_f 0.48; system TAF—R_f 0.50 (acidified iodoplatinate solution, blue; Mandelin's reagent, violet).

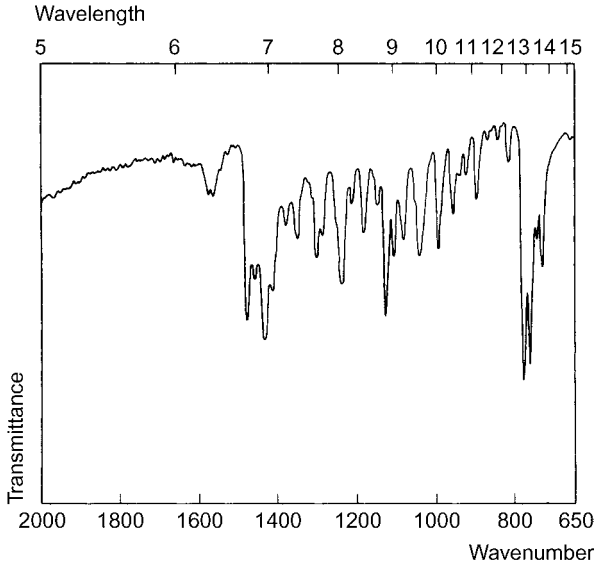
Gas Chromatography System GA—mianserin RI 2210, M (nor-) RI 2235, M (8-OH-) RI 2495, M (*N*-oxide) RI 2202, M (OH-methoxy-) RI 2530; system GB—mianserin RI 2302, M (nor-) RI 2348, M (8-OH-) RI 2628; system GF—RI 2595; system GM—mianserin RRT 0.879, M (nor-) RRT 1.105 (both relative to iprindole); system GS—RT 18.1 min.

High Performance Liquid Chromatography System HA—mianserin *k* 1.8, M (*N*-desmethyl-) *k* 2.4; system HX—RI 391; system HY—RI 342; system HZ—RT 4.6 min; system HAA—RT 13.8 min; system HAZ—mianserin *k* 1.18, M (nor-) *k* 0.88, M (*N*-oxide) *k* 0.53, M (8-OH-) *k* 0.19.

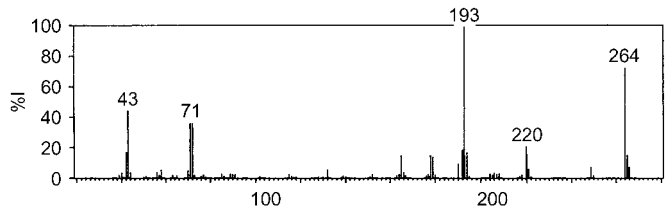
Ultraviolet Spectrum Aqueous acid—279 nm (A_1^1 = 75a).



Infrared Spectrum Principal peaks at wavenumbers 787, 772, 1138, 1254, 1314, 742 cm^{-1} (mianserin hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 193, 264, 43, 72, 71, 220, 192, 194; *N*-desmethylmianserin 193, 208, 194, 250, 178, 192, 29, 179.



M

Quantification

Blood **GC** Column: Rtx-5MS fused silica (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 3 mL/min. Temperature programme: 100° for 1 min to 250° at 20°/min to 300° at 5°/min. FID. Limit of detection, ~1 μg/L [Ishii *et al.* 2000].

GC-MS [Wille *et al.* 2009]. Column: SPB-1 (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 5 min to 280° at 20°/min. SIM acquisition mode. Retention time: 13.7 min. Limit of detection, 5.0 ng/g [Namera *et al.* 1998].

HPLC Column: XTerra RP-18. Mobile phase: acetonitrile : ammonium formate buffer 4 mmol/L (pH 3.2). Limit of quantification, 2 μg/L [Titier *et al.* 2007].

Plasma **GC** Column: HP 5890, DB-17 capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: N_2, 0.7 mL/min. Temperature programme, 260° for 1 min. NPD. Limit of quantification, 125 μg/L [Ulrich, Martens 1997]. Column: 3% OV-1 on 100/120 Gas-Chrom Q. Carrier gas: N_2, 40 mL/min. Temperature: 210°. NSD. Retention time: 2.3 min. Limit of detection, 2.5 μg/L [Lachâtre *et al.* 1982].

GC-MS Column: J, W-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min to 180° at 50°/min for 10 min to 300° at 10°/min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, 10 μg/L [Wille *et al.* 2007]. Column: 1.5% OV-1 on Gas Chrom Q 100/120 mesh (1.8 m × 2 mm i.d.). Temperature: 205°. SIM acquisition mode. Retention time: 3 min. Limit of detection, 5 μg/L [Jindal *et al.* 1982].

HPLC Column: Thermo Hypersil-HyPurity C_{18} (150 × 2.1 mm, 5 μm). Mobile phase: 10 μmol/L ammonium acetate (pH 3.4) : methanol : acetonitrile (35 : 50 : 15), flow rate 0.22 mL/min. Retention time 3.4 min. Limit of quantification, 1 μg/L [Xu *et al.* 2008]. Column: Supelcosil LC-SI (150 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : methanol : 25% ammonium hydroxide (345 : 65 : 1.6), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, <10 nmol [Tybring *et al.* 1995]. Limits of quantification, 4 μg/L and 2.5 μg/L [Eap *et al.* 1994]. Column: reversed-phase C_{18} (150 × 3.9 mm i.d.). Mobile phase: phosphate buffer : acetonitrile : methanol . Electrochemical detection. Limit of quantification, 1.67 μg/L [Brown *et al.* 1992]. Column: reversed-phase trimethylsilyl-packed. Mobile phase: acetate : acetonitrile . Electrochemical detection. Limit of detection, 5 μg/L [Suckow *et al.* 1982].

Serum **HPLC** Column: Hichrom RPB (250 × 4.6 mm, 5 mm). Mobile phase: 0.05 mol/L phosphoric acid (pH 3.0). UV detection (λ= 214 nm). Limit of quantification, 2 μg/L [Lukaszkiewicz *et al.* 2007].

Urine **GC** See Blood [Ishii *et al.* 2000].

HPLC See Plasma. Limit of quantification, 2.5 μg/L and 5 μg/L [Eap *et al.* 1994].

Brain **GC-MS** See Blood [Wille *et al.* 2009].

Hair **GC-MS** See Blood [Wille *et al.* 2009]. Column: BP-5 fused silica (12 m × 0.53 mm i.d., 1.0 μm). Carrier gas: He, 3 mL/min. Temperature programme: 100° for 2 min to 310° at 7.5°/min for 10 min. NPD. Limit of detection not reported [Couper *et al.* 1995].

Disposition in the Body Mianserin is readily absorbed after oral administration; bioavailability is reduced by first-pass metabolism. The major metabolites are *N*-desmethylmianserin and 8-hydroxymianserin, which are both active, and mianserin *N*-oxide. Approximately 30–40% of a dose is excreted in the urine in 24 h, and a total of ~70% is excreted over a period of several days, mainly as conjugated metabolites. Approximately 5% of a dose is excreted in the urine unchanged. It crosses the blood–brain barrier and the placenta; it is found in breast milk.

Therapeutic Concentration In plasma, usually in the range 0.015–0.07 mg/L. *N*-Desmethylmianserin is detectable in plasma at concentrations ~one-third of those of mianserin.

Following a single oral dose of 60 mg given to eight subjects, peak plasma concentrations of 0.05–0.14 mg/L (mean 0.10) and peak blood concentrations of 0.04–0.09 mg/L (mean 0.06) were attained in ~3 h [Maguire *et al.* 1982].

Following oral doses of 20 mg three times a day to 10 subjects, minimum steady-state plasma concentrations of 0.03–0.09 mg/L (mean 0.06) were reported [Lachâtre *et al.* 1982].

Toxicity Overdosage does not appear to cause the complications associated with overdose of tricyclic antidepressants. Toxic effects have been associated with plasma concentrations >0.5 mg/L.

Repeated episodes of complete heart block following overdose reported in a case study [Hla, Boyd 1987].

Plasma concentrations of 0.11 μg/mL mianserin and 0.5 mg/L lorazepam were reported on admission to hospital in a comatose subject who had ingested 600 mg mianserin plus an unknown amount of lorazepam; the patient died the following day [Crome, Newman 1977].

Half-life Plasma half-life, 6–40 h (mean 16), increased in elderly subjects.

Volume of Distribution ~13 L/kg.

Protein Binding ~90%.

Note For a review of metabolism of some 'second'- and 'fourth'-generation antidepressants, see Rotzinger *et al.* [1999]; for a review of mianserin, see Brogden *et al.* [1978].

Dose 30 to 90 mg of mianserin hydrochloride daily; maximum of 200 mg daily.

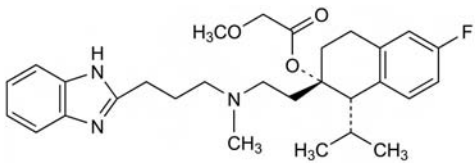
Mibefradil

Calcium Antagonist

$C_{29}H_{38}FN_3O_3$ = 495.6

CAS—116644-53-2

IUPAC Name [(1*S*,2*S*)-2-[2-[3-(1*H*-Benzimidazol-2-yl)propyl-methylamino] ethyl]-6-fluoro-1-propan-2-yl-3,4-dihydro-1*H*-naphthalen-2-yl] 2-methoxyacetate
Synonyms Methoxyacetic acid (1*S*,2*S*)-2-[2-[[3-(1*H*-benzimidazol-2-yl)-propyl]methylamino]ethyl]-6-fluoro-1,2,3,4-tetrahydro-1-(1-methylethyl)-2-naphthalenyl ester; mibefradilum; Ro-40-5967.

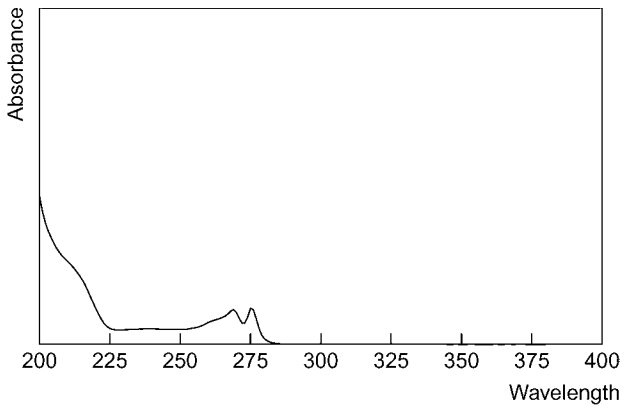


Chemical Properties pK_a 4.8; 5.5 (dihydrochloride).

Mibefradil Dihydrochloride

$C_{29}H_{38}FN_3O_3,2HCl = 568.6$
CAS—116666-63-8
Synonyms Miberfradil hydrochloride; Ro-40-5967/001.
Proprietary Name *Posicor*
Chemical Properties A white crystalline powder. Mp 128°. Soluble in water.

Ultraviolet Spectrum



Quantification
***Plasma* HPLC** Column: RP C_{18} LiChrospher, RP Select-B. Mobile phase: acetonitrile : aqueous solution of 39.3 mmol/L potassium dihydrogen phosphate and 8.2 mmol/L sodium pentanesulfonic acid (38:62), flow rate 2 mL/min. Fluorescence detection (λ_{ex}=270 nm, λ_{em}=300 nm). Retention time: 10.7 min. Limit of detection, 0.5 µg/L [Skerjanec *et al.* 1995].
***Urine* HPLC** See Plasma [Skerjanec *et al.* 1995].
Disposition in the Body Mibefradil is completely and rapidly absorbed with absorption unaffected by food. There is extensive distribution into peripheral tissues and it undergoes first-pass metabolism. The drug is metabolised via parallel pathways: esterase-catalysed hydrolysis and CYP3A4-mediated oxidation. The esterase pathway yields an alcohol metabolite, which has 10% of the pharmacological effect. After chronic dosing, the oxidative pathway becomes less important. The oxidation pathway leads to *O*-demethylation, *N*-demethylation and ring hydroxylation, yielding many identified metabolites. Elimination is via biliary (75%) and renal (25%) routes. 3% of the dose is excreted into urine as the unchanged drug. The drug displays zero order kinetics. Peak plasma level is reached within 1 to 2 h; steady state occurs within 3 to 4 days. Renal and mild-to-moderate hepatic dysfunction causes no change in pharmacokinetics.
Therapeutic Concentration
In a study of 42 healthy males, aged 18 to 35 years, peak plasma concentrations were 26.7, 67.8, 115.0, 61.0, 495.0, 777.0 and 1490.0 µg/L following oral administration of mibefradil at doses of 10, 20, 40, 80, 120, 160 and 320 mg, respectively, after an overnight fast. These were observed at 1.00, 0.96, 0.86, 0.87, 1.38, 1.50 and 2.00 h, respectively.

Three to 5 healthy males, with a mean age of 32.4 years, were administered orally 100, 150 or 250 mg mibefradil once daily, after an overnight fast, for 28 days. Peak plasma concentrations on day 1 were 520, 739 and 1322 µg/L for the three doses observed at 2.33, 1.17 and 2.33 h, respectively. On day 28, peak concentrations reached 718, 914 and 1506 µg/L in the same time period.

Twelve hypertensive patients were administered for 8 days with doses of 50, 100, 150 or 200 mg daily, after an overnight fast. On day 1, plasma concentrations of 220, 478, 952 and 1116 µg/L were observed at 0.94, 1.09, 1.54 and 1.67 h, respectively. On day 8, however, peak concentrations were 402, 929, 1373 and 1538 µg/L for the four doses and were seen at 1.72, 1.62, 2.14 and 1.33 h post-dosing [Welker 1998].

Bioavailability Approximately 80%.
Half-life 17 to 25 h.
Volume of Distribution Steady state, 176 to 255 L; also reported as 3.5 to 5.7 L/kg.
Clearance Plasma, 14.46 to 19.26 L/h; blood systemic, 26.16 L/h.
Distribution in Blood The blood : plasma ratio is 0.64.
Protein Binding >99%, mainly to α_1-acid glycoproteins.
Dose 50 to 100 mg/day.

Skerjanec A *et al.* (1995). High-performance liquid chromatographic analysis of mibefradil in dog plasma and urine. *J Chromatogr* 669: 377–382.

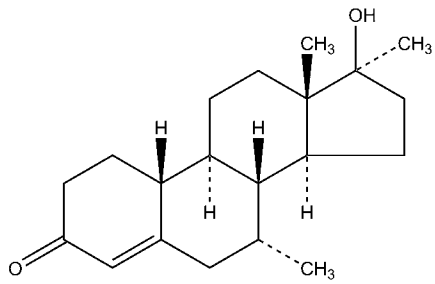
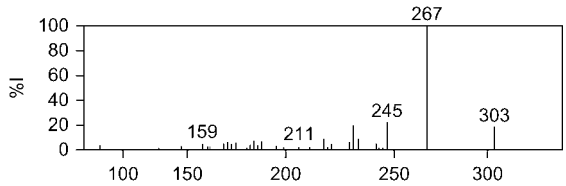
Mibolerone

Anabolic Steroid, Antigonadotropic (Veterinary)
$C_{20}H_{30}O_2 = 302.5$
CAS—3704-09-4
IUPAC Name (7*R*,8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-7,13,17-trimethyl-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-3-one
Synonyms 7α,17α-Dimethyl-19-nortestosterone; (7α,17β)-17-hydroxy-7,17-dimethylestr-4-en-3-one; U-10997.
Proprietary Names *Cheque*; *Matenon*.



Chemical Properties Crystalline solid. Soluble in deionised water. Log *P* (octanol/water), 3.19 [Sangster 1997]. Stability was at a maximum between pH 5.5 and 6.4 in aqueous solution [Amin *et al.* 1976].
Mass Spectrum Principal ions at *m/z* 303, 121, 285, 177, 95, 245, 227, 163.



Quantification
***Other* GC** Aqueous Solutions. Column: 1% QF-1 Gas Chrom 3 (460 × 3 mm i.d.). Carrier gas: He 70 mL/min. Temperature: 260°. FID . Limit of detection not reported [Amin *et al.* 1976].

LC-MS Canine Urine. Column: SB-C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: water : acetonitrile (75 : 25 to 65 : 35 in 30 min to 35 : 65 in 5 min for 5 min), flow rate 0.208 mL/min. DAD (λ = 246 nm). ESI, positive ion mode, full scan and SIM acquisition mode. Limit of detection not reported [Williams *et al.* 2000a]. Microsomes. Column: SB-C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 0.75% trifluroacetic acid in water : acetonitrile (1 : 1). DAD (λ = 244 nm). ESI. Limit of quantification not reported [Williams *et al.* 2000b].

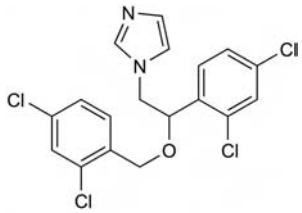
Miconazole

Antifungal
$C_{18}H_{14}Cl_4N_2O = 416.1$
CAS—22916-47-8
IUPAC Name 1-[2-(2,4-Dichlorophenyl)-2-[(2,4-dichlorophenyl)methoxy] ethyl]-1-*H*-imidazole

Proprietary Name *Daktarin*

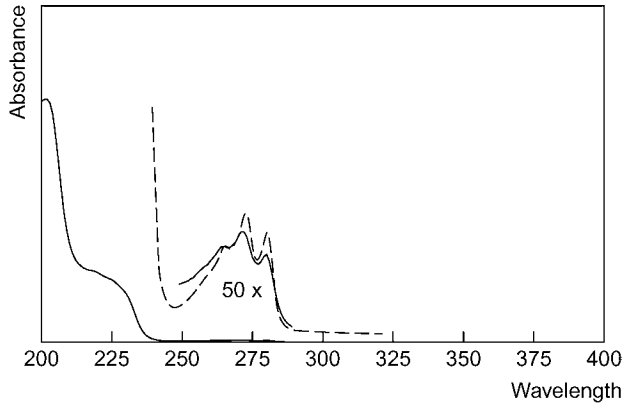


Chemical Properties A white crystalline powder. Very slightly soluble in water; very soluble in chloroform; soluble in most other organic solvents. pK_a 6.7.

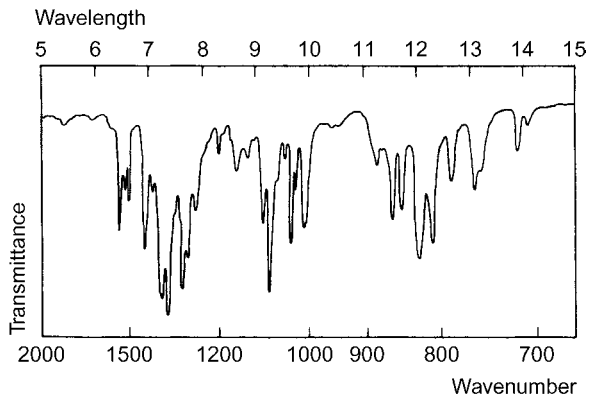
Miconazole Nitrate

$C_{18}H_{14}Cl_4N_2O,HNO_3 = 479.1$
CAS—22832-87-7
Proprietary Names *Albistat*; *Daktarin* (cream); *Dermonistat*; *Gyno-Daktarin*; *Micatin*; *Monistat*.
Chemical Properties A white crystalline powder. Mp about 182°. Very slightly soluble in water and ether; soluble 1 in 140 of ethanol; slightly soluble in chloroform.

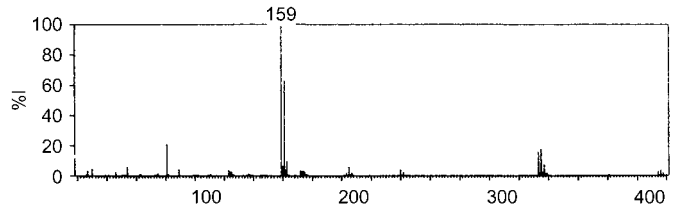
Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.11; system TC—R_f 0.67; system TE—R_f 0.80; system TF—R_f 0.07; system TL—R_f 0.37; system TAD—R_f 0.56; system TAE—R_f 0.77; system TAF—R_f 0.80 (Dragendorff spray).
Gas Chromatography System GA—RI 2965.
Ultraviolet Spectrum Methanol—264, 272 (A^1_1=17a), 280 nm.



Infrared Spectrum Principal peaks at wavenumbers 1085, 1319, 827, 1302, 1038, 812 cm^{-1} (miconazole nitrate, KBr disk).



Mass Spectrum Principal peaks at *m/z* 159, 161, 81, 335, 333, 163, 337, 205.



Quantification
Plasma **GC** [Szathmary, Luhmann 1988].
HPLC UV detection (λ=230 nm). Limit of detection, 5 µg/L [Kobylinska *et al.* 1996].
Serum **GC** ECD. Limit of detection, 1 µg/L [Männistö *et al.* 1982].
Bioassay [Espinel-Ingroff *et al.* 1977].
Saliva **HPLC** UV detection. Limit of detection, 500 µg/L [Turner, Warnock 1982].
Vaginal Fluid **HPLC** [Selinger *et al.* 1988].
Note For a rapid HPLC screen of antifungal agents in serum, see Ng *et al.* [1996].
Disposition in the Body Incompletely absorbed after oral administration and poorly absorbed after topical administration. Metabolised by oxidation to 2,4-dichloromandelic acid and 2-(2,4-dichlorobenzyloxy)-2-(2,4-dichlorophenyl) acetic acid which are both inactive. About 10 to 20% of an oral or IV dose is excreted in the urine in 6 days, with only about 1% of the dose as unchanged drug. About 50% of an oral dose is eliminated in the faeces, mostly unchanged.
Therapeutic Concentration
Following an IV infusion of 522 mg to 4 subjects, plasma concentrations of 2.0 to 9.1 µg/mL (mean 6.2) were reported at the end of the infusion [Lewi *et al.* 1976].
Toxicity For a report of convulsions after miconazole overdose, see Coulthard *et al.* [1987].
Half-life Plasma half-life, about 24 h.
Volume of Distribution About 20 L/kg.
Protein Binding About 92%.
Note For a review of the pharmacokinetics of systemic antifungal drugs, see Daneshmend and Warnock [1983].
Dose 0.6 to 3.6 g daily by IV infusion; 1 g daily orally.

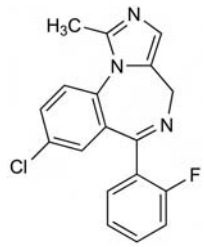
Midazolam

Benzodiazepine, Hypnotic
$C_{18}H_{13}ClFN_3 = 325.8$
CAS—59467-70-8
IUPAC Name 8-Chloro-6-(2-fluorophenyl)-1-methyl-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine
Synonyms Midazolamum; Ro-21-3971.
Proprietary Names *Dormicum*; *Dormonid*; *Hypnovel*; *Ipnovel*; *Midolam*; *Versed* (includes proprietary names of salts of midazolam).



Chemical Properties Colourless crystals. Mp 158° to 160°. Soluble in water. pKa 6.2. Log P (octanol/water), 4.3. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].
Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.06; system TC—R_f 0.60; system TD—R_f 0.13; system TE—R_f 0.60; system TF—R_f 0.05; system TL—R_f 0.19; system TAD—R_f 0.53; system TAE—R_f 0.69; system TAF—R_f 0.70.
Gas Chromatography System GA—midazolam RI 2575, M (α-OH-) RI 2830; system GB—midazolam RI 2722, M (α-OH-) RI 2901, M (α-OH-)-TMS RI 2866, M (4-OH-)-TMS RI 2775.

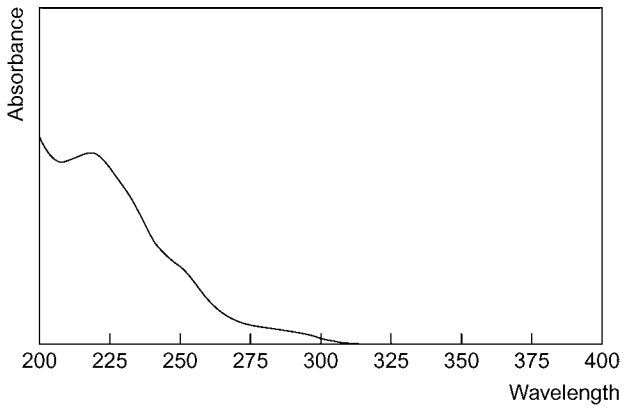
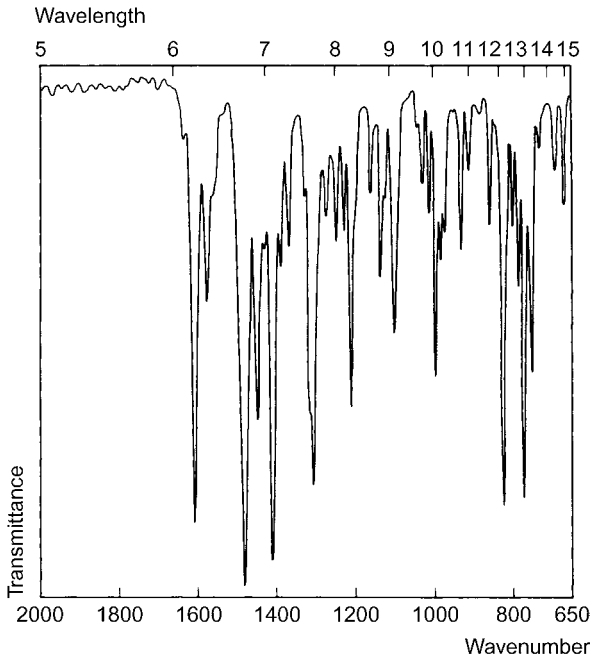
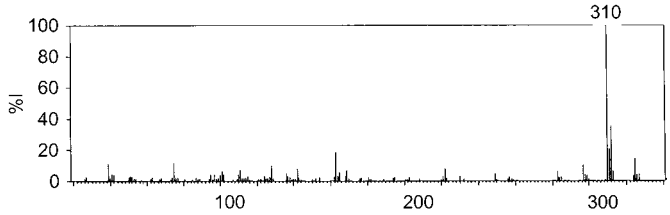
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1608, 820, 767, 1310, 1210, 995 cm^{-1} (KBr disk, see below).



Mass Spectrum Principal ions at *m/z* 310, 312, 311, 163, 325, 75, 39, 297.



Quantification

Blood **HPLC** Column: C_8 semi-microcolumn (Lichrospher select B, 125 × 3 mm). Mobile phase: 20 µmol/L phosphate buffer (pH 2.2) : acetonitrile (70 : 30, v/v). DAD (λ= 254 nm). [El Mahjoub, Staub 2001a]. Column: Lichrospher select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 2.1) : acetonitrile (65 : 35), flow rate 0.3 mL/min. DAD (λ= 220 nm). Limit of quantification, 10 µg/L, limit of detection, 3.5 µg/L [El Mahjoub, Staub 2000b].

Plasma **GC-MS** Column: OV-1 capillary (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.1 mL/min. Temperature programme: 85° for 1 min to to 200° at 30°/min to 310° at 10°/min for 1 min. MID, NCI, SIM acquisition mode. Limit of quantification, 10 ng/L [Eap *et al.* 2004]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.9 mL/min. Temperature programme: 150° for 0.5 min to 300° at 20°/min for 5 min. SIM acquisition mode. Limit of detection, 1 µg/L [Frison *et al.* 2001]. ECD, Limit of detection, 500 ng/L [Smith *et al.* 1981].

HPLC Column: LiChrospher Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer (pH 7.2, 6 : 94). UV detection (λ= 254 nm). Limit of detection, 15 µg/L [El Mahjoub, Staub 2000a]. Column: Spherisorb (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.02% perchloric acid (30 : 70). UV detection (λ= 200 nm). Limit of quantification, 10 µg/L [Portier *et al.* 1999]. Column: C_{18} capillary (150 mm × 0.8 mm i.d., 3 µm). Mobile phase: phosphate buffer : acetonitrile (65 : 35) for 16 min, phosphate buffer : acetonitrile (40 : 60) for 1 min, flow rate 16 µL/min. UV detection. Limit of quantification, 1 µg/L [Eeckhoudt *et al.* 1998]. Column: Ultrasphere ODS (75 × 4.6 mm, 3 µm). Mobile phase: 35.2% acetonitrile : 4.8% methanol : 60% 0.1 mol/L buffer acetate (pH 4.7), flow rate 1 mL/min. UV detection (λ= 254 nm). Limit of detection, 8 nmol [Carrillo *et al.* 1998]. Column: C_{18} Nova-Pak (150 × 3.9 mm, 4 µm). Mobile phase: acetonitrile : 0.05 mol/L phosphate buffer, pH 4.5, flow rate 1.2 mL/min. Retention time, 13.5 min. UV detection (λ= 207 nm) [Van Brandt *et al.* 1997].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water : 100 mmol/L ammonium formate (pH 3.0, 55 : 40 : 5). ESI, positive ion mode, MRM acquisition mode. Retention time: 4.03 min. Limit of detection, <10 µg/L [Marin *et al.* 2008]. Column: Reversed phase. Mobile phase: acetonitrile : 0.1 mol/L phosphate buffer [Kanazawa *et al.* 1998].

Serum **HPLC** See Blood [[El Mahjoub, Staub 2000b]. See Plasma [El Mahjoub, Staub 2000a]. Column: LiChrospher 100 (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : 0.05 mol/L HEPES buffer and 15 mmol/L dodecylammonium chloride (pH 5.25, 65 : 35), flow rate 1.0 mL/min. DAD (λ= 254 nm). Limit of quantification, 0.1 mg/L [van Rij *et al.* 1999]. Column: cyanopropyl type (150 × 4.6 mm). Mobile phase: acetonitrile 0.02 mol/L : sodium acetate at pH 3.0 (80 : 20), flow rate 1.2 mL/min. UV detection (λ = 240 nm) [Odou *et al.* 1997].

LC-MS See Plasma [Marin *et al.* 2008].

Urine **HPLC** See Plasma [Chan, Jones 1993; Ha *et al.* 1993].

LC-MS See Plasma [Marin *et al.* 2008].

Note For polarography for the quantification of midazolam, see Puglisi *et al.* [1978].

Meconium **LC-MS** See Plasma [Marin *et al.* 2008].

Note For a comparison of various chromatographic methods, see Vasiliades, Sahawneh [1982].

Hair **HPLC** Column: C_8 semi micro, Lichrospher select B (125 × 3 mm). DAD (λ= 254 nm) [El Mahjoub, Staub 2001b].

LC-MS Limit of quantification, 0.5–5 pg/mg [Villain *et al.* 2005].

Disposition in the Body Midazolam is rapidly absorbed after oral administration and undergoes first-pass metabolism. It crosses the placenta. Small quantities are found in breast milk. It is metabolised by hydroxylation to 1-hydroxymethylmidazolam (which is active), 4-hydroxymidazolam and 4-hydroxy-1-hydroxymethylmidazolam; the hydroxy metabolites are then conjugated with glucuronic acid. Up to 90% of a dose is excreted in the urine in 24 h as the conjugated metabolites, mainly as conjugated 1-hydroxymethylmidazolam (60–70% of a dose). Less than 1% of a dose is excreted in the urine as unchanged drug.

Therapeutic Concentration

Midazolam administered orally as a single dose (0.25–1.0 mg/kg) to 85 children, aged 6 months to 15 years, provided maximal sedation at plasma concentrations of 0.13796 mg/L (range 0.020–0.0.472) midazolam and 0.08958 mg/L (range 0.0048–0.180) α-hydroxymidazolam 30 min after dosing [Marshall *et al.* 2000].

Blood concentrations of 0.019–0.583 mg/L (mean 0.121) were attained 5–120 min after dosing in 60 mechanically ventilated pre-term infants administered midazolam 100 µg/kg (IV over 2 min) every 4–6 h [Lee *et al.* 1999].

The steady-state plasma concentration range was 0.010–0.147 mg/L (median 0.030) in 11 subjects receiving midazolam by continuous SC infusion at a rate 10–60 mg daily (median 20) [Bleasel *et al.* 1994].

In children given midazolam 0.2 mg/kg intranasally, 0.5 mg/kg orally or 0.3 mg/kg rectally, blood concentrations of 0.146 mg/L were attained in 11.5 min by the intranasal route, 0.104 mg/L in 21 min by the rectal route, and 0.093 mg/L in 23.1 min by the oral route [Malinovsky *et al.* 1995].

Toxicity

A 63-year-old man developed cardiorespiratory depression ~5 min after receiving 10 mg midazolam during endoscopic retrograde cholangiopancreatography. Blood and urine levels of midazolam of 2.8 and 0.18 mg/L, respectively, were reported ~40 min after the dose. Death occurred after 2 days and the postmortem midazolam blood concentration was 2.4 mg/L [Michalodimitrakis *et al.* 1999].

In a death caused by self-injection of midazolam and sufentanil, the following postmortem tissue concentrations were reported for midazolam and sufentanil, respectively: blood 0.05 and 0.0011 mg/L, urine 0.3 and 0.0013 mg/L, liver 930 and 1.75 ng/g, kidney 290 and 5.5 ng/g and vitreous humour 0.0012 mg/L (sufentanil only) [Ferslew *et al.* 1989].

Bioavailability After IM administration, more than 90%. Reduced to 30% from ~70% by first-pass metabolism.

Half-life Plasma half-life, ~2 h; increased in elderly subjects, in obesity, and in cirrhosis.

Volume of Distribution 1–3 L/kg.

Clearance Plasma clearance, 3–8 mL/min/kg (mean 5).

Protein Binding ~95–98%.

Dose As a sedative, the equivalent of 70 µg/kg midazolam by slow IV injection, usual dose range 2.5 to 7.5 mg; for induction of anaesthesia, 200 µg/kg by slow IV injection.

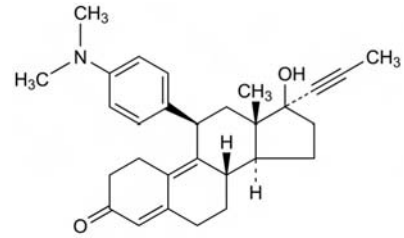
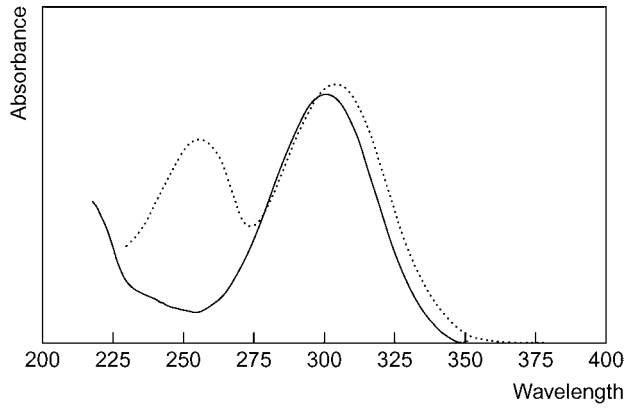
Mifepristone

Antiprogestogenic Steroid
$C_{29}H_{35}NO_2$ = 429.6
CAS—84371-65-3

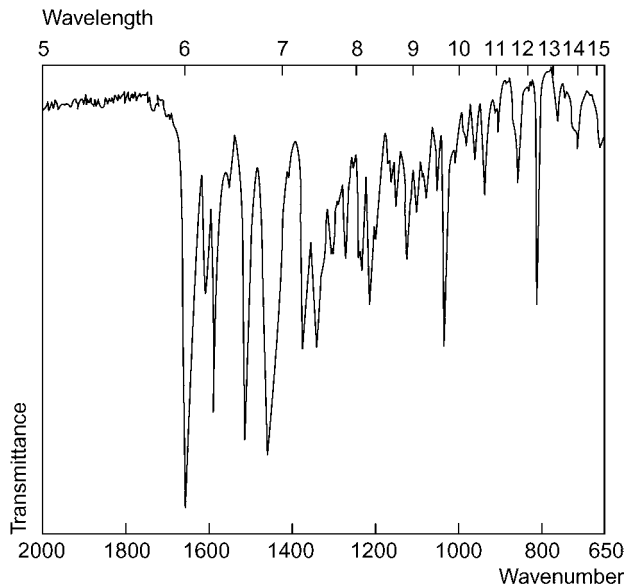
IUPAC Name (11β,17β)-11-[4-(Dimethylamino)phenyl]-17-hydroxy-17-(1-propynyl)-estra-4,9-dien-3-one
Synonyms RU-486; RU-38486.
Proprietary Name *Mifegyne*



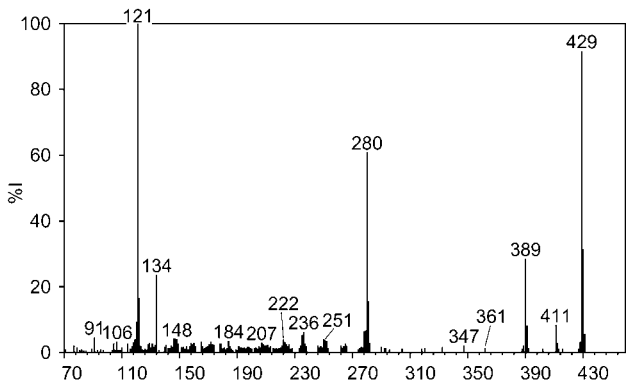
Chemical Properties Mp 150°.
Ultraviolet Spectrum Acid (0.1 mol/L HCl in 95% ethanol)—302 nm; base (0.1 mol/L NaOH in 95% ethanol)—256, 305 nm.



Infrared Spectrum Principal peaks at wavenumbers 1657, 1517, 1592, 1378, 1348, 1038 cm^{-1} (Nujol).



Mass Spectrum Principal ions at *m/z* 121, 429, 280, 430, 389, 134, 122, 281.



Quantification

Plasma **HPLC** Column: ODS RP (200 × 3.5 mm i.d.). Mobile phase: methanol : methylcyanide : water (42:28:30), flow rate 1 mL/min. Detection: not specified. Retention time: 10.37 min; monodemethylated metabolite, 6.92 min; didemethylated metabolite, 5.04 min; hydroxylated metabolite, 6.14 min. Limit of detection, 0.01 mg/L [Shi *et al.* 1993].

Disposition in the Body Mifepristone is rapidly absorbed after oral administration with peak plasma concentrations reached within 1 to 2 h. It undergoes metabolism in the liver, by rapid demethylation and hydroxylation, and its metabolites are excreted via the bile and eliminated in faeces. Metabolites include monodemethylated, didemethylated and hydroxylated derivatives which may undergo further metabolism before excretion. Only a small proportion of the parent drug is detected in urine.

Therapeutic Concentration

Healthy female volunteers were administered with 12.5, 25, 50 or 100 mg mifepristone twice daily for 4 days. The peak plasma concentrations ranged between 1.4 and 1.7 mg/L for a dose ≥50 mg twice daily [Heikinheimo *et al.* 1989].

Nine non-pregnant and 36 pregnant healthy women, mean age 28.9 years, were administered doses of 25, 100, 400 and 600 mg mifepristone. For the non-pregnant women, mean peak plasma concentrations were 0.82, 1.66, 2.09 and 2.29 mg/L for the four doses observed at 1.7, 1.7, 1.4 and 1.6 h, respectively. The pregnant women produced concentrations of 0.75, 1.32, 1.73 and 1.91 mg/L, respectively, at 1.8, 2.1, 1.6 and 1.5 h [Shi *et al.* 1993].

Bioavailability 70% (also reported as 40% after a 100 mg oral dose).

Half-life 18 h; also reported as 54 to 90 h, possibly due to cross-reacting of the metabolites.

Volume of Distribution Steady state, 25.7 L (8 L after 280 mg IV dose).

Clearance Plasma, 3 L/h.

Protein Binding 98%.

Dose The usual dose is 600 mg.

Heikinheimo O *et al.* (1989). Pharmacokinetics of the antiprogesterone RU 486 in women during multiple dose administration. *J Steroid Biochem* 32: 21–25.

Miglitol

α-*Glucosidase Inhibitor, Antidiabetic, Desoxynojirimycin Derivative*

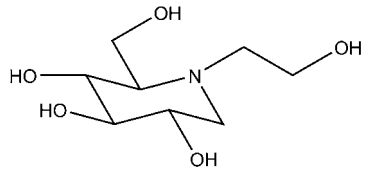
$C_8H_{17}NO_5$ = 207.2

CAS—72432-03-2

IUPAC Name (2*R*,3*R*,4*R*,5*S*)-1-(2-Hydroxyethyl)-2-(hydroxymethyl)piperidine-3,4,5-triol

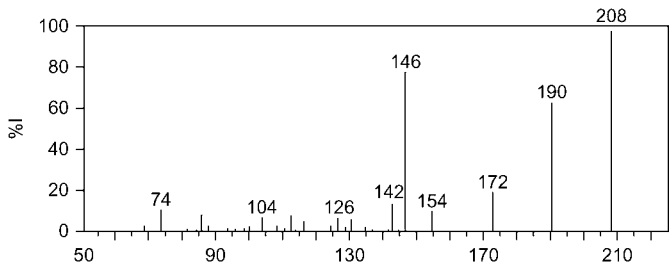
Synonyms Bay m 1099; 1,5-dideoxy-1,5-[(2-hydroxyethyl)imino]-D-glucitol; *N*-(β-hydroxyethyl)-1-deoxynojirimycin; *N*-(2-hydroxyethyl)moranoline.

Proprietary Names *Diastabol*; *Glyset*.



Chemical Properties Crystals. Mp 114°. Soluble in water. pK_a 5.9 [O'Neil *et al.* 2006]. Log *P* (octanol/water), −3.21 [Wishart *et al.* 2006]; distribution in blood (erythrocyte/plasma) log *P* 0.22 [Ahr *et al.* 1997]. Stock solutions showed no significant degradation when stored at room temperature for 12 h and they were stable for more than 2 months at −20° after 3 freeze–thaw cycles [Li *et al.* 2007]. Stable in human plasma for 3 freeze–thaw cycles, when stored below –50° and thawed to room temperature [Nirogi *et al.* 2006].

Mass Spectrum Principal ions at *m/z* 208, 190, 146, 172, 142, 112 .



Quantification

Plasma **LC-MS** Column: Nucleosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate, flow rate 1.0 mL/min. APCI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 1.0 µg/L [Li *et al.* 2007]. Column: YMC-Pack Ph reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium formate buffer : acetonitrile (40 : 60), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.1 mg/L [Nirogi *et al.* 2006].

Disposition in the Body Absorption of miglitol is saturable at high doses, with 25 mg being completely absorbed and 100 mg only 50 to 70% absorbed. Miglitilol is not metabolised in humans or any other species studied. After IV administration, miglitol is excreted rapidly and completely via the renal route.

Therapeutic Concentration After the IV administration of 1.4 mg/kg radiolabelled miglitol, the first elimination phase was characterised by a half-life of 1.8 h. After oral administration of 1.4 mg/kg, plasma concentrations reached 1.13 ± 1.35 kg/L at 2.3 ± 1.35 h [Ahr *et al.* 1997].

Toxicity Miglitol is unlikely to produce hypoglycaemia in overdose but abdominal discomfort and diarrhoea may occur. There are no published cases of overdose [Spiller 1998].

Half-life Approximately 0.4 to 1.8 h.

Volume of Distribution 0.3 to 0.8 L/kg.

Clearance Range of the glomerular filtration rate.

Distribution in Blood Log *P* (erythrocyte/plasma) 0.22.

Protein Binding Negligible (<4%).

Dose Oral dose 25 mg three times daily, increasing if necessary to a maximum of 100 mg three times a day.

Milnacipran

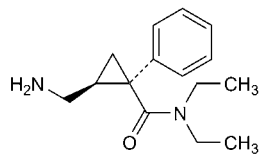
Antidepressant

$C_{15}H_{22}N_2O$ = 246.4

CAS—92623-85-3

IUPAC Name (1*R*,2*S*)-*rel*-2-(Aminomethyl)-*N*,*N*-diethyl-1-phenylcyclopropanecarboxamide

Synonym Mildacipran



Chemical Properties Plasma samples were unaffected by 3 freeze-thaw processes or by storage at room temperature for 24 h [Puozzo *et al.* 2004].

Milnacipran Hydrochloride

$C_{15}H_{22}N_2O$,HCl = 282.8

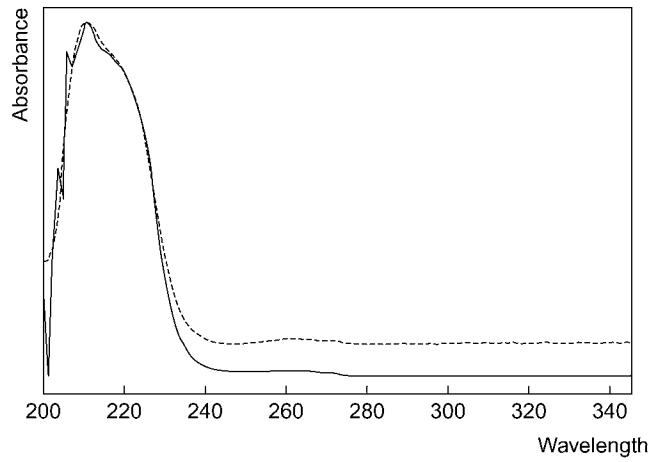
CAS—101152-94-7

Synonym F-2207

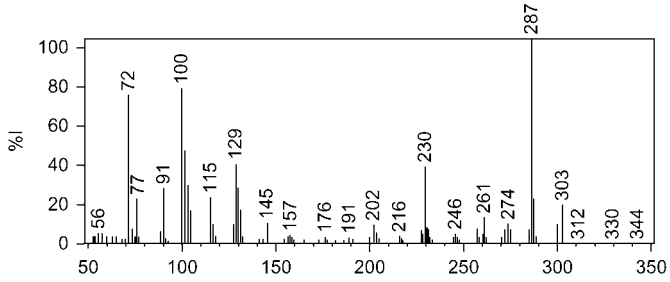
Proprietary Names *Ixel*; *Toledomin*.

Chemical Properties A white crystalline powder. Mp 180°.

Ultraviolet Spectrum



Mass Spectrum



Quantification

Blood **HPLC** Column: Symmetry (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.1 mol/L ammonium acetate (30 : 30 : 40), flow rate 1.0 mL/min. DAD (λ = 200 to 350 nm). Retention time: 4.64 min. Limit of detection not reported [Rop *et al.* 2002].

Plasma **HPLC** Column: YMC-Pack ODS-AQ (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate : acetonitrile (20 : 80 for 10 min to 30 : 70 at 20 min to 20 : 80 at 25 min), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 340 nm, λ_{em} = 440 nm). Limit of detection not reported [Higuchi *et al.* 2003].

LC-MS Column: Inertsil C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. SSI, positive ion mode, full scan mode. Retention time: 6.5 min. Limit of quantification, 0.15 mg/L, limit of detection, 0.08 mg/L [Shinozuka *et al.* 2006]. Column: Zorbax C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 6.67 mmol/L phosphate buffer (pH 7.0) : methanol (37 : 63), flow rate 0.5 mL/min. CI. Limit of quantification, 5 µg/L [Puozzo *et al.* 2004].

Serum **HPLC** Column: Hypersil ODS (150 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 5 mmol/L sodium acetate (pH 4.5; 70 : 30), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 340 nm, λ_{em} = 520 nm). Retention time: 11.1 min. Limit of quantification, 5 mg/L, limit of detection, 2.5 mg/L [Lacassie *et al.* 2000].

Disposition in the Body Absorption of milnacipran is rapid and at least 90% is absorbed. First-pass metabolism is low. The drug shows linear pharmacokinetics and peak plasma concentrations are reached within 3 h of dosing. Steady-state concentrations are rapidly achieved within 2 to 3 days of administration and the drug does not accumulate after multiple doses. The major metabolite is the glucuronide conjugate of the parent drug and no active metabolites has been identified: 50 to 60% of the drug is excreted unchanged, 20–30% as the glucurono-conjugated drug, and <20% as the glucurono-conjugated phase I metabolites including *N*-dealkylated milnacipran. Urine is the main route of elimination. More than 90% of the dose recovered in urine, with 5% in faeces over 96 h. Elimination is rapid and over 85% of the initial dose is recovered within the first 24 h. The metabolites are not pharmacologically active at clinically relevant doses. The liver and the kidney are both involved in the elimination of the drug. Milnacipran oxidative metabolism is not mediated through CYP2D6 or CYP2C19 polymorphic pathways, nor does it significantly interact with CYP1A2, CYP2C19, CYP2D6 or CYP3A4 [Puozzo *et al.* 2005]

Therapeutic Concentration

Six healthy male and female volunteers (aged 37–64 years; mean, 51.2 years) and 11 patients with moderate to severe liver impairment (aged 38–63 years; mean 53.4 years) were administered a 50 mg single dose with a light breakfast after a 10 h overnight fast. The peak plasma concentrations of unchanged milnacipran were 0.135 and 0.170 mg/L for the healthy individuals and patients observed at 2.0 and 2.7 h, respectively. The total drug concentrations were 0.323 and 0.242 mg/L attained at 2.5 and 3.6 h, respectively [Puozzo *et al.* 1998a].

Six healthy volunteers (aged 25–36 years; mean 30 years) with creatinine clearance 93–147 mL/min and 8 patients with renal impairment (aged 27–65 years; mean 51.5 years) and creatinine clearance 9–55.9 mL/min were administered 50 mg milnacipran orally after an overnight fast and were fed a light breakfast 2 h after dosing. The peak plasma concentrations were 0.147 mg/L and 0.190 mg/L for the unchanged drug and 0.269 and 0.530 mg/L for total drug concentrations for the healthy individuals and patients, respectively. These concentrations were observed at 1.9 h (unchanged concentration) and 1.7 h (total) for the healthy individuals and 1.9 h (unchanged) and 4.9 h (total) for the patients. [Puozzo *et al.* 1998b].

Note For pharmacokinetic parameters in depressed patients, see Higuchi *et al.* [2003].

Toxicity

A 44-year-old woman died in a road traffic accident. Her blood milnacipran concentration was 3.15 mg/L, 10.5 times the therapeutic concentration [Rop *et al.* 2002].

Half-life 6.1–8.1 h

Bioavailability 85%.

Volume of Distribution 5.5 L/kg (healthy); 6.3 L/kg (patients with liver impairment).

Clearance Total apparent clearance in healthy individuals, 40.0 L/h with oral administration and 34.3 L/h with IV administration; in patients with liver impairment, 27.6 L/h with oral administration and 29.6 L/h with IV administration.

Protein Binding Low, non-saturable binding to plasma protein is ~13%.

Note For a general review of milnacipran, see Spencer and Wilde [1998].

Dose The usual oral dose is 100 mg daily.

Milrinone

Cardiotonic, Phosphodiesterase Inhibitor

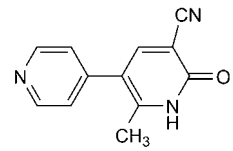
$C_{12}H_9N_3O$ = 211.2

CAS—78415-72-2

IUPAC Name 1-(2,6-Dimethylphenoxy)propan-2-amine

Synonyms 1,6-Dihydro-2-methyl-6-oxo-(3,4′-bipyridine)-5-carbonitrile; Win-47203-2.

Proprietary Names *Corotrop*; *Corotrope*; *Milrila*.



Chemical Properties Off-white crystals from ethanol or dimethylformamide (DMF) and water. Mp <300°. Very slightly soluble in water and chloroform, slightly soluble in methanol. Log *P* (octanol/water), 1.17.

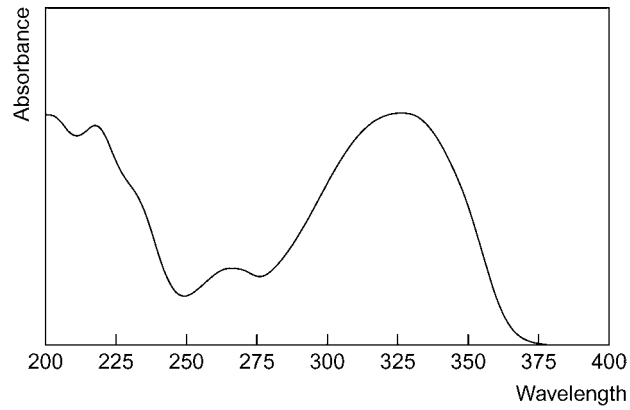
Milrinone Lactate

$C_{12}H_9N_3O,C_3H_6O_3$ = 301.3

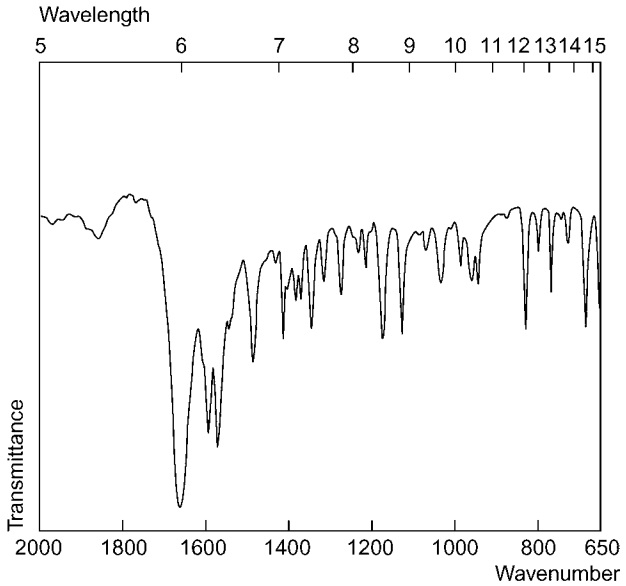
CAS—100286-97-3

Proprietary Name *Primacor*

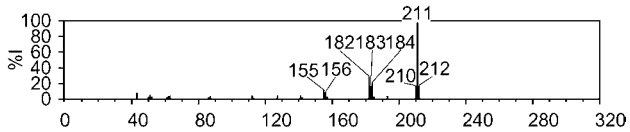
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—266, 322 nm; basic—282, 331 nm.



Infrared Spectrum Principal peaks at wavenumbers 1666, 1574, 590 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 211, 182, 184, 210, 212, 183, 155, 156.



Quantification

Plasma **HPLC** Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogen phosphate-3 mmol/L sulfuric acid-3.6 mmol/L TEA : methanol : acetonitrile (90 : 7 : 3), flow rate 1.0 mL/min. UV detection (λ = 326 nm). Retention time: 4.8 min. Limit of detection, 10 µg/L [Brocks *et al.* 2005]. Column: Partisil ODS-3 (250 × 4.6 mm i.d., 10 µm). Mobile phase: 0.1 mol/L sodium phosphate : acetonitrile (4 : 1), flow rate 2.5 mL/min. UV detection (λ = 340 nm). Limit of quantification, 5 µg/L [Woolfrey *et al.* 1995]. Column: RP Select B RT 250-4. Mobile phase: methanol : 25 mmol/L ammonium acetate buffer (pH 3.75; 25 : 75), flow rate 0.75 mL/min. UV detection (λ = 331 nm). *k* value: 2.3. Limit of detection, 5 µg/L [Verrijk *et al.* 1989]. Column: ODS (Spherisorb, 250 × 4.0 mm i.d., 5 µm). Mobile phase: 0.1 mol/L phosphate buffer (pH 6) : tetrahydrofuran:acetonitrile (73 : 2 : 25), flow rate 1 mL/min. UV detection (λ = 340 nm). Retention time: 4.3 min. Limit of detection, 5 µg/L. [Oddie *et al.* 1986]. Column: Partisil 10/25 ODS-3 (10 µm). Mobile phase: tetrahydrofuran : acetonitrile : 0.1 mol/L phosphate buffer (pH 6.0; 28 : 260 : 1000), flow rate 1.2 mL/min. UV detection (λ = 340 nm). Retention time: ~5 min. Limit of quantification, 2.3 µg/L [Edelson *et al.* 1983].

Urine **HPLC** Column: Partisil ODS-3 (250 × 4.6 mm i.d., 10 µm). Mobile phase: 0.1 mol/L sodium phosphate buffer : acetonitrile : tetrahydrofuran (250 : 65 : 7), flow rate 1.5 mL/min. UV detection (λ = 340 nm). Limit of quantification, 100 µg/L [Woolfrey *et al.* 1995]. See Plasma. Flow rate 1.5 mL/min. Limit of quantification, 0.003 mg/L [Edelson *et al.* 1983].

Disposition in the Body Milrinone is rapidly and almost completely absorbed after oral administration but in practice it is given IV because of the association of a higher mortality rate with oral administration. It is eliminated mainly in urine, with 80–85% of a dose detected as the unchanged drug and the remainder as its *O*-glucuronide metabolite. There are 5 metabolites but the *O*-glucuronide represents the major pathway of biotransformation.

Therapeutic Concentration The serum therapeutic concentration is 150–250 µg/L.

A group of 7 patients (aged 19–65 years) with stable chronic renal impairment (creatinine clearance 30–63 mL/min/1.73 m^2), a group of 7 patients (aged 51–70 years; mean 63 years) with creatinine clearance 9–29 mL/min/1.73 m^2, and 7 healthy men and women (aged 41–58 years; mean 48 years) were administered a single oral dose of 5 mg milrinone. A mean peak plasma concentration of 162 µg/L was reached for the healthy individuals in 0.64 h, and of 210 µg/L in 1.19 h for both groups with renal impairment [Larsson *et al.* 1986].

Seven adult patients (3 male) who needed inotropic support after cardiac surgery were enrolled and given an IV loading dose of milrinone 50 µg/kg over 10 min followed by an IV infusion of 0.5 µg/kg/min for a minimum of 5 h. Plasma concentrations of milrinone exceeded 100 µg/L within 2 min of starting the loading dose and were maintained above this concentration for the duration of the infusion [Das *et al.* 1994].

Twenty five patients just before or immediately after separation from cardiopulmonary bypass were administered a 50 µg/kg dose of milrinone plus 0.5 µg/kg/min milrinone. This resulted in plasma concentrations above 100 µg/L. The central compartment volume was 102 mL/kg; volume of distribution was 1698 mL/kg and elimination clearance was 1.88 mL/kg/min [Bailey *et al.* 1994].

Note For pharmacokinetics of milrinone in patients with CHF and moderate and severe renal failure, see Woolfrey *et al.* [1995].

Toxicity The toxic serum concentration is 0.3 mg/L.

In a study involving 1088 patients with severe chronic liver failure, 561 were treated with 40 mg milrinone and 527 received 40 mg placebo daily for 9 months. The study showed a 28% increase in mortality for those treated with milrinone compared with the placebo. An increase of 34% in cardiac mortality was also observed [Packer *et al.* 1991].

Bioavailability Healthy volunteers 92%; patients with congestive heart failure 76% (also reported as 80%).

Half-life Healthy individuals following oral and IV doses: 50 to 55 min. Patients with congestive heart failure: 1.7 h (IV dose) and 2.1 h (oral dose). Patients with renal impairment: 1.8 h (moderate impairment) and 3.2 h (severe impairment). Also reported as 2.3 h.

Volume of Distribution After doses of 10–125 µg/kg administered to healthy individuals: 0.32 L/kg. After IV doses of 12.5 to 75 µg/kg administered to patients with CHF: 0.3 to 0.42 L/kg.

Clearance 0.13 L/kg/h.

Protein Binding 70–80%.

Note For a general review of phosphodiesterase inhibitors in heart failure, see Arnold [1993].

Dose An initial loading dose of 50 µg/kg bodyweight is administered over 10 min followed by a maintenance dose titrated between 0.375 and 0.75 µg/kg/min. The total daily dose should not exceed 1.13 mg/kg. Dosage may be reduced in patients with renal impairment.

Minocycline

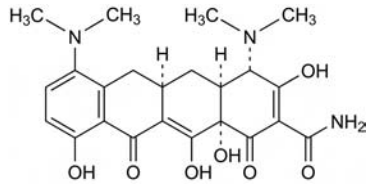
Antibacterial

$C_{23}H_{27}N_3O_7$ = 457.5

CAS—10118-90-8

IUPAC Name (2*Z*,4*S*,4*aS*,5*aR*,12*aS*)-2-[Amino(hydroxy)methylidene]-4,7-bis(dimethylamino)-10,11,12*a*-trihydroxy-4*a*,5,5*a*,6-tetrahydro-4*H*-tetracene-1,3,12-trione

Synonym [4*S*-(4α,4aα,5aα,12aα)]-4,7-Bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-2-naphthacenecarboxamide



Chemical Properties A bright yellow-orange amorphous solid. pK_a 2.8, 5.0, 7.8, 9.5. Log *P* (octanol/water), 0.1.

Minocycline Hydrochloride

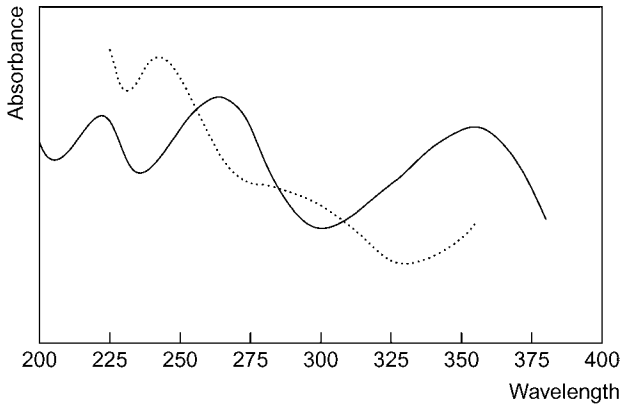
$C_{23}H_{27}N_3O_7$,HCl = 493.9

CAS—13614-98-7

Proprietary Names *Akamin*; *Aknemin*; *Aknin-N*; *Aknosan*; *Arestin*; *Blemix*; *Cyclomin*; *Dentomycin(e)*; *Dermirex*; *Dynacin*; *Klinomycin*; *Klinotab*; *Logryx*; *Mino(x)*; *Minocin*; *Minoclin*; *Minogal*; *Minomycin*; *Minotab(s)*; *Mynocine*; *Udima*; *Ultramycin*; *Vectrin*; *Zacnan*.

Chemical Properties A yellow crystalline powder. Soluble in water and in solutions of alkali hydroxides and carbonates; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Colour Test Sulfuric acid—yellow.
Thin-layer Chromatography System TAE—R_f 0.88; System TAJ—R_f 0.02; System TAK—R_f 0.00; System TAL—R_f 0.08.
High Performance Liquid Chromatography System HY—RI 240; system HAA—retention time 22.6 min.
Ultraviolet Spectrum Aqueous acid—265 (A_1^1=400b), 354 nm; aqueous alkali—243 nm (A_1^1=414b).



Infrared Spectrum Principal peaks at wavenumbers 1600, 1645, 1525, 1225, 1310, 1050 cm^{-1} (minocycline hydrochloride, KBr disk).
Quantitative

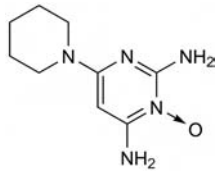
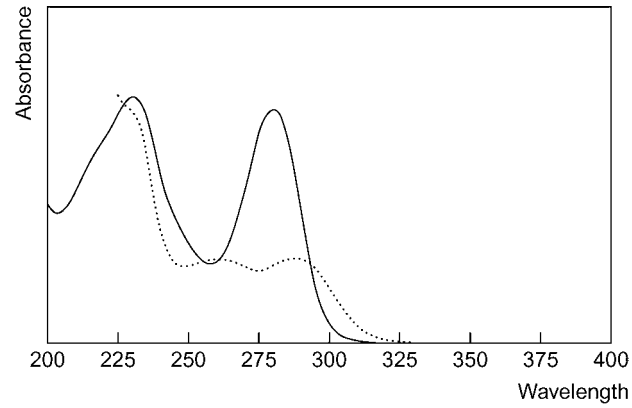
Minoxidil

Antihypertensive
$C_9H_{15}N_5O$ = 209.3
CAS—38304-91-5
IUPAC Name 3-Hydroxy-2-imino-6-piperidin-1-ylpyrimidin-4-amine
Synonyms PDP; 6-(1-piperidinyl)-2,4-pyrimidinediamine 3-oxide; U-10858.
Proprietary Names *Apo-Gain*; *Apohair*; *Alopexy*; *Alostil*; *Aloxidil*; *Folcress*; *Hairgain*; *Headway*; *Loniten*; *Lonnoten*; *Lonolox*; *Minona*; *Minovital*; *Minoxidine*; *Minox(i)*; *Minoxigaine*; *Minoximen*; *Moxiral*; *Neoxidil*; *Normoxidil*; *Ralogaine*; *Regaine*; *Regro*; *Rogaine*; *Tricoxidil*; *Unipexil*.

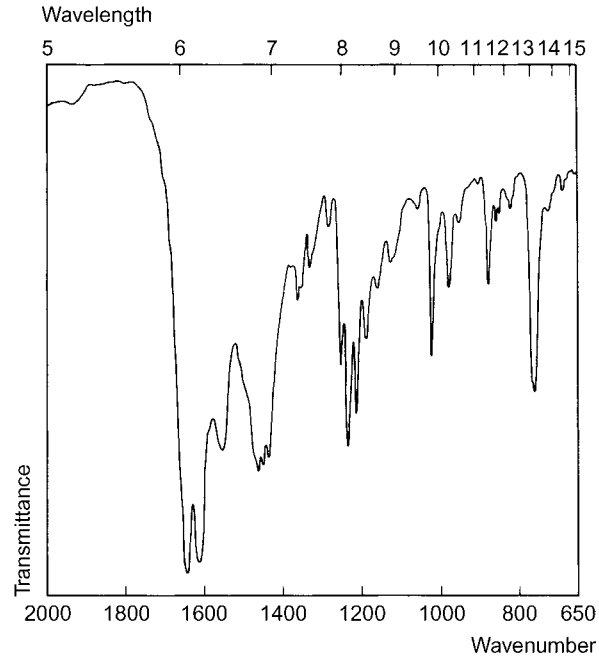


Chemical Properties A white crystalline solid. Mp about 225°, with decomposition. Soluble 1 in about 500 of water; readily soluble in ethanol and propylene glycol; practically insoluble in chloroform. pK_a 4.6. Log *P* (octanol/water), 1.2.

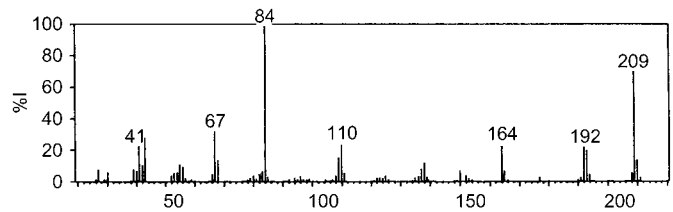
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.00; system TC—R_f 0.03; system TE—R_f 0.18; system TL—R_f 0.00; system TAE—R_f 0.44.
High Performance Liquid Chromatography System HX—RI 297; system HZ—retention time 2.4 min; system HAA—retention time 9.8 min.
Ultraviolet Spectrum Aqueous acid—230, 281 nm (A_1^1=547b); aqueous alkali—262, 288 nm.



Infrared Spectrum Principal peaks at wavenumbers 1640, 1610, 1550, 1231, 1210, 758 (KBr disk).



Mass Spectrum Principal ions at *m/z* 84, 209, 67, 43, 110, 41, 192, 164.



Quantification
Plasma **HPLC** Electrochemical detection. Limit of detection, 500 ng/L [Carrum *et al.* 1986].
Serum **Radioimmunoassay** Limit of detection, 3 µg/L [Royer *et al.* 1977].
Disposition in the Body Minoxidil is readily absorbed after oral administration. >80% of a dose is excreted in the urine in 24 h, mainly as glucuronide conjugates with <10% as unchanged drug; about 3% of a dose is eliminated in the faeces.
Therapeutic Concentration
Following daily oral administration of 27 to 30 mg to 6 subjects, serum concentrations of 0.04 to 0.25 (mean 0.10) mg/L were reported 1 to 2 h after a dose [Lowenthal *et al.* 1978].

Toxicity

The total serum-minoxidil concentration in a 20-year-old female who survived after ingesting an unknown quantity of minoxidil tablets in a suicide attempt was 3.14 mg/L [Poff, Rose 1992].

Half-life Plasma half-life, about 3 to 4 h.

Protein Binding Not significantly bound.

Note For a review of minoxidil, see Campese [1981].

Dose 5 to 50 mg daily; up to 100 mg daily has been given.

Mirtazapine

Antidepressant, Piperazinoazepine

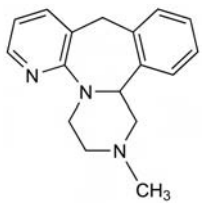
$C_{17}H_{19}N_3$ = 265.4

CAS—61337-67-5

IUPAC Name 1,2,3,4,10,14*b*-Hexahydro-2-methylpyrazino[2,1-*a*]pyrido[2,3-*c*][2]benzazepine

Synonyms 6-Azamianserin; mirtazepine; mepirzepine; Org-3770.

Proprietary Names *Remergil*; *Remeron*; *Zispin*.



Chemical Properties A white to creamy white crystalline powder. Mp 114° to 116°. It is slightly soluble in water. pK_a, 7.1. Log *P* (octanol/water), 3.3 [Kelder *et al.* 1997]. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

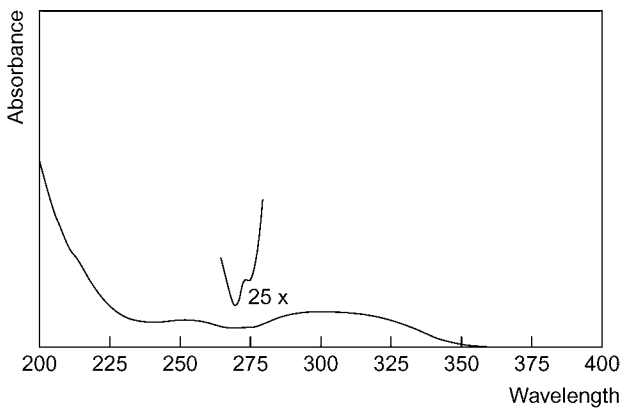
Gas Chromatography System GA—RI 2250; system GB—mirtazapine RI 2361; M (nor-) RI 2414; M (oxo-) RI 2665.

Column: HP-5 (15 m × 0.25 mm i.d., 0.25 µm) and HP-35 (15 m × 0.32 mm i.d., 0.32 µm). Temperature programme: 140° for 0.50 min to 300° at 10°/min for 10.5 min. IS: carbinoxamide maleate. NPD. Retention time: mirtazapine 9.76 min, IS 8.2 min (HP-5 column); mirtazapine 11.68 min, IS 9.6 min (HP-35) [Anderson *et al.* 1999].

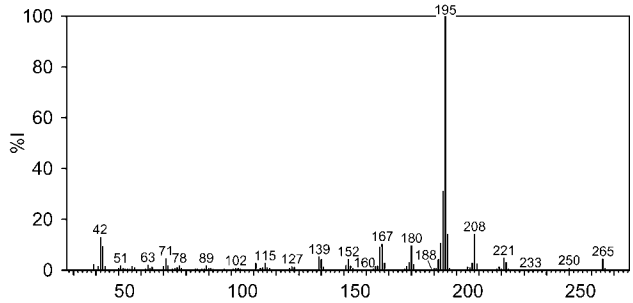
High Performance Liquid Chromatography System HZ—mirtazapine RT 2.8 min; desmethylmirtazapine RT 2.3 min.

Column: Chiralpak AD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : ethanol : propan-2-ol (98 : 1 : 1), flow rate 1.5 mL/min. IS: imipramine. UV detection (λ= 290 nm). Retention time: (+)-mirtazapine 12.5 min, (−)-mirtazapine 15.0 min [Dodd *et al.* 2000].

Ultraviolet Spectrum Aqueous acid (0.025 mol/L sulfuric acid)—314.5, 252.5 nm.



Mass Spectrum Principal ions at *m/z* 195, 208, 42, 180, 167, 71, 111, 265 (mirtazapine); *m/z* 195, 194, 196, 209, 180, 167 (desmethylmirtazapine).



Quantification

Blood **GC** Column: HP-50+ (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 50° for 0.5 min to 295° at 35° for 5.5 min. NPD. Limit of detection, 0.01 mg/L [Kirkton, McIntyre 2006]. NPD [Sánchez de la Torre *et al.* 2005]. Column: HP-5 (15 m × 0.25 mm i.d., 0.25 µm) or HP-35 (15 m × 0.32 mm i.d., 0.32 µm). Temperature programme: 140° for 0.5 min to 300° at 10°/min for 10.5 min. NPD. Retention times: 9.76 min (HP-5) and 11.8 min (HP-35). Limit of detection, 25 µg/L [Anderson *et al.* 1999]. Column: DB-5MS 5% phenylmethyl silicone (20 m × 0.18 mm i.d., 0.18 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 110° for 1.0 min to 200° at 20°/min to 290° at 10°/min for 7 min. Limit of detection, 0.01 mg/L [Moore *et al.* 1999].

GC-MS Column: DB-5 cross-linked 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 180° at 30°/min to 280° at 5°/min for 19 min. Full scan mode. Retention time: 18.0 min. Limit of quantification, 0.05 mg/L [Paterson *et al.* 2004].

LC-MS Column: XTerra RP_{18} (100 × 2.1 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2, 15 : 85 for 1 min to 35 : 65 over 12 min for 1 min), flow rate 1 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 µg/L [Castaing *et al.* 2007]. Column: Zorbax Eclipse XDB-C_8 (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 4 mmol/L ammonium acetate (pH 3.2, 20 : 20 : 60), flow rate 0.28 mL/min. TIS, MRM acquisition mode. Limit of detection, 1 µg/L [Wenzel *et al.* 2006].

Plasma **GC** Column: 5% phenylmethyl silicone cross-linked (25 m × 0.3 mm i.d., 0.54 µm). Carrier gas: He, 6 mL/min. Temperature programme: 80° for 1 min to 190° at 30°/min for 5 min to 270° at 10°/min for 10 min. NPD. Retention time: 9.6 min. Limit of detection, 0.5 µg/L [Paanakker, van Hal 1987].

GC-MS Column: J &W-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min to 180° at 50°/min for 10 min to 300° at 10°/min for 2.5 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, 7 µg/L [Wille *et al.* 2007]. Column: Varian factor FOUR VF-5ms (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 0.5 min to 180° at 50°/min for 10 min to 300° at 10°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection not reported [Wille *et al.* 2005].

HPLC Column: LiChrospher 60 RP-select B C_{18}. (250 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer (pH 3.8) : acetonitrile (53 : 47), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Retention time: 4.88 min. Limit of quantification, 50 µg/L [Silva *et al.* 2008]. Column: RP18 LicroCART (125 × 4 mm i.d., 5 µm). Mobile phase: 0.25 mol/L acetate buffer (pH 4.5) : acetonitrile : methanol (60 : 37 : 3), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Retention time: 8.9 min. Limit of quantification, 40 µg/L [Chaves *et al.* 2007]. Column: LiChrospher 60 RP-select B (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile-methanol : 0.25 mol/L sodium acetate buffer (pH 4.5, 35 : 65), low rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of quantification, 10 µg/L [Malfará *et al.* 2007]. Column: LiChrospher 60 RP-select B C_{18}. Mobile phase: 0.25 mol/L acetate buffer solution (pH 4.5) : acetonitrile : methanol (60 : 37 : 3), flow rate 1.0 mL/min. DAD (λ= 230 nm). Limit of quantification, 50 µg/L, limit of detection, 25 µg/L [Gonçalves Silva *et al.* 2007]. Column: Chirobiotic V (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L ammonium acetate (pH 5.0) : methanol : ethanol (60 : 25 : 15), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 300 nm, λ_{em}= 390 nm). Limit of detection, 0.25 µg/L [Meineke *et al.* 2006].

See also de Santana *et al.* [2004], Dodd *et al.* [2000], Duverneuil *et al.* [2003], Maris *et al.* [1999], Meineke *et al.* [2004], Ptácek *et al.* [2003], Titier *et al.* [2003].

LC-MS Column: Chiralpak AD-RH (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : ethanol (98 : 1 : 1), flow rate 1.0 mL/min. ESI, positive ion mode. Retention time: 3.52 min. Limit of quantification, 1.25 µg/L [de Santana, Bonato 2008]. Column: Chirobiotic V (250 × 4.6 mm i.d.). Mobile phase: methanol : water : acetic acid (80 : 20 : 0.01), flow rate 0.5 mL/min. ESI, SIM acquisition mode. Limit of quantification, 0.5 µg/L [Paus *et al.* 2004].

Serum **GC-MS** Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 1 min to 280° at 10°/min for 20 min. EI ionisation at 70 eV. Retention time: 21.3 min. Limit of detection, 0.025 mg/L, limit of detection, <0.025 mg/L [Maresova *et al.* 2008].

HPLC Column: Spherisorb Phenyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L potassium dihydrogen phosphate (pH 3.5, 20 : 80), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 290 nm, λ_{em}= 380 nm). Limit of

quantification, 10 nmol/L, limit of detection, 4 nmol/L [Reis *et al.* 2005]. Column: Lichrospher CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.15% TEA (pH 2.5; 15 : 85), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 290 nm, λ_{em} = 350 nm). Retention time: 15.07 min. Limit of quantification, 10 µg/L for mirtazapine, 5 µg/L for *N*-desmethylmirtazapine [Shams *et al.* 2004]. Column: Nucleosil 100-5-Protect 1 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogen phosphate (pH 7.0) : acetonitrile (60 : 40), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 16.6 min. Limit of detection not reported [Frahnert *et al.* 2003].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 3.1 µg/L. [Kirchherr, Kühn-Velten 2006].

Urine **GC** See Blood [Anderson *et al.* 1999; Moore *et al.* 1999].

GC-MS Column: CP-SIL 8 CB (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 2 min to 200° at 20°/min to 280° at 5°/min. EI ionisation at 70 eV. Limit of detection, 0.23 µg/L [Salgado-Petinal *et al.* 2005]. Column: HP-1 capillary (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV. Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001].

Other **CE** Formulations. Capillary: fused silica (48.5/40 cm total/effective length, 50 µm i.d.). Running buffer: 70 mmol/L phosphate in water : methanol (75 : 25). UV detection (λ = 210 nm). Limit of quantification, 0.07–0.13%, limit of detection, 0.02–0.4% [Wynia *et al.* 1997].

Disposition in the Body Mirtazapine is rapidly and completely absorbed after oral administration from the gastrointestinal tract. Peak plasma levels are reached after approximately 2 h. Steady state is reached after 3–4 days. Linear pharmacokinetics occur with the recommended dose range. Food intake has no influence on the pharmacokinetics. It is extensively metabolised in the liver and eliminated in urine (75%) and faeces (15%) within a few days. Metabolism occurs by the P450 cytochrome oxidase pathway into 4 metabolites via demethylation and hydroxylation followed by glucuronide conjugation. CYP2D6 and CYP1A2 are involved in the formation of 8-hydroxy metabolites, while the CYP3A isoform is involved in forming the *N*-desmethyl (active) and *N*-oxide metabolites [Anttila *et al.* 2001]. Elimination of the parent compound is mainly via hepatic metabolism, with demethylation and oxidation with subsequent conjugation of the metabolites [Grasmäder *et al.* 2005]. Clearance in CYP2D6 intermediate metabolisers is reduced by 26% compared with extensive metabolisers [Grasmäder *et al.* 2004].

Therapeutic Concentration The serum therapeutic concentration is 20–100 µg/L and the sum of the parent drug and desmethylmirtazepine is 50–300 µg/L.

Serum concentrations in patients receiving 15 mg mirtazapine daily were a median of 37 µg/L mirtazapine and 20 µg/L desmethylmirtazapine. Patients given a 30 mg dose showed higher median concentrations: 48 µg/L mirtazapine and 31 µg/L desmethylmirtazapine. After 45 mg mirtazapine daily, 62 µg/L mirtazapine and 52 µg/L desmethylmirtazapine were observed. The highest dose of 60 mg daily gave rise to concentrations of 83 µg/L mirtazapine and 65 µg/L desmethylmirtazapine [Meineke *et al.* 2004].

After a 15 mg daily dose, peak plasma concentrations (steady state) of 27–51 µg/L were reached in ≈5 days. After a 75 mg daily dose, peak plasma concentrations in the range 137–225 µg/L were achieved [Lavins *et al.* 1998].

Twenty healthy male volunteers were either administered 30 mg mirtazapine at 21.00 h for 7 days (NOCTE) or 2 doses of 15 mg mirtazapine administered at 21.00 h or 0.900 h for 7 days (BID). Pharmacokinetic parameters were as follows:

Parameter	*NOCTE*	*BID (evening)*	*BID (morning)*
C_{max} (ng/mL)	76 ± 33	47 ± 17	53 ± 19
t_{max}	1.99 ± 1.65	1.78 ± 0.84	1.79 ± 0.92
$C_{ss.min}$ (ng/mL)	11.4 ± 3.4	15.7 ± 4.1	16.1 ± 4.0
t_{ss} (days)	6	4	4
$t_{1/2}$ (h)	19.7 ± 3.0	–	20.8 ± 2.7

ss, steady state
[Timmer *et al.* 1997].

Note For pharmacokinetics of mirtazapine in patients with major depressive disorder see Reis *et al.* [2005].

Toxicity The toxic serum concentration (sum of the parent drug and metabolite) is 1 mg/L. For a review of cases see Waring *et al.* [2007].

A 76-year-old man was found dead near five empty packages of Zoloft. Postmortem concentrations (µg/L or ng/g) were as follows:

Tissue	*Mirtazapine*	*Desmethylmirtazapine*
Femoral vein blood	1030	NA
Heart blood	380	460
Gastric contents	1890	810
Bile	2950	19830
Urine	590	2410
Muscle	320	2060
Brain	560	4950
Lung	1190	8050
Kidney	1770	4890
Liver	2160	9940

NA, not available
[Wenzel *et al.* 2006]

Thirteen cases from the Los Angeles County Coroner's Office have been reported with postmortem concentrations (mg/L or mg/kg) in table at top of next page.

The following postmortem concentrations (mg/L or mg/kg) were reported in 8 cases:

Case	*Heart blood*	*Periph blood*	*Bile*	*Liver*	*Kidney*	*Urine*
1	0.33	ND	-0.11	ND	ND	0.5
2	0.07	ND	ND	ND	ND	0.14
3	0.13	0.14	0.9	0.52	0.48	ND
4	0.01	0.01	0.15	0.09	0.03	0.01
5	0.05	0.05	0.42	0.24	0.12	0.06
6	<0.01	<0.01	ND	0.04	0.02	0.06
7	0.12	ND	0.51	3.6	ND	0.33
8	0.13	0.14	1.6	0.77	0.4	3.2

ND, not determined
[Moore *et al.* 1999].

Six cases were reported from the San Diego County Medical Examiner's Office with the following concentrations (mg/L or mg/kg):

Case	*Peripheral blood*	*Central blood*	*Liver*	*Vitreous humour*	*Gastric contents*	*Mode of death*
1	2.1	2.3	15	1.0	120	Suicide
2	3.4	2.0	14	1.2	11	Suicide
3	0.45	0.38	1.7	0.14	9	Accident
4	0.44	0.36	1.5	0.30	ND	Natural
5	0.08	0.08	0.49	0.04	–	Suicide
6	0.03	0.04	0.2	0.01	–	Suicide

ND, not determined
Mirtazapine was identified as the cause of death in cases 1, 2 and 3 [Kirkton, McIntyre 2006].

For the analysis of samples from 1997 and 1998, see Robertson [1999].

Bioavailability ≈50%.

Half-life 20–40 h (the mean half-life for women is 37 h and men 26 h).

Protein Binding ≈85% over a concentration range of 0.01–10 mg/L.

Note For a general review of mitarzapine, see Holm, Markham [1999].

Dose The usual dose is 15 to 45 mg daily.

Misoprostol

Prostaglandin Analogue, Proton Pump Inhibitor

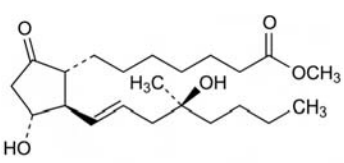
$C_{22}H_{38}O_5$ = 382.5

CAS—59122-46-2

IUPAC Name Methyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyloct-1-enyl]-5-oxocyclopentyl] heptanoate

Synonyms (11α,13*E*)-11,16-Dihydroxy-16-methyl-9-oxoprost-13-en-1-oic acid methyl ester; SC-29333.

Proprietary Names *Cytotec*; *Arthrotec* (with *Diclofenac*); *Napratec* (with *Naproxen*).



(11*R*, 16*S*)-Form

Chemical Properties Light yellow oil. It is soluble in water. Log *P* (octanol/water), 4.96.

High Performance Liquid Chromatography Column: ODS Supelco (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : water (45:20:35), flow

rate 1.5 mL/min. UV detection (λ=280 nm). Retention time: 7.5 min [Roston *et al.* 1995].

Quantification

Plasma **HPLC** Column: C_8 Zorbax (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L potassium phosphate buffer (pH 3) : acetonitrile : methanol (46:30:24), flow rate 1.7 mL/min. UV detection (λ=210 nm). Retention time: 18.5 min. Limit of quantification, 0.6 µg [Womack *et al.* 1996].

Disposition in the Body Misoprostol is rapidly absorbed after oral administration and metabolised to the active form, misoprostol acid (SC-30695), which is further metabolised by oxidation and excreted mainly via urine as its dimer and tetramer (65%) and some in faeces (15%). Approximately 88% of a dose is absorbed. No unchanged drug has been detected in plasma or urine. Excretion is mainly in the form of metabolites but little as the unchanged drug. The rate of absorption from the gastrointestinal tract is reduced by the presence of food but the extent of absorption appears to be unaffected. Peak plasma concentrations of the active metabolite have been observed after about 30 min. No accumulation of the metabolite occurs in plasma after repeated dosing of 400 µg twice daily.

Therapeutic Concentration

Six healthy volunteers, with a mean age of 26 years, were administered a mean oral dose of 386 µg radiolabelled misoprostol. The mean peak plasma concentrations, observed at 30 and 12 min, were 6.08 µg/L for misoprostol.

Twenty-four healthy subjects (mean age 27 years) were administered a single oral dose of 200 or 400 µg misoprostol after an overnight fast. Peak plasma concentrations were 0.397 and 0.835 µg/L, respectively [Information supplied by Pharmacia Limited, UK].

Half-life Misoprostol, <30 min; misoprostol acid, 20 min.

Volume of Distribution Approximately 6.6 L/kg.

Protein Binding 85% (the free acid of misoprostol).

Dose The usual daily dose is between 400 and 800 µg.

Pharmacia Limited, UK. Information on file.

Roston DA *et al.* (1995). Supercritical fluid extraction-liquid chromatography method development for a polymeric controlled-release drug formulation. *J Pharm Biomed Anal* 13: 1513–1520.

M

Mitoxantrone

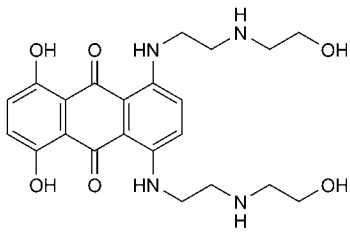
Antineoplastic

$C_{22}H_{28}N_4O_6$ = 44.5

CAS—65271-80-9

IUPAC Name 1,4-Dihydroxy-5,8-bis[2-(2-hydroxyethylamino)ethylamino]anthracene-9,10-dione

Synonyms DHAQ; 1,4-dihydroxy-5,8-bis{[2-[(2-hydroxyethyl)amino]ethyl]amino}-9,10-anthracenedione; mitozantrone; NSC-279836.



Chemical Properties Crystals. Mp 160° to 162°. It is sparingly soluble in water; slightly soluble in methanol; practically insoluble in acetone, acetonitrile and chloroform. pK_{a1} 5.99, pK_{a2} 8.13 [Rentsch *et al.* 1996]. Mitoxantrone reacts with sodium metabisulfite and EDTA although solutions containing metoxantrone are stabilised by 0.5% ascorbic acid. In the absence of ascorbic acid mitoxantrone was found to undergo rapid, biphasic degradation in plasma at 24° and 37°, with terminal half-lives of ~70 h [Priston, Sewell 1994]. Stable in spiked whole blood for 3–6 h provided the samples are kept on ice. Stable in plasma and deproteinised plasma samples for at least 24 h [Slordal *et al.* 1993].

Mitoxantrone Hydrochloride

$C_{22}H_{28}N_4O_6,2HCl$ =517.4

CAS—70476-82-3

IUPAC Name 1,4-Dihydroxy-5,8-bis{[2-[(2-hydroxyethyl)amino]ethyl]amino}-9,10-anthracenedione dihydrochloride

Synonyms CL-232315; DHAD; dihydroxyanthracenedione dihydrochloride; mitoxantrani hydrochloridum; NSC-301739.

Proprietary Names *Novantron*; *Novantrone*; *Onkotrone*; *Pralifan*.

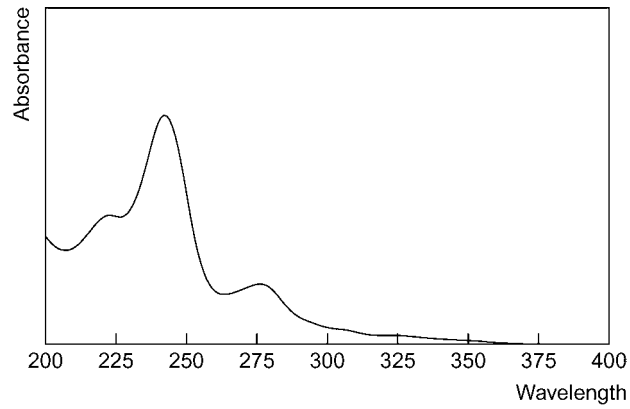
Chemical Properties A dark blue electrostatic, hygroscopic powder with Mp 203° to 205°. It is sparingly soluble in water; slightly soluble in methanol; practically insoluble in acetone, acetonitrile and chloroform. pK_a 5.99 and 8.13.

Thin-layer Chromatography All these systems refer to mitoxantrone hydrochloride:

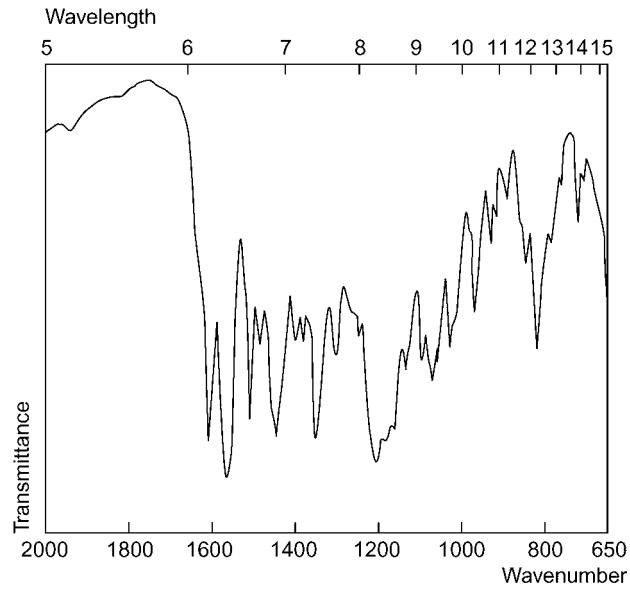
Plate: silica gel. Mobile phase: (A) methanol : ammonium solution (100 : 1.5); (B) chloroform : methanol : ammonia (9 : 3 : 1). R_f 0.04 (A); 0.77 (B). Plate: cellulose. Mobile phase: formic acid : water (4 : 96). R_f 0.33. Plate: micropolyamide. Mobile phase: (A) methanol : strong ammonia solution (100 : 1.5); (B) formic acid : water (4 : 96). R_f 0.53 (A); 0.92 (B). Plate: reversed phase KC-18F. Mobile phase: dimethylformamide : 0.5 mol/L sodium chloride solution: 1 mol/L ammonia : acetic acid (8 : 8 : 1 : 2). R_f 0.44. [Beijnen *et al.* 1991].

High Performance Liquid Chromatography Column: Nova-Pak ODS (75 × 3.9 mm i.d., 4 µm). Mobile phase: methanol : tetrahydrofuran : TEA phosphate : 1 mol/L tetramethylammonium chloride : water (30 : 1 : 10 : 2 : 57), flow rate 1 mL/min. UV detection (λ = 658 nm). Retention time: 3.5 min. [Lin *et al.* 1989].

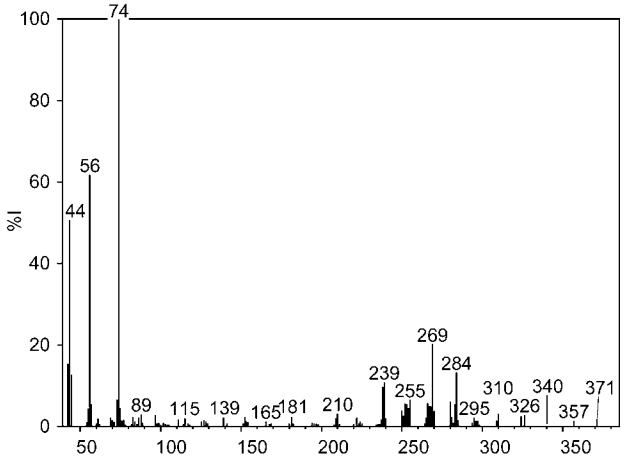
Ultraviolet Spectrum Aqueous acid (ethanol)—244, 279, 525, 620, 660 nm; 241, 273, 608, 658 nm (hydrochloride).



Infrared Spectrum Principal peaks at wavenumbers 1615, 1570, 1450, 1210, 825 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 74, 56, 44, 269, 284, 239, 255, 210.



Quantification

Plasma **HPLC** Column: HIRPB (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.05 mol/L ammonium formate buffer (pH 3.6; 22 : 78), flow rate 1.2 mL/min. UV detection (λ = 612 nm). Retention time: 5 min. Limit of detection not reported [Loadman, Calabrese 2001]. Column: Techopak 10 C_{18} (150 × 3.8 mm i.d., 10 µm). Mobile phase: 0.5 mol/L ammonium formate (pH 3.0) : acetonitrile (73 : 27), flow rate 1.1 mL/min. UV detection (658 nm). Limit of detection, 2 µg/L [Priston, Sewell 1994]. Column: Supelcosil C_{18} ODS (150 × 4.6 mm i.d., 3 µm). Mobile phase: triethylammonium formate buffer (pH 3.5) : acetone mixture (75 : 25), flow rate 1.0 mL/min. UV detection (λ = 658 nm). Limit of detection, 2.5 nmol/L (1.1 µg/L) [Slordal *et al.* 1993]. Column: Novapak ODS (75 × 3.9 mm i.d., 4 µm). Mobile phase: 1 mol/L TEA phosphate (pH 3.0) : tetrahydrofuran : methanol : 1 mol/L tetramethylammonium chloride : water (10 : 1 : 30 : 2 : 57) flow rate 1.0 mL/min. UV detection (λ = 658 nm). Limit of quantification, 1 µg/L [Lin *et al.* 1989]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.55 mol/L ammonium formate (pH 4.3) : acetonitrile (73 : 27), flow rate 0.5 mL/min. UV detection (λ = 658 nm). Limit of detection, 1 µg/L [Smyth *et al.* 1986].

Serum **HPLC** Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : water (25 : 75) containing 5 mmol/L 1-pentanesulfonic acid, flow rate 1 mL/min. UV detection (λ = 658 nm). Limit of detection, <1 µg/L [Ehninger *et al.* 1985].

Note For an ELISA, see Flavell and Flavell [1988] or Nicolau *et al.* [1985].

Urine **HPLC** See Plasma [Smyth *et al.* 1986]. See Serum. Limit of detection, 0.2 µg/L [Ehninger *et al.* 1985].

Ascitic Fluid **HPLC** Column: Alltech C_{18} (150 × 2.1 mm, 5 µm). Mobile phase: acetonitrile : 0.16 mol/L ammonium formate (pH 2.5; 27 : 73) with 8 mmol/L heptanesulfonic acid, flow rate 0.35 mL/min. UV detection (λ = 658 nm). Limit of detection not reported [Nagel *et al.* 1992].

Other **HPLC** Mouse Whole Blood and Tissues. Column: Nucleosil C_{18} (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.16 mol/L ammonium formate buffer (pH 2.7; 33 : 67) containing 0.25 mol/L hexanesulfonic acid, flow rate 1.0 mL/min. UV detection (λ = 658 nm). Retention time: 6.0 min. Limit of detection, 2 µg/L [Rentsch *et al.* 1996].

Disposition in the Body Mitoxantrone is rapidly and extensively distributed in the body after IV administration. It is extensively tissue bound and undergoes very slow redistribution back into the plasma. It is slowly excreted in urine and bile as the unchanged drug and its metabolites, monocarboxylic and dicarboxylic acid derivatives; 20–32% of the dose is excreted within 5 days. Between 6 and 11% of the dose is recovered from urine and between 13 and 25% in faeces; 65% of the unchanged drug is found in urine and 35% of the 2 inactive metabolites and their glucuronide conjugates. Two thirds of excretion occurs during the first day. Tissue concentrations exceed those in blood during the terminal elimination phase. Mitoxantrone does not appear to cross the blood–brain barrier. Hepatic metabolism is the major route of elimination of mitoxantrone so caution should be exercised when using the drug in patients with hepatic dysfunction [Smyth *et al.* 1986].

Therapeutic Concentration

Five patients with cancer of the peritoneal cavity were administered doses between 20 and 50 mg/m^2 via the IP route, as a 15 min infusion. The median peak plasma concentration was 1 µg/L and the peak peritoneal dialysate concentration was 490 µg/L [Nagel *et al.* 1992].

Patients with liver metastasis were administered 12 mg/m^2 doses by intra-arterial infusions of 2 and 24 h. The peak plasma concentrations were 305 µg/L at 0.9 h during the 2 h infusion, and 244 µg/L at 5.5 h during the 24 h infusion [Czejka *et al.* 1990].

Toxicity Fatalities have occurred on rare occasions as a result of severe leucopenia with infection after accidental administration of a single bolus injection of mitozantrone at over 10 times the recommended dose. Four patients received 140–180 mg/m^2 by single bolus injection and died from severe leucopenia [*APBI*].

Half-life 5–18 days. Initial phase 3–10 min, intermediate phase 0.3–3.1 h, terminal phase 23–215 h (mean 75 h). Terminal phase also reported as 37.4 h.

Volume of Distribution 13.8–14.4 L/kg or >2248 L/m^2 (Steady state >1000 L/m^2).

Clearance The mean body clearance is 238.7 mL/h/kg and is known to be reduced in hepatic impairment. Triphasic plasma clearance occurs.

Protein Binding Approximately 95% and 78% (albumin).

Note For a review of the pharmacokinetics of mitoxantrone, see Ehninger *et al.* [1990]; for a general review, see Faulds *et al.* [1991] or Smyth *et al.* [1986].

Dose The usual dose is 14 mg/m^2 body surface.

M

Mivacurium Chloride

Muscle Relaxant

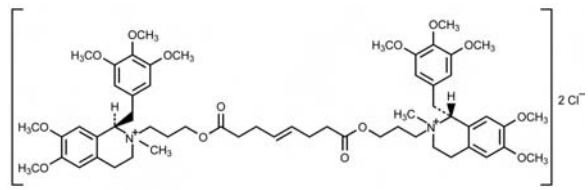
$C_{58}H_{80}Cl_2N_2O_{14}$ = 1100.2

CAS—106861-44-3

IUPAC Name (1*R*,1′*R*)-2,2′-[[(4*E*)-1,8-Dioxo-4-octene-1,8-diyl]bis(oxy-3,1-propane-diyl)]bis[1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-1-[(3,4,5-trimethoxyphenyl)methyl]]isoquinolinium dichloride

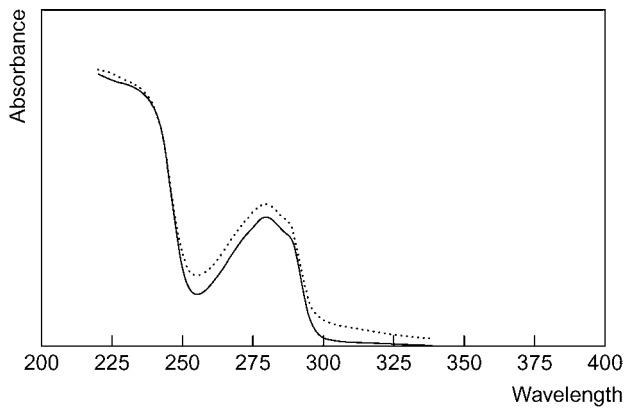
Synonym BW-B1090U

Proprietary Name *Mivacron*

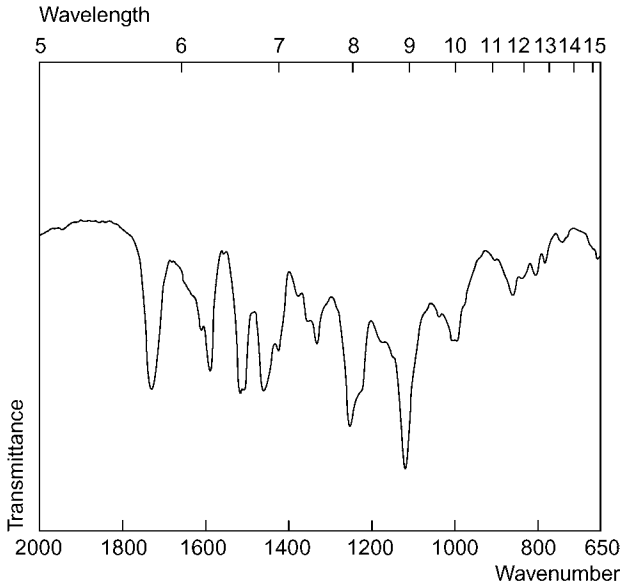


Chemical Properties An amorphous solid. Log *P* (octanol/water), 0.015.

Ultraviolet Spectrum Aqueous acid—280 nm; aqueous alkali—280 nm.



Infrared Spectrum Principal peaks at wavenumbers 1123, 1520, 1732, 1337 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** Column: C_1 Spherisorb (150 × 4.6 mm i.d., 5 µm). Mobile phase: (A) acetonitrile : 10 mmol/L potassium dihydrogen phosphate (pH 3, containing 10% methanol) (70:30); (B) acetonitrile : 50 mmol/L potassium dihydrogen phosphate (pH 3, containing 10% methanol) (70:30), flow rate 1 mL/min. Elution programme: (A:B) (100:0) for 3 min; to (0:100) in 2 min; hold for 4 min; to (100:0) in 2 min; hold for 2 min. Internal standard (IS): D-tubocurarine. Fluorescence detection (λ_{ex}=220 nm, λ_{em}=320 nm). Retention time: mivacurium chloride, 9.7 min; IS, 8.6 min. Column: SCX Spherisorb (250 × 4.6 mm, 10 µm). Mobile phase: acetonitrile : 70 mmol/L disodium sulfate (in 5 mmol/L sulfuric acid) (60:40), flow rate 1 mL/min. IS: laudanosine. Retention time: mivacurium chloride: *cis–cis* isomer, 6.5 min; *cis–trans* isomer, 6.8 min; *trans–trans* isomer, 7.0 min; IS, 4.8 min. Limit of detection, 1 µg/L [Weindlmayr-Goettel *et al.* 1996]. Fluorescence detection (λ_{ex}=202 nm, λ_{em}=290 nm). Limit of quantification, 3.9, 4.1, 10.4 and 15.6 µg/L for the mivacurium isomers, *cis* monoester, *trans* monoester and the alcohol metabolites [Lacroix *et al.* 1995]. Fluorescence detection (λ_{ex}=202 nm, λ_{em} = 320 nm). Limit of quantification, 5 µg/L [Brown *et al.* 1992].

Disposition in the Body Mivacurium undergoes enzymatic hydrolysis by plasma cholinesterases to inactivate the drug. Quaternary alcohol and monoester metabolites of the different isomers are produced. Peak concentrations of these can be observed ~25 s after an injection. Elimination of mivacurium occurs both in the kidneys and the liver with excretion in urine and bile, mostly as the metabolites (32 to 82% as the monoesters, 16 to 53% as the quaternary alcohols) and little unchanged drug (4 to 15% of a dose).

Therapeutic Concentration

Eight healthy patients (men and women) with a mean age of 33 years, were administered an IV dose of 0.15 mg/kg mivacurium chloride. Peak plasma concentrations of 4486, 2198 and 504 µg/L for the *trans–trans, cis–trans* and *cis–cis* isomers, respectively, were observed after 25 and 35 s. Plasma concentrations of the *trans–trans* and *cis–trans* isomers declined rapidly and could not be detected 10 to 20 min after administration. Peak concentrations of the *cis–cis* isomer declined less rapidly and it could still be detected up to 45 min after injection [Lacroix *et al.* 1997].

Toxicity Prolonged muscle paralysis and its consequences are the main signs of overdosing.

Half-life *Trans–trans* isomer, 2.4 min; *cis–trans* isomer, 2.0 min; *cis–cis* isomer, 28.5 min (mean values).

Volume of Distribution Drug in general, 0.2 L/kg. *Trans–trans* isomer, 0.047 L/kg; *cis–trans* isomer, 0.054 L/kg; *cis–cis* isomer, 0.189 L/kg.

Clearance Plasma: *trans–trans* isomer, 29.2 mL/min/kg; *cis–trans* isomer, 45.7 mL/min/kg; *cis–cis* isomer, 6.7 mL/min/kg.

Note For a general review of the pharmacology of mivacurium chloride, see Frampton and McTavish [1993].

Dose Initial dose is 70 to 250 µg/kg body weight IV injection and the maintenance dose is 100 µg/kg. Reduced doses may be necessary in the elderly. Continuous treatment may be at 8 to 10 µg/kg/min which can be increased in 1 µg/kg/min steps. Children 2 months to 12 years: 11 to 14 µg/kg/min.

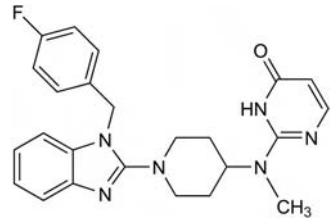
$C_{24}H_{25}FN_6O$ = 432.5

CAS—108612-45-9

IUPAC Name 2-[[1-[1-[(4-Fluorophenyl)methyl]-1*H*-benzimidazol-2-yl]-4-piperidinyl]-methylamino]-4(1*H*)-pyrimidinone

Synonym SL85-0324

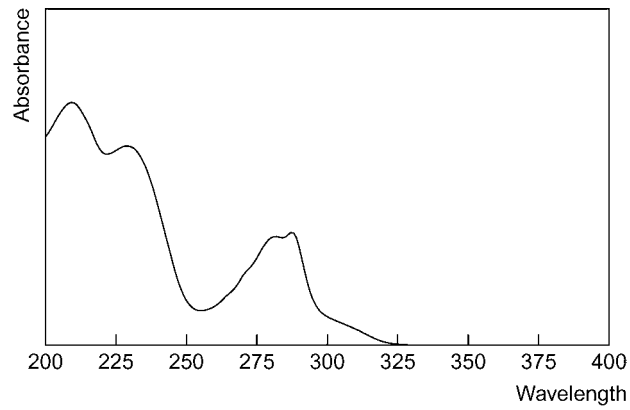
Proprietary Names *Mistamine*; *Mizollen*; *Zolim*.



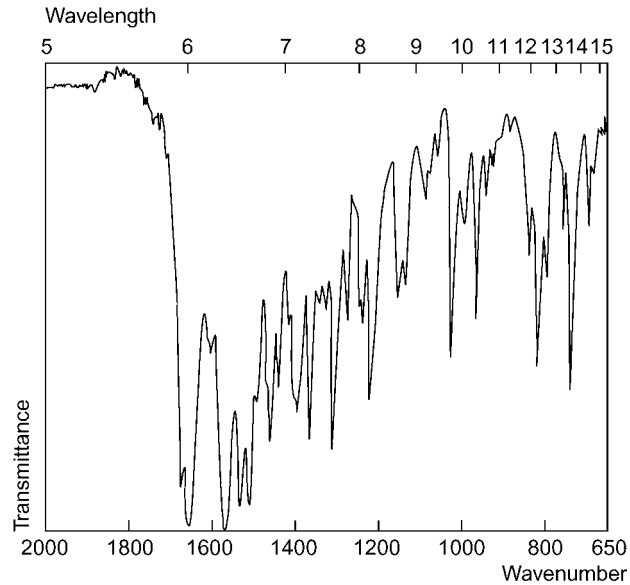
Chemical Properties Crystals. Mp 217°. Soluble in methanol.

High Performance Liquid Chromatography Column: C_8Ultra-base B5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogen phosphate (pH 2.5) : acetonitrile (72:28), flow rate 1 mL/min. UV detection (λ=285 nm). Retention time: not specified [Chosidow *et al.* 1996].

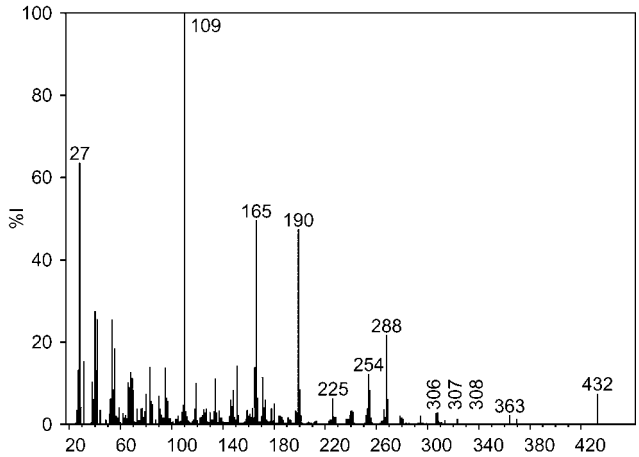
Ultraviolet Spectrum Aqueous acid—208, 229, 281, 288 nm; ethanol—214, 287 nm.



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 109, 27, 165, 198, 40, 55, 57, 288.



Quantification

Plasma **HPLC** Limit of detection, 0.5 µg/L [Ascalone, Rouchouse 1993].

Disposition in the Body Mizolastine is rapidly absorbed from the gastrointestinal tract and extensively metabolised. 0.5% of an administered dose is recovered from urine as the unchanged drug and 84 to 95% of the drug is excreted in faeces. 66% of the administered dose is metabolised by glucuronidation, and other metabolic pathways are also involved, including metabolism by cytochrome P450 isoenzyme CYP3A4 with the formation of inactive metabolites. No active metabolites have been identified. Linear kinetics are observed. Steady state is reached on the third day of administration and accumulation does not occur.

Therapeutic Concentration Peak plasma concentrations of 276, 408 and 595 µg/L have been observed 1.5 h after oral doses of 5, 10 and 15 mg, respectively.

Bioavailability Tablets: 65%. Capsules: 70%. Not influenced by food or alcohol.

Half-life Approximately 13 h. In patients with hepatic impairment, 15.1 ± 1.7 h and renal impairment, 19.2 ± 1.7 h.

Volume of Distribution 1.4 L/kg.

Clearance A total clearance of 1.15 mL/min/kg and systemic plasma clearance of 0.69 L/h/kg.

Protein Binding Approximately 98.4%.

Dose 10 mg daily.

Ascalone V, Rouchouse A (1993). Determination of mizolastine, a new antihistaminic drug, in human plasma by liquid-liquid extraction, solid-phase extraction and column-switching techniques in combination with high-performance liquid chromatography. *J Chromatogr* 619: 275–284.

Chosidow O *et al.* (1996). Plasma and skin suction-blister-fluid pharmacokinetics and time course of the effects of oral mizolastine. *Eur J Clin Pharmacol* 50: 327–333.

Moclobemide

Antidepressant

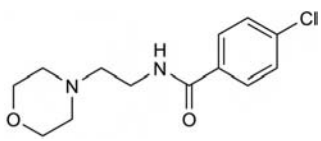
$C_{13}H_{17}ClN_2O_2$ = 268.7

CAS—71320-77-9

IUPAC Name 4-Chloro-*N*-[2-(4 morpholinyl)ethyl]benzamide

Synonyms Ro-11-1163; Ro-11-1163/000.

Proprietary Names *Aurorix*; *Manerix*; *Moclamine*.



Chemical Properties Crystals from propan-2-ol. Mp 137°. pK_a 6.2. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Moclobemide Hydrochloride

$C_{13}H_{17}ClN_2O_2$,HCl = 305.2

Chemical Properties Crystals from propan-2-ol with Mp 208°.

Thin-layer Chromatography System TB—R_f 0.1; system TE—R_f 0.52; system TAE—R_f 0.65.

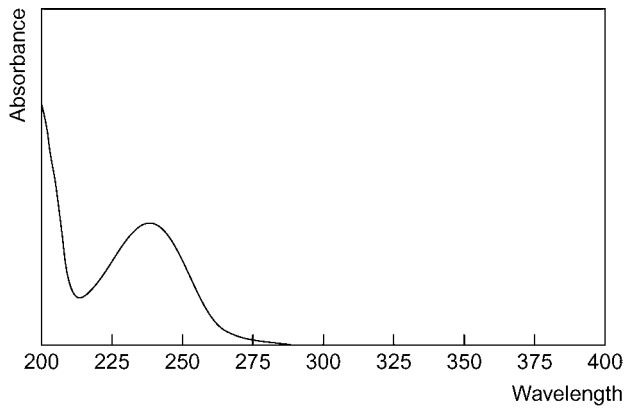
Gas Chromatography System GB—RI 2333; system GM—RRT 0.967; system GT—RI 2210.

Column: HP5 (0.32 mm i.d.). Temperature: 140° for 0.5 min to 300° at 20°/min for 2 min. NPD. Retention time: 3.0 min [Singer, Jones 1997].

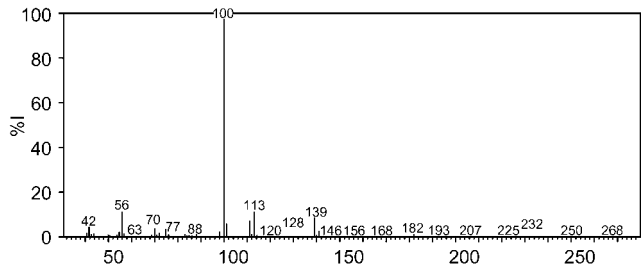
High Performance Liquid Chromatography System HX—RI 295; system HZ—RT 2.4 min; system HAA—RT 10.2 min; system HAX—RT 6.9 min; system HAY—RT 3.9 min.

Column: C_{18} (Kromasil, 150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol-water (90 : 10) : water-methanol (90 : 10) both containing 0.0125 mol/L sodium hydroxide (40 : 60 to 25 : 75 in 5 min for 8 min to 0 : 100 in 10 min, for 5 min. Internal standard (IS): Ro-11-9900. UV detection (λ = 237 nm). Retention time: 4.5 min for moclobemide, 5.5 min for IS [Isbister *et al.* 2001]. Column: Spherisorb S5 C_6 (125 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 67 mmol/L potassium phosphate (pH 3.9, 30 : 320) flow rate 1.3 mL/min. IS: Ro-11-9900. UV detection (λ = 240 nm). Retention time: 7.2 min for moclobemide, 5.3 min for metabolite, 8.6 min for *N*-oxide metabolite, 15.1 min for lactam derivative metabolite, 12.7 min for IS [Geschke *et al.* 1987].

Ultraviolet Spectrum Aqueous acid (pH 2.8)—196, 238 nm.



Mass Spectrum Principal ions at *m/z* 100, 182, 225, 250, 268, 113, 56, 42.



Quantification

Blood **HPLC** Column: XTerra RP-18. Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2). Limit of quantification, 2 µg/L [Titier *et al.* 2007]. UV detection (λ = 238 nm). Limit of detection, 0.012 mg/L [Gaillard, Pepin 1997].

Plasma **HPLC** Column: C_{18}. Mobile phase: acetonitrile : water (pH 2, 725 : 75). Spectrophotometric detection (λ = 239 nm). Limit of quantification, 10 µg/L [Plenis *et al.* 2007]. Column: Waters XTerra RP-18 (150 × 4.6 mm, 5 µm). Mobile phase: 10 µmol/L potassium dihydrogen phosphate with 1% TEA (pH 3.9) : acetonitrile (83 : 17), flow-rate, 1.2 mL/min. UV detection (λ = 240 nm). Limit of quantification, 0.02 mg/L [Rakic *et al.* 2007]. Column: ODS (250 × 4.6 mm, 5 µm). Mobile phase: 5 µmol/L sodium dihydrogen phosphate : acetonitrile : TEA (pH 3.4, 1000 : 350 : 10), flow-rate 1.0 mL/min. UV detection (λ = 240 nm). Limit of quantification, 15.6 µg/L, limit of detection, 5 µg/L [Amini *et al.* 2004]. Column: HyPurity C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : phosphate buffer (pH 3.8), flow rate 1.0 mL/min. DAD (λ = 220, 240, 290 nm). Limit of detection, 2.5–5 µg/L [Duverneuil *et al.* 2003]. Column: Waters Nova-Pak Phenyl (150 × 2 mm i.d., 4 µm). Mobile phase: 0.2 mol/L ammonium formate buffer (pH 3.57) : acetonitrile. Limit of quantification, 1 µg/L [Hoskins *et al.* 2001]. See also Geschke *et al.* [1987].

Serum **HPLC** Column: Nucleosil 100-Protect 1. Mobile phase: acetonitrile : potassium dihydrogen phosphate buffer [Frahnert *et al.* 2003].

Urine **GC-MS** Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001].

HPLC See Plasma [Geschke *et al.* 1987].

Disposition in the Body Moclobemide is readily absorbed after oral administration, with peak plasma concentrations observed after 1 to 2 h. The drug is almost completely absorbed and undergoes extensive and rapid hepatic metabolism to 19 metabolites, mostly by oxidation, deamination and aromatic hydroxylation.

Absorption is delayed in the presence of food. The drug is almost entirely metabolised before it is eliminated from the body. Slow metabolisers and extensive metabolisers both exist. The main metabolite is the lactam derivative, which is pharmacologically inactive, but the other metabolites retain some activity, in particular the *N*-oxide of the drug. It is widely distributed throughout the body including breast milk, and accumulation can occur. Moclobemide is excreted in urine mainly as the metabolites and a small amount as the unchanged drug (<1%), <5% in faeces.

Therapeutic Concentration The trough serum therapeutic concentration is 0.4–1.0 mg/L and peak, 1.5–4.0 mg/L.

Eight male volunteers, 29 to 37 years of age (mean, 33), were administered a single dose of 100 mg moclobemide. The mean peak plasma concentration was 575 µg/L (range, 333–1076), which was observed at 0.9 h (0.3–1.5 h) after administration [Schoerlin *et al.* 1991].

Toxicity Blood concentrations of 5–8 mg/L can be toxic and blood concentrations of 16 mg/L are sometimes associated with fatalities.

A 39-year-old woman was admitted to hospital with convulsions and a raised body temperature of 42.6°. The highest blood concentration measure was 36.5 mg/L and it was estimated that she probably ingested 10 g moclobemide. Her blood concentration was several fold higher than the peak concentrations observed after a single oral dose of 1.2 g observed in tolerance studies (11–12 mg/L, 0.25–0.5 h after administration). The patient recovered after receiving anticonvulsants and artificial respiration [Schoerlin *et al.* 1987].

A 48-year-old woman with a history of depression and repeated suicide attempts was found dead at home. Postmortem toxicological analysis showed a concentration of moclobemide in blood of 137 mg/L and in liver of 432 mg/kg. Low levels of diazepam, nordiazepam and trifluoperazine were also detected. It was concluded that death was caused by acute poisoning by moclobemide (the first case report of death caused by the toxic effects of this drug on its own) [Camaris, Little 1997].

A 41-year-old Caucasian man was found dead at his home; he had a history of depression and suicide attempts. Surrounding the man was a number of medication bottles and a bottle of whiskey. Toxicological analysis showed that the man had ethanol, lormetazepam, cotinine, caffeine, moclobemide and citalopram in his urine and blood. Moclobemide was detected in blood at a concentration of 5.62 mg/L and in urine at 204.0 mg/L. The metabolite 3-ketomoclobemide was found at concentrations of 2.26 mg/L and 49.7 mg/L in blood and urine, respectively, and moclobemide *N*-oxide at 424 mg/L in urine (this metabolite was not detected in blood). The cause of death was determined as the synergistic toxicity of moclobemide and citalopram; death was ruled as multiple drug intoxication [Dams *et al.* 2001].

Bioavailability 55–95% (single dose); 80% (multiple dosing).

Half-life 1–4 h.

Volume of Distribution 1.2 L/kg.

Clearance Blood, 20–50 L/h.

Protein Binding 50%.

Note For an update of the pharmacological properties and therapeutic use of moclobemide, see Fulton, Benfield [1996].

Dose The initial dose is 300 mg daily, divided in three doses; this may be adjusted if necessary. During therapy, the usual range is 150 to 600 mg daily.

Modafinil

α_1-Adrenoceptor Agonist, CNS Stimulant

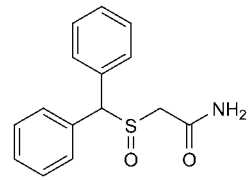
$C_{15}H_{15}NO_2S = 273.4$

CAS—68693-11-8

IUPAC Name 2-Benzhydrylsulfinylacetamide

Synonyms CEP-1538; CRL-40476; 2-[(diphenylmethyl)sulfinyl]acetamide.

Proprietary Names *Modiodal*; *Provigil*.



Chemical Properties A white to off-white crystalline powder with Mp 164° to 166°. Practically insoluble in water and cyclohexane; sparingly to slightly soluble in methanol and acetone. Extraction yield (chlorobutane), 0.35 [Demme *et al.* 2005]. Stability in human plasma has been demonstrated at –20° after 166 days, at –9 0° for 383 days and after 5 freeze-thaw cycles [Gorman 2002].

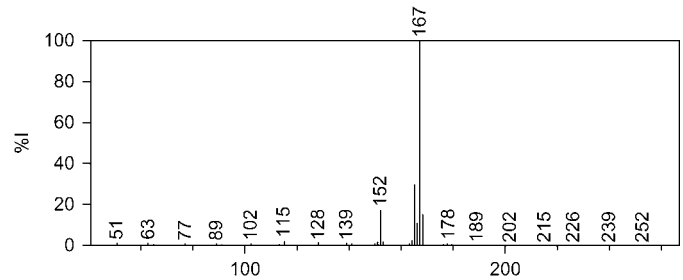
Mass Spectrum



Quantification

Plasma **HPLC** Column: APS-Nucleosil (150 × 4.6 mm i.d., 7 µm) followed by octyl BSA (10 × 46 mm i.d., 10 µm). UV detection (λ = 240 or 228 nm). Limit of quantification, 0.1 mg/L for (+)-modafinil; limit of detection, 0.05 mg/L for (+)-modafinil [Cass, Ferreira 2008]. Column: Symmetry C_{18} (250 × 4.6 mm i.d.). Mobile phase: methanol: water: acetic acid (500 : 500 : 1), flow rate, 1.0 mL/min. UV detection (λ = 220 or 233 nm). Retention time: 11.5 min. Limit of detection, 0.1 mg/L [Schwertner, Kong 2005]. Column: Cyclobond I-2000 RSP (250 × 4.6 mm i.d.). Mobile phase: 20 mmol/L sodium phosphate (pH 3.0) : acetonitrile-20 mmol/L sodium phosphate (pH 3.0; 30 : 70, 30 : 70 to 60 : 40 over 30 min to 30 : 70 for 5 min), flow rate 1.0 mL/min. UV detection (λ = 225 nm). Retention time: 22.1 min

for (+)-modafinil, 23.8 min for (−)-modafinil. Limit of quantification, 0.5 mg/L, limit of detection, 0.01 mg/L [Donovan *et al.* 2003]. Column: Hypersil BDS phenyl (150 × 2.0 mm i.d., 5 µm). Mobile phase: 0.02 mol/L phosphate buffer (pH 2.5) : methanol (64 : 36), flow rate 0.3 mL/min. UV detection (λ = 235 nm). Limit of quantification, 0.1 mg/L [Gorman 2002]. Column: APS-Nucleosil (150 × 4.6 mm i.d., 7 µm). Mobile phase: acetonitrile : water (25 : 75), flow rate 0.5 mL/min. UV detection (λ = 228 nm). Limit of quantification, 0.02 mg/L [Cass *et al.* 2001]. Column: β-cyclodextrin (250 × 4.0 mm i.d., 5 µm). Temperature programme: 12°. Mobile phase: 0.02 mol/L phosphate buffer (pH 3.0) : acetonitrile (84 : 16), flow rate 0.6 mL/min. I.S.: 3,3-diphenylpropylamine. DAD (λ = 225 nm). Retention time: (*R*)-modafinil, 19.0 min; (*S*)-modafinil, 22.0 min; I.S., 9 min. Limit of quantification, 0.1 mg/L [Gorman 1999]. Column: ChiraDex β-cyclodextrin (250 × 4.0 mm i.d.). UV detection (λ = 233 nm). Limit of detection, 0.1 mg/L [Wong *et al.* 1999a]. Column: Symmetry C_8 (150 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L orthophosphoric acid (26 : 74), flow rate 1.1 mL/min. UV detection (λ = 225 nm). Limit of quantification, 0.10 mg/L, limit of detection, 0.01 mg/L [Burnat *et al.* 1998]. See also [Moachon, Matinier 1994].

Urine **GC-MS** Column: 5% phenylmethyl silicone (17 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 18 psi. Temperature programme: 85° for 1.5 min to 270° at 15°/min to 290° at 50°/min for 2.5 min. EI ionisation at 70 eV, SIM and scan acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [Strano-Rossi *et al.* 2008]. Column: HP-5MS cross-linked 5% diphenylpolysiloxane 95% dimethylpolysiloxane (25 m × 0.25 mm i.d., 0.33 µm). Carrier gas: He, 1.1 mL/min. Temperature programme: 90° to 240° at 15°/min to 300° at 10°/min for 5 min. EI ionisation at 70 eV, full scan mode. Limit of quantification, 0.363 mg/L; limit of detection, 0.109 mg/L [Tseng *et al.* 2005].

HPLC See Plasma [Schwertner, Kong 2005].

Saliva **GC-MS** See Urine [Strano-Rossi *et al.* 2008].

Disposition in the Body Modafinil is a racemic compound whose enantiomers have different pharmacokinetics. It is rapidly and well absorbed from the gastrointestinal tract following oral administration. It is well distributed in tissues and metabolised in the liver by hydrolytic deamination, *S*-oxidation, aromatic ring hydroxylation, and glucuronide conjugation. Modafinil shows a possible induction effect on its own metabolism after chronic administration of dosages greater than 400 mg/day. The major metabolite is modafinil acid but there are at least 6 other metabolites present in much lower concentrations. The major route of elimination (~90%) is metabolism, primarily by the liver, with subsequent renal elimination; <10% of the dose is eliminated unchanged. Renal impairment does not affect pharmacokinetics. In hepatic impairment, oral clearance is decreased by ~60% and steady-state concentration is doubled. Steady state is achieved within 8 days.

Therapeutic Concentration

Twelve healthy young males (aged 22–37 years; mean 29 years), 12 young females (19–40 years; mean 26 years), and 12 elderly males (aged 53–72 years; mean 63 years) were administered a single oral dose of 200 mg modafinil after an overnight fast. The peak plasma modafinil concentration was 4.21 mg/L for the young males, which was observed at 2.0 h; 5.2 mg/L for the young females at 1.7 h, and 4.81 mg/L at 1.7 h for the elderly males. For the metabolite modafinil acid, concentrations were 2.06, 2.65, and 2.65 mg/L for the young males, females, and elderly males, respectively, observed at 2.8, 2.9 and 3.5 h, respectively [Wong *et al.* 1999a].

Thirty-two healthy male volunteers (aged 20 to 39 years; mean 26.2 years) were administered a 200, 400, 600, or 800 mg dose of modafinil after breakfast for 7 consecutive days. Peak plasma concentrations of the parent drug were 4.8 and 6.4 mg/L for the 200 mg dose on days 1 and 7, respectively. For the 400 mg dose, concentrations reached 8.7 mg/L at 2.3 h on day 1 and 11.0 mg/L at 1.7 h on day 7. For the 600 mg dose, concentrations were 13.0 and 17.0 mg/L on days 1 and 7, respectively, observed at 2.5 and 2.3 h, respectively. On day 1, the 800 mg dose of modafinil produced concentrations of 15.0 mg/L at 2.3 h [Wong *et al.* 1999b].

Note For pharmacokinetic parameters in cocaine-dependent subjects, see Donovan *et al.* [2003]; for a pharmacokinetic study of the effect of modafinil on warfarin, see Robertson *et al.* [2002a] and on ethinylestradiol and triazolam, see Robertson *et al.* [2002b].

Toxicity Doses of 4 g led to limited, expected, and not life-threatening adverse experiences, with patients making full recovery.

Half-life 10–15 h.

Volume of Distribution Approximately 0.9 L/kg or 80 L.

Clearance 3–5 L/h.

Protein Binding Approximately 62% (albumin).

Dose 200 to 400 mg.

Moexipril

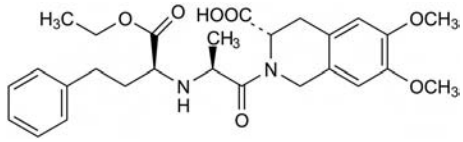
Antihypertensive

$C_{27}H_{34}N_2O_7$ = 498.6

CAS—103775-10-6

IUPAC Name (3*S*)-2-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-3-isoquinolinecarboxylic acid

Synonym RS-10085



Chemical Properties pK_a 3.05 (25°); 5.40 (25°). Log *P* (pH 7.5), 0.25; (pH 1.0), 2.34.

Moexipril Diacid Hydrochloride

$C_{27}H_{30}N_2O_7$,HCl = 531.0

CAS—82586-57-0

Synonym Moexiprilat hydrochloride

Chemical Properties Crystals from tetrahydrofuran and ethanol. Mp 145° to 170°.

Moexipril Hydrochloride

$C_{27}H_{34}N_2O_7$,HCl = 535.0

CAS—82586-52-5

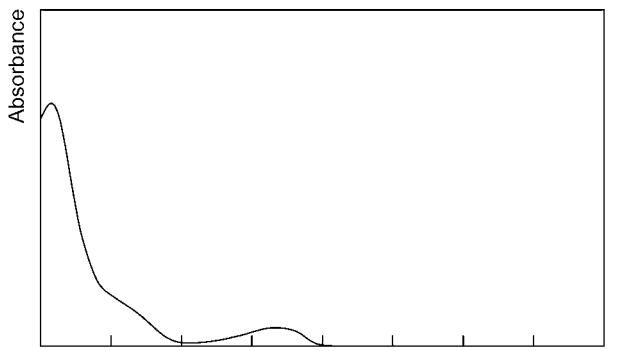
Synonyms CI-925; RS-10085-197; SPM-925.

Proprietary Names *Femipres*; *Perdix*; *Univasc*. It is also an ingredient of *Uniretic*.

Chemical Properties A fine-white to off-white powder. Mp 141° to 161°. Soluble in distilled water at room temperature.

Gas Chromatography System GP—RI 3575 moexipril-ME, RI 3580 M (moexiprilate)-ME3, RI 3775 M (moexiprilate-H_2O)-ME3.

Ultraviolet Spectrum Aqueous solution—283 nm (unaffected by pH).



Infrared Spectrum Principal peaks at wavenumbers 702, 753, 858, 1115, 1215, 1256 cm^{-1}.

Quantification
Plasma **GC-MS** Column: DB-1 fused-silica capillary (10 m × 0.32 mm i.d., 0.25 μm). Temperature programme: held at 150° for 0.1 min, to 300° at 25°/min, held for 1.5 min. Injector temperature: 70° to 300° at 10°/s, held for 5 min. Carrier gas: He, inlet pressure 13.8 kPa. Internal standard (IS): quinapril hydrochloride. MS detection (NICI, SIM at *m/z*: 302 and 288 for moexipril and moexiprilat, respectively). Retention time: moexipril, 7.32 min; moexiprilat, 7.25 min; IS, 6.2 min. Limit of quantification for moexipril and moexiprilat, 0.5 μg/L [Hammes *et al.* 1995].

Disposition in the Body Moexipril is rapidly but incompletely absorbed after oral administration and de-esterified to its active metabolite, moexiprilat. Absorption is reduced with the presence of food, and peak plasma concentrations of the metabolite are reached within 1.5 h. Both the parent drug and the active metabolite are mainly eliminated in urine along with other minor metabolites including diketopiperazine, and some moexiprilat is excreted in faeces (20% of an IV dose and 52% of an oral dose). 40% of an IV dose is excreted as moexiprilat in urine (7% oral dose) and 26% as the unchanged drug (1% oral). The pharmacokinetics of moexipril are significantly altered in patients with severe renal impairment (creatinine clearance 40 mL/min) and those with liver cirrhosis.

Therapeutic Concentration
Healthy volunteers were administered a 15 mg single dose of moexipril and peak plasma concentrations of 50 μg/L and 5 μg/L were respectively reached for the drug and its metabolite moexiprilat within 2 h [Stimpel *et al.* 1995].

Bioavailability 22%.
Half-life Approximately 10 h.
Volume of Distribution 183 L (moexipril and moexiprilat).
Clearance Plasma, moexipril, 441 mL/min; moexiprilat, 232 mL/min.
Protein binding Moexipril, 50%; moexiprilat, 72%.
Note For a review of the use of moexipril in the management of essential hypertension, see Brogden and Wiseman [1998].
Dose The usual initial dose is 7.5 mg and a maintenance dose of 7.5 to 15 mg daily is administered. Doses up to 30 mg may also be given. In the elderly, patients with renal failure or hepatic cirrhosis, and those being treated with a diuretic or nifedipine, the initial dose should be reduced by half.

Molgramostim

Antineoplastic, Antineutropenic
$C_{639}H_{1007}N_{171}O_{196}S_{18}$ = 14798.03
CAS—99283-10-0

Synonym Sch-39300
Proprietary Names *Leucomax*; *Mielogen*.
Chemical Properties Colony-stimulating factor 2 (human clone pHG25, protein moiety reduced). Soluble in water.
Quantification
Note For an ELISA for the quantification of molgramostim, see Cebon *et al.* [1988].

Disposition in the Body Maximum serum concentrations increase with administered dose but appear larger with IV doses compared with subcutaneous administration. Concentrations reached with SC treatment >1 μg/L, are maintained longer than those with IV administration. Molgramostim has been detected in urine, but only in very small amounts, suggesting non-renal elimination.

Therapeutic Concentration
Thirty-three male and female patients with advanced malignancy or neutropenia, aged between 30 and 74 years, were administered 0.3–30.0 μg/kg molgramostim per day as a SC bolus injection. Patients were also administered 0.3–20.0 μg/kg daily IV as a bolus injection or as a 2-h infusion. Molgramostim was detected within 30 min of the SC injection for those receiving 1.0 μg/kg and 5–15 min for the higher doses. The mean peak serum concentration was 22.1 μg/L for the patients receiving doses of 15.0 μg/kg and above. Serum concentrations were >1.0 μg/L for those receiving 1.0 μg/kg molgramostim and above but not for doses below this. After the IV bolus injection, peak concentrations ranged from 6.9–95.7 μg/L as the dose increased. After the 2-h IV infusion, molgramostim was detected in serum after 15 min. The peak concentration ranged from 18.2–235.0 μg/L; not correlated to dose [Cebon *et al.* 1990].

Half-life 0.24 to 1.18 h (after IV bolus dosing); mean 1.66 (range, 1.33–1.88) h (IV infusion); mean 3.16 h (after SC dosing).
Clearance Serum, 18.6–25.1 L/h (1.0 μg/kg SC dose of molgramostim); 33.3 L/h (3.0 μg/kg dose); 8.3 L/h at higher doses (10.0–30.0 μg/kg); and for doses 0.3–3.0 μg/kg, the clearance increased. After an IV bolus dose, 0.3 μg/kg, 16.0 L/h; IV infusion, 5.7 L/h.
Dose For antineoplastic therapy: SC injection, 5 to 10 μg/kg body weight daily starting 24 h after the last dose of antineoplastic. Treatment for 7 to 10 days.

For bone marrow transplantation: IV infusion, 10 μg/kg body weight over 4 to 6 h. Up to 30 days' treatment starting the day after the transplant.

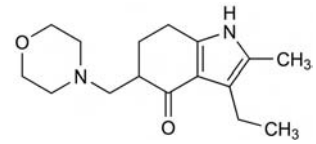
Cebon J *et al.* (1990). The effects of dose and route of administration on the pharmacokinetics of granulocyte-macrophage colony-stimulating factor. *Eur J Cancer* 26: 1064–1069.

Molindone

Tranquilliser
$C_{16}H_{24}N_2O_2$ = 276.4
CAS—7416-34-4

IUPAC Name 3-Ethyl–1,5,6,7-tetrahydro-2-methyl-5-(4-morpholinylmethyl)-4*H*-indol-4-one



Chemical Properties Crystals. Mp 180° to 181°. pK_a 6.9 (25°). Log *P* (octanol/water), 2.3.

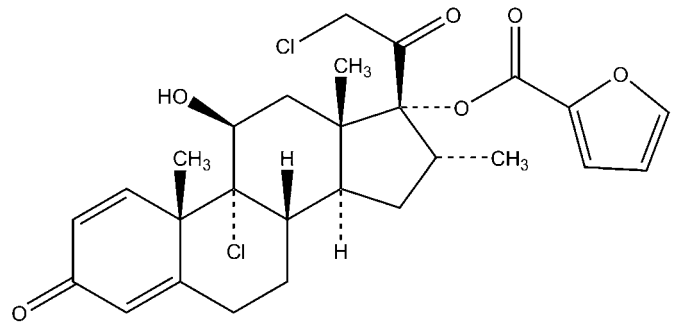
Molindone Hydrochloride
$C_{16}H_{24}N_2O_2$,HCl = 312.8
CAS—15622-65-8
Synonym EN-1733 A
Proprietary Names *Lidone*; *Moban*.
Chemical Properties A white crystalline powder. Freely soluble in water and ethanol.

Thin-layer Chromatography System TAJ—R_f 0.24; system TAK—R_f 0.00; system TAL—R_f 0.37.
Gas Chromatography System GA—RI 2465.
Ultraviolet Spectrum Aqueous acid—255 (A^1_1=41b), 299 nm.
Mass Spectrum Principal ions at *m/z* 100, 56, 42, 176, 98, 120, 70, 189.
Disposition in the Body Molindone is readily absorbed after oral administration; peak plasma concentrations of unchanged drug are attained in 1 to 2 h. It is extensively metabolised and excreted in the urine and faeces almost entirely as metabolites.
Dose 15 to 225 mg of molindone hydrochloride daily.

Mometasone Furoate

Antiinflammatory, Corticosteroid
$C_{27}H_{30}Cl_2O_6$ = 521.4
CAS—83919-23-7

IUPAC Name [(8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-Chloro-17-(2-chloroacetyl)-11-hydroxy-10,13,16-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-17-yl] furan-2-carboxylate
Synonyms 9α,21-Dichloro-11β,17-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione 17(2-furoate); (11β,16α)-9,21-dichloro-17-[(2-furanylcarbonyl)oxy]-11-hydroxy-16-methylpregna-1,4-diene-3,20-dione; Sch-32088.
Proprietary Names *Asmanex*; *Dermosona*; *Ecural*; *Elocon*; *Elovent*; *Flogocort*; *Lisoder*; *Metason*; *Metaspray*; *Movesan*; *Nasonex*; *Novasone*; *Rinelon*; *Topcort*; *Uniclar*. It is also an ingredient of *Elisalic*.



Chemical Properties Crystals. Mp 218° to 220°. Practically insoluble in water; slightly soluble in octanol; moderately soluble in ethyl alcohol. Degrades with increasing solution pH to several products [Sahasranaman *et al.* 2004].
Ultraviolet Spectrum Methanol—247 nm.
Quantification
Plasma **HPLC** Column: C_8 (150 × 2.0 mm i.d., 5 μm). Mobile phase: methanol : water (59 : 41), flow rate 0.28 mL/min. UV detection (λ= 248 nm). Limit of quantification, 0.2 mg/L [Teng *et al.* 2001].

LC-MS Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (85 : 15), flow rate 1 mL/min. APCI, negative ion mode, MRM acquisition mode. Limit of quantification, 15 ng/L [Sahasranaman *et al.* 2005]. Column: C_{18} (33 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 25 mmol/L ammonium acetate (80 : 20), flow rate 1.0 mL/min. API, positive ion mode. Limit of quantification, 49.7 ng/L [Affrime *et al.* 2000].

Urine **HPLC** See Plasma [Teng *et al.* 2003].

Other **HPLC** Simulated Lung Fluid. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (63 : 37), flow rate 1 mL/min. UV detection (λ = 254 nm). Limit of quantification, 0.125 mg/L [Sahasranaman *et al.* 2004].

LC-MS Simulated Lung Fluid. Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (70 : 30), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification not reported [Sahasranaman *et al.* 2004].

Disposition in the Body Following inhalation or intranasal administration, only a small amount of each dose (<20% from a conventional inhaler and 30% of an intranasal dose) reaches the lung or nose, while the majority is deposited in the oropharynx and is subsequently swallowed, resulting in very low measurable plasma levels. It is primarily metabolised in the liver, in part by CYP3A4. It also undergoes 6β-hydroxylation, hydrolysis of the furoate ester and substitution of the C-21 chloride with a hydroxyl group. At least 3 degradation products, including 9,11-epoxide mometasone furoate, have been identified in human lung tissue. Approximately 74% of a dose is recovered in the faeces, mostly derived from the proportion of the dose deposited in the oropharynx and swallowed. Mean urinary recovery is approx. 8% of a dose while 0 to 14% is exhaled.

Therapeutic Concentration

A group of 24 volunteers were administered 400 µg mometasone furoate as an IV infusion over 1 min. The plasma concentration was measured as 6.8 µg/L. In another study, the same group was administered the same dose of mometasone furoate via a dry-powder inhaler. The mean peak plasma concentration was 49.8 ng/L after 2 h (very close to the lower limit of quantification of the LC-MS method used) [Affrime *et al.* 2000].

Bioavailability Less than 1% (range 0.00–4.85).

Half-life 4.5 h.

Volume of Distribution Approximately 332 L.

Clearance 53.5 L/h

Dose Used as a cream, ointment or lotion containing 0.1% in skin disorders. A nasal suspension of mometasone furoate 0.05%, as the monohydrate, is given in the treatment and prophylaxis for allergic rhinitis. For mild to moderate asthma, an initial dose of 400 µg is given once daily.

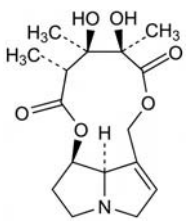
Monocrotaline

Alkaloid

$C_{16}H_{23}NO_6 = 325.4$

CAS—315-22-0

Synonyms Crotaline; (13α,14α)-14,19-dihydro-12,13-dihydroxy-20-norcrotolanan-11,15-dione; NSC-28693; NCI-C56462.



Chemical Properties An alkaloid obtained from *Crotalaria spectabilis* and other species of *Crotalaria* (Leguminosae). A white crystalline powder. Mp 197° to 198°, with decomposition. Soluble 1 in 80 of water; soluble in chloroform and dilute acetic acid. Log *P* (octanol/water), −1.2.

Colour Test Mandelin's test—green.

Thin-layer Chromatography System TA—R_f 0.36 (acidified iodoplatinate solution, positive).

Infrared Spectrum Principal peaks at wavenumbers 1736, 1064, 1110, 1183, 1242, 1174 cm^{-1} (KBr disk).

Monocrotophos

Acaricide, Insecticide

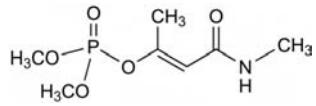
$C_7H_{14}NO_5P = 223.2$

CAS—6923-22-4

IUPAC Name Dimethyl [(*E*)-4-(methylamino)-4-oxobut-2-en-2-yl] phosphate

Synonyms C-1414; ENT-27129; (*E*)-phosphoric acid dimethyl [1-methyl-3-(methylamino)-3-oxo-1-propenyl]ester; SD-9129.

Proprietary Names *Azodrin*; *Bilobran*; *Crisodrin*; *Monocil*; *Monocron*; *Nuvacron*; *Pillardin*; *Plantdrin*; *Susvin*.

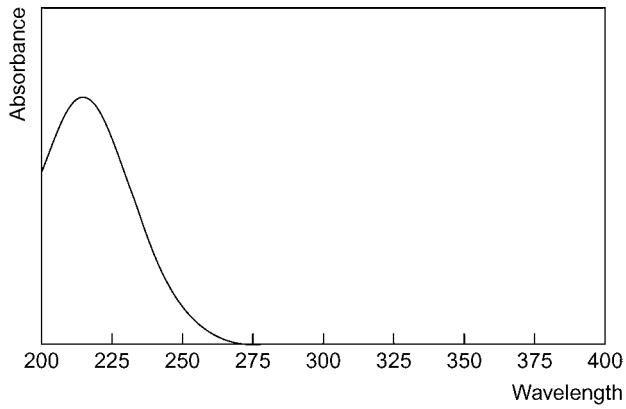


Chemical Properties A reddish-brown crystalline solid (commercial product). Mp 25° to 30° or Mp 54° to 55° (pure state). It is miscible with water (1 kg/kg at 20°) and soluble in acetone (700 g/kg at 20°), ethanol, diesel oils, kerosene, dichloromethane (800 g/kg at 20°), methanol (1000 g/kg at 20°), octan-1-ol (250 g/kg at 20°) and toluene (60 g/kg at 20°). Log *P* (octanol/water), −0.22.

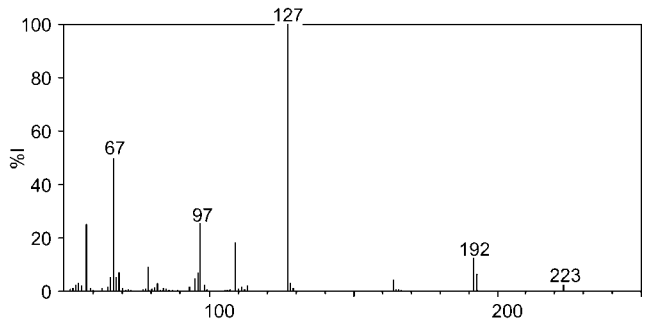
Thin-layer Chromatography System TX—R_f 0.01; system TY—R_f 0.01.

Gas Chromatography System GA—monocrotophos RI 1665; monocrotophos-TFA RI 1540; system GK—monocrotophos RRT 0.9 (relative to caffeine).

Ultraviolet Spectrum Principal peak at 215 nm.



Mass Spectrometry Principal ions at *m/z* 127, 67, 58, 97, 109, 192, 79, 223.



Quantification

Serum **GC** NPD. Limit of detection, 0.03 mg/L [Papa *et al.* 1998].

GC-MS Limit of detection, 0.06 mg/L for dimethylphosphate [Tarbah *et al.* 1998]. NPD. Limit of detection, 0.03 mg/L [Papa *et al.* 1998].

Disposition in the Body Monocrotophos is quickly metabolised by *N*-demethylation, *O*-demethylation and cleavage of the vinyl phosphate bond and excreted primarily in urine (70 to 90%). <10% can be found in faeces. One metabolite identified is dimethylphosphate (DMP). Some of the dose may also be excreted unchanged owing to its solubility in water, and is evenly distributed between tissues and organs. It does not appear to accumulate in the body and 60 to 65% of a dose is eliminated within the first 24 h. It is also readily absorbed through the skin.

Toxicity The allowed daily intake is 0.6 μg/kg.

An adult female was found dead after ingesting a plant protective containing monocrotophos, dodine and dinocap. Monocrotophos could be detected in

M

all tissues and in blood (at a concentration of 12 µg/g). Monocrotophos was found at concentrations of 13 µg/g in the lungs and brain, 11 µg/g in the kidneys, 1.8 µg/g in the liver and a total of 52 mg in the stomach. Small amounts of dodine and dinocap were only detected in the stomach [Gelbke, Schlicht 1978].

A 55-year-old male floriculturist was found unconscious in his greenhouse and died 7 days later despite hospital treatment. The first blood sample received was 44 h after intoxication and toxicological analysis showed a serum monocrotophos concentration of 24.0 mg/L. The serum levels decreased with time and were less than 0.03 mg/L at the time of death but cholinesterase levels never recovered. It is believed that 1200 mg of the pesticide was ingested [Papa *et al.* 1998].

Gelbke HP, Schlicht HJ (1978). Fatal poisoning with a plant protective containing monocrotophos, dodine and dinocap. *Toxicol Eur Res* 1(3): 181–184.

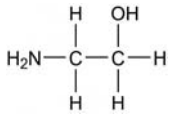
Tarbah FA *et al.* (1998). *TIAFT Poster Session* 4.

Monoethanolamine

Sclerosing Agent
C_2H_7NO = 61.1
CAS—141-43-5

IUPAC Name 2-Aminoethanol
Synonyms Aethanolaminum; ethanolamine; hydroxyethylamine; olamine.
Proprietary Names *Ethamolin (Oleate)*; *Oldamin (Oleate)*.



Chemical Properties A clear, colourless or pale-yellow, viscous liquid. Mass per mL 1.014 to 1.023 g. Bp about 170°. Miscible with water, acetone, ethanol and chloroform; slightly soluble in ether. pK_a 9.4 (25°). Log *P* (octanol/water), −1.3.

Monoethanolamine Oleate

$C_2H_7NO,C_{18}H_{34}O_2$ = 343.5
CAS—2272-11-9
Synonyms Aethanolaminum; monoethanolamine oleate; 2-hydroxyethylamine compound with oleic acid; 2-aminoethanol compound with oleic acid.
Proprietary Names *Antivariz*; *Esclerosina*; *Ethamolin*; *Oldamin*.
Chemical Properties Miscible with water, alcohol, acetone, chloroform and glycerol. Immiscible with petroleum spirit and fixed oils but will dissolve many essential oils.

Gas Chromatography System GA—monoethanolamine RI 780.
Mass Spectrum Principal ions at *m/z* 42, 31, 61, 43, 29, 27, 44, 41.
Disposition in the Body
Toxicity Overexposure to monoethanolamine oleate can lead to respiratory problems, skin and eye irritation, and lethargy.

Monoethanolamine oleate has been associated with acute renal failure (which did clear spontaneously within 3 weeks of treatment) in 2 obese women treated with injections of ethanolamine oleate. Injections of 15 to 20 mL containing 5% oleate and 2% benzyl alcohol were administered [Maling, Cretney 1975].

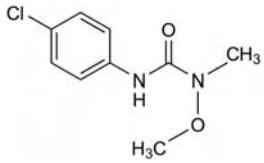
Dose Varicose veins, 2 to 5 mL 5% oleate solution; oesophageal varices, 1.5 to 5 mL 5% oleate solution per varix, maximum total of 20 mL per treatment.

Maling TJ, Cretney MJ (1975). Ethanolamine oleate and acute renal failure. *N Z Med J* 82: 269–270.

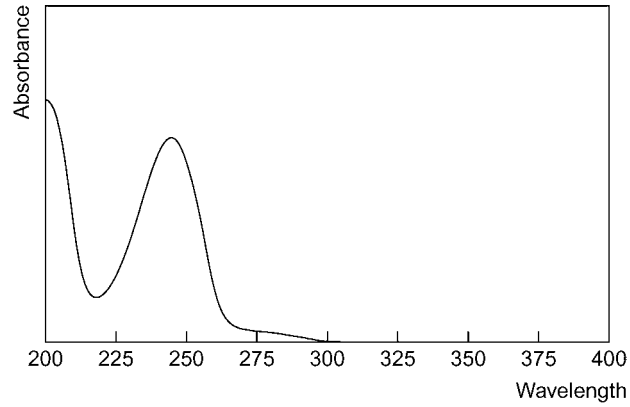
Monolinuron

Herbicide
$C_9H_{11}ClN_2O_2$ = 214.6
CAS—1746-81-2

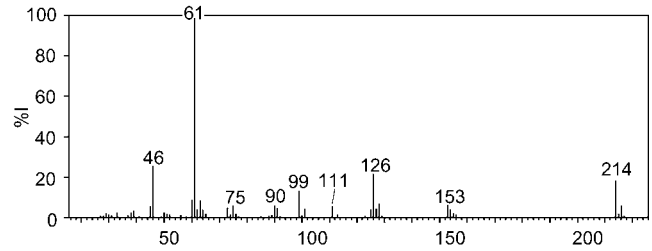
IUPAC Name 3-(4-Chlorophenyl)-1-methoxy-1-methylurea
Synonyms Chlorophenyl-*N*′-methoxy-*N*′-methylurea; HOE 2747.
Proprietary Names *Aresin*; *Aresine*; *Arresin*; *Monorotox*; *Premalin*.



Chemical Properties Solid. Mp 80° to 83°. Soluble in water (930 mg/L at 20°) and many organic solvents including alcohol, acetone, dioxane, xylene, chloroform and diethyl ether. Log *P* (octanol/water) 2.20.
Thin-layer Chromatography System TX—R_f 0.23; system TY—R_f 0.30.
High Performance Liquid Chromatography System HY—RI 411.
Gas Chromatography System GA—monolinuron RI 1910; monolinuron-Me RI 1675; M art (HOOC-)-Me RI 1690; system GK—monolinuron RRT 0.78 (relative to caffeine).
Ultraviolet Spectrum Principal peak at 244 nm.



Mass Spectrometry Principal ions at *m/z* 61, 46, 126, 214, 99, 60, 63, 153.



Disposition in the Body Monolinuron is metabolised to methylated monolinuron.
Toxicity

The allowed daily intake is 0.014 mg/kg. No toxic effect has been observed with levels of 250 mg/kg.

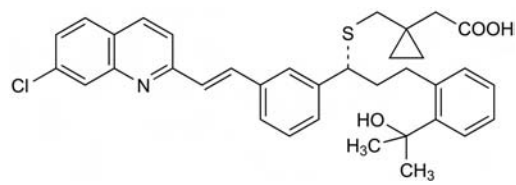
A 59-year-old male farmer attempted to commit suicide by ingesting Gramonol, containing paraquat and monolinuron. The plasma paraquat level was 1.1 mg/L (a fatal level) 8 h after ingestion but the man did not die until 10 days later due to renal, respiratory and liver failure. Methaemoglobinaemia also occurred 8 h after ingestion and this was a result of ingesting 40 mg/kg of monolinuron [Casey *et al.* 1994].

Casey PB *et al.* (1994). Methemoglobinemia following ingestion of a monolinuron/paraquat herbicide (Gramonol). *J Toxicol Clin Toxicol* 32(2): 185–189.

Montelukast

Antiasthmatic
$C_{35}H_{36}ClNO_3S$ = 586.2
CAS—158966-92-8

IUPAC Name 1-[[[(1*R*)-1-[3-[(1*E*)-2-(7-Chloro-2-quinolinyl)ethenyl]phenyl]-3-[2-(1-hydroxy-1-methylethyl)phenyl]propyl]thio]methyl]cyclopropaneacetic acid
Synonym MK-0476



Chemical Properties A white to off-white powder.

Montelukast Sodium

$C_{35}H_{35}ClNNaO_3S$ = 608.2
CAS—151767-02-1
Synonym MK-476
Proprietary Name *Singulair*
Chemical Properties A white to off-white powder. Freely soluble in ethanol, methanol and water; practically insoluble in acetonitrile.

High Performance Liquid Chromatography Column: C_8 Novapak (100 × 8.0 mm i.d., 4 µm). Temperature: 40°. Mobile phase: 25 mmol/L sodium acetate (pH 4) : acetonitrile (20:80), with 50 µL triethylamine, flow rate 1 mL/

min. Internal standard (IS): quinine bisulfate. Fluorescence detection (λ_{ex}=350 nm, λ_{em}=400 nm). Retention time: montelukast sodium, 6.1 min; IS, 4.2 min [Al-Rawithi *et al.* 2001].

Quantification

Blood **HPLC** Fluorescence detection (λ_{ex}=350 nm, λ_{em}=400 nm). Limit of detection, 9.6 µg/L [Liu *et al.* 1997].

Plasma **HPLC** Column: Apex octadecyl (50 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 0.05 mol/L ammonium phosphate buffer (pH 3.5, 62:38). Fluorescence detection (λ_{ex}=350 nm, λ_{em}=400 nm). Retention time: 4.0 min. Limit of quantification, 30 µg/L, limit of detection, 5 µg/L [Amin *et al.* 1995].

Disposition in the Body Montelukast is rapidly absorbed following oral administration. It is extensively metabolised by cytochromes P450 3A4, 2A6, 2C9. Montelukast and its metabolites are excreted almost exclusively via bile with <0.2% of the drug excreted in urine. Renal impairment and gender do not affect the pharmacokinetics of montelukast.

Therapeutic Concentration After a 10 mg tablet of montelukast, the mean peak plasma concentration is achieved within 3 h. After a 5 mg chewable tablet, mean peak plasma concentration is achieved within 2 h. At therapeutic doses, the plasma concentration of metabolites is undetectable at steady state in adults and children.

Bioavailability With a 10 mg tablet, 64%; 5 mg chewable tablet, 73%, which is reduced to 63% by food.

Half-life 2.7 to 5.5 h. In patients with mild–moderate hepatic insufficiency and clinical evidence of cirrhosis, the mean elimination half-life is prolonged to roughly 7.4 h.

Volume of Distribution 8 to 11 L at steady state.

Clearance 45 mL/min in healthy adults. Montelukast clearance is only slightly decreased in the elderly compared to younger adults.

Protein Binding 99%.

Note For a review of montelukast sodium and its therapeutic potential in persistent asthma, see Jarvis and Markham [2000].

Dose Adults, 10 mg; children, 5 mg.

Moracizine

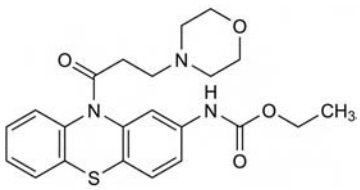
Antiarrhythmic

$C_{22}H_{25}N_3O_4S$ = 427.5

CAS—31883-05-3

IUPAC Name Ethyl *N*-[10-(3-morpholin-4-ylpropanoyl)phenothiazin-2-yl] carbamate

Synonyms EN-313; moricizine; [10-[3-(4-morpholinyl)-1-oxopropyl]-10*H*-phenothiazin-2-yl]carbamic acid ethyl ester.



Chemical Properties Crystals. Mp 156° to 157°. pK_a 6.4. Log *P* (octanol/water), 2.98.

Moracizine Hydrochloride

$C_{22}H_{25}N_3O_4S,HCl$ = 464.0

CAS—29560-58-5

Proprietary Names *Ethmozin*; *Ethmozine*.

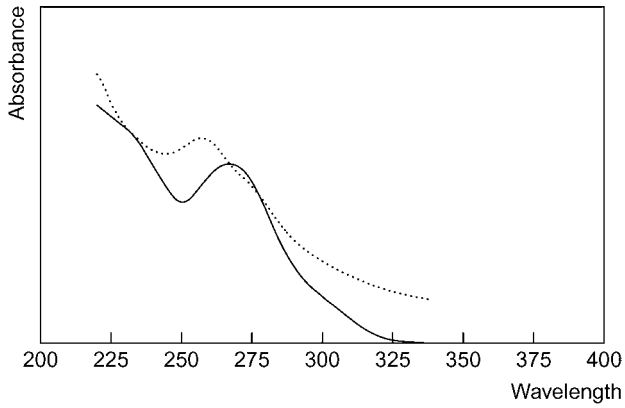
Chemical Properties A white to tan crystalline powder or crystals from dichloroethane. Mp 189°. Freely soluble in water and in alcohol.

Gas Chromatography Column: methyl silicone (HP1, 0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. MS detection. Retention index: 3526 [Mills, Roberson 1993].

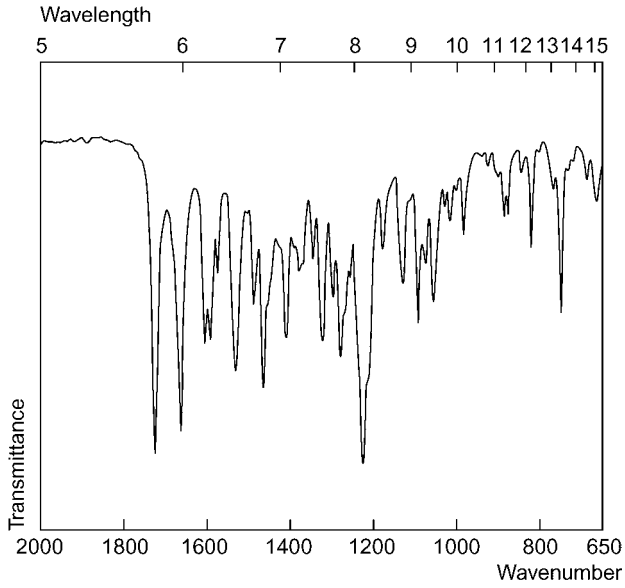
High Performance Liquid Chromatography Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, flow rate 0.5 mL/min. UV diode array detection. Retention time: 5.6 min [Mills, Roberson 1993].

Column: C_{18}µBondapak (100 × 8.0 mm i.d., 10 µm). Mobile phase: methanol : water : triethylamine (65:35:0.5), flow rate 2.0 mL/min. Internal standard (IS): clozapine. UV detection (λ=254 nm). Retention time: moracizine, 6.2 min; moracizine sulfoxide, 3.5 min; moracizine sulfone, 2.7 min; IS, 9.7 min [Yang, Chan 1995].

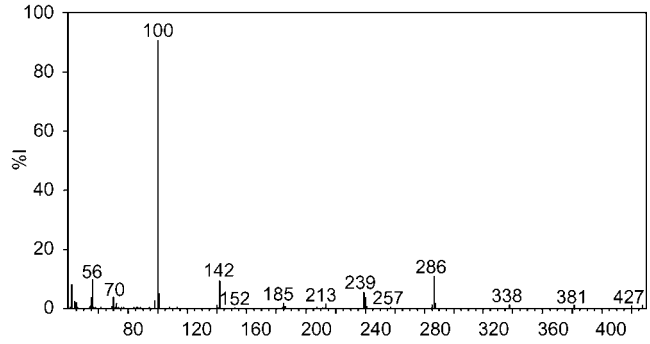
Ultraviolet Spectrum Aqueous acid—267 nm; basic—259 nm.



Infrared Spectrum Principal peaks at wavenumbers 1231, 1725, 1664, 1466 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 100, 286, 142, 56, 42, 239, 70, 185.



Quantification

Plasma **HPLC** UV detection (λ=268 nm). Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Poirier 1985]. UV detection (λ=268 nm). Limit of detection, 10 µg/L [Whitney *et al.* 1981].

Disposition in the Body Moracizine is readily and virtually completely absorbed after oral administration, with peak plasma concentrations being reached 0.5 to 2.0 h after administration. It undergoes hepatic metabolism to form many metabolites (~26, 9 of which have been identified) at a concentration of <1% of the dose. Two metabolites, moracizine sulfoxide and phenothiazine-2-carbamic acid ethyl ester sulfoxide, have anti-arrhythmic activity but represent <0.6% of the dose with a half-life of ~3 h. Moracizine is excreted mainly in faeces (56%) and urine (39%) with <1% as the unchanged drug. The drug appears in urine mainly as unconjugated metabolites and glucuronide-conjugated metabolites.

Therapeutic Concentration Therapeutic plasma concentration is 0.25 to 3.0 mg/L. Twelve healthy males, aged between 19 and 36 years, non-smokers, were administered either 250 mg every 8 h for 14 days or 250 mg every 8 h for 7

days followed by placebo for 7 days. The mean peak concentrations were 0.64 mg/L after a single dose, 0.64 mg/L after 6 days and 0.55 mg/L after 13 days. These concentrations were observed after ~1 h (range, 0.75 to 1.5 h) for both treatments [Benedek *et al.* 1994].

Toxicity In total 2 deaths have been attributed to moracizine overdose; 2.25 and 10 g [DuPont Pharmaceuticals, data on file].

Bioavailability 38%.

Half-life 2 to 4 h (healthy individuals); 6 to 13 h (patients with arrhythmias).

Volume of Distribution 8.3 to 11.1 L/kg (oral administration); 185 to 210 L (IV administration).

Clearance Plasma, 2.2 to 2.65 L/min (healthy, oral); 1.3 L/min (patients, IV).

Distribution in Blood 57% of a dose is associated with erythrocytes.

Protein Binding 81 to 95%.

Dose The usual dose is 600 to 900 mg daily (in the hydrochloride form). Reduction may be required in patients with renal and hepatic impairment.

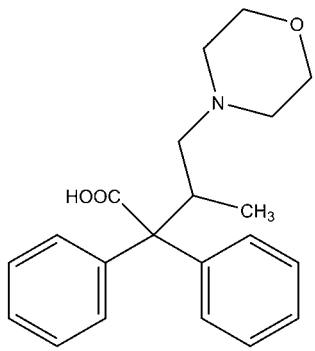
Moramide Intermediate

Narcotic Intermediate

$C_{21}H_{25}NO_3 = 339.4$

Synonym 2-Methyl-3-morpholino-1,1-diphenylpropane-carboxylic acid



Chemical Properties White powder. Soluble in ether and dilute acetic acid. Moramide intermediate is extracted by ether from aqueous alkaline solutions.

Colour Tests Ammonium molybdate test—faint blue-grey (limit of detection, 1.0 µg); ammonium vanadate test—dull purple (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1—R_f 0.68 (location reagent iodoplatinate spray, positive reaction).

Morantel

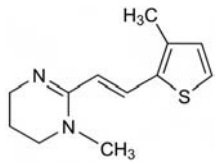
Anthelmintic (Veterinary)

$C_{12}H_{16}N_2S = 220.3$

CAS—20574-50-9

IUPAC Name 1-Methyl-2-[(*E*)-2-(3-methylthiophen-2-yl)ethenyl]-5,6-dihydro-4*H*-pyrimidine

Synonym (*E*)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)ethenyl]-pyrimidine



Chemical Properties Crystals. Mp 239° to 241°. Log *P* (octanol/water), 3.7.

Morantel Citrate

$C_{12}H_{16}N_2S,C_6H_8O_7,\ H_2O = 430.5$

CAS—69525-81-1

Proprietary Names *Exhelm*; *Wormtec*.

Morantel Tartrate

$C_{12}H_{16}N_2S,C_4H_6O_6 = 370.4$

CAS—26155-31-7

Synonym CP-12009-18

Proprietary Names *Equiban*; *Paratect*; *Rumatel*.

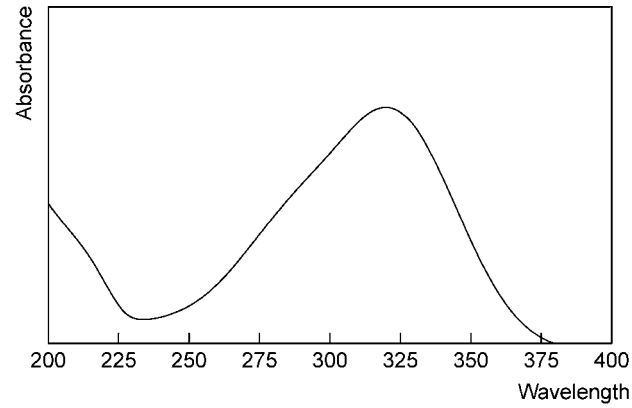
Chemical Properties Pale yellow to greenish-yellow crystals. Mp 167° to 170°. Readily soluble in water.

Colour Tests Liebermann's reagent—black; Mandelin's test—violet; Marquis test—blue-violet; sulfuric acid—violet-red.

Thin-layer Chromatography System TA—R_f 0.60 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—not eluted.

Ultraviolet Spectrum Methanol—322 nm (A^1_1=864b).



Infrared Spectrum Principal peaks at wavenumbers 1626, 1577, 1319, 1305, 1148, 955 cm^{-1} (KBr disk).

Morazone

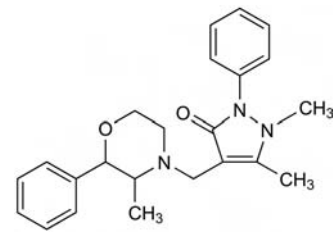
Analgesic

$C_{23}H_{27}N_3O_2 = 377.5$

CAS—6536-18-1

IUPAC Name 1,5-Dimethyl-4-[(3-methyl-2-phenylmorpholin-4-yl)methyl]-2-phenylpyrazol-3-one

Synonyms 1,2-Dihydro-1,5-dimethyl-4–[(3-methyl-2–phenyl-4-morpholinyl) methyl]-2-phenyl-3*H*-pyrazol-3-one; R-445.



Chemical Properties A white crystalline powder. Mp 149° to 150°. Freely soluble in chloroform; soluble in methanol and acetone; slightly soluble in ether. Log *P* (octanol/water), 2.0.

Morazone Hydrochloride

$C_{23}H_{27}N_3O_2,HCl = 413.9$

CAS—50321-35-2

Proprietary Names *Rosimon-Neu*; *Tarugan*.

Chemical Properties Crystals. Mp 171° to 172°, with decomposition. Soluble in water.

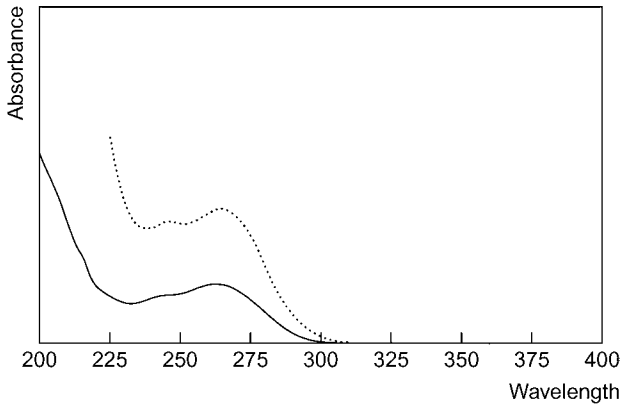
Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.08; system TC—R_f 0.46; system TE—R_f 0.58; system TL—R_f 0.31; system TAE—R_f 0.61 (acidified iodoplatinate solution, positive).

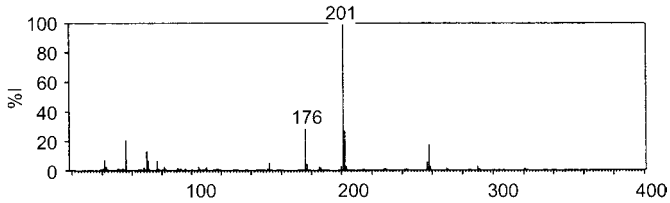
Gas Chromatography System GA—Morazone RI 3130, M (phenmetrazine) RI 1432, M (OH-phenmetrazine isomer 1) RI 1830, M (OH-phenmetrazine isomer 2) RI 1865, M (OH-MeO-phenmetrazine) RI 1900; system GB—M (phenmetrazine) RI 1483. Morazone is also metabolised to phenazone.

High Performance Liquid Chromatography System HA—*k* 0.7; system HD—*k* 0.4; system HW—*k* 2.05; system HY—RI 294.

Ultraviolet Spectrum Aqueous acid—258 nm (A^1_1=212a); aqueous alkali—244, 263 nm (A^1_1=201b).



Infrared Spectrum Principal peaks at wavenumbers 754, 1656, 700, 1492, 1590, 1117 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 201, 176, 202, 56, 258, 70, 71, 42.

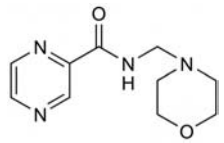


Dose Morazone hydrochloride has been given in doses of 75 to 150 mg.

Morinamide

Tuberculostatic
$C_{10}H_{14}N_4O_2$ = 222.2
CAS—952-54-5

IUPAC Name *N*-(4-Morpholinylmethyl)pyrazinecarboxamide
Synonyms Morphazinamide; B-2310.

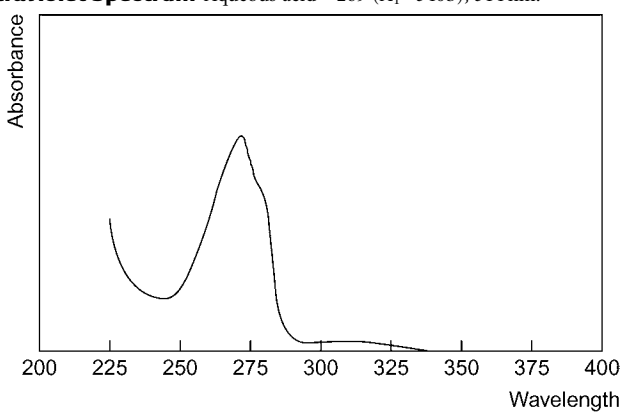


Chemical Properties Crystals. Mp 118.5° to 119.5°. Soluble 1 in 3 of water, 1 in 30 of ethanol, 1 in 30 of benzene and 1 in 2.5 of chloroform. Log *P* (octanol/water), −1.2.

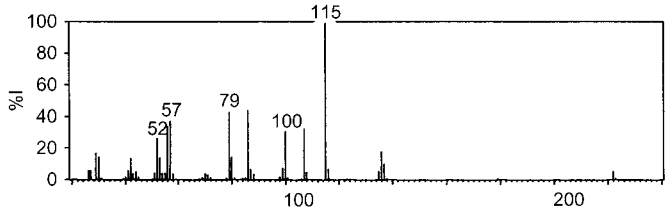
Morinamide Hydrochloride

$C_{10}H_{14}N_4O_2$,HCl = 258.7
CAS—1473-73-0
Synonym B-2311.
Proprietary Name *Piazofolina*
Chemical Properties A white crystalline powder. Mp 196°. Soluble 1 in 2 of water, 1 in 350 of ethanol and 1 in 2000 of chloroform.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.08; system TC—R_f 0.49; system TL—R_f 0.32 (acidified iodoplatinate solution, weak reaction; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1906.
Ultraviolet Spectrum Aqueous acid—269 (A_1^1=340b), 314 nm.



Infrared Spectrum Principal peaks at wavenumbers 1667, 1101, 1499, 1125, 1002, 1019 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 115, 86, 79, 57, 56, 107, 100, 52.

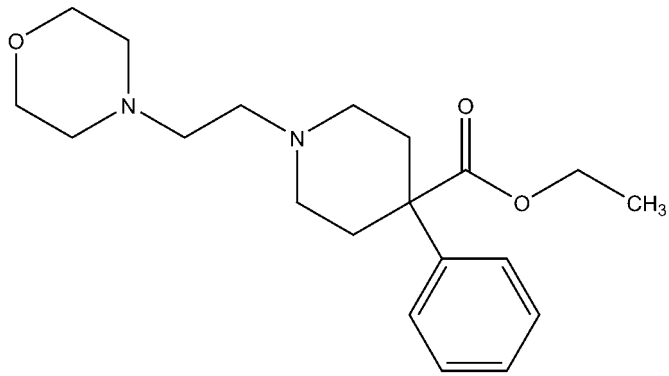


Dose Morinamide has been given in doses of 3 g daily.

Morpheridine

Narcotic
$C_{20}H_{30}N_2O_3$ = 346.5
CAS—469-81-8

IUPAC Name Ethyl 1-(2-morpholin-4-ylethyl)-4-phenylpiperidine-4-carboxylate
Synonyms Ethyl 1-(2-morpholinoethyl)-4-phenylpiperidine-4-carboxylate; morpholinoethylnorpethidine; 1-[2-(morpholinyl)ethyl]-4-phenyl-4-piperidinecarboxylic acid ethyl ester.



Chemical Properties Liquid. Bp 188° to 192° Morpheridine is extracted by organic solvents from aqueous alkaline solutions; hydrolysis of biological material is required to improve the yield.

Morpheridine Dihydrochloride

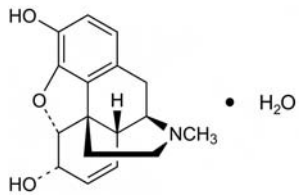
$C_{20}H_{30}N_2O_3$,2HCl = 419.4
Synonym TA-1
Chemical Properties Crystals from dilute ethanol. Mp 264° to 266° with decomposition.

Colour Test Sulfuric acid-formaldehyde test—dull orange (limit of detection, 1.0 μg).
Thin-layer Chromatography System T1—R_f 0.56 (location reagent iodoplatinate spray, positive reaction).
Gas Chromatagraphy System G2/225—retention time 1.54 (relative to codeine).
Disposition in the Body
Toxicity LD_{50} in mice 45 mg/kg (IV), 118 mg/kg (IP).

Morphine

Narcotic Analgesic
$C_{17}H_{19}NO_3$,H_2O = 303.4
CAS—57-27-2 (anhydrous); 6009-81-0 (monohydrate)

IUPAC Name (5α,6α)-7,8-Didehydro-4,5-epoxy-17-methylmorphinan-3,6-diol monohydrate
Synonym Morphia



Chemical Properties The principal alkaloid of opium. A white crystalline powder or colourless or white acicular crystals. Mp 254° to 256°, with decomposition. Soluble 1 in 5000 of water, 1 in 210 of ethanol, 1 in 1220 of chloroform and 1 in 125 of glycerol; practically insoluble in ether. Solubility can vary according to the

method of preparation and the crystalline state. pK_{a1} 8.0, pK_{a2} 9.9 (20°). Log *P* (octanol/water pH 7.4), −0.1. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Morphine Acetate

$C_{17}H_{19}NO_3,C_2H_4O_2,3H_2O = 399.4$
CAS—596-15-6 (anhydrous); 5974-11-8 (trihydrate)
Chemical Properties A white amorphous or crystalline powder. Soluble 1 in 2.25 of water, 1 in 22 of ethanol, 1 in 4.75 of chloroform and 1 in 4.5 of glycerol; practically insoluble in ether.

Morphine Hydrochloride

$C_{17}H_{19}NO_3,HCl,3H_2O = 375.8$
CAS—52-26-6 (anhydrous); 6055-06-7 (trihydrate)
Chemical Properties Colourless silky crystals or crystalline powder, or cubical white masses. A solution in water is laevorotatory. Soluble 1 in 17.5 of water and 1 in 52 of ethanol; slowly soluble in glycerol; practically insoluble in chloroform and ether.

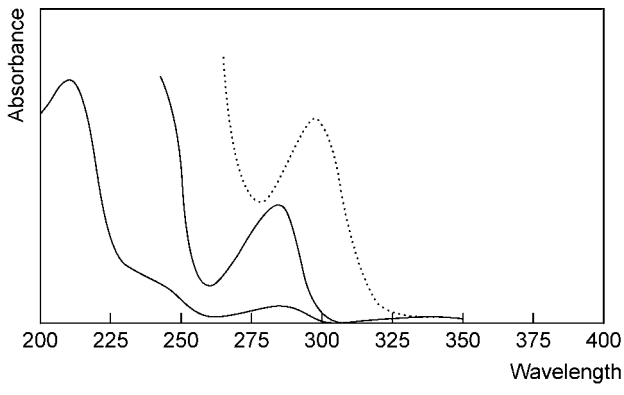
Morphine Sulfate

$(C_{17}H_{19}NO_3)_2,H_2SO_4,5H_2O = 758.8$
CAS—64-31-3 (anhydrous); 6211-15-0 (pentahydrate)
Proprietary Names *Astramorph*; *Duramorph*; *Infumorph*; *Kadian*; *Moraxen*; *Morcap*; *MS Contin(us)*; *MSIR*; *MST-Continus*; *MXL*; *Oramorph*; *RMS*; *Roxanol*; *Sevredol*; *Zomorph*.
Chemical Properties White, acicular crystals, cubical masses or crystalline powder. When exposed to air, it gradually loses water of crystallisation. It darkens on prolonged exposure to light. Mp 250°, with decomposition (anhydrous form). A solution in water is laevorotatory. Soluble 1 in 15.5 of water and 1 in 565 of ethanol; practically insoluble in chloroform and ether.

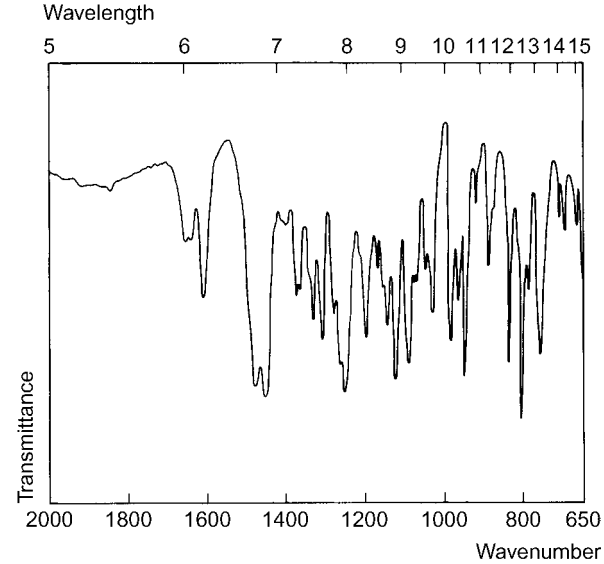
Morphine Tartrate

$(C_{17}H_{19}NO_3)_2,C_4H_6O_6,3H_2O = 491.4$
CAS—302-31-8 (anhydrous); 6032-59-3 (trihydrate)
Proprietary Names It is an ingredient of *Cyclimorph*.
Chemical Properties Minute, colourless, acicular, efflorescent crystals.Soluble 1 in 11 of water and 1 in 1000 of ethanol; practically insoluble in chloroform,ether, and carbon disulfide.

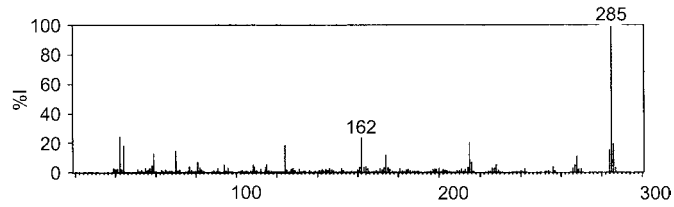
Colour Test Ferric chloride—blue; Liebermann's reagent—black; Mandelin's test—blue-grey; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.37; system TB—R_f 0.00; system TC—R_f 0.09; system TE—R_f 0.20; system TL—R_f 0.01; system TAE—R_f 0.18; system TAF—R_f 0.23; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.15. (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis reagent—violet).
Gas Chromatography System GA—RI 2445, RI 2615 morphine-AC_2 (diamorphine), RI 2360 morphine-PFP_2, RI 2560 morphine-TMS_2, RI 2250 morphine-TFA_2, RI 2459, M (nor-)-AC_3 RI 2955, RI 2440 M (nor-)-PFP_2, RI 2405 M (nor-)PFP_3, RI 2605 M (nor-)-TMS_3, RI 2375 codeine, RI 2388 norcodeine; system GB—RI 2564, RI 2769 diamorphine, RI 2602 morphine-TMS_2, RI 2511 codeine, RI 2535 norcodeine; system GC—RI 2542, RI 2681 codeine; system GM—not eluted.
High Performance Liquid Chromatography System HA—*k* 3.8 (tailing peak), *k* 4.8 (tailing peak) codeine, *k* 3.2 (tailing peak) morphine *N*-oxide, *k* 3.1 (tailing peak) norcodeine, *k* 2.9 (tailing peak) normorphine; system HC—*k* 1.30, *k* 1.21 codeine, *k* 1.56 M (3-glucuronide), *k* 3.51 norcodeine, *k* 3.92 normorphine; system HS—*k* 5.16; system HX—RI 200, RI 266 codeine; system HY—RI 182, RI 133 normorphine, codeine RI 237; system HZ—RT 1.8 min; system HAA—RT 3.3 min; system HAX—RT 5.6 min; system HAY—RT 3.2 min.
Ultraviolet Spectrum Aqueous acid—285 nm (A_1^1 = 52a); aqueous alkali—298 nm (A_1^1 = 92a).



Infrared Spectrum Principal peaks at wave numbers 805, 1243, 1118, 945, 1086, 833 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 285, 162, 42, 215, 286, 124, 44, 284 (morphine); 299, 42, 162, 124, 229, 59, 300, 69 (codeine); 285, 81, 215, 148, 286, 164, 110, 115 (norcodeine); 271, 81, 150, 201, 148, 110, 272, 82 (normorphine)
.



Quantification

Blood **GC** EI ionisation. Limit of quantification, 0.01 mg/L [Mykkänen *et al.* 2000]. ECD. Limit of detection, 1 µg/L [Felby 1979]. FID. Limit of detection, 50 µg/L [Nakamura, Way 1975].

GC-MS Limit of detection, 5 µg/L [Geier *et al.* 1996].

HPLC Varian Pursuit C_{18} (100 × 3 mm i.d., 3 µm). Limit of quantification, 0.0005–0.01 mg/kg [Bjork *et al.* 2010]. Column: LiChrospher 60 RP-select B (250 × 4 mm i.d., 5 µm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate-2 mmol/L heptanosulfonic acid (pH 2.5) : acetonitrile (92.5 : 7.5). Fluorescence detection. Limit of detection, 3 ng/g [Beike *et al.* 1999]. Morphine and its glucuronides, fluorescence detection [Beike *et al.* 1997]. UV and fluorescence detection. Limit of quantification, 0.1 mg/L [Crump *et al.* 1994].

LC-MS Column: Waters HSS T3 (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: 1% formic acid in water : 1% formic acid in acetonitrile (97 : 3 for 0.1 min to 80 : 20 at 2.5 min to 1 : 99 at 2.55 min for 0.45 min to 97 : 3 at 3.01), flow rate 0.6 mL/min. ESI, positive ion mode. Limit of quantification, 10 µg/L [Dahn *et al.* 2010]. Column: Inertsil ODS-3 (150 × 3 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium formate (pH 3) : acetonitrile (95 : 5 for 5 min to 80 : 20 in 5 min for 5 min), flow rate 0.4 mL/min. SIM acquisition mode (*m/z* 286.1). Retention time: 2.7 min for morphine, 2.2 min for morphine 3-glucuronide and 4.3 min for morphine 6-glucuronide [Dienes-Nagy *et al.* 1999]. Limit of quantification, 0.0007–0.02 g/L [Karinen *et al.* 2009]. Screening for opioid drugs [Gergov *et al.* 2009]. Column: Phenomenex Synergi. Mobile phase : 10 mmol/L ammonium formate (pH 3) : acetonitrile. Limit of quantification, 0.5–4.09 µg/L, limit of detection, 0.16–1.2 µg/L [Al Asmari, Anderson 2007]. Column: Superspher RP 18 (125 × 3 mm i.d., 4 µm). Mobile phase acetonitrile : 50 mmol/L ammonium formate buffer (pH 3, 5 : 95), flow rate 0.6 mL/min for 4 min then 1.1 mL/min. SIM acquisition mode (*m/z* 334). Limit of detection, 1 µg/L for morphine, 5 µg/L for the 3-glucuronide and the 6-glucuronide metabolite [Bogusz *et al.* 1997].

Plasma **GC-MS** Limit of quantification, 1.25 nmol/L [Leis *et al.* 2002a]. Morphine glucuronides [Leis *et al.* 2002b]. Column: DB-5MS fused silica capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2, 5 mL/min. Temperature: 280°. Limit of quantification, ~0.8 µg/L [Leis *et al.* 2000]. Column: 5% phenylmethylsiloxane capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min Temperature programme: 150° for 1 min to 250° at 40°/min for 21.5 min..SIM acquisition mode (*m/z* 414.3). Retention time: 5.84 min. Limit of quantification, 0.75 µg/L, estimated limit of detection, 0.2 µg/L [Fryirs *et al.* 1997]. See Blood [Geier *et al.* 1996].

HPLC UV detection. Limit of detection, 0.5 ng/mL for morphine and 10 µg/L for its glucuronides [Ary, Rona 2001]. Electrochemical and fluorometric detection. Limit of detection, 0.1 µg/L [Meng *et al.* 2000]. Electrochemical detection [Wright, Smith 1998]. Column: µPorasil (300 × 3.9 mm i.d., 10 µm). Mobile phase:

5 mmol/L sodium acetate buffer (pH 3.75) : acetonitrile (25 : 75), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 10.45 min (*k*, 5.04). Limit of detection, 0.1 µg/L [Liaw *et al.* 1998]. Fluorescence detection [Emara 1998]. Electrochemical detection [Liu *et al.* 1997]. UV detection (λ= 240 nm). Limit of quantification, 50 µg/L [Freiermuth, Plasse 1997]. Fluorescence detection. Limit of detection, 1 µg/L [Huwyler *et al.* 1995; Rotshteyn, Weingarten 1996]. Electrochemical detection. Limit of detection, 0.02 µmol/L [Wright *et al.* 1994; Wright, Smith 1998] Electrochemical detection. Limit of detection, 1 µg/L [Rop *et al.* 1994]. Fluorimetric detection. Limit of detection, ~5–10 µg/L [Hartley *et al.* 1993]. Fluorescence detection. Limit of quantification, 10 µg/L [Barrett *et al.* 1991].

LC-MS See Blood [Dahn *et al.* 2010]. Column: YMC ODS-AQ (150 × 2.0 mm i.d., 3 µm). Mobile phase: water-1% formic acid : acetonitrile (95 : 5), flow rate 0.2 mL/min [Slawson *et al.* 1999].

Serum **GC-MS** Morphine and other opioids [Piekoszewski *et al.* 2001]. Column: DB-5 (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2. Temperature: 280°. SIM acquisition mode (*m/z* 557). Limit of quantification, 5.7 ng/L for morphine and 0.71 ng/L for its glucuronides [Hofmann *et al.* 1999].

HPLC Column: Nucleosil C_{18} (250 × 8.4 mm i.d., 5 µm). Mobile phase: acetonitrile : TEA phosphate buffer (1 : 99 to 3 : 97 in 8 min until 23 min. flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 245 nm, λ_{em}= 345 nm) Retention time: 6.97 min for morphine, 4.91 min morphine 3-glucuronide and 8.71 min for morphine 6-glucuronide. Limit of detection, 5 µg/L [Aderjan *et al.* 1995].

LC-MS See Blood [Dahn *et al.* 2010]. Limit of detection, 0.025 mg/L [Maresova *et al.* 2008]. Limit of quantification, 1.3 pmol/mL [Schanzle *et al.* 1999]. Column: LiChropher 30 × 4 mm i.d.). Mobile phase: acetonitrile : 0.001 mol/L ammonium formate (6 : 94)-1% formic acid, flow rate 0.3 mL/min. Limit of quantification, 1 µg/L [Blanchet *et al.* 1999]. Column: Supelcosil LC-Si (25 m × 2.1 mm I.d. 5 µm). Mobile phase: methanol : acetonitrile: water : formic acid (59.8 : 5.2 : 34.65 : 0.35), flow rate 230 µL/min to 460 µL/min. SIM acquisition mode (*m/z* 286). Limit of quantification, 4.0 µg/L [Zuccaro *et al.* 1997]. Morphine and its glucuronides. Limit of quantification, ~0.8 µg/L [Tyrefors *et al.* 1996]. Column: Supelcosil ABZ column (250 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (85 : 15 to 40 : 60), flow rate 0.8 mL/min. SIM acquisition mode (*m/z* 286). Limit of quantification, 10 µg/L [Pacifici *et al.* 1995].

Urine **GC** NPD, FID [Vu-Duc, Vernay 1990]. See Blood. Limit of detection, 500 µg/L [Nakamura, Way 1975].

GC-MS Morphine and other opioids [Meadway *et al.* 2002]. Morphine and other drugs of abuse [Vorce *et al.* 2000]. Morphine and other drugs of abuse. Limit of detection, 3–12 µg/L [Karacic, Skender 2000]. SIM acquisition mode (*m/z* 364, 477). Limit of quantification, 1 µg/L [Pragst *et al.* 1999]. See Serum [Hofmann *et al.* 1999]. SIM acquisition mode (*m/z* 341). Limit of quantification, 25 µg/L, limit of detection, 10 µg/L [Meatherall 1999]. SIM acquisition mode (*m/z* 341, 268, 397). Limit of quantification, 10.0 µg/L, limit of detection, 2.0 µg/L [O'Neal, Poklis 1997]. Morphine and other opioids [Broussard *et al.* 1997; Cremese *et al.* 1998].

HPLC Quantification of morphine and metabolites [Ahsman *et al.* 2010]. Electrochemical detection [Rashid *et al.* 1998]. See Blood [Bogusz *et al.* 1997]. UV and Electrochemical detection. Limit of detection, 50 µg/L [Gerostamoulos *et al.* 1993].

LC-MS Quantification of morphine and other opiates [Shakleya *et al.* 2010]. See Blood [Gergov *et al.* 2009]. See Serum. Limit of quantification, 10 nmol/L [Schanzle *et al.* 1999].

Bile **HPLC** See Blood [Crump *et al.* 1994].

CSF **GC-MS** See Urine [Pragst *et al.* 1999].

HPLC See Plasma [Wright *et al.* 1994; Wright, Smith 1998]. See Blood [Bogusz *et al.* 1997].

LC-MS See Serum [Schanzle *et al.* 1999].

Oral Fluid **GC-MS** See Serum [Piekoszewski *et al.* 2001]. See Hair [Jones *et al.* 2002].

Vitreous Humour **HPLC** See Blood [Bogusz *et al.* 1997].

GC-MS See Urine [Pragst *et al.* 1999].

Bone and Bone Marrow **GC** Column: AT-5 (30 m × 0.25 mm i.d., 0.25 µm). Temperature: 250°. FID [Raikos *et al.* 2001].

SIM acquisition mode (*m/z* 430 and 433 (morphine), 629 (normorphine)). Limit of quantification, 0.5 mg/g [Hold *et al.* 1998]. Morphine and other opioids. Limit of detection, 0.12–0.28 µg/L [Gaillard, Pepin 1997].

Kidney **GC** See Blood. Limit of detection, 300 ng/g [Nakamura, Way 1975].

Liver **GC** See Blood. Limit of detection, 300 ng/g [Nakamura, Way 1975].

Disposition in the Body Morphine is rapidly absorbed after SC, IV or IM administration. Absorption after oral administration is variable and there is considerable first-pass metabolism; bioavailability ~20–30%. Enterohepatic circulation may occur. It is widely distributed, mainly in kidneys, liver, lungs and spleen, with lower concentrations in the brain and muscles, but it does not accumulate in the tissues. Morphine crosses the blood–brain barrier and the placenta; it is found in breast milk and sweat. Approximately 90% of a dose is metabolised after administration. The major metabolic reaction is conjugation to form morphine 3- and 6-glucuronides; morphine 6-glucuronide probably contributes to the analgesic effect, but the 3-glucuronide may antagonise analgesia. Other reactions include *N*-demethylation, *O*-methylation, and *N*-oxide formation, and other active metabolites include normorphine, codeine and morphine ethereal sulfate. After a parenteral dose, up to 90% is excreted in the urine in 24 h, including ~10% of the dose as free morphine, 65–70% as conjugated morphine, up to 10% as morphine 3-ethereal sulfate, 1% as normorphine, and 3% as normorphine glucuronide. After an oral dose, ~60% is excreted in the urine in 24 h, and ~3% of the dose is excreted as free morphine in 48 h. The urinary excretion of morphine appears to be pH dependent to some extent; as the urine becomes more acid, excretion of free morphine rises, and as the urine becomes more alkaline, excretion of the glucuronide conjugate rises. Up to ~10% of a dose may be excreted in the bile.

Morphine is the major active metabolite of diamorphine, and is also a metabolite of codeine.

Note Morphine may be slowly converted to pseudomorphine in cadavers and can be found as such on exhumation.

Therapeutic Concentration In plasma, usually in the range 0.01–0.07 mg/L.

In 10 patients receiving oral morphine as either a once-a-day extended-release formulation or a twice-a-day extended-release formulation for 7 days, plasma concentrations 30 min after a dose were reported as follows (normalised to a total daily dose of 100 mg):

	Twice daily	*Once daily*
Morphine (µg/L)	11.0	17.1
Morphine 3-glucuronide (µg/L)	592	709
Morphine 6-glucuronide (µg/L)	85.8	91.8

[Portenoy *et al.* 2002]

Thirty-one newborn infants (gestational age, 24–41 weeks) on ventilation were administered 140 µg/kg morphine for 1 h followed by 20 µg/kg/h for 2–4 days. The mean serum morphine concentration during the constant infusion was 105 µg/L, observed at 2 h. The mean steady-state concentration was 167 µg/L, which was achieved between 24 and 48 h after starting the infusion. Steady-state concentrations of morphine 6-glucuronide and morphine 3-glucuronide were not reached within 60 h [Saarenmaa *et al.* 2000].

In 8 patients receiving morphine, 60–3000 mg daily via chronic (8–160 days) SC infusion for severe cancer pain, the normalised plasma concentrations of morphine, morphine 6-glucuronide, and morphine 3-glucuronide were 0.3 to 0.8 µg/L, 1.0 to 3.1 µg/L, and 6.8 to 24.3 µg/L, respectively [Vermeire *et al.* 1998].

Twelve patients with post-hepatic cirrhosis (mean age, 40.3 years; range, 35–45) and 10 healthy volunteers (mean age, 39.3 years) were administered 30 mg controlled-release morphine. The peak serum concentration was 35.2 µg/L in the cirrhotic patients and 12.8 µg/L in the healthy volunteers, observed at 174.0 and 142.5 min, respectively [Kotb *et al.* 1997].

Four healthy volunteers, aged 19–34 years, were administered 3 consecutive doses of 2.2, 4.4 and 8.8 mg morphine sulfate pentahydrate at 40-min intervals via an aerosol delivery system. Plasma morphine concentrations were proportional to the dose in this study. Additionally, 6 volunteers were administered 4.4 mg aerosolised morphine sulfate over a 2.1-min period on 3 occasions and IV infusions of 2 and 4 mg morphine sulfate over 3 min. The mean peak plasma morphine concentration for the aerosol dose was 109 µg/L (range, 39–398), attained at 2.7 min; it was 165 µg/L for the 2 mg IV dose, attained at 3.0 min, and 273 µg/L for the 4 mg IV dose, attained at 3.2 min [Ward *et al.* 1997].

Toxicity The estimated minimum lethal dose for adults is 200 mg, but addicts may be able to tolerate up to 10 times as much. Morphine is initially eliminated from the blood fairly quickly and blood concentrations are difficult to interpret, especially as toxic effects depend on the degree of tolerance that has been acquired.

A 46-year-old woman who was admitted to hospital in a coma with severe respiratory failure later developed cardiovascular instability and convulsions but recovered sufficiently 2 days later to communicate in writing that she had ingested a large quantity of controlled-release morphine tablets. At 60 h after the presumed intake, the plasma concentrations of morphine, morphine 3-glucuronide, and morphine 6-glucuronide were 2160, 13100 and 2330 nmol/L, respectively; urinary recovery of morphine and its metabolites amounted to 6.8 mmol, equivalent to an oral intake of at least 2500 mg [Westerling *et al.* 1998].

An 8-year-old girl accidentally ingested morphine before going to bed and was found dead the next morning. Following a tonsillectomy, she was prescribed meperidine syrup at a dose of 100 mg every 4 h but the pharmacist accidentally dispensed Roxanol containing 20 g/L morphine sulfate. The little girl took 1–2 teaspoons as prescribed. The morphine concentration in blood was 0.128 mg/L, in bile 135 mg/L and in stomach

contents 16 mg/L (a total amount of 2.3 mg). The cause of death was determined as morphine poisoning, which resulted in respiratory depression [Poklis *et al.* 1995].

A 90-year-old woman apparently died of natural causes in a nursing home. Subsequent investigation indicated that she had received an unauthorised bolus of morphine just before her death. Following exhumation of the embalmed body, toxicological analysis of the liver revealed a free morphine concentration of 1.5 µg/g. This level was deemed consistent with a lethal concentration. The manner of death was homicide [Levine *et al.* 1994].

Bioavailability About 20–30%

Half-life Plasma half-life, ~2–3 h.

Volume of Distribution ~3–5 L/kg.

Clearance Plasma clearance, ~15–20 mL/min/kg; mean total body clearance for newborn infants (24–41 weeks of gestation), 2.4 mL/min/kg (range, 0.8–6.4).

Protein Binding 20–35%.

Note For a review of the metabolism of morphine, see Christrup [1997]; for a review of the pharmacokinetics of sustained-release morphine, see Gourlay [1998].

Dose Morphine hydrochloride, sulfate, or tartrate, 5 to 20 mg by mouth or parenterally, every 4 h.

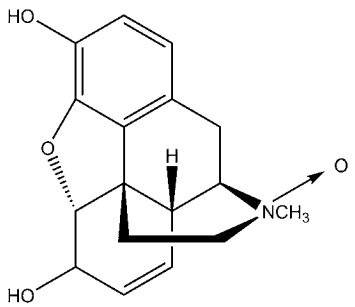
Morphine N-oxide

Narcotic
$C_{17}H_{19}NO_4 = 301.3$
Synonyms Genomorphine; morphine aminoxide; *N*-oxymorphine.



Chemical Properties Mp 275°. It is stated to be bimolecular. Slightly soluble in water, insoluble in chloroform.
Colour Tests Ammonium molybdate test—deep purple→blue→green (limit of detection, 0.1 µg); ammonium vandate test—dull purple→brown (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—purple (limit of detection., 0.1 µg).
Thin-layer Chromatography System T10—R_f 0.23 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—284.5 nm with an inflexion at 279 nm.
Quantification
Other **TLC** Guinea-Pig Urine. Plates: silica gel. Solvent system A: 1-butanol : acetic acid : water (35 : 3 : 10). Solvent system B: ethyl acetate : methanol : ammonium hydroxide (17 : 2 : 1). Visualisation with iodoplatinate. R_f 0.8 and 0.4 for system A and B, respectively [Yeh *et al.* 1979].

GC Guinea-Pig Urine. Column: Gas Chrom Q 3% OV-17 (0.9 m × 2 mm). Temperature: 220°. Retention time: 5.6 min. Limit of detection not reported [Yeh *et al.* 1979].

GC-MS Guinea-Pig Urine. Column: Gas Chrom Q 3% OV-17 (0.9 m × 2 mm). Carrier gas: CH_3. Temperature: 210°. CI at 80 eV, full scan mode. Limit of detection not reported [Yeh *et al.* 1979].

Disposition in the Body After the administration of morphine *N*-oxide to rats, morphine appeared in the urine equivalent to 61% of the amount of the dose. Reduction of *N*-oxides to the corresponding tertiary base is an established metabolic pathway. Morphine *N*-oxide inhibits demethylation *in vivo*, a finding which could explain the lack of normorphine in the urine of rats. Reduction is the only demonstrable metabolic pathway for morphine *N*-oxide *in vivo* [Heimans *et al.* 1971].
Toxicity The IV and SC acute toxicities of morphine *N*-oxide in mice are 3.2- and 8-times less than that of morphine, respectively [Fennessy, Fearn 1969].

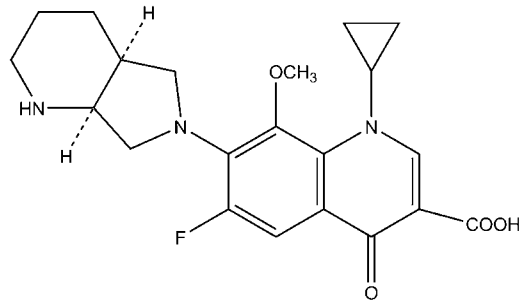
Moxifloxacin

Antibacterial, Fluoroquinolone
$C_{21}H_{24}FN_3O_4 = 401.4$
CAS—151096-09-2
IUPAC Name 7-[(4a*S*,7a*S*)-1,2,3,4,4a,5,7,7a-Octahydropyrrolo[3,4b]pyridin-6-yl]-1-cyclopropyl-6-fluoro-8-methoxy-4-oxoquinoline-3-carboxylic acid
Synonym 1-Cyclopropyl-6-fluoro-1,4-dihydro-8-methoxy-7-[(4a*S*,7a*S*)-octahydro-6*H*-pyrrolo[3,4-b]pyridin-6-yl]-4-oxo-3-quinolinecarboxylic acid



Chemical Properties Mp 238° to 242°. Log *P* (octanol/water), 2.03 [Wishart 2006].

Moxifloxacin Hydrochloride

$C_{21}H_{24}FN_3O_4,HCl = 437.9$
CAS—186826-86-8
Synonym Bay-12-8039
Proprietary Names *Actimax*; *Actira*; *Avalox*; *Avelon*; *Avelox*; *Flovacil*; *Izilox*; *Megaxin*; *Moxicip*; *Octegra*; *Proflox*; *Vigamox*; *Vigamoxi*.
Chemical Properties Slightly yellow to yellow crystalline powder. Mp 324° to 325° with decomposition. Stable in serum samples at room temperature over 24 h [Nguyen *et al.* 2004].
Quantification
Plasma **HPLC** Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L orthophosphoric acid (pH 2.5, 80 : 20), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 464$ nm, $\lambda_{em} = 537$ nm). Retention time: 4.8 min. Limit of quantification, 15 µg/L; limit of detection, 6 µg/L [Tatar Ulu 2007]. Column: Supelco LC-Hisep (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.25 mol/L trisodium phosphate (pH 3.0, 5 : 95) with 10 mmol/L sodium dodecyl sulfate, flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 290$ nm, $\lambda_{em} = 500$ nm). Retention time: 6.2 min. Limit of quantification, 3.0 µg/L, limit of detection, 1.0 µg/L [Laban-Djurdjevi *et al.* 2006]. Column: Adsorbosphere HS C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L sodium dodecyl sulfate–10 mmol/L tetrabutylammonium acetate–25 mmol/L citric acid : acetonitrile (57 : 43, pH 3.5), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 293$ nm, $\lambda_{em} = 500$ nm) or UV detection ($\lambda = 293$ nm). Retention time: 7.0 min. Limit of quantification, 20 µg/L (fluorescence detection), 100 µg/L (UV detection) [Liang *et al.* 2002]. Column: Supelcosil ABZ + (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L potassium dihydrogen phosphate (pH 4.0, 18 : 82), flow rate 1.25 mL/min. UV detection ($\lambda = 296$ nm). Retention time: 6.1 min. Limit of quantification, 30 µg/L, limit of detection, 6.5 µg/L [Lemoine *et al.* 2000]. Column: Nucleosil 100 C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L tetrabutylammonium sulfate–0.05 mol/L sodium dihydrogen phosphate (pH 3.0) : acetonitrile (95 : 5 to 75 : 25 at 1 min for 4 min to 30 : 70 at 5.1 min for 1.4 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 296$ nm, $\lambda_{em} = 504$ nm). Retention time: 6.6 min. Limit of quantification, 2.5 µg/L [Stass, Dalhoff 1997].

CE Column: fused silica capillary (270 × 0.05 mm i.d.). Fluorescence detection ($\lambda_{ex} = 325$ nm, $\lambda_{em} = 520$ nm). Retention time: 4.1 min. Limit of quantification; 2.5 µg/L, limit of detection, 0.5 µg/L [Moller *et al.* 1998].
Serum **HPLC** Column: Supelcosil ABZ + (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate (pH 2.5) with 2 mmol/L tetrabutylammonium bromide : acetonitrile (88 : 12), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 296$ nm, $\lambda_{em} = 504$ nm). Retention time: 5.2 min. Limit of quantification, 125 µg/L, limit of detection, 35 µg/L [Nguyen *et al.* 2004].
Oral Fluid **HPLC** See Plasma. Retention time: 7.6 min. Limit of quantification, 10 µg/L [Stass and Dalhoff 1997].
Urine **HPLC** See Plasma. Retention time: 9.0 min. Limit of quantification, 50 µg/L [Stass, Dalhoff 1997].
Aqueous Humour **HPLC** Column: Waters AccQ Tag amino acid (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile–methanol–0.05 mol/L tetrabutylammonium chloride–trifluoroacetic acid (pH 3.0, 37.5 : 12.5 : 949 : 1) : acetonitrile–methanol–0.05 mol/L tetrabutylammonium chloride–trifluoroacetic acid (pH 3.0, 75 : 25 : 899 : 1; 100 : 0 for 3 min to 0 : 100 at 12 min to 100 : 0 at 16 min for 5 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 290$ nm, $\lambda_{em} = 500$ nm). Retention time: 16.7 min. Limit of quantification, 10 µg/L [Chan *et al.* 2006].
Vitreous Humour **HPLC** See Aqueous Humour [Chan *et al.* 2006].
Other **HPLC** Lung Tissue. Column: Supelcosil ABZ + (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L potassium dihydrogen phosphate (pH 4.0; 18 : 82), flow rate 1.25 mL/min. UV detection ($\lambda = 296$ nm). Retention time:

M

6.1 min. Limit of quantification, 0.4 µg/g; limit of detection, 0.05 µg/L [Lemoine *et al.* 2000].

CE Microdialysate. Column: fused silica capillary (27 cm × 50 µm). Fluorescence detection ($\lambda_{ex} = 325$ nm, $\lambda_{em} = 520$ nm). Migration time: 4.1 min. Limit of quantification, 5 µg/L; limit of detection, 0.5 µg/L [Moller *et al.* 1998].

Disposition in the Body Readily absorbed from the gastrointestinal tract after oral doses. It is widely distributed throughout the body tissues. It does not appear to be metabolised by the CYP450 pathways but is metabolised mainly via sulfate and glucuronide conjugation; it is excreted in the urine and the faeces as unchanged drug and as metabolites. The sulfate conjugate is excreted primarily in the faeces and the glucuronide is excreted exclusively in the urine. Distribution into milk has been found in animals.

Therapeutic Concentration

A group of 27 adult patients undergoing elective pars plana vitrectromy was administered a single tablet of 400 mg of moxifloxacin 1 to 2 h before surgery. The mean sampling times after oral administration of the drug for serum and aqueous and vitreous humours were 2.0, 1.5 and 1.5 h, respectively. Moxifloxacin mean concentrations measured in the serum and aqueous and vitreous humours were 1.34, 0.21 and 0.09 mg/L, respectively. Some values obtained were considered outliers as one patient had serum levels approx. 67-fold the mean value calculated and 2 other patients had vitreous levels 45 times below the mean values of the rest of the group [Vedantham *et al.* 2006].

A group of 35 patients scheduled for cataract surgery was administered a single 400 mg tablet of moxifloxacin. The mean peak aqueous humour moxifloxacin concentration was 1.17 mg/L after 10 h and the mean peak value in serum was 3.16 mg/L at 4 h [Walter *et al.* 2007].

A total of 45 healthy volunteers were administered single ascending doses of moxifloxacin (range 50 to 800 mg) in a dose-finding study. Mean peak plasma concentrations were as follows:

Dose (mg)	*C_{max} (mg/L)*	*Time (h)*
50	0.29	1.75
100	0.59	2.0
200	1.16	2.5
400	2.5	1.5
600	3.19	2.5
800	4.73	3.0

Plasma concentrations decreased between 30 and 55% of the peak concentrations within 4 to 5 h. Pharmacokinetics in saliva were investigated over the dose range 50 to 200 mg. Following administration of the drug, peak concentrations in saliva were reached approximately 1 to 4 h after administration and were 0.14 to 0.52 mg/L after the 50 mg dose, 0.41 to 1.80 mg/L after the 100 mg dose, and 1.12 to 2.83 mg/L after the 200 mg dose. The renal clearance data indicated partial tubular reabsorption of the drug [Stass *et al.* 1998].

A group of 49 patients undergoing lung surgery was administered 400 mg moxifloxacin daily either orally or as an IV infusion for 5 days. Plasma and lung concentrations in the IV groups were as follows:

Group	*Time (h)*	*Plasma (mg/L)*	*Lung (µg/g)*
A	1	5.9	8.8
B	2	2.5	12.4
C	3.4	3.3	10.4
D	8.9	2.0	8.7
E	23.8	0.7	2.1
F	33.4	0.4	1.3

In the orally treated groups, values were:

Group	*Time (h)*	*Plasma (mg/L)*	*Lung (µg/g)*
G	2.4	2.5	16.2
H	3.1	3.2	15.6
I	8.3	2.5	9.3
J	12.0	1.9	8.3
K	24.1	0.7	2.5
L	36.3	0.8	1.7

[Breilh *et al.* 2003].

A group of 97 patients scheduled to undergo cataract surgery was administered 0.5% moxifloxacin as eye drops. The patients were split into 4 groups according to administration method and dose. All patients received the drops four times a day starting 2 days before surgery. Patients in subgroup A did not receive any drops on the day of surgery. Those in subgroup B received the drops 3 times at 15 min intervals starting approx. 2 h before surgery. In subgroup C, eyes were dilated with a wick soaked in a dilating mixture containing moxifloxacin that was placed in the lower fornix for 10 min approx. 2 h before surgery. The final subgroup (D) had the wick and also received drops at the time of preparation for surgery. Aqueous humour concentrations of moxifloxacin in the 4 groups were:

Group	*Moxifloxacin (mg/L)*
A	0.38
B	2.16
C	0.88
D	0.97

[Ong-Tone 2007].

Topical application of moxifloxacin 0.5% (4 times a day for 3 days before surgery and every 15 min for 3 doses beginning 1 h before surgery) in eyes of 14 patients (average age, 71 years) resulted in a mean aqueous humour concentration of 1.31 mg/L [Solomon *et al.* 2005].

Toxicity Absorption of moxifloxacin is impaired by concomitant administration of aluminium- and magnesium-containing antacids, and administration of these agents should be staggered. An interval of 2 h before or 4 h after taking the antacid ensures that the effect of the interaction is not clinically relevant [Stass *et al.* 2001].

Bioavailability 90%.

Half-life Approximately 11 to 14 h.

Volume of Distribution 216 to 308 L.

Clearance 202 to 297 mL/min.

Protein Binding Approximately 48%.

Dose Moxifloxacin is given by mouth, or by IV infusion over 60 min, for the treatment of susceptible infections, including respiratory, skin and skin structure, and intra-abdominal infections. Moxifloxacin is given as the hydrochloride but doses are expressed in terms of the base; moxifloxacin hydrochloride 436.3 mg is equivalent to approx. 400 mg moxifloxacin. The usual dose is 400 mg once daily.

Moxifloxacin is also used topically as the hydrochloride in eye drops containing the equivalent of 0.5% of moxifloxacin for the treatment of bacterial conjunctivitis.

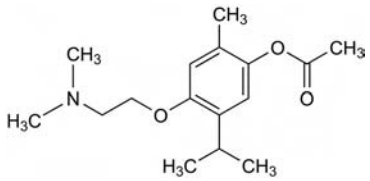
Moxisylyte

Vasodilator

$C_{16}H_{25}NO_3 = 279.4$

CAS—54-32-0

IUPAC Name [4-(2-(Dimethylaminoethoxy)-2-methyl-5-propan-2-ylphenyl]acetate
Synonyms 4-[2-(Dimethylamion)ethoxy]-2-methyl-5-(1-methylethyl)phenol] acetate; thymoxamine

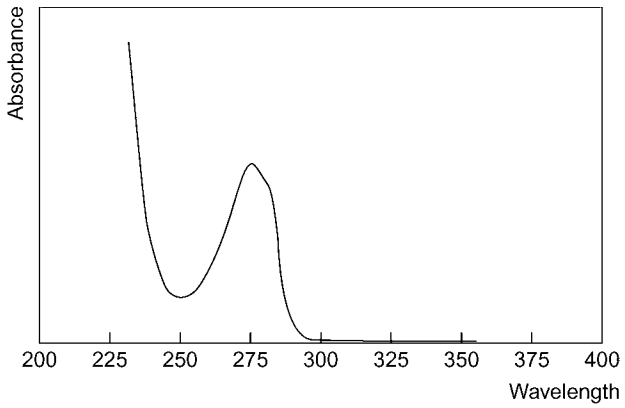


Chemical Properties Practically insoluble in water; soluble in chloroform. pK_a 8.7. Log *P* (octanol/water), 3.2.

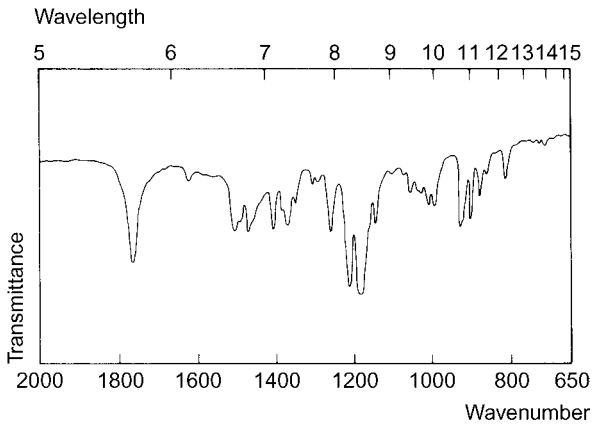
Moxisylyte Hydrochloride

$C_{16}H_{25}NO_3$,HCl = 315.8
CAS—964-52-3
Proprietary Names *Arlitene*; *Carlytène*; *Icavex*; *Opilon*; *Vasoklin*.
Chemical Properties A white crystalline powder. Mp 208° to 210°. Soluble 1 in 2.5 of water, 1 in 11 of ethanol and 1 in 3 of chloroform; practically insoluble in ether.

Colour Test Marquis test—yellow-brown.
Thin-layer Chromatography System TA—R_f 0.52; system TL—R_f 0.19; system TB—R_f 0.31; system TC—R_f 0.44 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1832.
High Performance Liquid Chromatography System HA—Moxisylyte *k* 2.9, desacetylmoxisylyte *k* 2.3.
Ultraviolet Spectrum Aqueous acid—275 nm (A_1^1=80a); aqueous alkali—235, 301 nm (A_1^1=146b).



Infrared Spectrum Principal peaks at wavenumbers 1184, 1212, 1761, 1261, 1504, 931 cm^{-1} (moxisylyte hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 72, 279, 234, 151, 192, 166, 165.
Quantification
Plasma **HPLC** Fluorescence detection. Metabolites of moxisylyte. Limit of detection, 2.5 to 2.8 µg/L for desacetyl and sulfate metabolites [Marquer, Bressolle 1997]. Fluorimetric detection. For method of quantification for metabolites of moxisylyte, see Costa *et al.* [1993].

Spectrofluorimetry For method, see Arbab and Turner [1971].
Urine **HPLC** See Plasma. Limit of detection, 40 to 200 µg/L for desacetyl and sulfate metabolites [Marquer, Bressolle 1997]. See Plasma [Costa *et al.* 1993].
Other (Monkey Plasma) **HPLC** Fluorescence detection. Metabolites of moxisylyte. Limit, of detection, 2 ng for desacetylmoxisylyte and 4 ng for desmethyldesacetylmoxisylyte [Geahchan, Chambon 1980].
Disposition in the Body Moxisylyte is poorly absorbed after oral administration. Deacetylation to give desacetylmoxisylyte and subsequent demethylation to give desmethyldesacetylmoxisylyte may occur.
Therapeutic Concentration

After single oral doses of 150 mg to 4 female subjects, plasma concentrations of about 0.06 mg/L were achieved after 30 to 60 min in 2 subjects; the drug was not detected in the other 2 subjects. After an IV injection of 0.2 mg/kg over 2 min to 2 male subjects, plasma concentrations at 2, 7 and 15 min were 0.14, 0.08 and 0.05 mg/L in the first subject and 0.1, 0.04 and 0.03 mg/L in the other [Arbab, Turner 1971].

Dose The equivalent of 160 mg of moxisylyte daily.

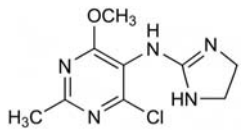
Moxonidine

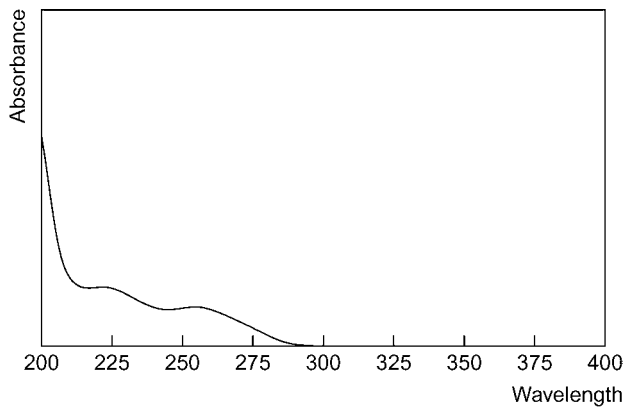
Antihypertensive
$C_9H_{12}ClN_5O$ = 241.7
CAS—75438-57-2
IUPAC Name 4-Chloro-*N*-(4,5-dihydro-1*H*-imidazol-2-yl)-6-methoxy-2-methyl-5-pyrimidinamine
Synonyms BDF-5895, BE-5895.
Proprietary Names *Cynt*; *Physiotens*.



Chemical Properties Mp 217° to 219°.

Moxonidine Hydrochloride

$C_9H_{12}ClN_5O.xHCl$
CAS—75438-58-3
Chemical Properties Crystals from isopropanol/ether. Mp 189°.
Ultraviolet Spectrum Principal peaks at 222, 258 nm.



Quantification
Plasma **GC–MS** MS detection (NICI, SIM at *m/z* 721). Limit of quantification, 0.1 µg/L, limit of detection, 0.05 µg/L [Kirch 1990].

Disposition in the Body Moxonidine is well absorbed after oral administration (peak plasma concentrations are reached between 0.5 and 3.0 h). It is not subject to first-pass metabolism and food does not interfere with its pharmacokinetics. It is metabolised mainly to 4,5-dehydromoxonidine and a guanine derivative. It is excreted in urine mainly as the unchanged drug (50 to 75%) and as its metabolites. Only 1% of a dose is excreted via faeces. The drug is detectable in breast milk.

Therapeutic Concentration

Eight hypertensive patients previously treated with antihypertensive therapy, aged between 32 and 69 years, were administered a single oral dose of 0.25 mg moxonidine. A mean peak concentration of 1.96 µg/L (range, 1.16 to 3.06 µg/L) was observed at 1.07 h (0.29 to 2.55 h) after administration [Kirch 1990].

Group 1: 8 individuals with normal renal function (creatinine clearance, 6.4 L/h), group 2: 8 patients with moderately impaired renal function (creatinine clearance, 3 L/h), group 3: 8 patients with severe renal dysfunction (creatinine clearance, 1.4 L/h). Each group was administered 0.3 mg daily for 7 days. The peak plasma concentrations were 1.5, 2.1 and 2.3 µg/L for groups 1, 2 and 3, respectively, observed at 1.0, 1.3 and 1.1 h [Kirch *et al.* 1988].

Toxicity

Three cases of overdose have been reported, two of which involved the children (2 to 3 years old) of 2 patients accidentally ingesting moxonidine. Full recoveries were made without any signs of cardiovascular disorder. A third case involved a 23-year-old man who intentionally ingested moxonidine, ranitidine and alcohol in a suicide attempt. Plasma concentrations were 70-fold higher than would be expected after ingestion of the recommended dose. Bradycardia, somnolence and hypotension were observed and treated, and the patient made a full recovery [Schachter *et al.* 1998].

Bioavailability 88%.

Half-life 2 to 3 h (prolonged in renal impairment).

Volume of Distribution 1.39 L/kg (0.85 to 1.75 L/kg).

Clearance Plasma, 0.77 L/h/kg (43.6 to 69 L/h/kg; 32.9 L/h/kg for those with moderate renal impairment; 22.1 L/h/kg, severe renal impairment).

Protein Binding 5.8 to 7.9%.

Note For a review of moxonidine, see Prichard *et al.* [1999].

Dose The usual initial dose is 200 µg daily which may be increased to a maximum of 600 µg over a number of weeks. The dose may be reduced in those with renal impairment.

Mupirocin

Antibacterial (Topical)

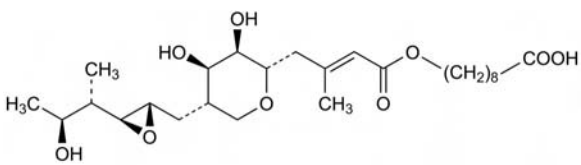
$C_{26}H_{44}O_9 = 500.6$

CAS—12650-69-0

IUPAC Name 9-[(*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-3,4-Dihydroxy-5-[[(2*S*,3*S*)-3-[(2*S*,3*S*)-3-hydroxybutan-2-yl]oxiran-2-yl]methyl]oxan-2-yl]-3-methylbut-2-enoyl]oxy-nonanoic acid

Synonyms (2*E*)-5,9-Anhydro-2,3,4,8-tetradeoxy-8-[[(2*S*,3*S*)-3-[(1*S*,2*S*)-2-hydroxy-1-methylpropyl]oxiranyl]methyl]-3-methyl-L-*talo*-non-2-enonic acid, 8-carboxyoctyl ester; BRL-4910A, pseudomonic acid A; *trans*-pseudomonic acid.

Proprietary Names *Bactoderm*; *Bactroban Ointment*; *Celefer*; *Plasimine*; *Eismycin*; *Turixin*.



Chemical Properties An off-white crystalline solid. Mp 77° to 78°. Soluble in dehydrated alcohol, acetone and chloroform; slightly soluble in water and ether. pKa (22°), 5.

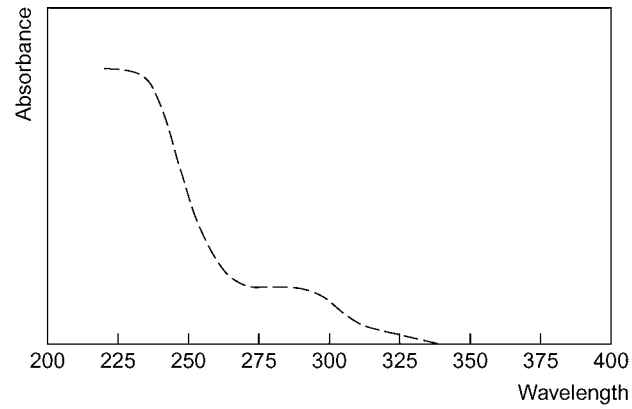
Mupirocin Calcium

Proprietary Name *Bactroban Nasal*

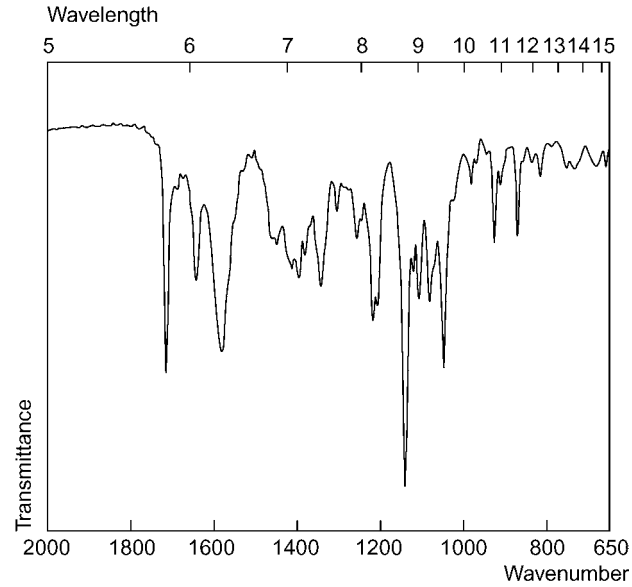
Thin-layer Chromatography System TE—R_f 0.01; system TF—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 459.

Ultraviolet Spectrum Ethanol—222 nm; basic—287 nm.



Infrared Spectrum Principal peaks at wavenumbers 1718, 1146, 1052 cm^{-1}.



Disposition in the Body Systemic absorption after topical application is very small. Mupirocin is rapidly metabolised to monic acid (microbiologically inactive) by de-esterification. Following IV administration of a single 125 mg mupirocin sodium salt dose, ~0.5% is excreted unchanged in urine, whereas 72% is excreted as monic acid within 12 h. Mupirocin does not appear to be inactivated by non-specific esterases present in blood.

Therapeutic Concentration

Following IV infusions over 25 min, in healthy adults, of 31.3, 61.2, 125 and 252 mg mupirocin sodium salt, peak plasma concentrations reached were 1.9, 1.9, 7.1 and 14.1 µg/mL, respectively. Serum concentrations declined rapidly and mupirocin was undetectable within 3 h [GlaxoSmithKline].

Half-life After IV administration, mupirocin, 15 to 30 min; monic acid, 32 to 78 min.

Protein Binding 95 to 97%.

Dose Applied topically as a 2% ointment in macrogol bases for the treatment of various bacterial skin infections up to 3 times a day for up to 10 days.

GlaxoSmithKline, Patient Information Leaflet, data on file.

Muscimol

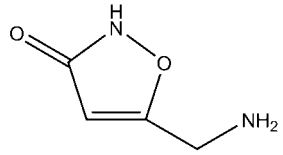
CNS Depressant, $GABA_A$ Receptor Agonist

$C_4H_6N_2O_2 = 114.1$

CAS—2763-96-4

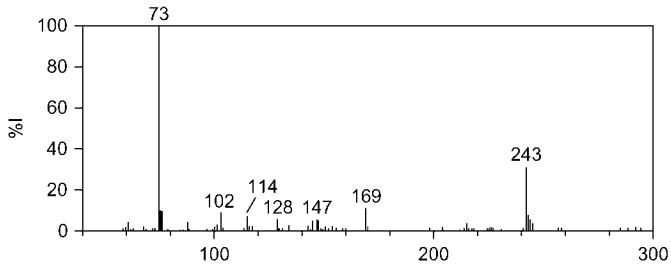
IUPAC Name 5-(Aminomethyl)-1,2-oxazol-3-one

Synonyms Agarin; 5-aminomethyl-3-hydroxyisoxazole; 5-(aminomethyl)-3-isoxazolol; 5-(aminomethyl)-3(2*H*)-isoxazolone; 3-hydroxy-5-aminomethylisoxazole; pantherine.



Chemical Properties Crystals. Mp 175°. Log *P* (octanol/water), −2.39 [Hansch *et al.* 1995]. Muscimol is the major psychoactive alkaloid of the mushroom *Amanita muscaria* (Fly Agaric).

Mass Spectrum Principal ions at *m/z* 73, 243, 169, 102, 114, 147, 128 (di-TMS derivative) [Tsujikawa *et al.* 2006].



Quantification

Other **TLC** Rat Brain and Urine. Plates: Whatman PK5F. Solvent system: methanol : dichloromethane : 0.1 mmol/L hydrochloric acid (50 : 40 : 10). Scintillation counting. Limit of detection not reported [Matthews *et al.* 1981].

GC-MS Dried Mushrooms. Column: DB-5 MS capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 53.0 mL/min. Temperature programme: 100° for 1 min to 300° at 15°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 25 μg/L [Tsujikawa *et al.* 2006].

LC-MS Dried Mushrooms. Column: Symmetry C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (70 : 30 for 1 min to 10 : 90 at 25 min for 5 min to 70 : 30 at 31 min for 15 min), flow rate 0.2 mL/min. DAD (λ = 256 nm). Limit of quantification, 4.6 μg/L; limit of detection, 1.4 μg/L [Tsujikawa *et al.* 2007].

Note For a GLC-mass spectral analysis of fungal metabolites, see Repke *et al.* [1978].

Disposition in the Body After ingestion, muscimol proceeds to the brain or is eliminated via the systemic circulation [Michelot, Melendez-Howell 2003].

Toxicity The lethal dose of muscimol is estimated to be 12 mg and symptoms of toxicity appear within 6 h of ingestion. For an overview of the features of various types of mushroom poisoning, see DiPalma [1981]. The LD_{50} in mice is 3.8 mg/kg (SC) and 2.5 mg/kp (IP); in rats it is 4.5 mg/kg (IV) and 45 mg/kg (oral) [O'Neil *et al.* 2006].

A 72-year-old woman ingested *Amanita pantherina* and developed diarrhoea and severe transient neurological disorders followed by hallucinations and deep coma. The patient presented with skeletal muscle flaccidity with hyporeflexia. A CT scan showed a small ischaemic focus in capsula interna. Over the following 6 h, the neurological symptoms resolved. It was concluded that the patient's symptoms were a result of panther cap poisoning complicated by transient ischaemia of the brain [Magdalan, Antonczyk 2007].

A 47-year-old mother and her 27-year-old daughter ingested 5 fried mushroom caps thinking that they were parasol mushrooms *Macrolepiota procera*. Approximately 2 h after ingestion, the women suffered from nausea, stomach ache, and diarrhoea and had vomited several times. After several days in hospital, both patients were discharged [Satora *et al.* 2006].

A 48-year-old man consumed a plate of what he thought were *Amanita caesarea* mushrooms. Half an hour later he became nauseous, vomited, and fell asleep. His wife found him 3 h later comatose and having a seizure-like episode. Examination of the mushrooms he had picked revealed *A. muscaria* among them. Ten hours after ingestion he awoke and was completely oriented. Eight hours later, however, his condition deteriorated and he became confused and uncooperative. He developed visual and auditory hallucinations as well as paranoia. He refused treatment and was diagnosed with paranoid psychosis. He was transferred to a psychiatric hospital 3 days later. On the fifth day he started to drink and take tablets and on the sixth day all symptoms of psychosis disappeared and he was discharged [Brvar *et al.* 2006].

Four men (aged 18 to 21 years) and an 18-year-old woman picked, skinned, shredded and dried 6 large *A. muscaria* mushrooms. That evening the mushrooms were served at a party. After ~20 min, each person experienced auditory and visual hallucinations. The girl, however, experienced severe hallucinations followed by a loss of consciousness. Her companions induced her to vomit and drink fluids. The following morning she was admitted to hospital. Urine samples taken 5 h after ingestion were negative for tetrahydrocannabinol, amfetamines, opiates and amanitin. Because not all of the active compounds in this species of mushroom are known, she was kept in for observation. She was discharged 4 days later [Satora *et al.* 2005].

Nine patients aged 1 to 6 years were admitted to hospital between April 6 and May 23, 1992. They presented with CNS depression, ataxia, waxing and waning obtundation, hallucinations, intermittent hysteria, or hyperkinetic activity. Seizures occurred in 4 of the 9 patients but this was controlled with standard anticonvulsant therapy. Recovery was rapid (within 12 h) and complete in all cases [Benjamin 1992].

Note For a study investigating the ibotenic acid-muscimol content of various *Amanita* species from several continents, see Chilton and Ott [1976].

Dose Muscimol is used as a neuropharmacological tool to investigate GABA receptor function.

Mustine

Antineoplastic

$C_5H_{11}Cl_2N$ = 156.1

IUPAC Name 2-Chloro-*N*-(2-chloroethyl)-*N*-methylethanamine

Synonyms Chlorethazine; chlormethine; 2,2′-dichloro-*N*-methyldiethylamine; HN 2; mechlorethamine; methchlorethamine; nitrogen mustard.

Chemical Properties Oily substance. Relatively insoluble in water.

Mustine Hydrochloride

Proprietary Name *Mustargen hydrochloride*

Chemical Properties White, hygroscopic, vesicant, crystalline powder or mass. Mp about 108°. Very soluble in water.

Caution Mustine hydrochloride is highly toxic; it is a strong vesicant and a strong nasal irritant.

Disposition in the Body In neutral or alkaline solutions mustine rapidly undergoes intramolecular transformation with release of a chloride ion to form a cyclic ethyleneimmonium derivative which is highly chemically reactive. Some of the physiological effects of mustine may be due to deactivation of crucial enzymes, but it is more likely that mustine acts mainly on proliferating cells by alkylating the nucleic acids of the chromosomes. Mustine is active only if given parenterally, and it is rapidly removed from the blood-stream. Metabolism is so rapid that <0.01% of the drug may be recovered in the urine.

Toxicity Severe haemopoietic depression may follow administration of even therapeutic doses. Bone-marrow changes may lead to severe anaemia and thrombocytopenic purpura. Skin reactions may also occur.

LD_{50} (oral): in rats 10 mg/kg.

Dose The usual dose is 0.4 mg/kg IV.

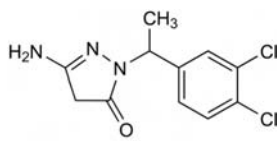
Muzolimine

Diuretic

$C_{11}H_{11}Cl_2N_3O$ = 272.1

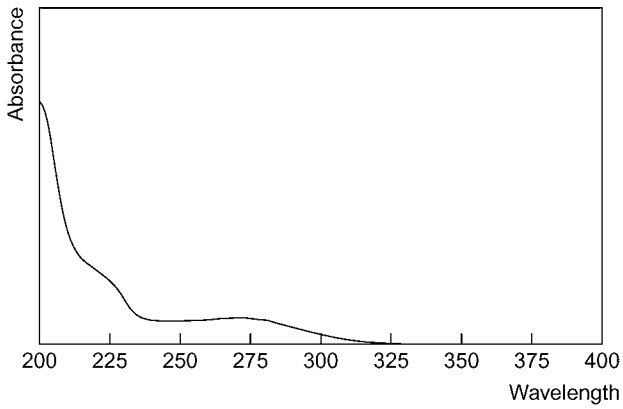
CAS—55294-15-0

IUPAC Name 5-Amino-2-[1-(3,4-dichlorophenyl)ethyl]-2,4-dihydro-3*H*-pyrazol-3-one



Chemical Properties Crystals. Mp 134° to 137°. Practically insoluble in water; soluble 1 in 4 of ethanol, 1 in 9 of acetone and 1 in 3 of chloroform. pK_a 9.3.

Ultraviolet Spectrum Methanolic acid—240 nm (A_1^1=489b).



Infrared Spectrum Principal peaks at wavenumbers 1690, 1640, 1602, 835, 665, 880 cm^{-1} (KBr disk).

Quantification

Plasma **TLC** Limit of detection, 2 μg/L [Ritter 1977].

Urine **TLC** See Plasma [Ritter 1977].

Disposition in the Body Muzolimine is readily absorbed following oral administration. About 5% of a dose is excreted unchanged in the urine in 10 h.

Therapeutic Concentration

After a single oral dose of 30 mg given to 6 subjects, peak plasma concentrations of 0.29 to 0.51 (mean 0.44) mg/L were attained in 1 to 3 h [Loew *et al.* 1977].

Half-life Plasma half-life, 10 to 17 h.

Dose 40 to 80 mg daily.

Loew D *et al.* (1977). Comparison of the pharmacodynamic effects of furosemide and BAY g 2821 and correlation of the pharmacodynamics and pharmacokinetics of BAY g 2821 (muzolimine). *Eur J Clin Pharmacol* 12: 341–344.

Ritter W (1977). Thin-layer densitometric determination of muzolimine (BAY g 2821), a structurally new diuretic drug, at the nanogram level in biological fluids. *J Chromatogr* 142: 431–440.

M

Mycophenolate Mofetil

Immunosuppressant

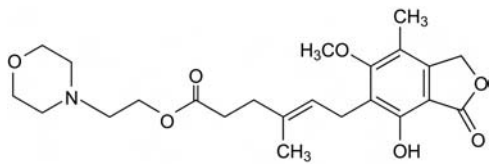
$C_{23}H_{31}NO_7$ = 433.5

CAS—115007-34-6; 128794-94-5

IUPAC Name 2-Morpholinoethyl-(*E*)-6-(4-hydroxy-6-methoxy-7-methyl-3-oxo-5-phthalanyl)-4-methyl-4-hexenoate

Synonyms Morpholinoethyl; mycophenolate; RS-61443.

Proprietary Name *CellCept*



Chemical Properties White to off-white crystalline powder. Mp 93° to 94°. Slightly soluble in water; soluble in acetone and methanol; sparingly soluble in ethanol. pK_a 5.6 (mycophenolate mofetil), 4.5 (acid). Log *P* (octanol/phosphate buffer pH 2), 0.0085; (octanol/phosphate buffer pH 7.4), 238 (mycophenolate mofetil); log *P* (octanol/phosphate buffer pH 2), 570; (octanol/phosphate buffer pH 7.4), 1.6 (acid).

Mycophenolic Acid

$C_{17}H_{20}O_6$ = 320.3

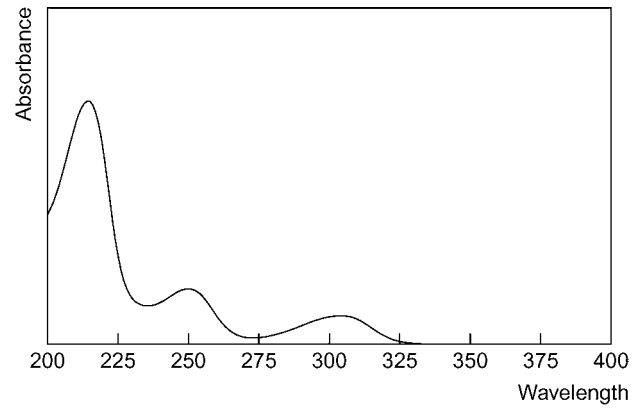
CAS—24280-93-1

IUPAC Name 6-(4-Hydroxy-6-methoxy-7-methyl-3-oxo-5-phthalanyl)-4-methyl-4-hexenoic acid

Chemical Properties Needles from hot water. Mp 141°. It is soluble in alcohol; moderately soluble in ether and chloroform; sparingly soluble in toluene; almost insoluble in cold water.

High Performance Liquid Chromatography Column: ODS (150 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : trifluoroacetic acid (48:52), flow rate 1.5 mL/min. IS: suprofen. UV detection (λ=250 nm). Retention time: mycophenolic acid, 14.6 min; mycophenolate phenol glucuronide, 3.6 min; IS, 9.2 min [Wiwattanawongsa *et al.* 2001].

Ultraviolet Spectrum Principal peaks at 214, 251, 303 nm.



Quantification

Plasma **HPLC** UV detection (λ=254 nm). Limit of quantification, 0.1 mg/L for mycophenolic acid and 4.0 mg/L for its glucuronic conjugate [Tsina *et al.* 1996].

Body Fluids **HPLC** UV detection (λ=215 nm and 304 nm). Limit of detection, 0.17 mg/L [Sugioka *et al.* 1994].

Skin **HPLC** MS detection. Limit of detection, 0.85 μg/L for mycophenolate mofetil, 1 μg/L for mycophenolic acid [Platzer *et al.* 2001].

Disposition in the Body Mycophenolate mofetil is an ethyl ester prodrug. It is rapidly absorbed after oral administration and completely hydrolysed to form the active drug mycophenolic acid (MPA). Mycophenolic acid is further metabolised through glucuronidation to form an inactive metabolite (MPAG), which is excreted in urine. About 6% of the dose is excreted in faeces. The pharmacokinetics of MPA and MPAG are altered if mycophenolate mofetil is administered with a high fat content meal or antacids containing aluminium and magnesium hydroxides. Food has little effect on the bioavailability of mycophenolate mofetil, but antacids reduce the peak plasma concentration by 40%.

Therapeutic Concentration

Ten patients with rheumatoid arthiritis, 6 females and 4 males, with a mean age of 55.6 years, were administered 2 g mycophenolate mofetil after an overnight fast. It was either administered on its own, with food, or with an antacid. The mean peak plasma concentrations of MPA were 23.8, 18 and 14.8 mg/L, respectively, and were observed between 0.5 and 3 h post-administration. Mean concentrations of MPAG at 52.7, 68.4 and 38.8 mg/L were reached in individuals in the fasting state, fed state and for those administered with an antacid, respectively. These levels were seen 2 to 4 h after administration [Bullingham *et al.* 1996].

Bioavailability 94%.

Half-life Mycophenolic acid, 18 h.

Volume of Distribution Mycophenolic acid, 3.6 L/kg.

Clearance 11.6 L/h (193 mL/min).

Protein Binding Mycophenolic acid, 97%; MPAG (glucuronide metabolite), 82%.

Note For a review of the pharmacokinetics of mycophenolate mofetil, see Fulton and Markham [1996].

Dose The initial dose is 2 g daily which may be increased to 3 g if necessary.

Myristicin

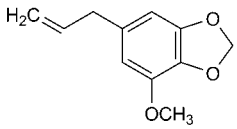
Hallucinogen

$C_{11}H_{12}O_3$ = 92.2

CAS—607-91-0

IUPAC Name 4-Methoxy-6-prop-2-enyl-1,3-benzodioxole

Synonym 4-Methoxy-6-(2-propenyl)-1,3-benzodioxole



Chemical Properties The most toxic principle of nutmeg and nutmeg oil. Mp below −20°. Bp 276° to 277°. Refractive index 1.5403. Slightly soluble in ethanol; soluble in ether.

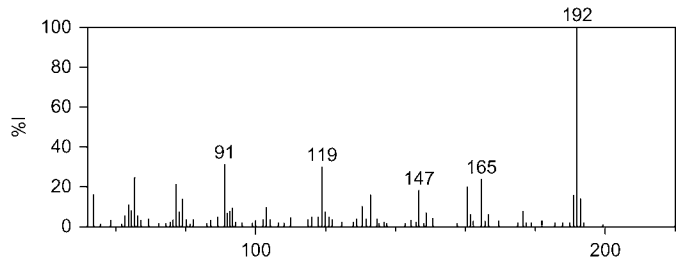
Nutmeg

Synonyms Muscade; myristica; nux moschata.
Chemical Properties The dried kernels of the seeds of *Myristica fragrans* (Myristicaceae), containing not less than 5% of volatile oil.

Nutmeg Oil

CAS—8008-45-5
Synonyms Essence de muscade; myristica oil; oleum myristicae.
Chemical Properties A volatile oil obtained by distillation from nutmeg. East Indian oil contains ~15% myristicin and West Indian ~2%. A colourless, pale yellow, or pale green liquid. Wt per mL: East Indian oil 0.885–0.915 g; West Indian oil 0.86–0.88 g. Refractive index 1.472–1.488. Freely soluble in ethanol (90%); soluble in glacial acetic acid. Log *P* (octanol/water), 3.5.

Mass Spectrum



Quantification

Urine **GC-MS** Column: HP-1MS (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV. Limit of detection not reported [Beyer *et al.* 2006].

Disposition in the Body

Toxicity Severe symptoms of poisoning have been caused by the ingestion of 1–1.5 nutmegs, and doses of 5 g or more of nutmeg or nutmeg powder will produce a marked depressive action on the CNS.

A 28-year-old woman ingested 18.3 g of powdered nutmeg. Following a period of disorientation, delirium, and excitement, she became semi-stuporous for 12 h. For some days she complained of numbness, dizziness, and nausea and there were further periods of excitement. No specific therapy was given and she was discharged after 7 days [Green 1959].

Two young women consumed 15 and 25 g, respectively, of ground nutmeg in order to experience its hallucinogenic action. Both became intoxicated but recovered [Åkesson, Walinder 1965].

The cause of death in a 55-year-old woman was attributed to the ingestion of nutmeg. The concentration of myristicin in the postmortem blood was 4.0 mg/L (it was speculated that the ingested dose of nutmeg had been 560 to 840 mg/kg); flunitrazepam was also present (0.072 mg/L). In a 2-year period in which 7 cases of nutmeg poisoning had been recorded by the Erfurt Poison Information Centre, even where higher doses (20–80 g of powder; 280–1100 mg/kg) had been ingested, a life-threatening situation had never arisen; in 1 case a myristicin blood level of 2 mg/L was measured 8 h after ingestion of ~14–21 g (280–420 mg/kg) of nutmeg powder [Stein *et al.* 2001].

Note For a review of the toxic effects and uses of nutmeg, see Weil [1966].

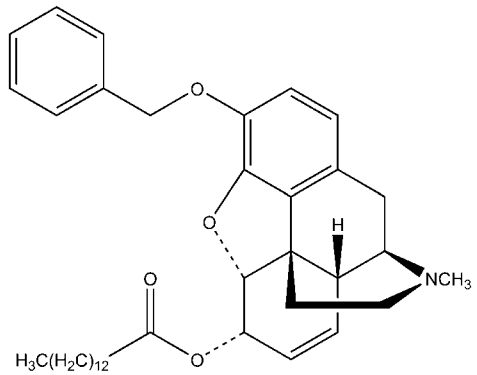
Myrophine

Narcotic
$C_{38}H_{51}NO_4$ = 585.8
CAS—467-18-5

Synonyms 3-Benzyloxy-7,8-dehydro-4,5-epoxy-*N*-methyl-6-myristoyloxymorphinan; 3-benzylmorphine 6-myristate; benzylmorphine myristic acid ester; benzylmorphinyl myristate; 3-benzyloxy-6-myristoyloxy-*N*-methyl-4,5-epoxy-7-morphinene; 3-benzyloxy-6-myristoyloxymorphine; C 5; 7,8-didehydro-4,5-epoxy-17-methyl-3-(phenylmethoxy)morphinan-6-ol tetradecanoate (ester); leucodinine; myricodine; myristylbenzylmorphine; myrocodine; myrophinium; NIH 5986; peronine myristate.



Chemical Properties Solid. Mp 41°. Myrophine is extracted by organic solvents from aqueous alkaline solutions.

Myrophine Hydrochloride

$C_{38}H_{51}NO_4$,HCl = 622.3
Chemical Properties Solid Mp 198° to 199°.

Colour Tests Ammonium molybdate test—blue-violet (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—brown-purple (limit of detection, 0.25 µg); Vitali's test—yellow/yellow/orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.52 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum 0.1 N hydrochloric acid—283 nm (E1%, 1 cm 29), minimum at 261 nm.

Nabilone

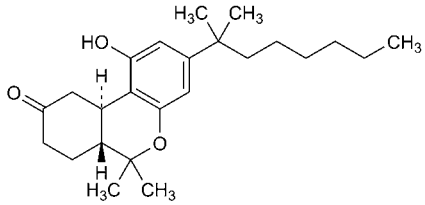
Antiemetic

$C_{24}H_{36}O_3$ = 72.5

CAS—51022-71-0

IUPAC Name 6a*R*,10a*R*)-*rel*-3-(1,1-Dimethylheptyl)-6,6a,7,8,10,10a-hexahydro-1-hydroxy-6,6-dimethyl-9*H*-dibenzo[*b*,*d*]pyran-9-one

Proprietary Name *Cesamet*

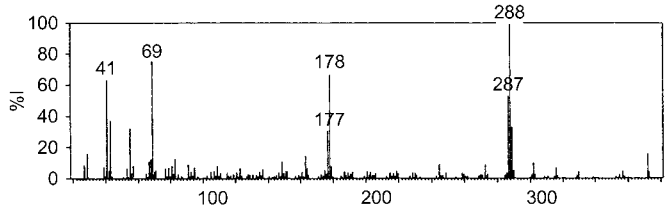


Chemical Properties Nabilone is a synthetic cannabinoid.

Ultraviolet Spectrum Methanol—275 (A^1_1 = 35b), 282 nm (A^1_1 = 35b).

Infrared Spectrum Principal peaks at wavenumbers 1696, 1619, 1574, 1260, 1100, 1038 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 288, 69, 178, 41, 287, 43, 289, 55.



Disposition in the Body Readily absorbed after oral administration; rapidly distributed into the tissues and metabolised by reduction of the 9-keto group forming a mixture of isomeric alcohols (carbinols) together with several other unidentified metabolites. Approximately 65% of a dose is eliminated in the faeces, and ~20% is excreted in the urine as polar acidic metabolites [Rubin *et al.* 1977].

Half-life Plasma half-life, ~2 h.

Dose 2 to 4 mg daily; maximum of 6 mg daily.

Rubin A *et al.* (1977). Physiologic disposition of nabilone, a cannabinol derivative, in man. *Clin Pharmacol Ther 22*,85–91.

Nabumetone

NSAID

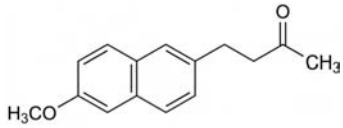
$C_{15}H_{16}O_2$ = 228.3

CAS—42924-53-8

IUPAC Name 4-(6-Methoxy-2-naphthalenyl)-2-butanone

Synonyms BRL-14777, nabumetonum.

Proprietary Names *Arthaxan*; *Balmox*; *Consolan*; *Diosmal*; *Nabuser*; *Relafen*; *Relifen*; *Relifex*.



Chemical Properties A white crystalline powder which is soluble in acetone and slightly soluble in methyl alcohol. Mp 80°. Practically insoluble in water. Log *P* (octanol/phosphate buffer [pH 7.4]), 2400 for nabumetone; log *P* (octanol/water), 0.5 for 6-methoxy-2-naphthylacetic acid (6-MNA).

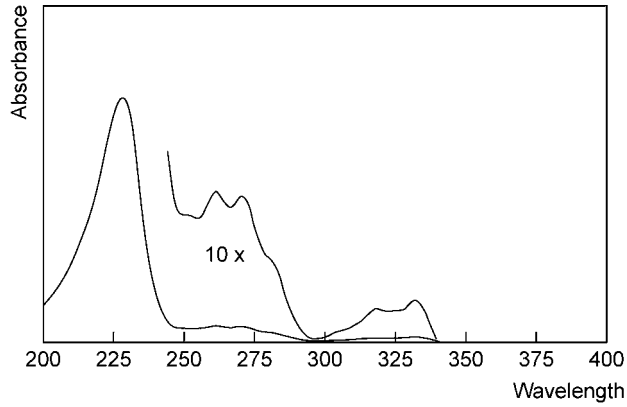
Gas Chromatography System GB—nabumatone RI 2084 , M (6-MNA) RI 2322 , M (O-desmethyl) RI 2385.

Gas Chromatography-Mass Spectrometry Column: methyl silicone HP1 (0.2 mm i.d., 0.33 µm). Temperature: 250°. Carrier gas: He, 0.9 mL/min. Retention index: 2082 [Mills, Roberson 1993].

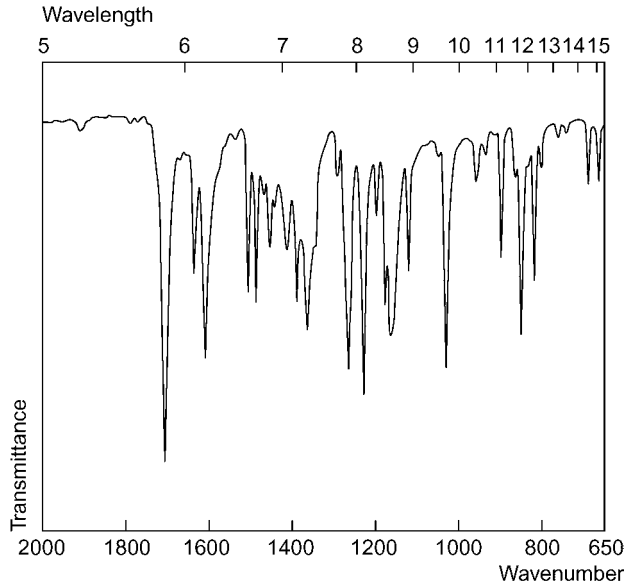
High Performance Liquid Chromatography System HZ—retention time 13.6 min.

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : aqueous 0.01 mol/L dihydrogen potassium phosphate buffer (pH 3.5), flow rate 1 mL/min. DAD. Retention time: 3.4 min [Mills, Roberson 1993].

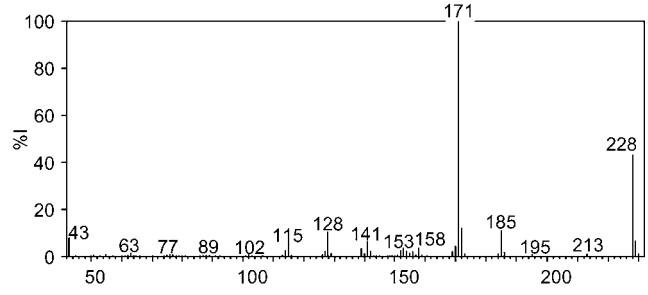
Ultraviolet Spectrum Aqueous acid—230, 261, 270, 333 nm.



Infrared Spectrum Principal peaks at wavenumbers 1696, 1260, 1020 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 171, 228, 172, 185, 128, 43, 115, 141, 158.



Quantification

Plasma **HPLC** UV detection (λ=280 nm). Limit of quantification, 70 µg/L [Jager *et al.* 2000].

Urine **HPLC** Column: 5-C_{18} Wakosil (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : triethylamine (500 : 500 : 1), containing 0.5 g/L 1-heptane sulfonic acid, flow rate 1.0 mL/min. IS: methyl *p*-toluate. UV detection (λ=270 nm); fluorescence detection (λ_{ex}=280 nm; λ_{em}=350 nm). *k* values: nabumetone, 6.3; 6-methoxy-2-naphthylacetic acid, 1.9; IS, 4.6. Limit of detection, 120 µg for nabumetone, 16 µg for 6-methoxy-2-naphthylacetic acid [Mikami *et al.* 2000].

Other **HPLC** Pharmaceuticals. See Urine [Mikami *et al.* 2000].

Disposition in the Body Nabumetone is well absorbed from the gastrointestinal tract and rapidly converted to the active metabolite 6-methoxy-2-

naphthylacetic acid (6-MNA; BRL-10720) via hepatic metabolism. Peak plasma concentrations of 6-MNA are observed 2–8 h after administration with a possible secondary peak at 28–36 h. The active metabolite 6-MNA undergoes further metabolism via *O*-methylation and conjugation to 6-hydroxy-2-naphthylacetic acid, which may also be conjugated. Alternative metabolic pathways are *O*-demethylation and reduction of the ketone to alcohol and esters. Other metabolites include 4-(6-hydroxy-2-naphthyl)-butan-2-one, 4-(6-hydroxy-2-naphthyl)-butan-2-ol and 6-hydroxy-2-naphthylacetic acid, which may undergo further conjugation resulting in many metabolites detected in urine. About 80% of the dose is excreted in urine as inactive metabolites with ~1% as unchanged 6-MNA. 10% is excreted in faeces. 6-MNA diffuses in synovial fluids.

Therapeutic Concentration

Twelve healthy young male and female volunteers, aged between 18 and 21 years, were administered a 1 g single dose of nabumetone. Twelve male and female elderly volunteers, 63–83 years, were also administered with the same dose. This single dose study was followed by multiple dosing of 1 g daily. Mean peak plasma concentrations of 21.9 mg/L (range, 11.3–34.0 mg/L) and 33.7 (range, 6.7–64.1) mg/L were observed for the young and elderly individuals, respectively, for the single 1 g dose, and were observed between 3 and 24 h (mean, 13 and 12.2 h, respectively). After multiple dosing, the plasma levels reached 52.3 (range, 32.0–71.9) mg/L and 66.7 (range, 15.1–103.0) mg/L for the young and elderly, respectively, ~5 h after administration (1–10 h) [Kendall *et al.* 1989].

Bioavailability The absolute mean bioavailability is 38%.

Half-life 6-MNA, 22–27 h (young healthy subjects), 25–34 h (elderly).

Volume of Distribution 7.5 L (steady state); ranges between 5 and 10 L (0.1–0.2 L/kg).

Clearance The apparent clearance is 0.7 L/h (creatinine clearance, 40 to >80 mL/min); 0.93 (creatinine clearance, 10–39 mL/min); 1.41 (creatinine clearance, <10 mL/min) after single oral doses.

Protein Binding 6-MNA, >99%.

Note For a review of nabumetone, see Friedel *et al.* [1993].

Dose 1 g administered at night with 0.5 to 1 g extra in the morning if necessary. The elderly are administered 0.5 to 1 g.

Nadolol

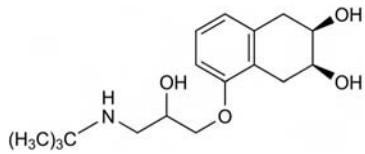
β-*Blocker*

$C_7H_{27}NO_4 = 309.4$

CAS—42200-33-9

IUPAC Name 5-[3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-1,2,3,4-tetrahydro-2,3-naphthalenediol

Proprietary Names *Apo-nadol*; *Corgard*; *Solgol*. It is an ingredient of *Corgaretic*, *Corzide* and *Solgeretik*.



Chemical Properties A white crystalline powder. Mp 124° to 136°. Soluble in water; freely soluble in ethanol and propylene glycol; slightly soluble in chloroform; insoluble in acetone, benzene, ether and hexane. Log *P* (octanol/water), 0.8. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

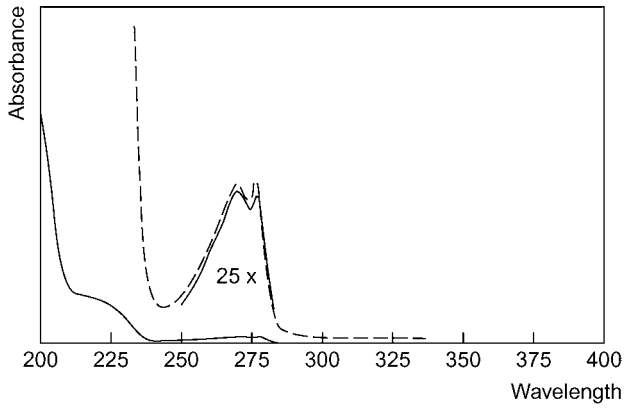
Colour Tests Liebermann's reagent—brown; Mandelin's test—brown-red; Marquis test—red; Nessler's reagent—brown.

Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.20; system TL—R_f 0.01; system TAE—R_f 0.14.

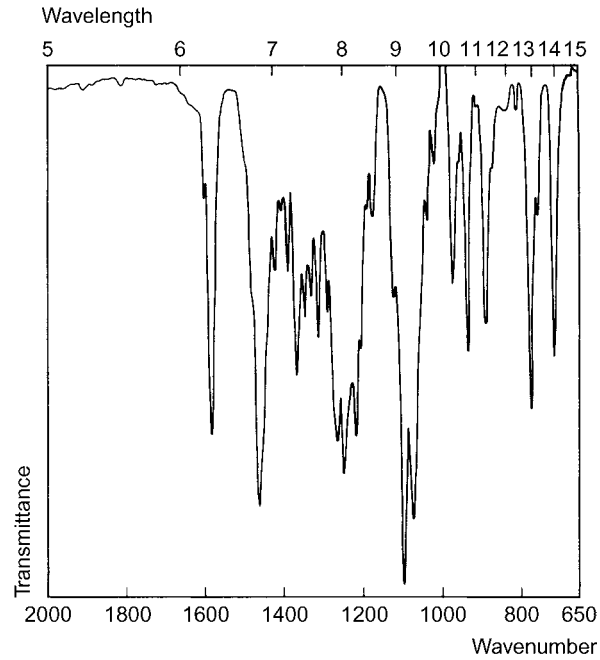
Gas Chromatography System GA—nadolol RI 2540, art RI 2560; system GB—nadolol RI 2658, art RI 2670.

High Performance Liquid Chromatography System HA—*k* 1.2; system HX—RI 288; system HY—RI 249; system HAA—retention time 6.8 min.

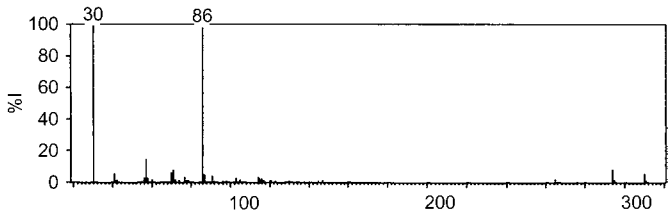
Ultraviolet Spectrum Aqueous acid—269, 276 nm; methanol—270, 278 nm (A^1_1=38a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1092, 1070, 1248, 1262, 1582, 1217 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 30, 86, 57, 294, 71, 310, 70, 87.



Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, 2.5 µg/L for nadolol enantiomers [Belas *et al.* 1995]. Fluorescence detection. Limit of detection, 5 µg/L [Srinivas *et al.* 1995a]. Fluorescence detection. Limit of detection, 2 µg/L for nadolol enantiomers [Srinivas *et al.* 1995b]. UV or fluorescence detection. For method for quantification of nadolol and other beta-blockers, see Musch *et al.* [1989].

Serum **GC–MS** Limit of detection, 7 µg/L [Funke *et al.* 1978].

HPLC Fluorescence detection. Limit of detection, 1 µg/L [Noguchi *et al.* 1992]. Electrochemical detection. For method, see Surmann [1980].

Spectrofluorimetry Limit of detection, <10 µg/L [Ivashkiv 1977].

Urine **HPLC** Amperometric detection. Limit of detection, 15 ppb to 500 ppb for nadolol and other beta-blockers [Maguregui *et al.* 1995].

Spectrofluorimetry See Serum [Ivashkiv 1977].

Disposition in the Body Nadolol is absorbed after oral administration. It is excreted almost entirely as unchanged drug; about 15 to 21% of the dose is excreted in the urine and 68 to 85% is eliminated in the faeces in 4 days, after oral administration. After IV administration, about 75% of a dose is excreted in the urine unchanged.

Therapeutic Concentration

Following single oral doses of 60 and 120 mg to 7 subjects, peak plasma concentrations of 0.02 to 0.14 (mean, 0.07) mg/L and 0.05 to 0.25 (mean, 0.13) mg/L were attained in 1 to 4 h [Schäfer-Korting *et al.* 1984].

Single oral doses of 80 mg to 4 subjects resulted in peak plasma concentrations of 0.04 to 0.21 (mean, 0.14) mg/L in 1 to 4 h. During daily oral dosing of 4 subjects with 80 mg a day, peak plasma concentrations of 0.11 to 0.24 (mean, 0.22) mg/L were observed 2 to 4 h after a morning dose [Dreyfuss *et al.* 1979].

Toxicity

Following intentional overdose, a 57-year-old woman presented in a poorly responsive state with haemodynamic compromise and an elevated nadolol serum concentrations of 0.39 mg/L; other drugs were present within their normal therapeutic range (diltiazem, paracetamol, salicylate) [Ehgartner, Zelinka 1988].

Bioavailability About 30%.
Half-life Plasma half-life, 6 to 24 h.
Volume of Distribution About 2 L/kg.
Clearance Plasma clearance, about 3 mL/min/kg.
Protein Binding About 4 to 30% (mean, 14%).
Note For a review of the pharmacokinetics of nadolol, see Heel *et al.* [1980].
Dose 40 to 240 mg daily.

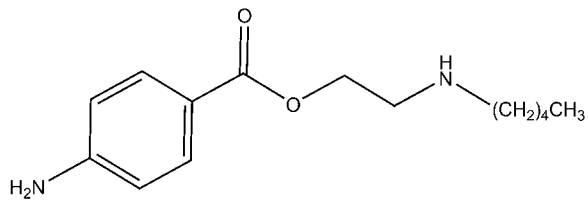
Naepaine

Anaesthetic (Local)
$C_{14}H_{22}N_2O_2$ = 250.3
CAS—2188-67-2

IUPAC Name 2-(Pentylamino)ethyl 4-aminobenzoate
Synonyms Amalcaine; 2-pentylaminoethyl *p*-aminobenzoate.



Chemical Properties Naepaine is extracted by organic solvents from aqueous alkaline solutions. Mp 64° to 66°.

Naepaine Hydrochloride

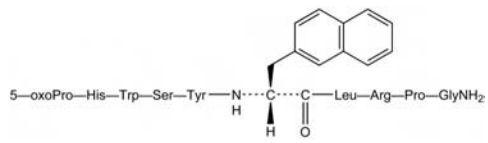
$C_{14}H_{22}N_2O_2$,HCl = 286.8
Proprietary Name *Amylsine*
Chemical Properties Fine white crystals, or a fine powder. Mp of one form 153° and of the other form 175° to 177°. Soluble in water; sparingly soluble in ethanol; insoluble in ether and chloroform.

Colour Test Vitali's test—yellow/orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.63 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid—273 (E1%, 1 cm 83), 279 (E1%, 1 cm 84) and about 290 nm (E1%, 1 cm 61).
Infrared Spectrum Principal peaks at wavenumbers 1605, 1277, 1170 or 1685 cm^{-1} (KBr disk, naepaine base).
Disposition in the Body
Toxicity Naepaine hydrochloride is about 1.5-times as toxic as procaine hydrochloride systemically. The maximum amount which is safe for surface use is 100 mg of the hydrochloride. The minimum IV lethal dose in guinea-pigs is 10 to 40, in rabbits 28.5, and in rats 25 to 30 mg/kg.

Nafarelin

Gonadorelin Analogue, Treatment of Endometriosis
$C_{66}H_{83}N_{17}O_{13}$ = 1322.5
CAS—76932-56-4

IUPAC Name *N*-[1-[[1-[[1-[[1-[[1-[[1-[[1-[[1-[[2-[(2-Amino-2-oxoethyl)carbamoyl] pyrrolidin-1-yl]-5-(diaminomethylideneamino)-1-oxopentan-2-yl]amino]-4-methyl-1-oxopentan-2-yl]amino]-3-naphthalen-2-yl-1-oxopropan-2-yl] amino]-3-(4-hydroxyphenyl)-1-oxopropan-2-yl]amino]-3-hydroxy-1-oxopropan-2-yl] amino]-3-(1*H*-indol-3-yl)-1-oxopropan-2-yl]amino]-3-(1*H*-imidazol-5-yl)-1-oxopropan-2-yl]-5-oxopyrrolidine-2-carboxamide
Synonyms NAG; 5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-3-(2-naphthyl)-D-alanyl-L-leucyl-L-arginyl-L-prolylglycinamide.



Nafarelin Monoacetate

$C_{66}H_{83}N_{17}O_{13}C_2H_4O_2$ = 1382.6
Chemical Properties Mp 188° to 190°.

Nafarelin Acetate Hydrate

$C_{66}H_{83}N_{17}O_{13}$, $xC_2H_4O_2$, yH_2O
CAS—86220-42-0
Synonyms D-Nal(2)^6-LHRH acetate hydrate; RS-94991-298.
Proprietary Names *Nacenyl*; *Nasanyl*; *Synarel*; *Synarela*; *Synrelina*.

High Performance Liquid Chromatography Column: silica TSK 2000 SW (300 × 7.5 mm i.d.). Mobile phase: acetonitrile (initially 100%; stepped to 30% in 0.15 mmol/L phosphate buffer) : 13 mmol/L $NaClO_4$ (85:15), flow rate 1.0 mL/min. UV detection (λ=225 nm). Retention time: 22 min [Kenley *et al.* 1987].
Disposition in the Body Nafarelin is rapidly absorbed after intranasal administration, and peak plasma concentrations are reached within ~20 min. It is metabolised by peptidases in the body and is excreted in urine as the metabolites and a small amount as the unchanged drug. The most common metabolites are the (5–10) hexapeptide amine (the key intermediate for the other metabolites) and the naphthylalanine. Metabolites are excreted in urine (44 to 55%) and faeces (18.5 to 44.2%). Only about 3% of unchanged nafarelin is excreted in urine. The drug is rapidly distributed throughout the body and undergoes extensive extravascular distribution.

Therapeutic Concentration

Ten women, aged 32 to 59 years, were intranasally administered total doses of 84, 206 and 391 µg (4 women for each dosage). Peak plasma concentrations of 0.10, 0.35 and 1.59 µg/L were reached within 0.34, 0.46 and 0.28 h, respectively. Twenty-three men, 20 to 54 years old, were administered a 400 µg dose of nafarelin SC and 304 µg intranasally. Mean peak concentrations of 13.66 µg/L were observed for the SC dose and 4.02 µg/L for the nasally administered dose. These levels were reached at 0.72 and 0.20 h, respectively [Chan *et al.* 1988].

Bioavailability 4 to 21% (intranasal administration).
Half-Life 3 to 4 h (intranasal administration). Also reported as 2.0 to 2.7 h after SC and intranasal administration.
Protein Binding 78 to 84%, mostly albumin.
Note For a review of nafarelin, see Chrisp and Goa [1990].
Dose The usual dose is 200 to 800 µg twice daily intranasally.

Chan RL *et al.* (1988). Absorption and metabolism of nafarelin, a potent agonist of gonadotropin-releasing hormone. *Clin Pharmacol Ther* 44: 275–282.

Chrisp P, Goa KL (1990). Nafarelin. A review of its pharmacodynamic and pharmacokinetic properties, and clinical potential in sex hormone-related conditions. *Drugs* 39: 523–551.

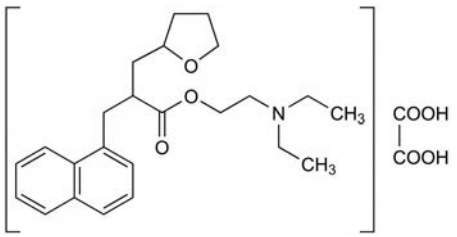
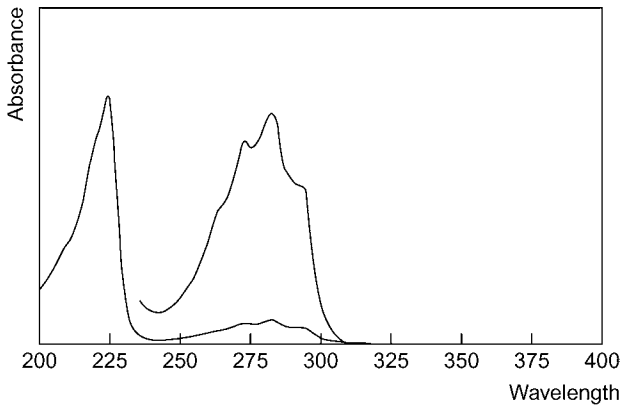
Naftidrofuryl Oxalate

Vasodilator
$C_{24}H_{33}NO_3$,$C_2H_2O_4$ = 473.6
CAS—31329-57-4 (naftidrofuryl); 3200-06-4 (oxalate)

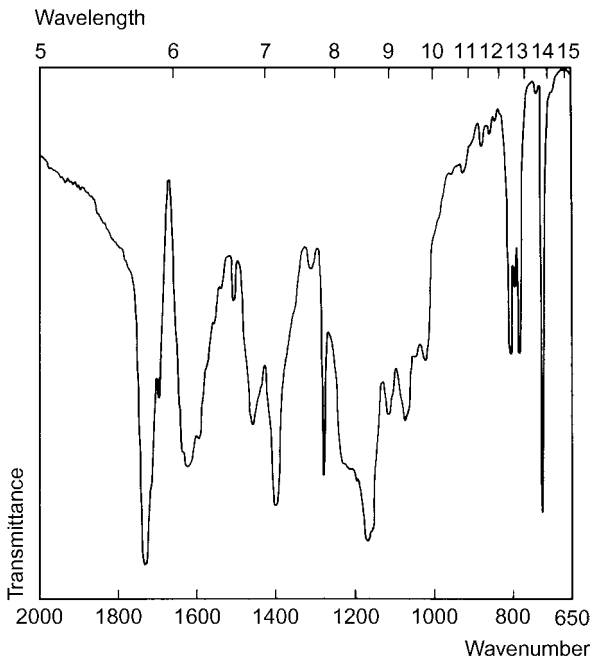
IUPAC Name Tetrahydro-α-(1-naphthalenylmethyl)-2-furanpropanoic acid 2-(diethylamino)ethyl ester acid oxalate
Synonym Nafronyl oxalate
Proprietary Names *Artocoron*; *Azunaftil*; *Di-Actane*; *Dusodril*; *Esedril*; *Gevatran*; *Luctor*; *Nafti*; *Naftilong*; *Naftilux*; *Naftodril*; *Praxilene*; *Sodipryl retard*; *StimLor*.



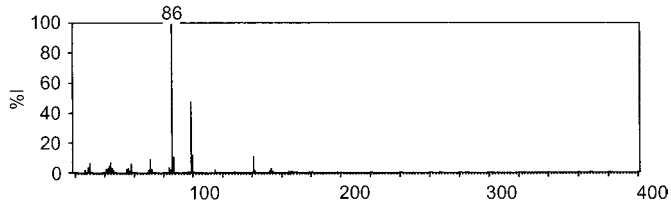
Chemical Properties A white powder. Mp about 108°. Soluble in water. pK_a 8.2 (30°). Log *P* (octanol/water), 5.4 (naftidrofuryl).
Thin-layer Chromatography Naftidrofuryl: system TA—R_f 0.64; system TB—R_f 0.52; system TC—R_f 0.41; system TE—R_f 0.78; system TL—R_f 0.35; system TAE—R_f 0.43.
Gas Chromatography System GA—RI 2748.
High Performance Liquid Chromatography Naftidrofuryl: system HY—RI 409; system HAA—retention time 15.8 min.
Ultraviolet Spectrum Aqueous acid—273, 283 nm (A^1_1=141a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1730, 1165, 722, 1280, 1620, 1070 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 100, 141, 87, 71, 44, 58 (naftidrofuryl).

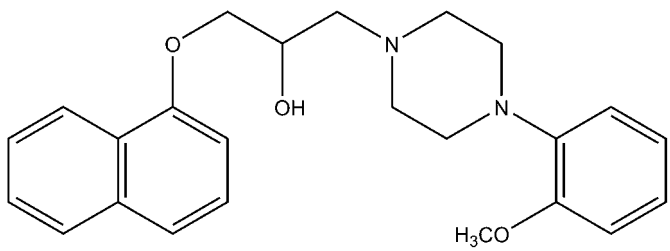


Quantification
***Plasma* HPLC** Fluorescence detection. Naftidrofuryl and its metabolite naftidrofuryl acid. Limit of detection, 4 µg/L for naftidrofuryl [Stehlik, Houbova 1990]. UV detection. Limit of detection, 20 µg/L [Brodie *et al.* 1979].
Disposition in the Body Naftidrofuryl oxalate is absorbed after oral administration. It is metabolised by hydrolysis to the free acid, 3-(1-naphthyl)-2-tetrahydrofurfuryl propionic acid. <1% of a dose is excreted in the urine in 48 h as free or conjugated naftidrofuryl. Most of a dose appears to be excreted in the bile.
Therapeutic Concentration
After oral administration of 100 mg to 2 subjects, peak plasma concentrations averaging 0.21 mg/L were attained in 0.5 to 0.75 h [Brodie *et al.* 1979].
Dose 300 to 600 mg daily.

Brodie RR *et al.* (1979). Determination of naftidrofuryl in the plasma of humans by high-performance liquid chromatography. *J Chromatogr* 164: 534–540.
Stehlik P, Houbova H (1990). Determination of naphthidrofuryl and naphthidrofurylic acid in human plasma using RP-HPLC and fluorimetric detection. *Cesk Farm* 39: 394–399.

Naftopidil

α_1-Adrenoceptor Antagonist, Antihypertensive, 5-HT_1 Receptor Agonist, Treatment of BPH
$C_{24}H_{28}N_2O_3$ = 392.5
CAS—57149-07-2
IUPAC Name 1-[4-(2-Methoxyphenyl)piperazin-1-yl]-3-naphthalen-1-yloxypropan-2-ol
Synonyms BM-15275; KT-611; (±)-4-(*o*-methoxyphenyl)-α-[(1-naphthyloxy)methyl]-1-piperazineethanol; 1-(2-methoxyphenyl)-4-[3-(naphth-1-yloxy)-2-hydroxypropyl]-piperazine; (*RS*)-1-[4-(2-methoxyphenyl)-1-piperazinyl]-3-(1-naphthoxy)-propan-2-ol.
Proprietary Names *Avishot*; *Flivas*.



Chemical Properties Colourless crystals. Mp 125° to 129°. Insoluble in water. Log *P* (octanol/water), 75 [O'Neil *et al.* 2006]. Plasma samples were stable at –18° for up to 1 year [Niebch *et al.* 1990].

Naftopidil Dihydrochloride
$C_{24}H_{28}N_2O_3$,2HCl = 465.4
CAS—57149-08-3
Chemical Properties Crystals. Mp 212° to 213°. Log *P* (octanol/water), 4.81 [ACD 2007].

Quantification
***Plasma* HPLC** Column: RP-C_{18}. Mobile phase: methanol : acetonitrile: 0.02 mol/L potassium dihydrogen phosphate. UV detection (λ = 240 nm). Retention time: 10.5 min. Limit of detection, 5 µg/L [Yuan *et al.* 1998]. Column: Hibar RP-LiChrosorb Select B (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L potassium dihydrogen phosphate (pH 1.8) : acetonitrile–methanol (1 : 1; 55 : 45), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 215 nm, λ_{em} = 320 nm). Limit of quantification, 2 µg/L [Niebch *et al.* 1990].
***Urine* TLC** Plates: Silicagel SIF/Riedel. Solvent systems: (1) chloroform : methanol : concentrated ammonia (80 : 30 : 8); (2) chloroform : methanol : 0.01 mol/L ammonia (90 : 5 : 5). Liquid scintillation counting. Limit of detection not reported [Niebch *et al.* 1991].
***Bile* TLC** See Urine [Niebch *et al.* 1991].
***Faeces* TLC** See Urine [Niebch *et al.* 1991].

Note For the determination of naftopidil in biological fluids by a non-protected fluid phosphorimetric procedure at room temperature, see Murillo Pulgarin *et al.* [2001a] or Murillo Pulgarin *et al.* [2001b]. For a flow injection method for the determination of naftopidil based on oxidation by potassium permanganate in a sulfuric acid medium, see Townshend *et al.* [2005].

Disposition in the Body Metabolic products include (naphthyl)hydroxyl-naftopidil, methoxyphenyl-piperazinpropyleneglycol, (phenyl)hydroxyl-naftopidil and *o*-desmethyl-naftopidil. Hydroxylation and cleavage of naptofidil to the propylene glycol metabolite are the predominant reactions in humans. Demethylation only occurs to a minor extent.

Therapeutic Concentration

Ten patients (aged 48 to 69 years; weight 55 to 92 kg) with hepatic impairment were administered naftopidil either as an IV infusion or as a 50 mg tablet. After the IV infusion, the pharmacokinetic parameters were comparable in hepatic impairment and controls: $t_{1/2}$ 3.6 ± 3.4 h and 3.3 ± 2.1 h, respectively; clearance 11.9 ± 4.7 mL/min/kg and 11.0 ± 1.6 mL/min/kg, respectively. The exception was C_{max}, where mean values were 180 and 65 µg/L for patients and controls, respectively, attained at 0.75 and 0.5 h, respectively. After oral administration, plasma levels and half-lives were significantly increased in liver impairment [Farthing *et al.* 1994].

Bioavailability Healthy subjects, 17%; patients with hepatic dysfunction, 75%.

Half-life Healthy subjects, 5.4 ± 3.2 h; after an oral dose in patients with hepatic dysfunction, 16.6 ± 19.3 h.

Protein Binding 82% to 97% in rats.

Dose 50 to 75 mg daily.

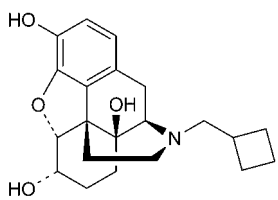
Nalbuphine

Narcotic Analgesic

$C_{21}H_{27}NO_4 = 57.4$

CAS—20594-83-6

IUPAC Name (5α,6α)-17-(Cyclobutylmethyl)-4,5-epoxymorphinan-3,6,14-triol



Chemical Properties Crystals Mp ≈231°. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005]. Stock and working solutions were stable for at least 4 weeks and 12 h, respectively. Stable in plasma for 6 h after storage at 20° and 4° [de Cazanove *et al.* 1997]. Nalbuphine was stable in mobile phase for 24 h, in plasma at 37° for 4 h, and in plasma at -20° for 6 weeks [Ho *et al.* 1996] and 7 weeks [Dubé *et al.* 1988]. Stable in plasma stored for 18 weeks at –15° to –20° [Lo *et al.* 1984].

Nalbuphine Hydrochloride

$C_{21}H_{27}NO_4$,HCl = 393.9

CAS—23277-43-2

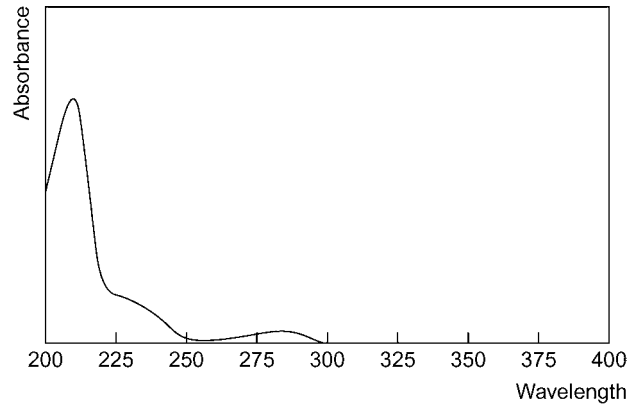
Proprietary Names *Azerty*; *Bufigen*; *Bufilem*; *Intapan*; *Nalbu*; *Nubain*.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.34; system TAE—R_f 0.58.

Gas Chromatography System GA—RI 2960; system GB—not eluted.

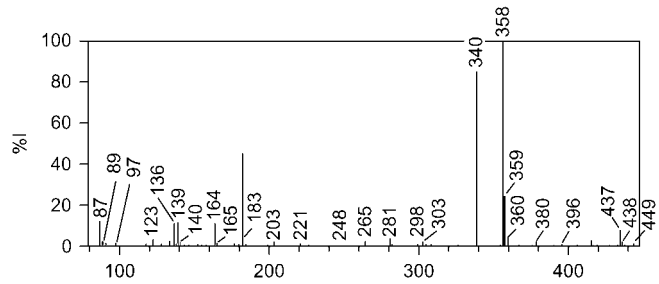
High Performance Liquid Chromatography System HX—RI 295.

Ultraviolet Spectrum Aqueous acid—284 nm ($A_1^1 = 46b$); aqueous alkali—297 nm.



Infrared Spectrum Principal peaks at wavenumbers 970, 1080, 1033, 1060, 1115, 1495 cm^{-1}.

Mass Spectrum



Quantification

Plasma **GC-MS** Column: BP 5 SGE (12 m × 0.22 mm i.d., 0.25 µm). Carrier gas: He, 1.8 mL/min. Temperature programme: 60° to 280° at 30°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 7.42 min. Limit of detection, 2 µg/L [Kintz *et al.* 1992].

GC Column: 3.8% methyl vinyl silicone gum rubber (1.2 m × 4 mm i.d.). Carrier gas: He, 75 mL/min. Temperature: 235°. ECD. Retention time: 3.7 min. Limit of detection, 0.5 µg/L [Weinstein *et al.* 1978].

HPLC Column: Supelcosil LC_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L sodium acetate (pH 6) : acetonitrile (70 : 30). Fluorescence detection ($\lambda_{ex} = 210$ nm, $\lambda_{em} = 346$ nm). Limit of quantification, 20 µg/L [Jacqz-Aigrain *et al.* 2007]. Column: Lichrosphere C_{18} (150 × 4.6 mm i.d., 5 mm). Mobile phase: methanol : 24 mmol/L potassium dihydrogen phosphate plus 0.06 mmol/L EDTA (20 : 80), flow rate 0.8 mL/min. Electrochemical detection. Limit of quantification, 0.1 µg/L [Bessard *et al.* 1997]. Column: Ultrasphere ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : phosphate buffer (20 : 80), flow rate 1.0 mL/min. Electrochemical detection. Limit of quantification, 0.3 µg/L, limit of detection, 0.1 µg/L [de Cazanove *et al.* 1997]. Column: µPorasil (300 × 3.9 mm i.d., 10 µm). Mobile phase: 5 mmol/L sodium acetate buffer (pH 6.0) : acetonitrile (40 : 60), flow rate 1.2 mL/min. UV detection (λ = 210 nm). Retention time: 13.9 min. Limit of quantification, 0.75 µg/L [Ho *et al.* 1996]. Column: Lichrospher (150 × 4.6 mm i.d.,m 5 µm). Mobile phase: methanol : 24 mmol/L potassium dihydrogen phosphate plus 0.06 mmol/L EDTA (20 : 80), flow rate 0.8 mL/min. Electrochemical detection. Limit of quantification, 0.1 µg/L, limit of detection, 0.02 µg/L [Nicolle *et al.* 1997]. Limit of quantification, 0.5 µg/L, limit of detection, 0.1 µg/L [Nicolle *et al.* 1996]. See also Aitkenhead *et al.* [1988]; Dubé *et al.* [1988]; Keegan and Kay [1984]; Kintz *et al.* [1992]; Lake *et al.* [1982]; Lo *et al.* [1984]; Nicolle *et al.* [1995]; and Wetzelsberger *et al.* [1988].

Urine **GC-MS** Column: SE-54 (15 m × 0.25 mm i.d.). Carrier gas: He, 7 mL/min. Temperature programme: 200° for 1 min to 280° at 10°/min for 10 min. EI ionisation at 70 eV. Limit of detection, 0.05 mg/L [Yoo *et al.* 1995]. See Plasma. Limit of detection, 3 µg/L [Kintz *et al.* 1992].

HPLC See Plasma [Kintz *et al.* 1992].

Milk **HPLC** See Plasma [Jacqz-Aigrain *et al.* 2007].
