Cyclamates are prepared by the sulfonation of cyclohexylamine in the presence of a base. Commercially, the sulfonation can involve sulfamic acid, a sulfate salt, or sulfur trioxide. Tertiary bases such as triethylamine or trimethylamine may be used as the condensing agent. The amine salts of cyclamate that are produced are converted to the sodium, calcium, potassium, or magnesium salt by treatment with the appropriate metal oxide.

14 Safety

There has been considerable controversy concerning the safety of cyclamate following the FDA decision in 1970 to ban its use in the US.[2–4] This decision resulted from a feeding study in rats that suggested that cyclamate could cause an unusual form of bladder cancer. However, that study has been criticized because it involved very high doses of cyclamate administered with saccharin, which has itself been the subject of controversy concerning its safety; *see* Saccharin. Although excreted almost entirely unchanged in the urine, a potentially harmful metabolite of sodium cyclamate, cyclohexylamine, has been detected in humans.[5] In addition, there is evidence to suggest cyclamate is metabolized to cyclohexylamine by the microflora in the large intestine of some individuals (approximately 25% of the population with higher precedence in Japanese than Europeans or North Americans). Cyclohexylamine, following absorption, is metabolized to an extent of 1-2% to cyclohexanol and cyclohexane-1,2-diol. Established no-observed-effect level (NOEL) and acceptable daily intake (ADI) values are based on cyclohexylamine levels of high cyclamate converters.[6,7]

Extensive long-term animal feeding studies and epidemiological studies in humans have failed to show any evidence that cyclamate is carcinogenic or mutagenic.[8,9] As a result, sodium cyclamate is now accepted in many countries for use in foods and pharmaceutical formulations. *See also* Section 16.

Few adverse reactions to cyclamate have been reported, although its use has been associated with instances of photosensitive dermatitis.[10]

The WHO has set an estimated acceptable daily intake for sodium and calcium cyclamate, expressed as cyclamic acid, at up to 11 mg/kg body-weight.[11] In Europe, a temporary acceptable daily intake for sodium and calcium cyclamate, expressed as cyclamic acid, has been set at up to 1.5 mg/kg body-weight.

LD_{50} (mouse, IP): 1.15 g/kg[12]

LD_{50} (mouse, IV): 4.8 g/kg

LD_{50} (mouse, oral): 17 g/kg

LD_{50} (rat, IP): 1.35 g/kg

LD_{50} (rat, IV): 3.5 g/kg

LD_{50} (rat, oral): 15.25 g/kg

15 Handling Precautions

S

Observe normal precautions appropriate to the circumstances and quantity of material handled. Avoid contact with skin and eyes, and avoid the formation of dust and aerosols. Eye protection and gloves are recommended.

16 Regulatory Status

The use of cyclamates as artificial sweetners in food, soft drinks, and artificial sweetening tablets was at one time prohibited in the UK and some other countries owing to concern about the metabolite cyclohexylamine. However, this is no longer the case, and cyclamates are now permitted for use as a food additive in Europe.

Included in the FDA Inactive Ingredients Database (oral powder, solutions, chewable tablets, and suspensions). Included in nonparenteral medicines licensed in the UK. Sodium cyclamate is listed in the EAFUS list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Alitame; calcium cyclamate; cyclamic acid.

Calcium cyclamate

Empirical formula $C_{12}H_{24}CaN_2O_6S_2 \cdot 2H_2O$
Molecular weight 432.57
CAS number

[5897-16-5] for the dihydrate;

[139-06-0] for the anhydrous form.

Synonyms Calcium *N*-cyclohexylsulfamate dihydrate; *Cyclan*; cyclohexanesulfamic acid calcium salt; cyclohexylsulfamic acid calcium salt; E952; *Sucaryl calcium*.
Appearance White, odorless or almost odorless crystals or a crystalline powder with an intensely sweet taste.
Acidity/alkalinity pH = 5.5–7.5 for a 10% w/v aqueous solution.
Solubility Freely soluble in water; practically insoluble in benzene, chloroform, ethanol (95%), and ether.

Cyclamic acid

Empirical formula $C_6H_{13}NO_3S$
Molecular weight 179.23
CAS number [100-88-9]
Synonyms Cyclamate; cyclohexanesulfamic acid; *N*-cyclohexylsulfamic acid; E952; hexamic acid; *Sucaryl*.
Appearance White, odorless or almost odorless crystals or a crystalline powder with an intensely sweet taste.
Melting point 169–170°C
Solubility Slightly soluble in water.

18 Comments

Sodium cyclamate is also used as an intense sweetening agent in foods, beverages, and table-top sweeteners. The perceived intensity of sweeteners relative to sucrose depends upon their concentration, temperature of tasting, and pH, and on the flavor and texture of the product concerned.

Intense sweetening agents will not replace the bulk, textural, or preservative characteristics of sucrose if sucrose is removed from a formulation.

Synergistic effects for combinations of sweeteners have been reported, e.g. sodium cyclamate with saccharin sodium or acesulfame potassium.

Sodium cyclamate has also been used to increase the solubility of neohesperidin dihydrochalcone in sweetener blends.[13]

A specification for sodium cyclamate is contained in the *Food Chemicals Codex* (FCC).[14]

The PubChem Compound ID (CID) for sodium cyclamate is 23665706. The EINECS number for sodium cyclamate is 205-348-9.

Sodium Formaldehyde Sulfoxylate

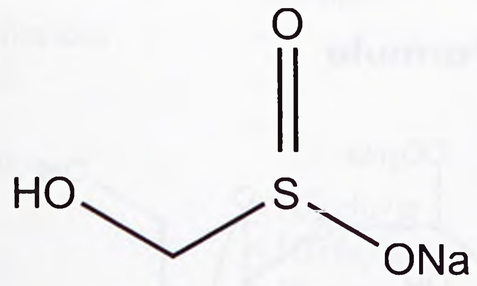
1 Nonproprietary Names

USP–NF: Sodium Formaldehyde Sulfoxylate

2 Synonyms

Formaldehyde hydrosulfite; formaldehyde sodium sulfoxylate; formaldehydesulfoxylic acid sodium salt; methanesulfinic acid, hydroxy-, monosodium salt; monosodium hydroxymethane sulfinate; *Rongalite*; sodium hydroxymethane sulfinate; sodium hydroxymethylsulfinate; sodium methanalsulfoxylate; sodium sulfinomethanolate.

3 Chemical Name and CAS Registry Number



Sodium formaldehyde sulfoxylate [149-44-0]

Sodium formaldehyde sulfoxylate dihydrate [6035-47-8]

4 Empirical Formula and Molecular Weight

CH_3NaO_3S 118.09
$CH_3NaO_3S{\cdot}2H_2O$ 154.11

5 Structural Formula

6 Functional Category

Antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium formaldehyde sulfoxylate is a water-soluble antioxidant and is generally used as the dihydrate. It is used in the formulation of injection products at a level of up to 0.1% w/v in the final preparation administered to the patient.

8 Description

When freshly prepared, sodium formaldehyde sulfoxylate occurs as white, odorless crystals, which quickly develop a characteristic garlic odor on standing.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium formaldehyde sulfoxylate.

Test	USP 40–NF 35 S1
Identification	+
Clarity and color of solution	+
Alkalinity	+
pH (1 in 50 solution)	9.5–10.5
Loss on drying	≤27.0%
Sulfide	+
Iron	+
Sodium sulfite	≤5.0%
Assay (as sulfur dioxide)	45.5–54.5%

Note: USP 40–NF 35 S1 also states that sodium formaldehyde sulfoxylate may contain a suitable stabilizer such as sodium carbonate.

10 Typical Properties

Acidity/alkalinity pH = 9.5–10.5 (2% w/v aqueous solution)
Melting point 64–68°C (dihydrate)
Solubility Freely soluble in water; slightly soluble in ethanol, chloroform, ether and benzene.

11 Stability and Storage Conditions

Store in well-closed, light-resistant containers at controlled room temperature (15–30°C).

12 Incompatibilities

Sodium formaldehyde sulfoxylate is incompatible with strong oxidizing agents; it is decomposed by dilute acid.

13 Method of Manufacture

Sodium formaldehyde sulfoxylate is manufactured from sodium dithionate and formaldehyde in water.

14 Safety

The toxicological properties of sodium formaldehyde sulfoxylate have not been fully investigated. However, it is used in the formulation of injection products at a level to 0.1% w/v in the final preparation administered to the patient.

Sodium formaldehyde sulfoxylate is moderately toxic by ingestion, and when heated to decomposition it emits toxic fumes of sulfur dioxide and sodium oxide.[1]

LD_{50} (mouse, oral): 4 g/kg[1]
LD_{50} (rat, IP): >2 g/kg[2]
LD_{50} (rat, oral): >2 g/kg[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. May cause irritation of the eyes, skin, respiratory tract and digestive tract; the use of eye protection, a respirator and gloves is strongly recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (parenteral products up to 0.1% via the IM, IV, and SC routes).

17 Related Substances

Zinc formaldehyde sulfoxylate.

Zinc formaldehyde sulfoxylate
Empirical formula $C_2H_6O_6S_2Zn$
Molecular weight 256.5
CAS number [24887-06-7]
Comments Used as an additive in polymers and textiles. The EINECS number is 246-515-6.

18 Comments

Sodium formaldehyde sulfoxylate has been investigated as an antidote to mercury poisoning, but is considered less effective than dimercaprol (British anti-lewisite (BAL)) and other treatments.[3,4] It is also used as an industrial bleach. It is used in chemical synthesis as a nucleophilic agent in the preparation of sulfones. The empirical formula and molecular weight are also given as CH_4O_3SNa and 119.1, respectively.[1]

A specification for sodium formaldehyde sulfoxylate is included in the *Japanese Pharmaceutical Excipients* (JPE).[5]

The EINECS number for sodium formaldehyde sulfoxylate is 205-739-4. The PubChem Compound ID for sodium formaldehyde sulfoxylate is 23725019.

Sodium Hyaluronate

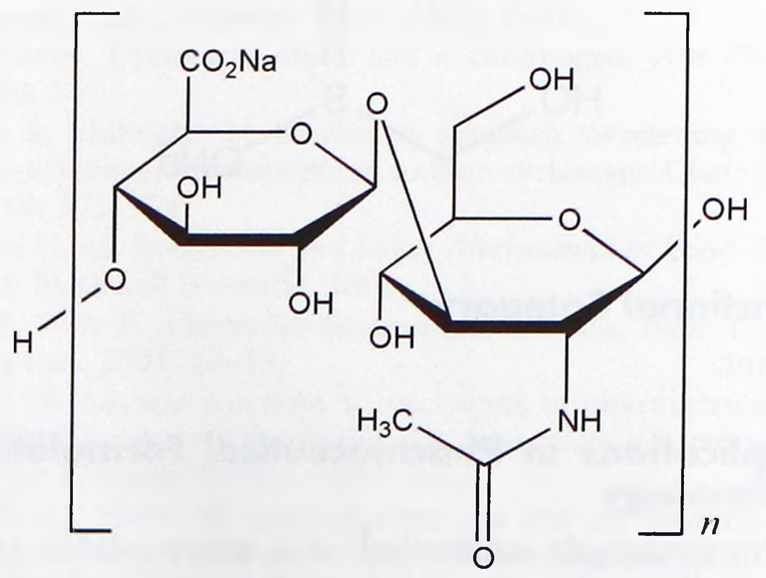
S

1 Nonproprietary Names

BP: Sodium Hyaluronate
JP: Purified Sodium Hyaluronate
PhEur: Sodium Hyaluronate

2 Synonyms

Hyaluronan; hyaluronate sodium; natrii hyaluronas; *RITA HA C-1-C*.



3 Chemical Name and CAS Registry Number

Sodium hyaluronate [9067-32-7]

4 Empirical Formula and Molecular Weight

$(C_{14}H_{20}NO_{11}Na)_n$ $(401.3)_n$

5 Structural Formula

6 Functional Category

Humectant; lubricant; modified-release agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium hyaluronate is the predominant form of hyaluronic acid at physiological pH. The name hyaluronan is used when the polysaccharide is mentioned in general terms, and in the literature the terms hyaluronic acid and sodium hyaluronate are used interchangeably.

Crosslinked hyaluronan gels are used as drug delivery systems.[1] Hyaluronan is the most common negatively charged glycosaminoglycan in the human vitreous humor, and is known to interact with polymeric and liposomal DNA complexes,[2] where hyaluronan solutions have been shown to decrease the cellular uptake of complexes.[3] This is useful for enhancing the availability and retention time of drugs administered to the eye. It is immunoneutral, which makes it useful for the attachment of biomaterials for use in tissue engineering and drug delivery systems.[4]

See also Section 18.

8 Description

The PhEur 9.2 describes sodium hyaluronate as the sodium salt of hyaluronic acid, a glycosaminoglycan consisting of D-glucuronic acid and *N*-acetyl-D-glucosamine disaccharide units.

Sodium hyaluronate occurs as white to off-white powder or granules. It is very hygroscopic.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specification for sodium hyaluronate.

Test	JP XVII[a]	PhEur 9.2
Characters	–	+
Identification	+	+
Appearance of solution	+	+
pH	–	5.0–8.5
Intrinsic viscosity	+	+
Sulfated glycosaminoglycans	–	≤1%
Nucleic acids	≤0.02%	≤0.5
Protein	≤0.05%	≤0.3%[b]
Chlorides	≤0.124%	≤0.5%
Iron	–	≤80 ppm
Loss on drying	≤15%	≤20.0%
Heavy metals	≤20 ppm	–
Acidic mucopolysaccharides	+	–
Hemolytic streptococci	+	–
Hemolysis	+	–
Microbial contamination		
TAMC	$\leq 10^2$ cfu/g	$\leq 10^2$ cfu/g
TYMC	≤10 cfu/g	–
Bacterial endotoxins	–[c]	<0.5 IU/mg[d]
Average molecular mass	+	–
Assay	90.0–105.0%[e]	95.0–105.0%

(a) Osmotic pressure ratio, pH, foreign insoluble matter, insoluble particulate matter and sterility specifications are also included for parenteral and ophthalmic dosage forms, and extractable volume for parenteral dosage forms.
(b) <0.1% for parenteral dosage forms.
(c) <0.003 EU/mg for parenteral dosage forms.
(d) ≤0.5 IU/mg for parenteral dosage forms.
(e) 90.0–110.0% for parenteral and ophthalmic dosage forms.

10 Typical Properties

Acidity/alkalinity pH = 5.0–8.5 (0.5% w/v aqueous solution)

Solubility Soluble in water, although speed of dissolution depends upon molecular weight (higher molecular weights are slower to dissolve, although this process can be increased by gentle agitation). Slightly soluble in mixtures of organic solvents with water.[5]

11 Stability and Storage Conditions

Sodium hyaluronate should be stored in a cool, dry place in tightly sealed containers. The powder is stable for 3 years if stored in unopened containers.

12 Incompatibilities

—

13 Method of Manufacture

Sodium hyaluronate occurs naturally in vitreous humor, serum, chicken combs, shark skin, and whale cartilage; it is usually extracted and purified from chicken combs. It may also be manufactured by fermentation of selected *Streptococcus zooepidemicus* bacterial strains; sodium hyaluronate is removed from the fermentation medium by filtration and purified by ultrafiltration. It is then precipitated with an organic solvent and dried.

14 Safety

Sodium hyaluronate is used in cosmetics and in topical, parenteral, and ophthalmic pharmaceutical formulations. It is generally regarded as a relatively nontoxic and nonirritant material. Sodium hyaluronate has been reported to be an experimental teratogen.[6]

LD_{50} (mouse, IP): 1.5 g/kg[6]
LD_{50} (rabbit, IP): 1.82 g/kg
LD_{50} (rat, IP): 1.77 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, sodium hyaluronate emits toxic fumes of Na_2O.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical gel preparation).

17 Related Substances

Hyaluronic acid.

Hyaluronic acid

Molecular weight Hyaluronic acid molecules have a molecular weight of 300–2000 kDa as the number of repeating disaccharide units in each molecule is variable. In its natural form, hyaluronic acid exists as a high-molecular-weight polymer of 10 000 000–100 000 000 Da.

CAS number [9067-32-7]

Appearance Hyaluronic acid appears as a white to off-white powder or granules.

Comments Hyaluronic acid is used as an adjuvant for ophthalmic drug delivery,[7] and has been found to enhance the absorption of drugs and proteins via mucosal tissue.[8] It has also been used experimentally in controlled-release films that are suitable for application to surgical sites for the prevention of adhesion formation,[9] and in matrix formulations used in gene delivery systems.[10]

18 Comments

Microspheres prepared from hyaluronan esters have been evaluated for the vaginal administration of calcitonin in the treatment of postmenopausal osteoporosis.[11] Microspheres prepared from hyaluronan esters have also been used experimentally as delivery devices for nerve growth factors,[12] and as a nasal delivery system for insulin.[13]

An *N*-(2-hydroxypropyl)methacrylamide (HPMA)–hyaluronan polymeric drug delivery system has been studied for the targeted

S

delivery of doxorubicin to cancer cells. This copolymer exhibited increased toxicity due to hyaluronan receptor-mediated uptake of the macromolecular drug.[14]

Hyaluronan is used therapeutically to treat osteoarthritis in the knee, and is an effective treatment for arthritic pain.[15] It also has important applications in the fields of vascosurgery and vascosupplementation.[16]

The EINECS number for sodium hyaluronate is 232-678-0. The PubChem Compound ID (CID) for sodium hyaluronate is 3084049.

Sodium Hydroxide

S

1 Nonproprietary Names

BP: Sodium Hydroxide
JP: Sodium Hydroxide
PhEur: Sodium Hydroxide
USP–NF: Sodium Hydroxide

2 Synonyms

Caustic soda; E524; lye; natrii hydroxidum; soda lye; sodium hydrate.

3 Chemical Name and CAS Registry Number

Sodium hydroxide [1310-73-2]

4 Empirical Formula and Molecular Weight

NaOH 40.00

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium hydroxide is widely used in pharmaceutical formulations to adjust the pH of solutions.[1] It can also be used to react with weak acids to form salts.

8 Description

Sodium hydroxide occurs as a white or nearly white fused mass. It is available in small pellets, flakes, sticks, and other shapes or forms. It is hard and brittle and shows a crystalline fracture. Sodium hydroxide is very deliquescent and on exposure to air it rapidly absorbs carbon dioxide and water.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity

pH ≈ 12 (0.05% w/w aqueous solution);
pH ≈ 13 (0.5% w/w aqueous solution);
pH ≈ 14 (5% w/w aqueous solution).

Melting point 318°C
Solubility *see* Table II.

Table I: Pharmacopeial specifications for sodium hydroxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Appearance of solution	+	+	–
Insoluble substances and organic matter	–	–	+
Sodium carbonate	≤2.0%	≤2.0%	–
Sulfates	–	≤200 ppm	–
Chlorides	≤0.05%	≤200 ppm	–
Iron	–	≤10 ppm	–
Mercury	+	–	–
Heavy metals	≤30 ppm	–	≤30 ppm
Potassium	+	–	+
Assay (total alkali calculated as NaOH)	≥95.0%	97.0–100.5%	95.0–100.5%

11 Stability and Storage Conditions

Sodium hydroxide should be stored in an airtight nonmetallic container in a cool, dry place. When exposed to air, sodium hydroxide rapidly absorbs moisture and liquefies, but subsequently becomes solid again owing to absorption of carbon dioxide and formation of sodium carbonate.

12 Incompatibilities

Sodium hydroxide is a strong base and is incompatible with any compound that readily undergoes hydrolysis or oxidation. It will react with acids, esters, and ethers, especially in aqueous solution.

13 Method of Manufacture

Sodium hydroxide is manufactured by electrolysis of brine using inert electrodes. Chlorine is evolved as a gas at the anode and hydrogen is evolved as a gas at the cathode. The removal of chloride and hydrogen ions leaves sodium and hydroxide ions in solution. The solution is dried to produce the solid sodium hydroxide.

A second method uses the Kellner–Solvay cell. Saturated sodium chloride solution is electrolyzed between a carbon anode and a flowing mercury cathode. In this case the sodium is produced at the cathode rather than the hydrogen because of the readiness of sodium to dissolve in the mercury. The sodium–mercury amalgam is then exposed to water and a sodium hydroxide solution is produced.

14 Safety

Sodium hydroxide is widely used in the pharmaceutical and food industries and is generally regarded as a nontoxic material at low concentrations. At high concentrations it is a corrosive irritant to the skin, eyes, and mucous membranes.

LD_{50} (mouse, IP): 0.04 g/kg[2]

LD_{50} (rabbit, oral): 0.5 g/kg

15 Handling Precautions

Observe normal handling precautions appropriate to the quantity and concentration of material handled. Gloves, eye protection, a respirator, and other protective clothing should be worn.

Sodium hydroxide is a corrosive irritant to the skin, eyes, and mucous membranes. The solid and solutions cause burns, often with deep ulceration. It is moderately toxic on ingestion and harmful on inhalation.

Table II: Solubility of sodium hydroxide.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol	1 in 7.2
Ether	Practically insoluble
Glycerin	Soluble
Methanol	1 in 4.2
Water	1 in 0.9 1 in 0.3 at 100°C

In the UK, the workplace exposure limit for sodium hydroxide has been set at 2 mg/m^3 short-term.[3]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (dental preparations; injections; inhalations; nasal, ophthalmic, oral, otic, rectal, topical, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Potassium hydroxide.

18 Comments

Sodium hydroxide is most commonly used in solutions of fixed concentration. Sodium hydroxide has some antibacterial and antiviral properties and is used as a disinfectant in some applications.[4–6]

A specification for sodium hydroxide is contained in the *Food Chemicals Codex* (FCC).[7]

The EINECS number for sodium hydroxide is 215-185-5. The PubChem Compound ID (CID) for sodium hydroxide is 14798.

2 Synonyms

E325; 2-hydroxypropanoic acid monosodium salt; *Lacolin*; lactic acid monosodium salt; lactic acid sodium salt; natrii lactatis solutio; *Patlac*; *Purasal*; *Ritalac NAL*; sodium α-hydroxypropionate.

3 Chemical Name and CAS Registry Number

Sodium lactate [72-17-3]

4 Empirical Formula and Molecular Weight

$C_3H_5NaO_3$ 112.06

5 Structural Formula

The PhEur 9.2 and USP 40–NF 35 S1 describe sodium lactate solution as a mixture of the enantiomers of sodium 2-hydroxypropanoate in approximately equal proportions.

6 Functional Category

Antimicrobial preservative; buffering agent; emulsifying agent; flavoring agent; humectant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium lactate is widely used in cosmetics,[1,2] food products, and pharmaceutical applications including parenteral and topical formulations.

S

8 Description

Sodium lactate occurs as a clear, colorless, slightly syrupy liquid. It is odorless, or has a slight odor with a characteristic saline taste. It is hygroscopic.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 7 for an aqueous solution.
Boiling point 112°C
Hygroscopicity Very hygroscopic.
Melting point 17°C with decomposition at 140°C.
Solubility Miscible with ethanol (95%), and with water.
Specific gravity 1.31–1.34

11 Stability and Storage Conditions

Sodium lactate should be stored in a well-closed container in a cool, dry place. Sodium lactate is combustible and decomposes upon heating.

12 Incompatibilities

See Lactic Acid.

Table I: Pharmacopeial specifications for sodium lactate solution.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

(a) If intended for use in the manufacture of parenteral dosage forms, hemodialysis, or hemofiltration solutions.
(b) If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.
(c) PhEur 9.2 also lists sodium (S) lactate solution, which has an additional requirement for the content of the (S)-enantiomer of ≤95%.

13 Method of Manufacture

See Lactic Acid.

14 Safety

Sodium lactate occurs naturally in the body and is involved in physiological processes. It is generally regarded as a relatively nontoxic and nonirritant material when used as an excipient. Low concentrations are well tolerated by skin and eye mucosa, although higher concentrations should be avoided.

LD_{50} (rat, IP): 2 g/kg[3]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium lactate may cause eye irritation. When heated to decomposition, sodium lactate emits toxic fumes of Na_2O.[3]

16 Regulatory Status

GRAS listed (not for infant formulas). Included in the FDA Inactive Ingredient Database (epidural, IM, IV, and SC injections; oral suspensions; topical gels and solutions). Included in nonparenteral

medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lactic acid.

18 Comments

Generally, the commercially available product is a mixture with water containing 70–80% sodium lactate.

Therapeutically, sodium lactate is used in infusions as a component of Ringer-lactate solution; as an alternative for sodium biocarbonate in light acidosis; as a rehydrating agent; and as a carrier for electrolyte concentrates or medicines in perfusion/infusion solutions.

A specification for sodium lactate solution is contained in the *Food Chemicals Codex* (FCC).[4]

The EINECS number for sodium lactate is 200-772-0. The PubChem Compound ID (CID) for sodium lactate is 23666456.

Sodium Lauryl Sulfate

1 Nonproprietary Names

BP: Sodium Lauryl Sulfate

JP: Sodium Lauryl Sulfate

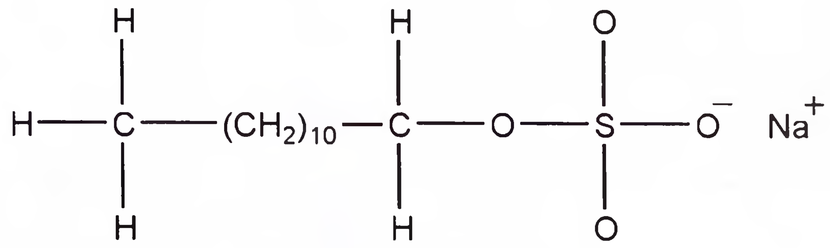
PhEur: Sodium Laurilsulfate

USP–NF: Sodium Lauryl Sulfate

2 Synonyms

Dodecyl alcohol hydrogen sulfate, sodium salt; dodecyl sodium sulfate; dodecylsulfate sodium salt; *Elfan 240*; lauryl sodium sulfate; lauryl sulfate, sodium salt; monododecyl sodium sulfate; natrii laurilsulfas; sodium dodecyl sulfate; sodium *N*-dodecyl sulfate; sodium laurilsulfate; sodium monododecyl sulfate; sodium monolauryl sulfate; SDS; SLS; sulfuric acid monododecyl ester, sodium salt; *Texapon K12P*.

3 Chemical Name and CAS Registry Number



Sulfuric acid monododecyl ester sodium salt (1 : 1) [151-21-3]

4 Empirical Formula and Molecular Weight

$C_{12}H_{25}NaO_4S$ 288.38

The USP 40–NF 35 S1 describes sodium lauryl sulfate as a mixture of sodium alkyl sulfates consisting mainly of sodium lauryl sulfate [$CH_3(CH_2)_{10}CH_2OSO_3Na$]. The combined content of sodium chloride and sodium sulfate is not more than 8.0%. The PhEur 9.2 and USP 40–NF 35 S1 state that sodium lauryl sulfate should contain not less than 85% of sodium alkyl sulfates calculated as $C_{12}H_{25}NaO_4S$. The JP XVII describes sodium lauryl sulfate as a mixture of sodium alkyl sulfate consisting mainly of sodium lauryl sulfate ($C_{12}H_{25}NaO_4S$).

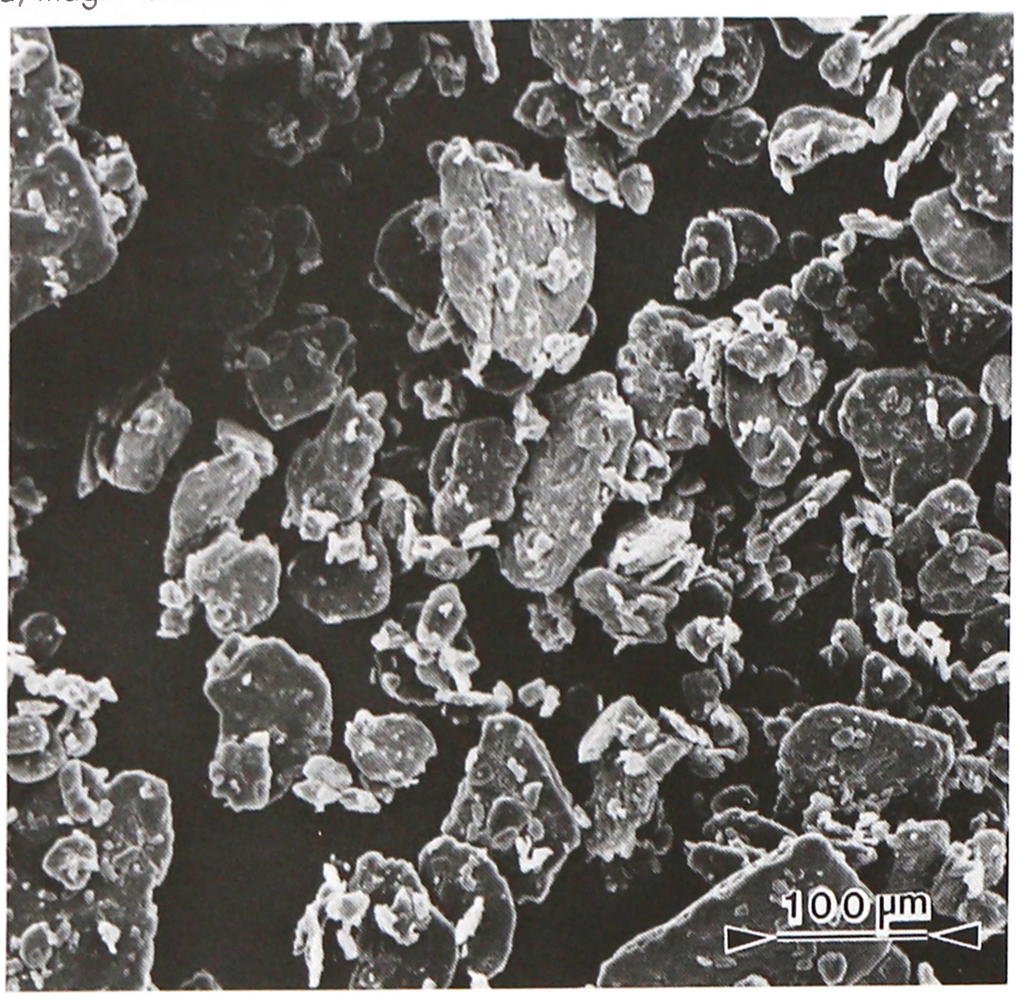
5 Structural Formula

6 Functional Category

Anionic surfactant; emulsifying agent; modified-release agent; penetration enhancer; solubilizing agent; tablet and capsule lubricant.

S

7 Applications in Pharmaceutical Formulation or Technology



Sodium lauryl sulfate is an anionic surfactant employed in a wide range of nonparenteral pharmaceutical formulations and cosmetics; *see* Table I.

It is a detergent and wetting agent effective in both alkaline and acidic conditions. In recent years it has found application in analytical electrophoretic techniques: SDS (sodium dodecyl sulfate) polyacrylamide gel electrophoresis is one of the more widely used techniques for the analysis of proteins;[1] and sodium lauryl sulfate has been used to enhance the selectivity of micellar electrokinetic chromatography (MEKC).[2]

8 Description

Sodium lauryl sulfate occurs as white or cream to pale yellow-colored crystals, flakes, or powder having a smooth feel, a soapy, bitter taste, and a faint odor of fatty substances.

SEM 1: Excipient: sodium lauryl sulfate; manufacturer: Canadian Alcolac Ltd; magnification: 120×.

SEM 2: Excipient: sodium lauryl sulfate; manufacturer: Canadian Alcolac Ltd; magnification: 600×.

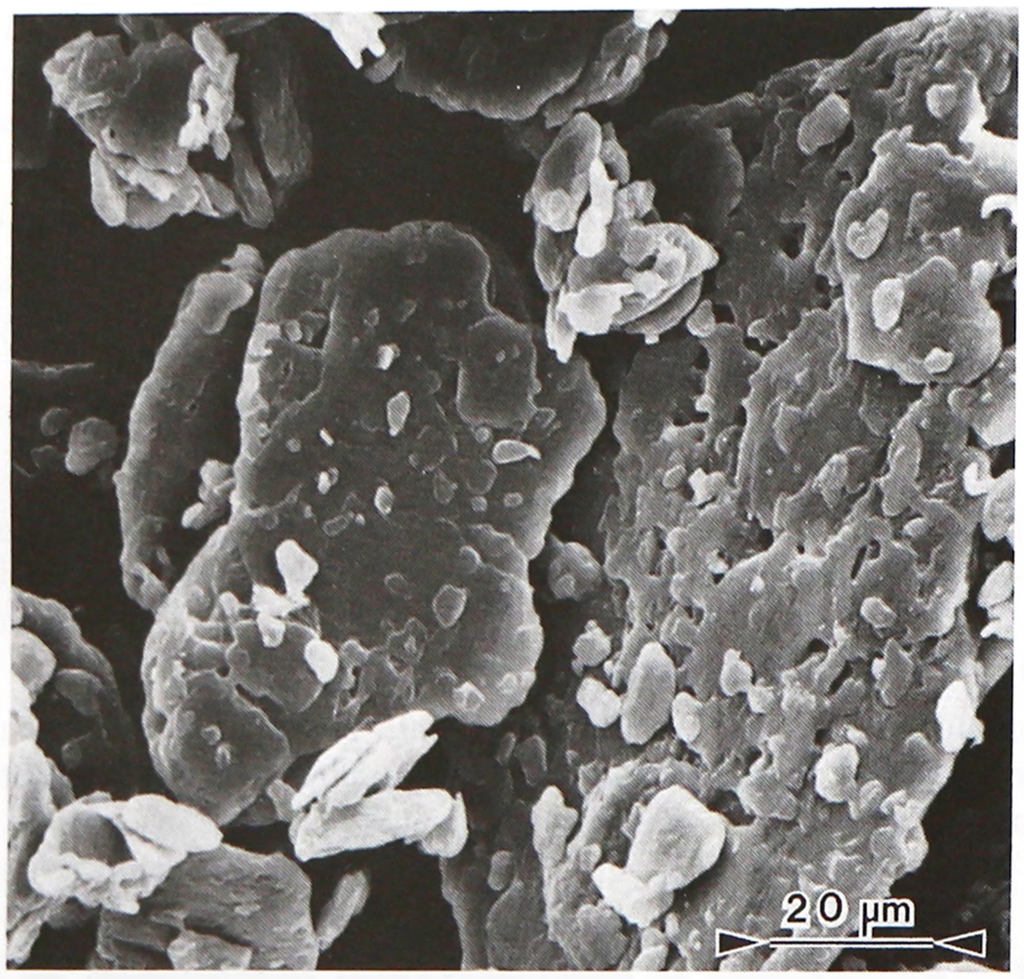


Table I: Uses of sodium lauryl sulfate.

9 Pharmacopeial Specifications

The pharmacopeial specifications for sodium lauryl sulfate have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

10 Typical Properties

Acidity/alkalinity pH = 7.0–9.5 (1% w/v aqueous solution)
Acid value 0
Antimicrobial activity Sodium lauryl sulfate has some bacteriostatic action against Gram-positive bacteria but is ineffective against many Gram-negative microorganisms. It potentiates the fungicidal activity of certain substances such as sulfanilamide and sulfathiazole. It has also been demonstrated that sodium lauryl sulfate has microbicidal activity against human immunodeficiency virus type I (HIV-1).[3]

The micelle formation and surface activity of sodium lauryl sulfate has also been evaluated at various temperatures.[4,5]
Density 1.07 g/cm^3 at 20°C
Dissociation constant pK_a = 1.9
HLB value ≈40
Interfacial tension 11.8 mN/m (11.8 dynes/cm) for a 0.05% w/v solution (unspecified nonaqueous liquid) at 30°C.
Melting point 204–207°C (for pure substance)
Moisture content ≤5%; sodium lauryl sulfate is not hygroscopic.
Solubility Freely soluble in water, giving an opalescent solution; partly soluble in ethanol (96%); practically insoluble in chloroform and ether.
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

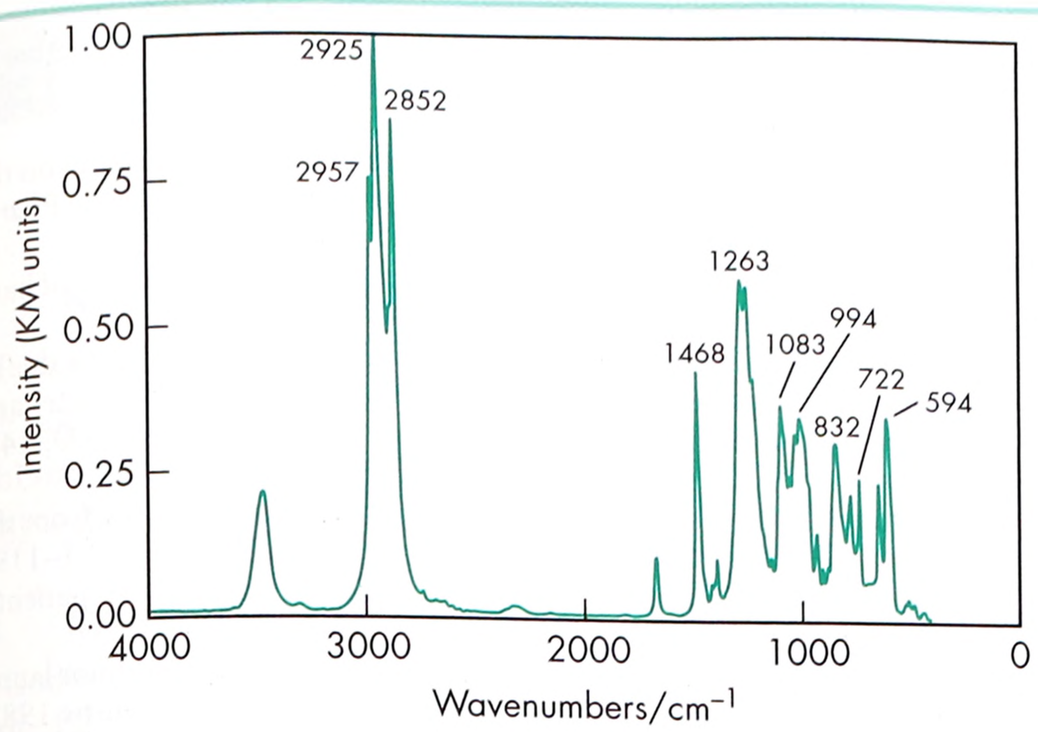

Figure 1: Infrared spectrum of sodium lauryl sulfate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

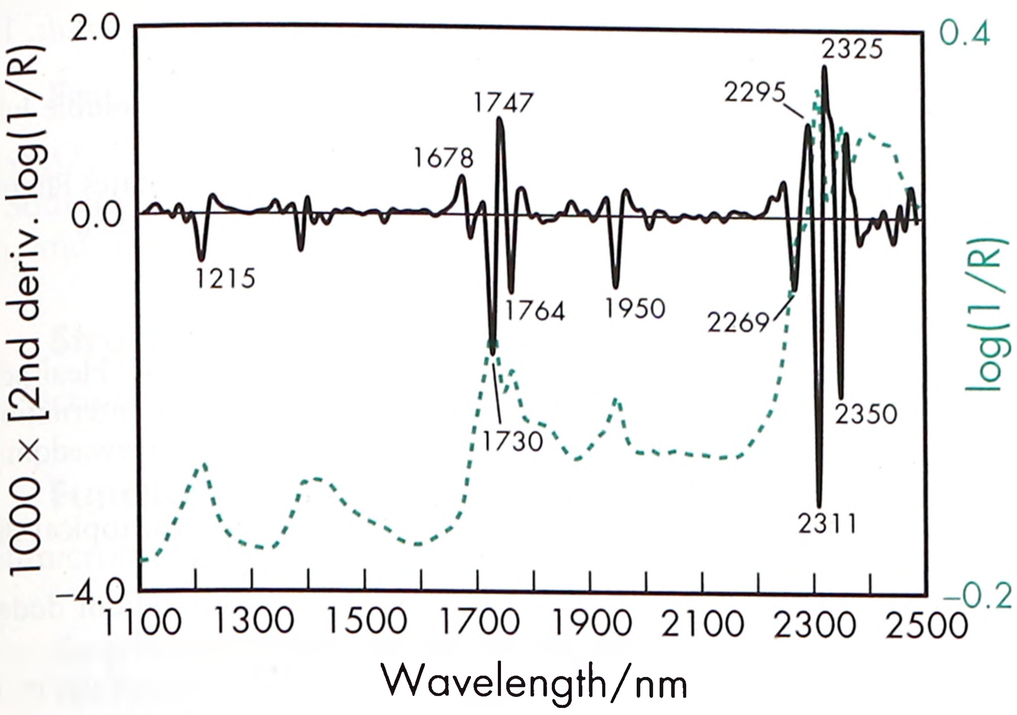

Figure 2: Near-infrared spectrum of sodium lauryl sulfate measured by reflectance.

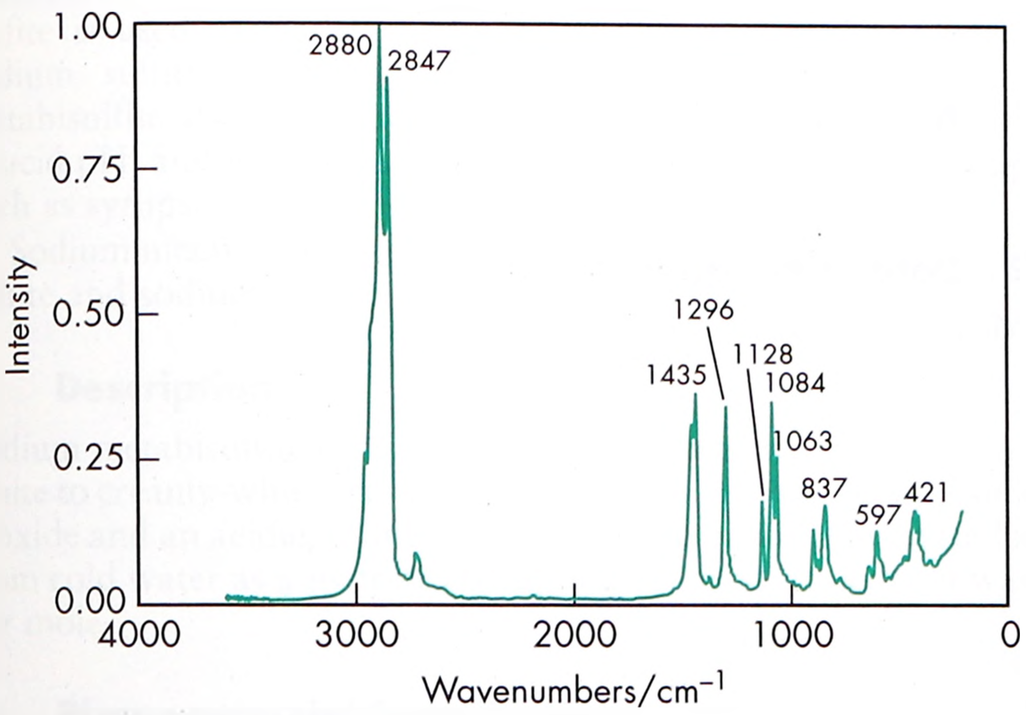

Figure 3: Raman spectrum of sodium lauryl sulfate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Spreading coefficient −7.0 (0.05% w/v aqueous solution) at 30°C

Surface tension 25.2 mN/m (25.2 dynes/cm) for a 0.05% w/v aqueous solution at 30°C

Wetting time (Draize test) 118 seconds (0.05% w/v aqueous solution) at 30°C

11 Stability and Storage Conditions

Sodium lauryl sulfate is stable under normal storage conditions. However, in solution, under extreme conditions, i.e. pH 2.5 or below, it undergoes hydrolysis to lauryl alcohol and sodium bisulfate.

The bulk material should be stored in a well-closed container away from strong oxidizing agents in a cool, dry place.

12 Incompatibilities

Sodium lauryl sulfate reacts with cationic surfactants, causing loss of activity even in concentrations too low to cause precipitation. Unlike soaps, it is compatible with dilute acids and calcium and magnesium ions.

Sodium lauryl sulfate is incompatible with salts of polyvalent metal ions, such as aluminum, lead, tin or zinc, and precipitates with potassium salts. Solutions of sodium lauryl sulfate (pH 9.5–10.0) are mildly corrosive to mild steel, copper, brass, bronze, and aluminum.

Sodium lauryl sulfate (an anionic surfactant) has been shown to bind to nonionic cellulose ethers to form a strong gel matrix, which can subsequently retard drug release from a matrix system.[6–8] Sodium lauryl sulfate has also been shown to negatively impact dissolution of drugs that have been formulated in gelatin capsules. This phenomenon has been observed when sodium lauryl sulfate is incorporated into the dissolution media at a pH < 5 due to the formation of a less soluble precipitate of gelatin.[9]

13 Method of Manufacture

Sodium lauryl sulfate is prepared by sulfation of lauryl alcohol, followed by neutralization with sodium carbonate.

14 Safety

Sodium lauryl sulfate is widely used in cosmetics and oral and topical pharmaceutical formulations. It is a moderately toxic material with acute toxic effects including irritation to the skin, eyes, mucous membranes, upper respiratory tract, and stomach. Repeated, prolonged exposure to dilute solutions may cause drying and cracking of the skin; contact dermatitis may develop.[10] Prolonged inhalation of sodium lauryl sulfate will damage the lungs. Pulmonary sensitization is possible, resulting in hyperactive airway dysfunction and pulmonary allergy. Animal studies have shown intravenous administration to cause marked toxic effects to the lung, kidney, and liver. Mutagenic testing in bacterial systems has proved negative.[11]

Adverse reactions to sodium lauryl sulfate in cosmetics and pharmaceutical formulations mainly concern reports of irritation to the skin[10,12–14] or eyes[15] following topical application.

Sodium lauryl sulfate should not be used in intravenous preparations for humans. The probable human lethal oral dose is 0.5–5.0 g/kg body-weight.

LD_{50} (mouse, IP): 0.25 g/kg[16]
LD_{50} (mouse, IV): 0.12 g/kg
LD_{50} (rat, oral): 1.29 g/kg
LD_{50} (rat, IP): 0.21 g/kg
LD_{50} (rat, IV): 0.12 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Inhalation and contact with the skin and eyes should be avoided; eye protection, gloves, and other protective clothing, depending on the circumstances, are recommended. Adequate ventilation should be provided or a dust respirator should be worn. Prolonged or repeated exposure should be avoided. Sodium lauryl sulfate emits toxic fumes on combustion.

S

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (dental preparations; oral capsules, suspensions, and tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cetostearyl alcohol; cetyl alcohol; magnesium lauryl sulfate; wax, anionic emulsifying.

Magnesium lauryl sulfate

Empirical formula $C_{12}H_{26}O_4S{\cdot}HMg$
CAS number [3097-08-3]
Comments A soluble tablet lubricant.[17] The EINECS number for magnesium lauryl sulfate is 221-450-6.

18 Comments

Sodium lauryl sulfate is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

A specification for sodium lauryl sulfate is contained in the *Food Chemicals Codex* (FCC).[18]

The EINECS number for sodium lauryl sulfate is 205-788-1. The PubChem Compound ID (CID) for sodium lauryl sulfate is 3423265.

Sodium Metabisulfite

1 Nonproprietary Names

BP: Sodium Metabisulfite

JP: Sodium Pyrosulfite

PhEur: Sodium Metabisulfite

USP–NF: Sodium Metabisulfite

2 Synonyms

Disodium disulfite; disodium pyrosulfite; disulfurous acid, sodium salt; E223; natrii disulfis; natrii metabisulfis; sodium acid sulfite; sodium disulfite; sodium pyrosulfite.

3 Chemical Name and CAS Registry Number

Sodium pyrosulfite [7681-57-4]

4 Empirical Formula and Molecular Weight

$Na_2S_2O_5$ 190.1

Sodium metabisulfite contains 24.19% sodium, 42.08% oxygen, and 33.73% sulfur.

5 Structural Formula

See Section 4.

6 Functional Category

Antimicrobial preservative; antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium metabisulfite is used as an antioxidant in oral, parenteral, and topical pharmaceutical formulations, at concentrations of 0.01–1.0% w/v, and at a concentration of approximately 27% w/v in intramuscular injection preparations. Primarily, sodium metabisulfite is used in acidic preparations; for alkaline preparations, sodium sulfite is usually preferred; *see* Section 18. Sodium metabisulfite also has some antimicrobial activity, which is greatest at acid pH, and may be used as a preservative in oral preparations such as syrups.

Sodium metabisulfite usually contains small amounts of sodium sulfite and sodium sulfate.

8 Description

Sodium metabisulfite occurs as colorless, prismatic crystals or as a white to creamy-white crystalline powder that has the odor of sulfur dioxide and an acidic, saline taste. Sodium metabisulfite crystallizes from cold water as a hydrate containing seven equivalents of water per mole.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium metabisulfite.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—
Appearance of solution	+	+	—
pH (5% w/v solution)	—	3.5–5.0	—
Chloride	—	—	≤0.05%
Thiosulfate	+	+	≤0.05%
Arsenic	≤4 ppm	≤5 ppm	—
Heavy metals	≤20 ppm	—	≤20 ppm
Iron	≤20 ppm	≤20 ppm	≤20 ppm
Assay (as $Na_2S_2O_5$)	≥95.0%	95.0–100.5%	—
Assay (as SO_2)	—	—	65.0–67.4%

10 Typical Properties

Acidity/alkalinity pH = 3.5–5.0 for a 5% w/v aqueous solution at 20°C.

Melting point Sodium metabisulfite melts with decomposition at less than 150°C.

Osmolarity A 1.38% w/v aqueous solution is isoosmotic with serum.

Solubility *see* Table II.

Specific gravity 1.48

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

On exposure to air and moisture, sodium metabisulfite is slowly oxidized to sodium sulfate with disintegration of the crystals.[1] Addition of strong acids to the solid liberates sulfur dioxide.

In water, sodium metabisulfite is immediately converted to sodium (Na^+) and bisulfite (HSO_3^-) ions. Aqueous sodium metabisulfite solutions also decompose in air, especially on heating. Solutions that are to be sterilized by autoclaving should be filled into containers in which the air has been replaced with an inert gas, such as nitrogen. The addition of dextrose to aqueous sodium metabisulfite solutions results in a decrease in the stability of the metabisulfite.[2]

The bulk material should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Sodium metabisulfite reacts with sympathomimetics and other drugs that are *ortho*- or *para*-hydroxybenzyl alcohol derivatives to form sulfonic acid derivatives possessing little or no pharmacological activity. The most important drugs subject to this inactivation are epinephrine (adrenaline) and its derivatives.[3] In addition, sodium metabisulfite is incompatible with chloramphenicol owing to a more complex reaction;[3] it also inactivates cisplatin in solution.[4,5]

It is incompatible with phenylmercuric acetate when autoclaved in eye drop preparations.[6]

Sodium metabisulfite may react with the rubber caps of multidose vials, which should therefore be pretreated with sodium metabisulfite solution.[7]

13 Method of Manufacture

Sodium metabisulfite is prepared by saturating a solution of sodium hydroxide with sulfur dioxide and allowing crystallization to occur; hydrogen is passed through the solution to exclude air. Sodium metabisulfite may also be prepared by saturating a solution of

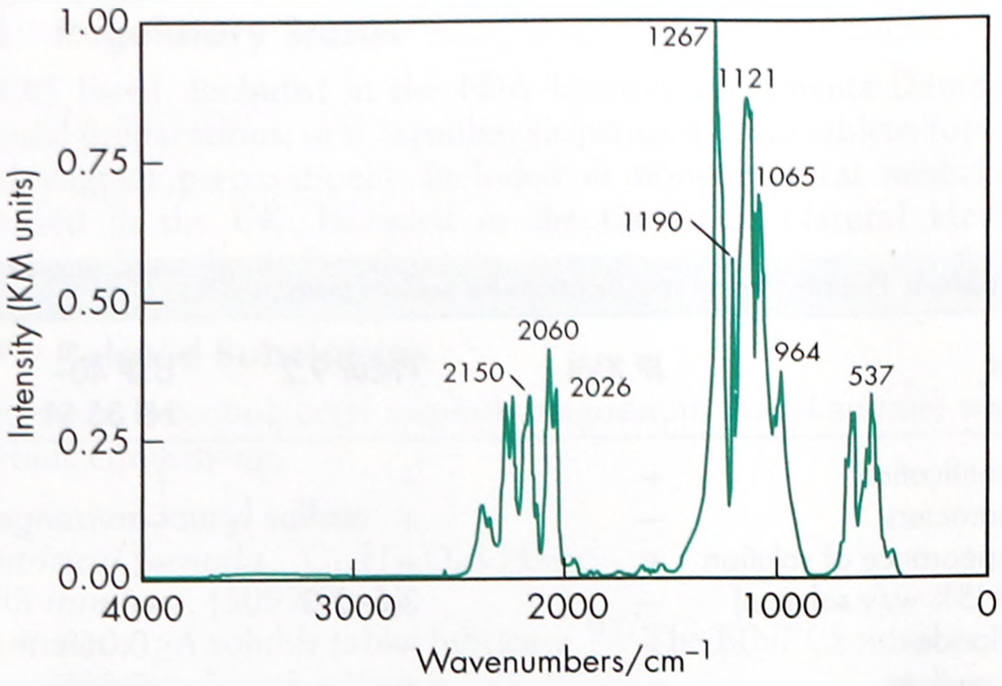

Figure 1: Infrared spectrum of sodium metabisulfite measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

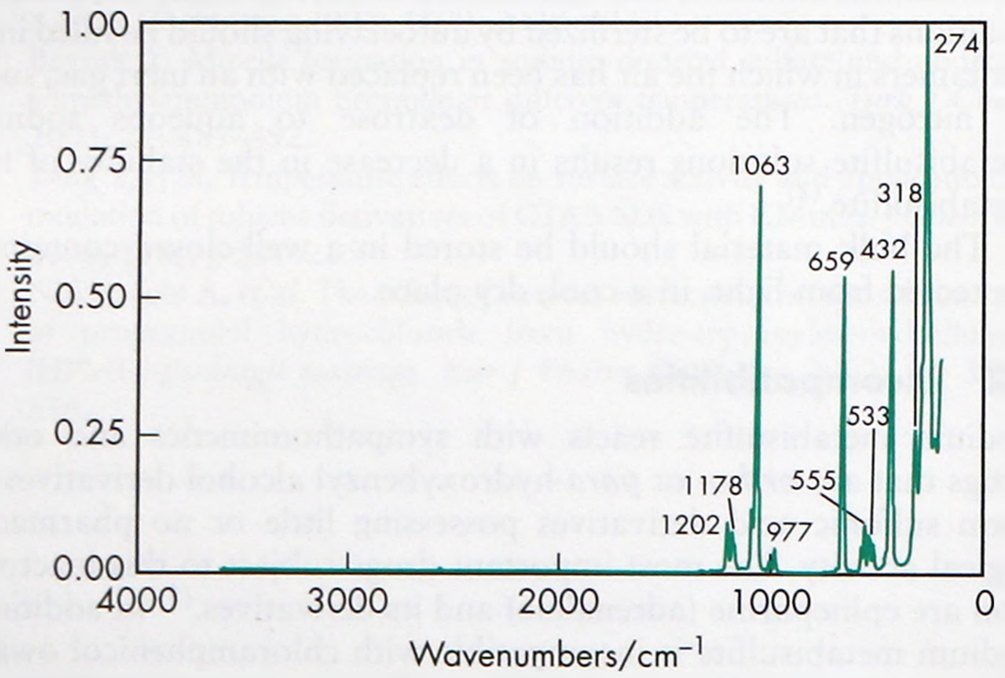

Figure 3: Raman spectrum of sodium metabisulfite measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Table II: Solubility of sodium metabisulfite.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	Slightly soluble
Glycerin	Freely soluble
Water	1 in 1.9
	1 in 1.2 at 100°C

sodium carbonate with sulfur dioxide and allowing crystallization to occur, or by thermally dehydrating sodium bisulfite.

14 Safety

Sodium metabisulfite is widely used as an antioxidant in oral, topical, and parenteral pharmaceutical formulations; it is also widely used in food products.

Although it is extensively used in a variety of preparations, sodium metabisulfite and other sulfites have been associated with a number of severe to fatal adverse reactions.[8–19] These are usually hypersensitivity-type reactions and include bronchospasm and anaphylaxis. Allergy to sulfite antioxidants is estimated to occur in 5–10% of asthmatics, although adverse reactions may also occur in nonasthmatics with no history of allergy. Sodium metabisulfite can also cause contact dermatitis.[20]

Following oral ingestion, sodium metabisulfite is oxidized to sulfate and is excreted in urine. Ingestion may result in gastric irritation, owing to the liberation of sulfurous acid, while ingestion of large amounts of sodium metabisulfite can cause colic, diarrhea, circulatory disturbances, CNS depression, and death.

In the UK, the acceptable daily intake of sodium metabisulfite and other sulfites used in foodstuffs has been set at up to 3.5 mg/kg body-weight, calculated as sulfur dioxide (SO_2). [21]The WHO has also set an acceptable daily intake of sodium metabisulfite, and other sulfites, at up to 0.7 mg/kg body-weight, calculated as sulfur dioxide (SO_2).[22]

See also Potassium Metabisulfite for more safety information regarding the sulfites in general.

LD_{50} (rat, IV): 0.12 g/kg[23]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium metabisulfite may be irritant to the skin and eyes; eye protection and gloves are recommended. In the UK, the long-term (8-hour TWA) workplace exposure limit for sodium metabisulfite is 5 mg/m^3.[24]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (epidural; inhalation; IM and IV injections; ophthalmic solutions; oral preparations; rectal, topical, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Potassium metabisulfite; sodium bisulfite; sodium sulfite.

Sodium bisulfite

Empirical formula $NaHSO_3$
Molecular weight 104.07
CAS number [7631-90-5]
Synonyms E222; sodium hydrogen sulfite.
Appearance White crystalline powder.
Density 1.48 g/cm^3
Solubility Soluble 1 in 3.5 parts of water at 20°C; 1 in 2 parts of water at 100°C; and 1 in 70 parts of ethanol (95%). Freely soluble in glycerol. Aqueous solution is acidic.
Comments Most substances sold as sodium bisulfite contain significant, variable amounts of sodium metabisulfite, as the latter is less hygroscopic and more stable during storage and shipment. *See* Section 18.

S

18 Comments

Sodium metabisulfite is used as an antioxidant at low pH, sodium bisulfite at intermediate pH, and sodium sulfite at higher pH values. A specification for sodium metabisulfite is contained in the *Food Chemicals Codex* (FCC).[25]

In the food industry and in wine production, sodium metabisulfite is similarly used as an antioxidant, antimicrobial preservative, and antibrowning agent. However, at concentrations above about 550 ppm it imparts a noticeable flavor to preparations. Like all sulfites, sodium metabisulfite is not recommended for use in foods that are a source of thiamin, owing to the instability of the vitamin in their presence. Such foods include meat, raw fruits and vegetables, fresh potatoes, and foods that are a source of vitamin B_{12}.

Sodium metabisulfite is used in a number of hair dyes and colours.[26]

The EINECS number for sodium metabisulfite is 231-673-0. The PubChem Compound ID (CID) for sodium metabisulfite is 656671.

Sodium Phosphate, Dibasic

1 Nonproprietary Names

BP: Anhydrous Disodium Hydrogen Phosphate
Disodium Hydrogen Phosphate Dihydrate
Disodium Hydrogen Phosphate Dodecahydrate

JP: Dibasic Sodium Phosphate Hydrate

PhEur: Disodium Phosphate, Anhydrous
Disodium Phosphate Dihydrate
Disodium Phosphate Dodecahydrate

USP–NF: Dibasic Sodium Phosphate

Note that the BP 2017 and PhEur 9.2 contain three separate monographs for the anhydrous, the dihydrate, and the dodecahydrate; the JP XVII contains one monograph for the dodecahydrate; and the USP 40–NF 35 S1 contains one monograph that includes the anhydrous, the monohydrate, the dihydrate, the heptahydrate, and the dodecahydrate. *See also* Section 8.

2 Synonyms

Dinatrii phosphas anhydricus; dinatrii phosphas dihydricus; dinatrii phosphas dodecahydricus; disodium hydrogen phosphate; disodium phosphate; E339; phosphoric acid, disodium salt; secondary sodium phosphate; sodium orthophosphate.

3 Chemical Name and CAS Registry Number

Anhydrous dibasic sodium phosphate [7558-79-4]
Dibasic sodium phosphate dihydrate [10028-24-7]
Dibasic sodium phosphate dodecahydrate [10039-32-4]
Dibasic sodium phosphate heptahydrate [7782-85-6]
Dibasic sodium phosphate hydrate [10140-65-5]
Dibasic sodium phosphate monohydrate [118830-14-1]

4 Empirical Formula and Molecular Weight

Na_2HPO_4	141.96
$Na_2HPO_4 \cdot H_2O$	159.94
$Na_2HPO_4 \cdot 2H_2O$	177.98
$Na_2HPO_4 \cdot 7H_2O$	268.03
$Na_2HPO_4 \cdot 12H_2O$	358.08

5 Structural Formula

See Section 4.

6 Functional Category

Buffering agent; complexing agent.

7 Applications in Pharmaceutical Formulation or Technology

Dibasic sodium phosphate is used in a wide variety of pharmaceutical formulations as a buffering agent and as a complexing agent.

Dibasic sodium phosphate is also used in food products; for example as an emulsifier in processed cheese.

8 Description

The USP 40–NF 35 S1 states that dibasic sodium phosphate is dried or contains, 1, 2, 7, or 12 molecules of water of hydration.

Anhydrous dibasic sodium phosphate occurs as a white powder. The dihydrate occurs as white or almost white, odorless crystals. The heptahydrate occurs as colorless crystals or as a white granular or caked salt that effloresces in warm, dry air. The dodecahydrate occurs as strongly efflorescent, colorless or transparent crystals.

9 Pharmacopeial Specifications

See Table I.

(a) JP XVII for the dodecahydrate.
(b) PhEur 9.2 for the anhydrous, dihydrate and dodecahydrate.

10 Typical Properties

Acidity/alkalinity pH = 9.1 for a 1% w/v aqueous solution of the anhydrous material at 25°C. A saturated aqueous solution of the dodecahydrate has a pH of about 9.5.

Ionization constants

pK_{a1} = 2.15 at 25°C;[1]
pK_{a2} = 7.20 at 25°C;
pK_{a3} = 12.38 at 25°C.

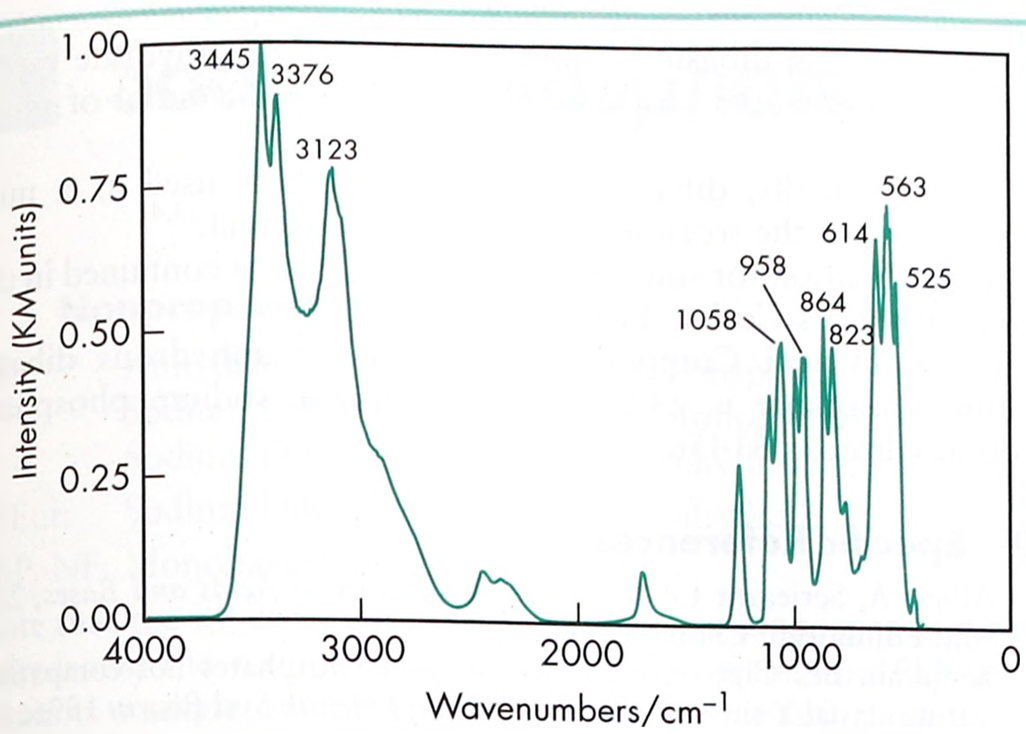

Figure 1: Infrared spectrum of dibasic sodium phosphate (anhydrous) measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

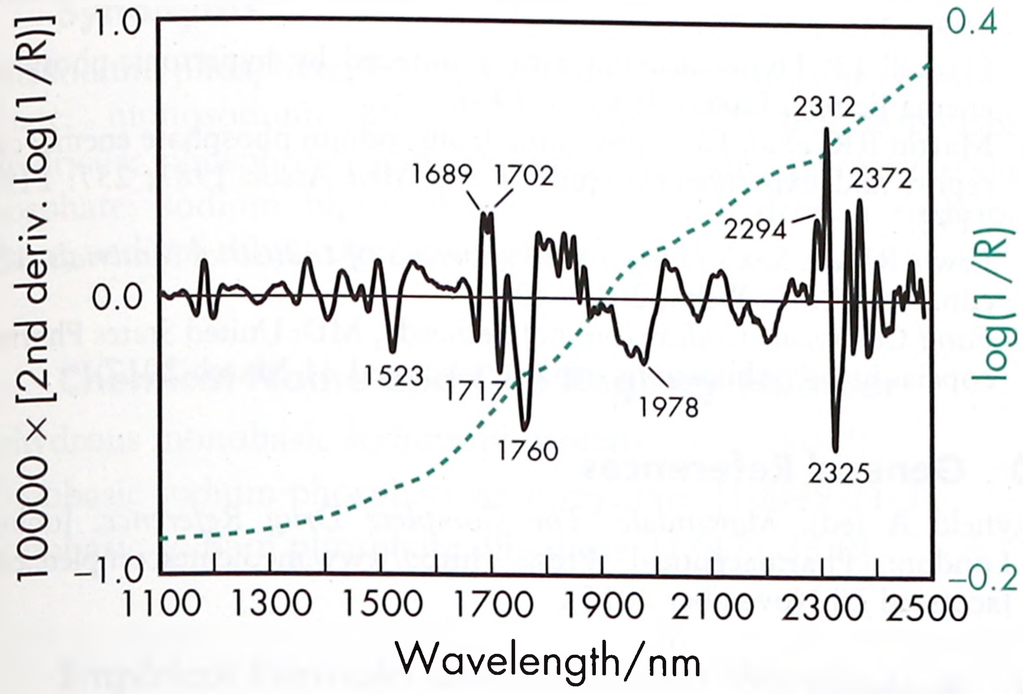

Figure 2: Near-infrared spectrum of dibasic sodium phosphate measured by reflectance.

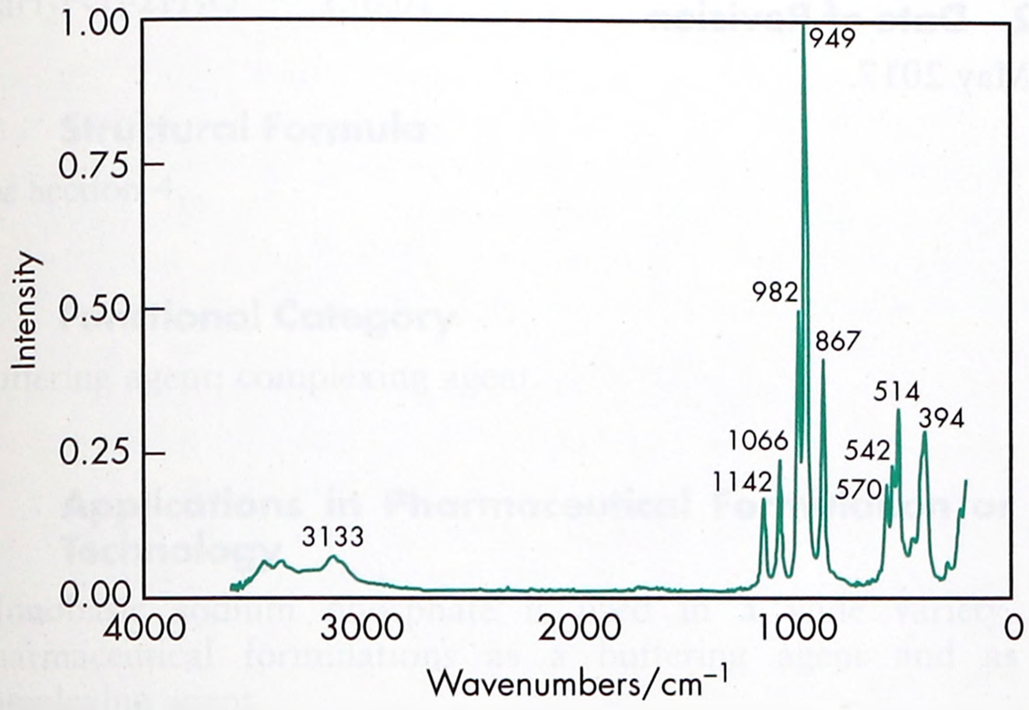

Figure 3: Raman spectrum of dibasic sodium phosphate (anhydrous) measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Moisture content The anhydrous form is hygroscopic and will absorb up to 7 moles of water on exposure to air, whereas the heptahydrate is stable in air.

Osmolarity A 2.23% w/v aqueous solution of the dihydrate is isoosmotic with serum; a 4.45% w/v aqueous solution of the dodecahydrate is isoosmotic with serum.

Solubility Very soluble in water, more so in hot or boiling water; practically insoluble in ethanol (95%). The anhydrous material is soluble 1 in 8 parts of water, the heptahydrate 1 in 4 parts of water, and the dodecahydrate 1 in 3 parts of water.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

The anhydrous form of dibasic sodium phosphate is hygroscopic. When heated to 40°C, the dodecahydrate fuses; at 100°C it loses its water of crystallization; and at a dull-red heat (about 240°C) it is converted into the pyrophosphate, $Na_4P_2O_7$. Aqueous solutions of dibasic sodium phosphate are stable and may be sterilized by autoclaving.

The bulk material should be stored in an airtight container, in a cool, dry place.

12 Incompatibilities

Dibasic sodium phosphate is incompatible with alkaloids, antipyrine, chloral hydrate, lead acetate, pyrogallol, resorcinol and calcium gluconate, and ciprofloxacin.[2] Interaction between calcium and phosphate, leading to the formation of insoluble calcium–phosphate precipitates, is possible in parenteral admixtures.

13 Method of Manufacture

Either bone phosphate (bone ash), obtained by heating bones to whiteness, or the mineral phosphorite is used as a source of tribasic calcium phosphate, which is the starting material in the industrial production of dibasic sodium phosphate.

Tribasic calcium phosphate is finely ground and digested with sulfuric acid. This mixture is then leached with hot water and neutralized with sodium carbonate, and dibasic sodium phosphate is crystallized from the filtrate.

14 Safety

Dibasic sodium phosphate is widely used as an excipient in parenteral, oral, and topical pharmaceutical formulations.

Phosphate occurs extensively in the body and is involved in many physiological processes since it is the principal anion of intracellular fluid. Most foods contain adequate amounts of phosphate, making hypophosphatemia (phosphate deficiency)[3] virtually unknown except for certain disease states[4] or in patients receiving total parenteral nutrition. Treatment is usually by the oral administration of up to 100 mmol of phosphate daily.

Approximately two-thirds of ingested phosphate is absorbed from the gastrointestinal tract, virtually all of it being excreted in the urine, and the remainder is excreted in the feces.

Excessive administration of phosphate, particularly intravenously, rectally, or in patients with renal failure, can cause hyperphosphatemia that may lead to hypocalcemia or other severe electrolyte imbalances.[5,6] Adverse effects occur less frequently following oral consumption, although phosphates act as mild saline laxatives when administered orally or rectally. Consequently, gastrointestinal disturbances including diarrhea, nausea, and vomiting may occur following the use of dibasic sodium phosphate as an excipient in oral formulations. However, the level of dibasic sodium phosphate used as an excipient in a pharmaceutical formulation is not usually associated with adverse effects.

LD_{50} (rat, oral): 17 g/kg[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Dibasic sodium phosphate may be

S

irritating to the skin, eyes, and mucous membranes. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted in Europe for use as a food additive. Included in the FDA Inactive Ingredients Database (injections; infusions; nasal, ophthalmic, oral, otic, topical, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dibasic potassium phosphate; sodium phosphate, monobasic; tribasic sodium phosphate.

Tribasic sodium phosphate

Empirical formula $Na_3PO_4 \cdot xH_2O$

Molecular weight

163.94 for the anhydrous material

380.06 for the dodecahydrate ($12H_2O$)

CAS number [7601-54-9] for the anhydrous material.

Synonyms E339; trisodium orthophosphate; trisodium phosphate; TSP.

Acidity/alkalinity pH = 12.1 for a 1% w/v aqueous solution of the anhydrous material at 25°C. A 1% w/v aqueous solution of the dodecahydrate at 25°C has a pH of 12.0–12.2.

Density

1.3 g/cm^3 for the anhydrous material;

0.9 g/cm^3 for the dodecahydrate.

Solubility The anhydrous material is soluble 1 in 8 parts of water, while the dodecahydrate is soluble 1 in 5 parts of water at 20°C.

18 Comments

One gram of anhydrous dibasic sodium phosphate represents approximately 14.1 mmol of sodium and 7.0 mmol of phosphate.

One gram of dibasic sodium phosphate dihydrate represents approximately 11.2 mmol of sodium and 5.6 mmol of phosphate.

One gram of dibasic sodium phosphate heptahydrate represents approximately 7.5 mmol of sodium and 3.7 mmol of phosphate.

One gram of dibasic sodium phosphate dodecahydrate represents approximately 5.6 mmol of sodium and 2.8 mmol of phosphate.

Therapeutically, dibasic sodium phosphate is used as a mild laxative and in the treatment of hypophosphatemia.[3,4]

A specification for sodium phosphate, dibasic is contained in the *Food Chemicals Codex* (FCC).[8]

The PubChem Compound ID (CID) for anhydrous dibasic sodium phosphate is 24203, and for dibasic sodium phosphate dodecahydrate is 61456.

Sodium Phosphate, Monobasic

1 Nonproprietary Names

BP: Anhydrous Sodium Dihydrogen Phosphate
Sodium Dihydrogen Phosphate Monohydrate
Sodium Dihydrogen Phosphate Dihydrate

PhEur: Sodium Dihydrogen Phosphate Dihydrate

USP–NF: Monobasic Sodium Phosphate

Note that the BP 2017 contains three separate monographs for the anhydrous, the monohydrate, and the dihydrate; the PhEur 9.2 contains a single monograph for the dihydrate; and the USP 40–NF 35 S1 contains one monograph for the anhydrous, the monohydrate and the dihydrate. *See also* Section 8.

2 Synonyms

Acid sodium phosphate; E339; *Kalipol 32*; monosodium orthophosphate; monosodium phosphate; natrii dihydrogenophosphas dihydricus; phosphoric acid, monosodium salt; primary sodium phosphate; sodium biphosphate; sodium dihydrogen orthophosphate; sodium dihydrogen phosphate.

3 Chemical Name and CAS Registry Number

Anhydrous monobasic sodium phosphate [7558-80-7]

Monobasic sodium phosphate monohydrate [10049-21-5]

Monobasic sodium phosphate dihydrate [13472-35-0]

4 Empirical Formula and Molecular Weight

NaH_2PO_4 119.98
$NaH_2PO_4 \cdot H_2O$ 137.99
$NaH_2PO_4 \cdot 2H_2O$ 156.01

5 Structural Formula

See Section 4.

6 Functional Category

Buffering agent; complexing agent.

7 Applications in Pharmaceutical Formulation or Technology

Monobasic sodium phosphate is used in a wide variety of pharmaceutical formulations as a buffering agent and as a complexing agent.

Monobasic sodium phosphate is also used in food products, for example, in baking powders, and as a dry acidulant and sequestrant.

8 Description

The USP 40–NF 35 S1 states that monobasic sodium phosphate contains one or two molecules of water of hydration or is anhydrous.

The hydrated forms of monobasic sodium phosphate occur as odorless, colorless or white, slightly deliquescent crystals. The anhydrous form occurs as a white crystalline powder or granules.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium phosphate, monobasic.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Aluminum, calcium and related elements	–	+
Arsenic	≤2 ppm	≤8 ppm
Chloride	≤200 ppm	≤0.014%
Insoluble substances	–	≤0.2%
Heavy metals	–	≤0.002%
Iron	≤10 ppm	–
pH	4.2–4.5	4.1–4.5
Reducing substances	+	–
Sulfate	≤300 ppm	≤0.15%
Water	+	+
Anhydrous	–	≤2.0%
Monohydrate	–	10.0–15.0%
Dihydrate	21.5–24.0%	18.0–26.5%
Assay (dried basis)	98.0–100.5%	98.0–103.0%

10 Typical Properties

Acidity/alkalinity pH = 4.1–4.5 for a 5% w/v aqueous solution of the monohydrate at 25°C.

Density 1.915 g/cm^3 for the dihydrate.

Dissociation constant pK_a = 2.15 at 25°C

Solubility Soluble 1 in 1 of water; very slightly soluble in ethanol (95%).

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectra *see* Figures 2 and 3.

Raman spectrum *see* Figure 4.

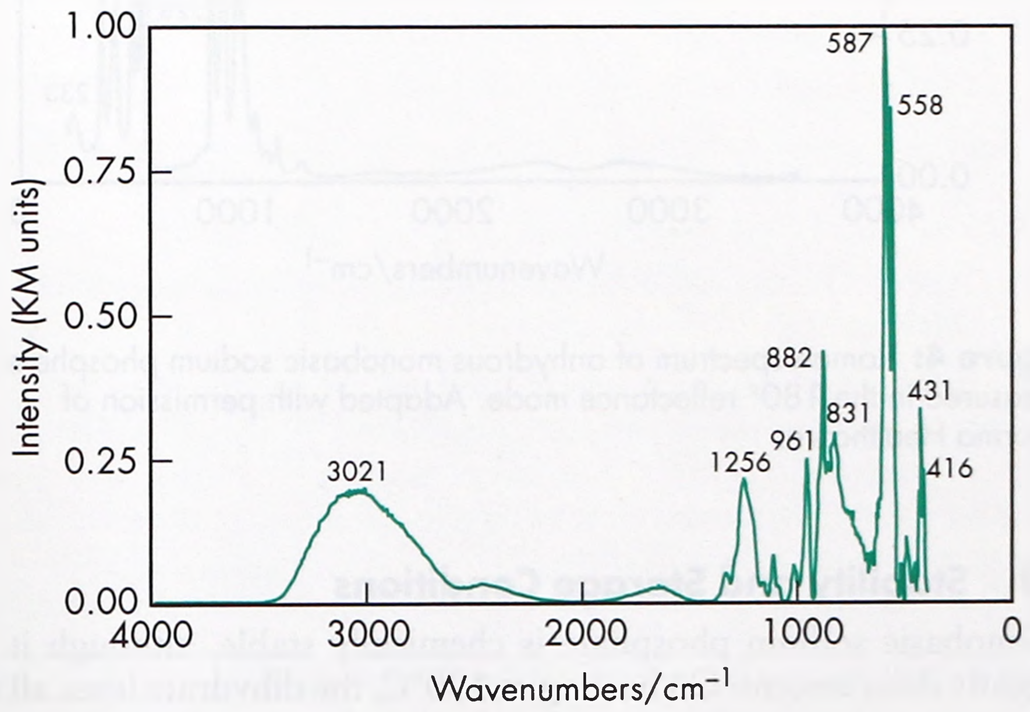

Figure 1: Infrared spectrum of anhydrous monobasic sodium phosphate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

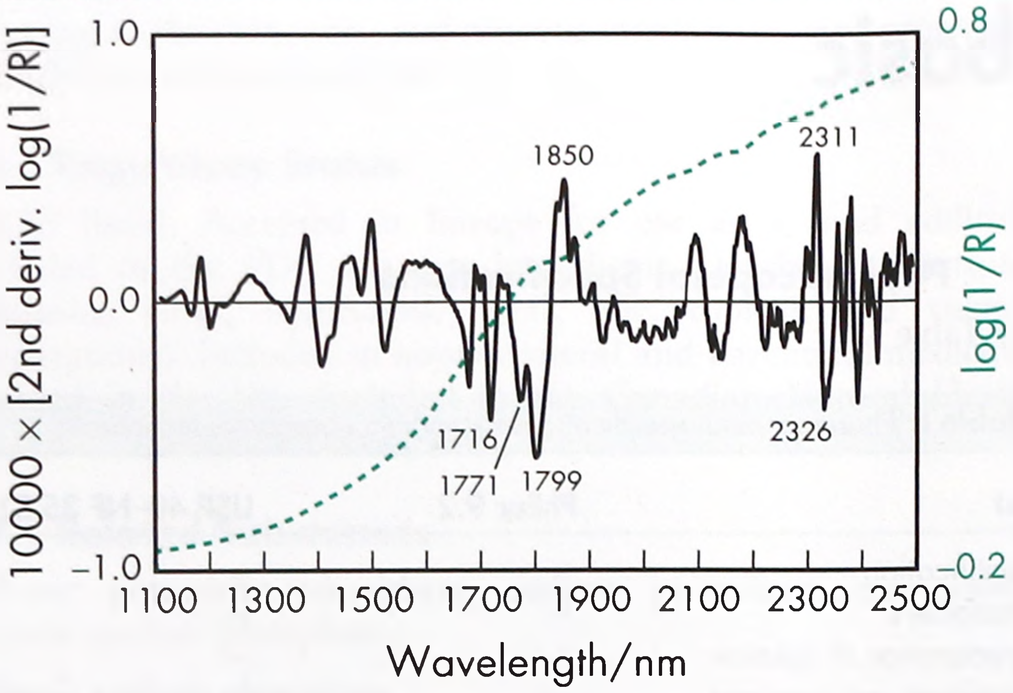

Figure 2: Near-infrared spectrum of anhydrous monobasic sodium phosphate measured by reflectance.

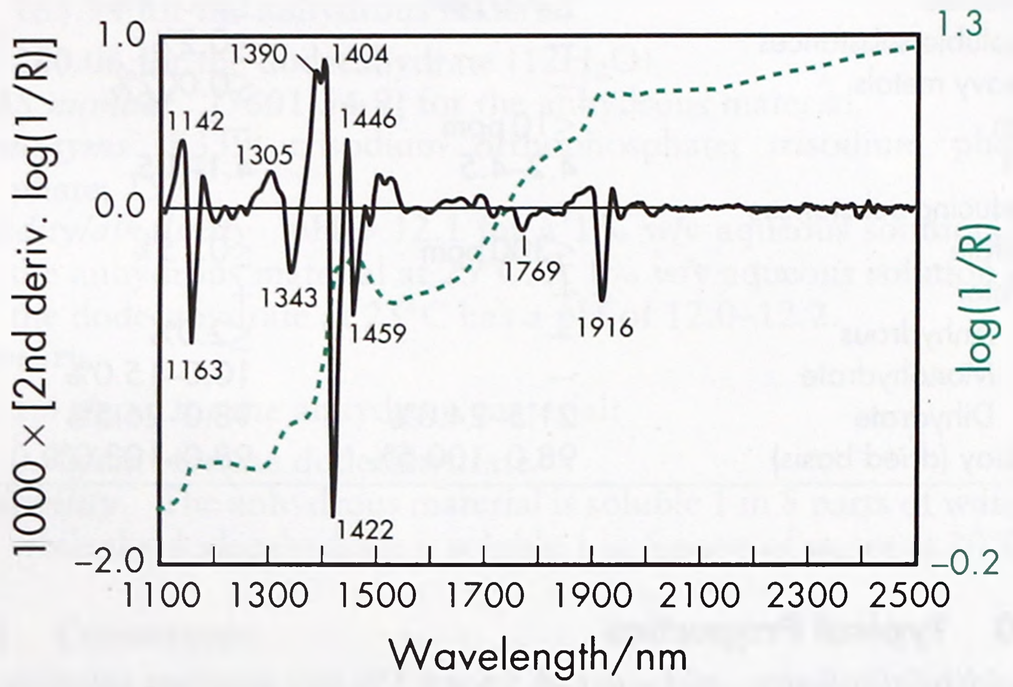

Figure 3: Near-infrared spectrum of monobasic sodium phosphate dihydrate measured by reflectance.

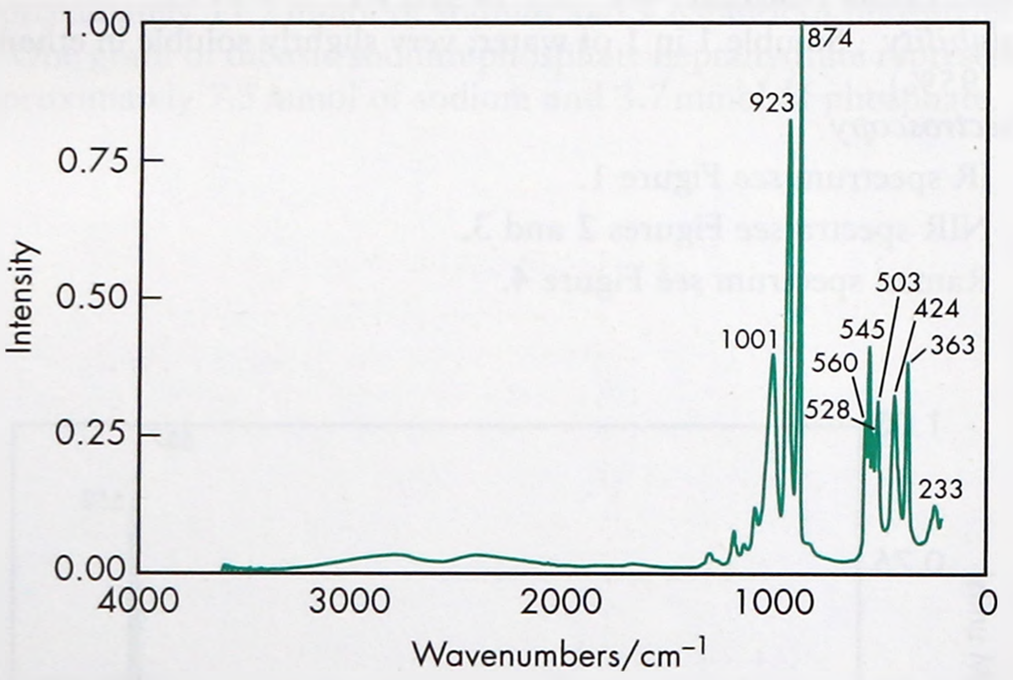

Figure 4: Raman spectrum of anhydrous monobasic sodium phosphate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Monobasic sodium phosphate is chemically stable, although it is slightly deliquescent. On heating at 100°C, the dihydrate loses all of its water of crystallization. On further heating, it melts with decomposition at 205°C, forming sodium hydrogen pyrophosphate, $Na_2H_2P_2O_7$. At 250°C it leaves a final residue of sodium metaphosphate, $NaPO_3$.

Aqueous solutions are stable and may be sterilized by autoclaving.

Monobasic sodium phosphate should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Monobasic sodium phosphate is an acid salt and is therefore generally incompatible with alkaline materials and carbonates; aqueous solutions of monobasic sodium phosphate are acidic and will cause carbonates to effervesce.

Monobasic sodium phosphate should not be administered concomitantly with aluminum, calcium, or magnesium salts since they bind phosphate and could impair its absorption from the gastrointestinal tract. Interaction between calcium and phosphate, leading to the formation of insoluble calcium phosphate precipitates, is possible in parenteral admixtures.[1–3]

13 Method of Manufacture

Monobasic sodium phosphate is prepared by adding phosphoric acid to a hot, concentrated solution of disodium phosphate until the liquid ceases to form a precipitate with barium chloride. This solution is then concentrated and the monobasic sodium phosphate is crystallized.

14 Safety

Monobasic sodium phosphate is widely used as an excipient in parenteral, oral, and topical pharmaceutical formulations.

Phosphate occurs extensively in the body and is involved in many physiological processes since it is the principal anion of intracellular fluid. Most foods contain adequate amounts of phosphate, making hypophosphatemia[4] virtually unknown except in certain disease states[5] or in patients receiving total parenteral nutrition. Treatment is usually by the oral administration of up to 100 mmol of phosphate daily.

Approximately two-thirds of ingested phosphate is absorbed from the gastrointestinal tract, virtually all of it being excreted in the urine, and the remainder is excreted in the feces.

Excessive administration of phosphate, particularly intravenously, rectally, or in patients with renal failure, can cause hyperphosphatemia that may lead to hypocalcemia or other severe electrolyte imbalances.[6–8] Adverse effects occur less frequently following oral consumption, although phosphates act as mild saline laxatives when administered orally or rectally (2–4 g of monobasic sodium phosphate in an aqueous solution is used as a laxative). Consequently, gastrointestinal disturbances including diarrhea, nausea, and vomiting may occur following the use of monobasic sodium phosphate as an excipient in oral formulations. However, the level of monobasic sodium phosphate used as an excipient in a pharmaceutical formulation is not usually associated with adverse effects.

LD_{50} (rat, IM): 0.25 g/kg[9]

LD_{50} (rat, oral): 8.29 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Monobasic sodium phosphate may be irritant to the skin, eyes, and mucous membranes. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (injections;

infusions; ophthalmic, oral, topical, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dibasic sodium phosphate; monobasic potassium phosphate.

Monobasic potassium phosphate

Empirical formula KH_2PO_4
Molecular weight 136.09
CAS number [7778-77-0]
Synonyms E340; monopotassium phosphate; potassium acid phosphate; potassium biphosphate; potassium dihydrogen orthophosphate.
Appearance Colorless crystals or a white, odorless, granular or crystalline powder.
Acidity/alkalinity pH ≈ 4.5 for a 1% w/v aqueous solution at 25°C.
Solubility Freely soluble in water; practically insoluble in ethanol (95%).
Comments 1 g of monobasic potassium phosphate represents approximately 7.3 mmol of potassium and of phosphate.

The EINECS number for monobasic potassium phosphate is 231-913-4.

18 Comments

One gram of anhydrous monobasic sodium phosphate represents approximately 8.3 mmol of sodium and of phosphate.

One gram of monobasic sodium phosphate monohydrate represents approximately 7.2 mmol of sodium and of phosphate.

One gram of monobasic sodium phosphate dihydrate represents approximately 6.4 mmol of sodium and of phosphate.

Therapeutically, monobasic sodium phosphate is used as a mild saline laxative and in the treatment of hypophosphatemia.[4,5,10]

A specification for sodium phosphate monobasic is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for monobasic sodium phosphate is 231-449-2. The PubChem Compound ID (CID) for monobasic sodium phosphate dihydrate is 23673460.

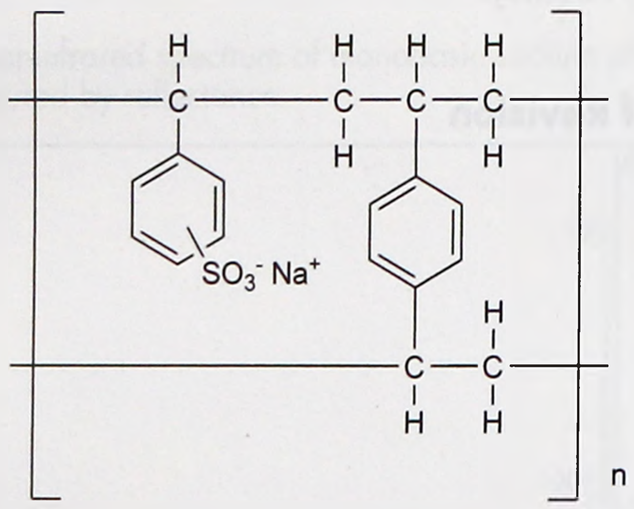
3 Chemical Name and CAS Registry Number



Divinylbenzene copolymer with styrene, sulfonated, sodium salt [63182-08-1]

4 Empirical Formula and Molecular Weight

Sodium polystyrene sulfonate is a cation exchange resin prepared as the sodium form of a sulfonated styrene-divinylbenzene copolymer.

Sodium polystyrene sulfonate is a polymer of infinite molecular weight. The infinite molecular weight is due to the cross-linked structure of the styrene-divinylbenzene copolymer. The cross-linking nature of styrene and divinylbenzene leads to one large polymer molecule (tri-dimensional matrix). Due to this chemistry, an average molecular weight determination is not possible.

5 Structural Formula

6 Functional Category

Complexing agent; modified-release agent; solubilizing agent; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium polystyrene sulfonate is used as an excipient to form a complex ('resinate') with various drugs to modify the release profile, and to improve solubility and taste-masking.[1] It has also been identified for uses as an abuse deterrent, to increase drug stability, and to eliminate polymorphism.[2]

The sodium ion (Na^+) of the ion exchange resin (sodium polystyrene sulfonate in the form of a powder or spherical beads) is replaced by the therapeutic drug cation (R^+) i.e. the drug is loaded on the ion exchange resin to form a complex, *see* Figure 1. Typical drug loadings of sodium polystyrene sulfonate range between 5–75% of the total exchange capacity (~5 mEq/g). The amount of drug loaded will be influenced by factors such as selectivity of the

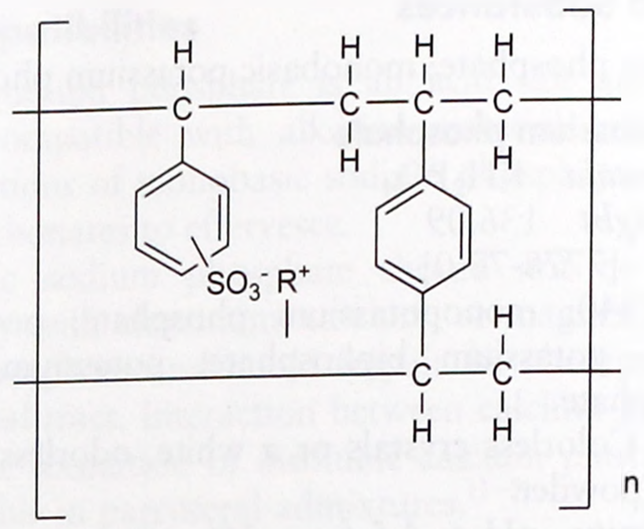


Figure 1: Sodium polystyrene sulfonate–drug complex

exchange resin for the drug, concentration of the drug for exchange, or competition from cations in the exchange solution. The rate of loading will be influenced by the drugs size and the extent of resin swelling.[1] The drug can be loaded onto the resin by a batch or continuous column process; however batch equilibration is preferred when the resin is a finely divided powder, and it may be necessary to repeat the loading stage two or more times to achieve maximum drug loading.[1]

The drug is released by further exchange with cations in the gastrointestinal tract.[1] Drug release *in vivo* is controlled by the diffusion rate of the drug from the resin, the selectivity of the drug for the resin, and concentration of electrolytes in the exchange environment.[1] Hydrophobic interactions between the aromatic structure of the resin and drug results in hydrophobic drugs eluting from the resin at a lower rate.[1]

Sodium polystyrene sulfonate has been used to form complexes with drugs such as codeine, chlorpheniramine, carbinoxamine, and clonidine.[3–6]

8 Description

Sodium polystyrene sulfonate occurs as an almost white, light brown or golden brown powder.

The intermediate of sodium polystyrene sulfonate in the form of beads (noncompendial) occurs as brown, small spherical beads (0.2–1.2 mm).

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity

pH (1% in brine) = 6.0–9.5;

pH (1% in water) = 6.0–11.0.

Solubility Practically insoluble in water, ethanol (96%), methylene chloride, acetone, and diethyl ether.

Spectroscopy IR spectrum *see* Figure 2.

11 Stability and Storage Conditions

Sodium polystyrene sulfonate is stable for at least 2 years. It is recommended to store the product tightly-closed in its original packaging and under normal storage conditions, away from heat, light or moisture.

12 Incompatibilities

Sodium polystyrene sulfonate is incompatible with oxidising agents.

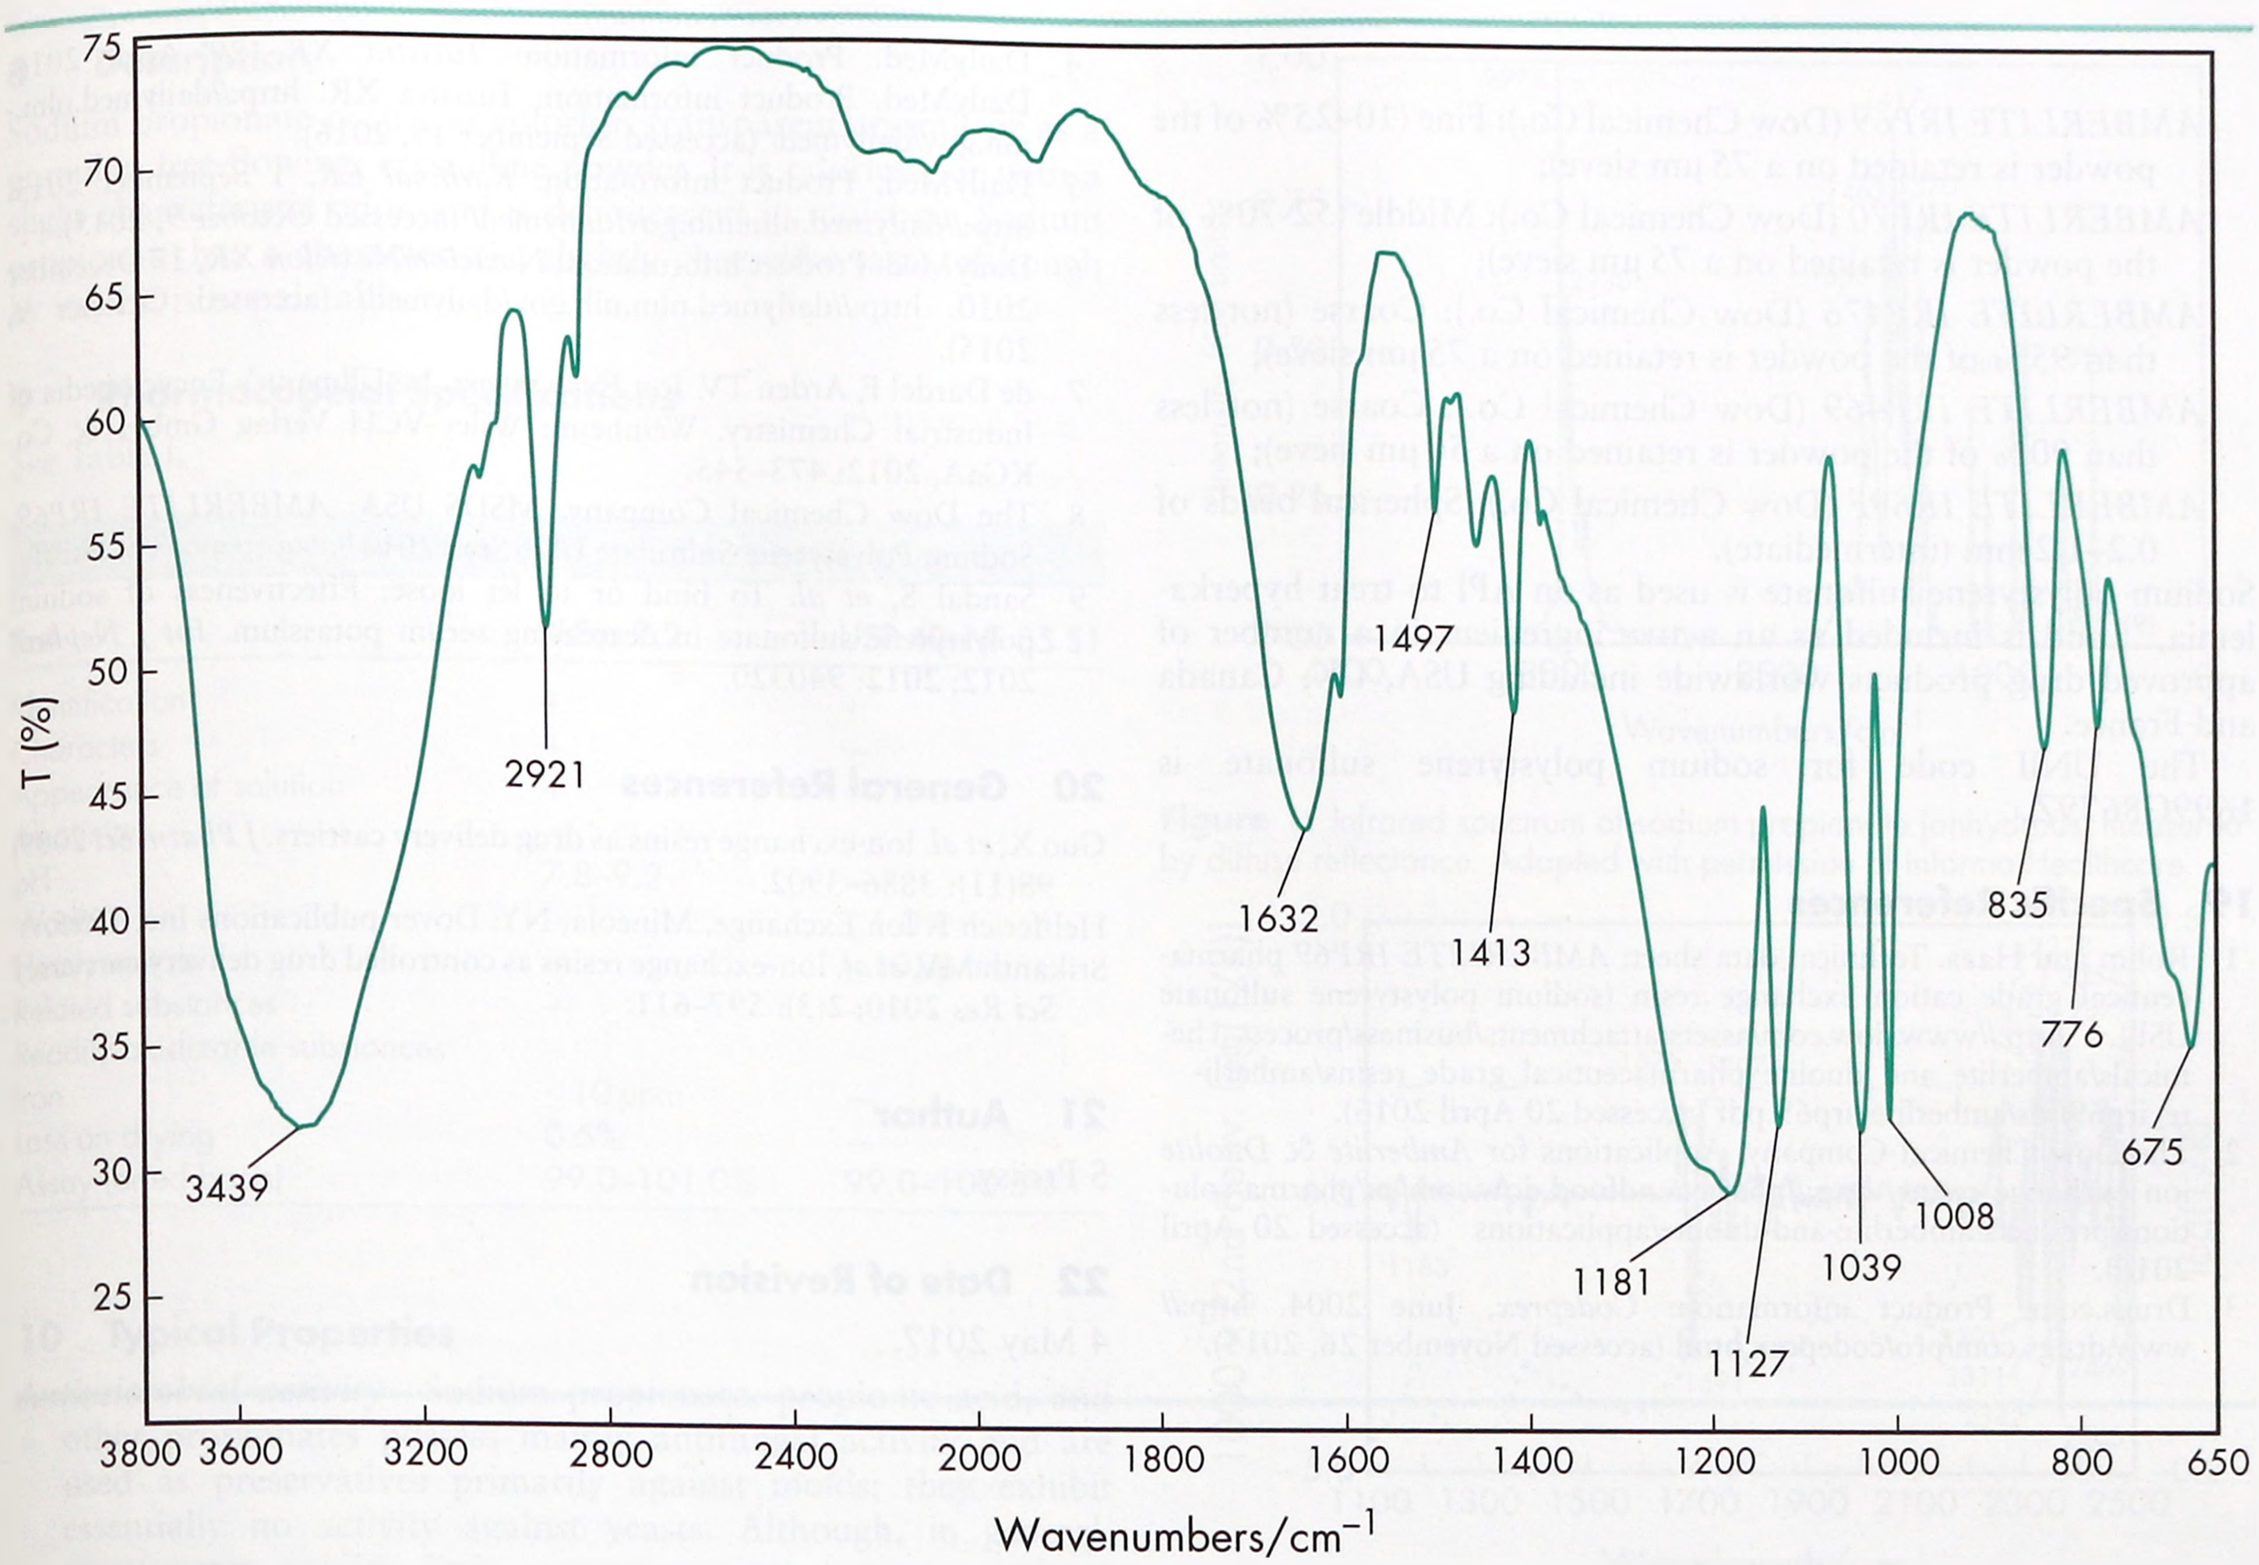

Figure 2: Infrared spectrum of sodium polystyrene sulfonate measured by transmission.

13 Method of Manufacture

Sodium polystyrene sulfonate is produced from a styrene-divinylbenzene copolymer sulfonated using a strong acid (e.g. sulphuric acid) and further converted to the sodium form using, for instance, sodium hydroxide. This leads to a cation–exchange resin in the form of spherical beads. This intermediate is further ground to obtain a powder.[7]

Table I: Pharmacopeial specifications for sodium polystyrene sulfonate.

Test	USP 40–NF 35 S1	PhEur 9.2	JP XVII
Identification	—	+	+
Characters	—	+	—
Potassium exchange capacity	110–135 mg/g	2.8–3.4 mmol/g	0.110–0.135 g/g

Arsenic	—	—	≤1 ppm
Microbial contamination (gram-negative bacteria)	—	≤10^2 CFU/g	—
Assay (sodium)	9.4–11.5%	9.4–11.0%	9.4–11.0%

14 Safety

Sodium polystyrene sulfonate is not mutagenic in the Ames Test based on testing conducted on an aqueous leachate of sodium polystyrene sulfonate.[8]

LD_{50} (rat, oral): >2 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Dust formation should be avoided. Avoid contact with eyes. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (sustained released tablets). Included in the Canadian Natural Health Products database.

17 Related Substances

—

18 Comments

Sodium polystyrene sulfonate is described in the USP 40–NF 35 S1 and PhEur 9.2 as a powder; however no specific particle size distribution is prescribed. Manufacturers have developed sodium polystyrene sulfonate powders meeting a wide range of particle size distributions in order to meet specific customer's requirements. For example:

S

AMBERLITE IRP69 (Dow Chemical Co.): Fine (10–25% of the powder is retained on a 75 μm sieve);
AMBERLITE IRP70 (Dow Chemical Co.): Middle (52-70% of the powder is retained on a 75 μm sieve);
AMBERLITE IRP476 (Dow Chemical Co.): Coarse (not less than 95% of the powder is retained on a 75 μm sieve);
AMBERLITE IRP469 (Dow Chemical Co.): Coarse (not less than 90% of the powder is retained on a 50 μm sieve);
AMBERLITE IR69F (Dow Chemical Co.): Spherical beads of 0.2–1.2 mm (intermediate).

Sodium polystyrene sulfonate is used as an API to treat hyperkalemia,[9] and is included as an active ingredient in a number of approved drug products worldwide including USA, UK, Canada and France.

The UNII code for sodium polystyrene sulfonate is 1699G8679Z.

Sodium Propionate

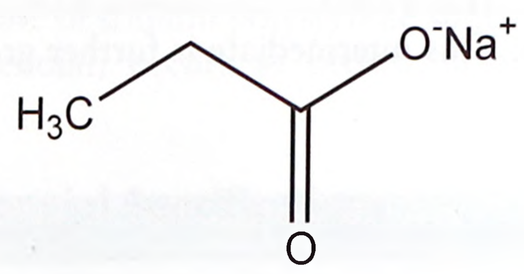
S

1 Nonproprietary Names

BP: Sodium Propionate
PhEur: Sodium Propionate
USP–NF: Sodium Propionate

2 Synonyms

E281; ethylformic acid, sodium salt; methylacetic acid, sodium salt; napropion; natrii propionas; prophyllin; sodium propanoate; sodium propionate.



3 Chemical Name and CAS Registry Number

Propionic acid, sodium salt, hydrate [6700-17-0]
Propionic acid, sodium salt, anhydrous [137-40-6]

4 Empirical Formula and Molecular Weight

$C_3H_5NaO_2 \cdot xH_2O$ 114.06 (for monohydrate)
$C_3H_5NaO_2$ 96.06 (for anhydrous)

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Sodium propionate is used in oral pharmaceutical formulations as an antimicrobial preservative. Like propionic acid, sodium propionate and other propionic acid salts are fungistatic and bacteriostatic against a number of Gram-positive cocci. Propionates are more active against molds than sodium benzoate, but have essentially no activity against yeasts; *see* Section 10. Sodium propionate has also been used as a preservative in eye drops.[1]

8 Description

Sodium propionate occurs as colorless transparent crystals or as a granular, free-flowing, crystalline powder. It is odorless, or with a slight characteristic odor, and is deliquescent in moist air. Sodium propionate has a characteristic, slightly cheeselike taste, although by itself it is unpalatable.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium propionate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Alkalinity	–	+
pH	7.8–9.2	–
Water	–	≤1.0%
Heavy metals	–	≤10 ppm
Related substances	+	–
Readily oxidizable substances	+	–
Iron	≤10 ppm	–
Loss on drying	0.5%	–
Assay (dried basis)	99.0–101.0%	99.0–100.5%

10 Typical Properties

Antimicrobial activity Sodium propionate, propionic acid, and other propionates possess mainly antifungal activity and are used as preservatives primarily against molds; they exhibit essentially no activity against yeasts. Although, in general, propionates exhibit little activity against bacteria, sodium propionate is effective against *Bacillus mesenterium*, the organism that causes 'rope' in bread. Antimicrobial activity is largely dependent upon the presence of the free acid and hence propionates exhibit optimum activity at acid pH, notably at less than pH 5. Synergistic effects occur between propionates and carbon dioxide or sorbic acid. *See also* Propionic acid.

Melting point 285°C

Solubility Soluble 1 in 24 of ethanol (95%), 1 in 1 of water, and 1 in 0.65 of boiling water; practically insoluble in chloroform, ether, and methylene chloride.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Sodium propionate is deliquescent and should therefore be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Incompatibilities for sodium propionate are similar to those of other weak organic acids.

13 Method of Manufacture

Sodium propionate is prepared by the reaction of propionic acid with sodium carbonate or sodium hydroxide.

14 Safety

Sodium propionate and other propionates are used in oral pharmaceutical formulations, food products, and cosmetics. The free acid, propionic acid, occurs naturally at levels up to 1% w/w in certain cheeses.

Following oral consumption, propionate is metabolized in mammals in a manner similar to that of fatty acids. Toxicity studies in animals have shown sodium propionate and other propionates to be relatively nontoxic materials.[2,3] In veterinary medicine, sodium propionate is used as a therapeutic agent for cattle and sheep.[4]

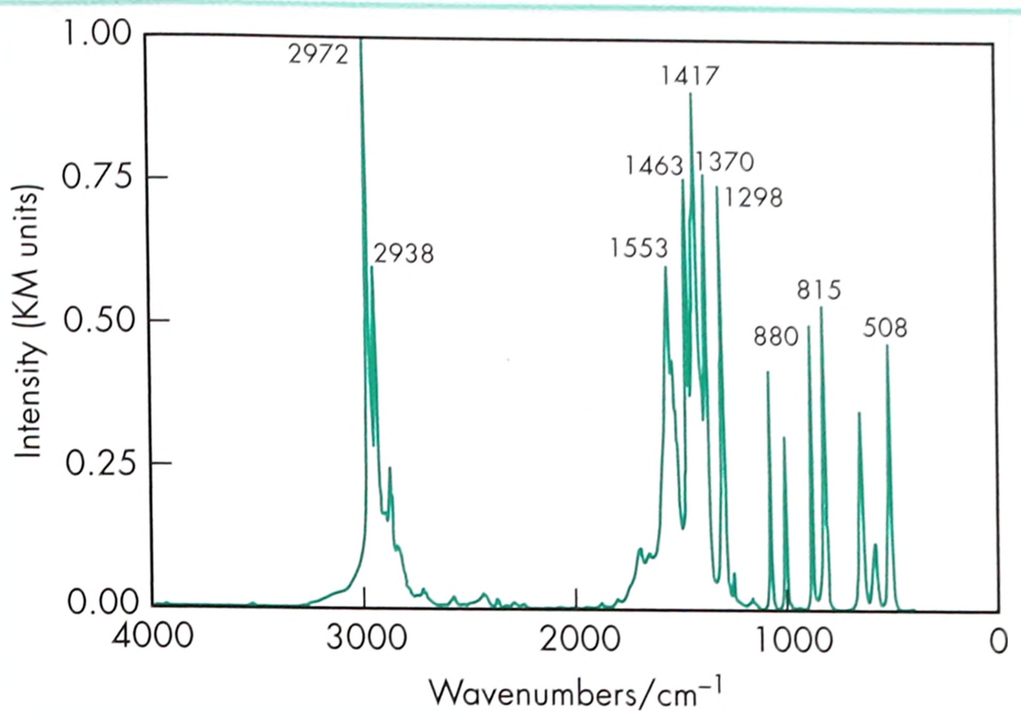


Figure 1: Infrared spectrum of sodium propionate (anhydrous) measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

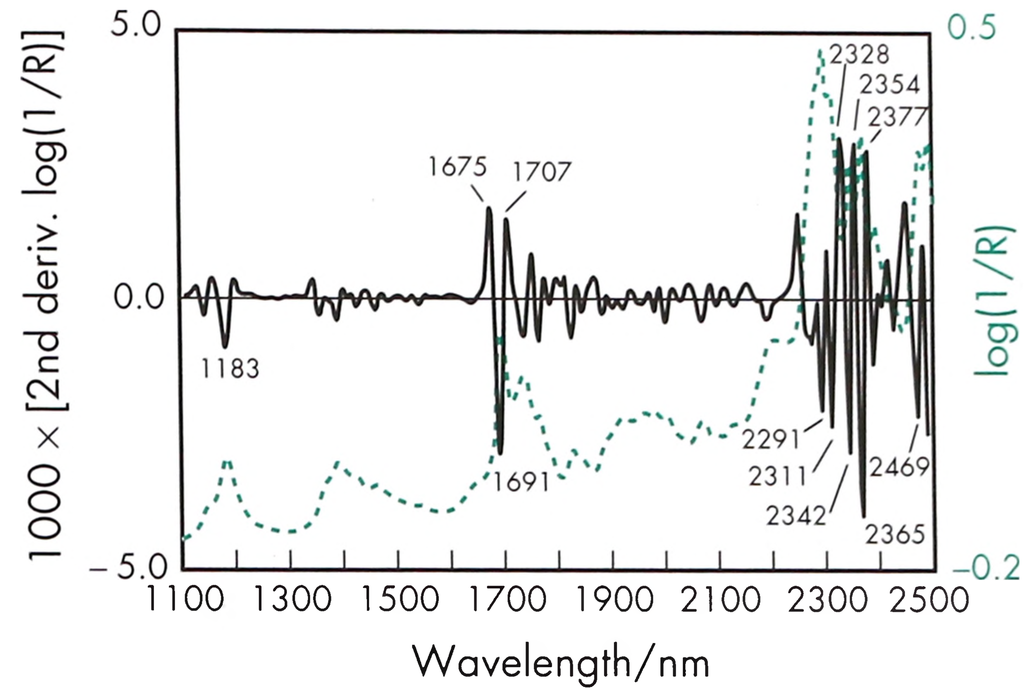

Figure 2: Near-infrared spectrum of sodium propionate measured by reflectance.

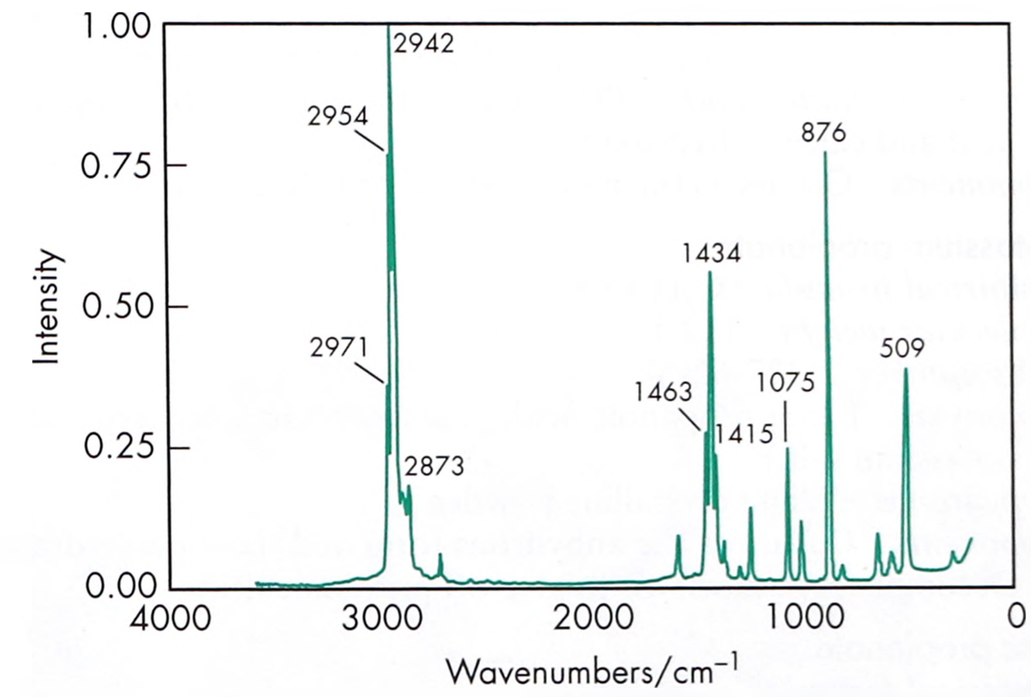

Figure 3: Raman spectrum of sodium propionate (anhydrous) measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

In humans, 6 g of sodium propionate has been administered daily without harm.[2] However, allergic reactions to propionates can occur.

LD_{50} (mouse, oral): 6.33 g/kg[5]
LD_{50} (mouse, SC): 2.1 g/kg
LD_{50} (rabbit, skin): 1.64 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium propionate may be irritant to the eyes and skin. Gloves, eye protection, and a dust-mask are recommended. When heated to decomposition, sodium propionate emits toxic fumes of sodium monoxide, Na_2O.

In the UK, the workplace exposure limits for propionic acid are 31 mg/m^3 (10 ppm), long-term (8-hour TWA) and 46 mg/m^3 (15 ppm) short-term.[6]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral tablets, capsules, powder, suspensions, and syrups). Included in nonparenteral medicines licensed in the UK. Sodium propionate is listed as a food additive in the EAFUS list compiled by the FDA. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium propionate; potassium propionate; propionic acid; zinc propionate.

Calcium propionate

Empirical formula $C_6H_{10}O_4Ca$
Molecular weight 186.22
CAS number [4075-81-4]
Synonyms Calcium dipropionate; E282; propanoic acid, calcium salt; propionic acid, calcium salt.
Appearance White crystalline powder.
Solubility Soluble in water; slightly soluble in ethanol (95%) and methanol; practically insoluble in acetone and benzene.
Method of manufacture Prepared by the reaction of propionic acid and calcium hydroxide.
Comments Occurs as the monohydrate or trihydrate.

S

Potassium propionate

Empirical formula $C_3H_5O_2K$
Molecular weight 112.17
CAS number [327-62-8]
Synonyms E283; propanoic acid, potassium salt; propionic acid, potassium salt.
Appearance White crystalline powder.
Comments Occurs as the anhydrous form and the monohydrate. Decomposes in moist air to give off propionic acid.

Zinc propionate

Empirical formula $C_6H_{10}O_4Zn$
Molecular weight 211.52
CAS number [557-28-8]
Synonyms Propanoic acid, zinc salt; propionic acid, zinc salt.
Appearance White platelets or needlelike crystals (for the monohydrate).
Solubility The anhydrous form is soluble 1 in 36 of ethanol (95%) at 15°C, 1 in 6 of boiling ethanol (95%), and 1 in 3 of water at 15°C.
Method of manufacture Prepared by dissolving zinc oxide in dilute propionic acid solution.
Comments Occurs as the anhydrous form and the monohydrate. Decomposes in moist air to give off propionic acid.

18 Comments

Propionate salts are used as antimicrobial preservatives in preference to propionic acid since they are less corrosive.

In food processes, particularly baking, sodium propionate is used as an antifungal agent; it may also be used as a flavoring agent in food products. In cheese products, propionates are limited to 0.3% w/w concentration; a limit of 0.32% w/w is applied in flour and white bread rolls, while a limit of 0.38% w/w is applied in whole wheat products.

Therapeutically, sodium propionate has been used topically in concentrations up to 10% w/w alone or in combination with other propionates, caprylates, or other antifungal agents, in the form of ointments or solutions for the treatment of dermatophyte infections. However, the therapeutic use of sodium propionate in topical antifungal preparations has largely been superseded by a new generation of antifungal drugs.

In veterinary medicine, sodium propionate is used therapeutically as a glucogenic substance in ruminants.[4]

A specification for sodium propionate is contained in the *Food Chemicals Codex* (FCC).[7]

The EINECS number for sodium propionate is 205-290-4. The PubChem Compound ID (CID) for sodium propionate is 23663426.

Sodium Starch Glycolate

1 Nonproprietary Names

BP: Sodium Starch Glycolate

JP: Sodium Starch Glycolate

PhEur: Sodium Starch Glycolate

USP–NF: Sodium Starch Glycolate

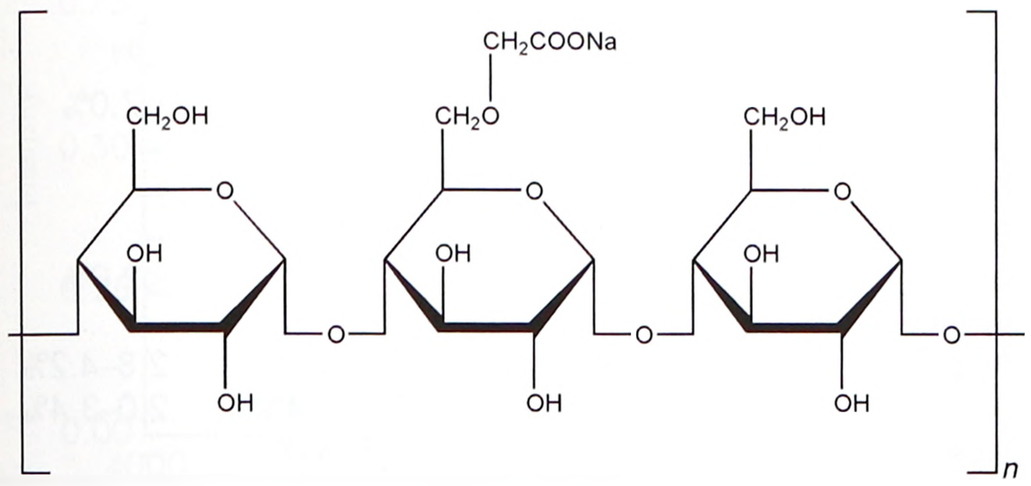
2 Synonyms

Carboxymethyl starch, sodium salt; carboxymethylamylum natricum; *Explosol*; *Explotab*; *Glycolys*; *Primojel*; *SSG Sanaq*; starch carboxymethyl ether, sodium salt; *Tablo*; *Vivastar Low pH*; *Vivastar P.*

3 Chemical Name and CAS Registry Number

Sodium carboxymethyl starch [9063-38-1]

4 Empirical Formula and Molecular Weight



The USP 40–NF 35 S1 describes two types of sodium starch glycolate, Type A and Type B, and states that sodium starch glycolate is the sodium salt of a carboxymethyl ether of starch or of a crosslinked carboxymethyl ether of starch.

The PhEur 9.2 describes three types of material: Type A and Type B are described as the sodium salt of a crosslinked partly *O*-carboxymethylated starch. Type C is described as the sodium salt of a partly *O*-carboxymethylated starch, crosslinked by physical dehydration. Types A, B, and C are differentiated by their pH, sodium, and sodium chloride content.

The PhEur and USP–NF monographs have been harmonized for Type A and Type B variants.

Sodium starch glycolate may be characterized by the degree of substitution and crosslinking. The molecular weight is typically 500 000–1 000 000.

5 Structural Formula

6 Functional Category

Tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium starch glycolate is widely used in oral pharmaceuticals as a disintegrant in capsule[1–6] and tablet formulations.[7–10] It is commonly used in tablets prepared by either direct-compression[11–13] or wet-granulation processes.[14–16]

Sodium starch glycolate has been used to accelerate the disintegration and formation of emulsion from tablets when in contact with gastrointestinal fluids in a self-microemulsifying drug delivery system.[17] It has also been investigated for use as a suspending vehicle.[18]

The usual concentration employed in a formulation is between 2% and 8%, with the optimum concentration about 4%, although in many cases 2% is sufficient. Disintegration occurs by rapid uptake of water followed by rapid and enormous swelling.[19–21]

Although the effectiveness of many disintegrants is affected by the presence of hydrophobic excipients, such as lubricants, the disintegrant efficiency of sodium starch glycolate is unimpaired. Increasing the tablet compression pressure also appears to have no effect on disintegration time.[10–12]

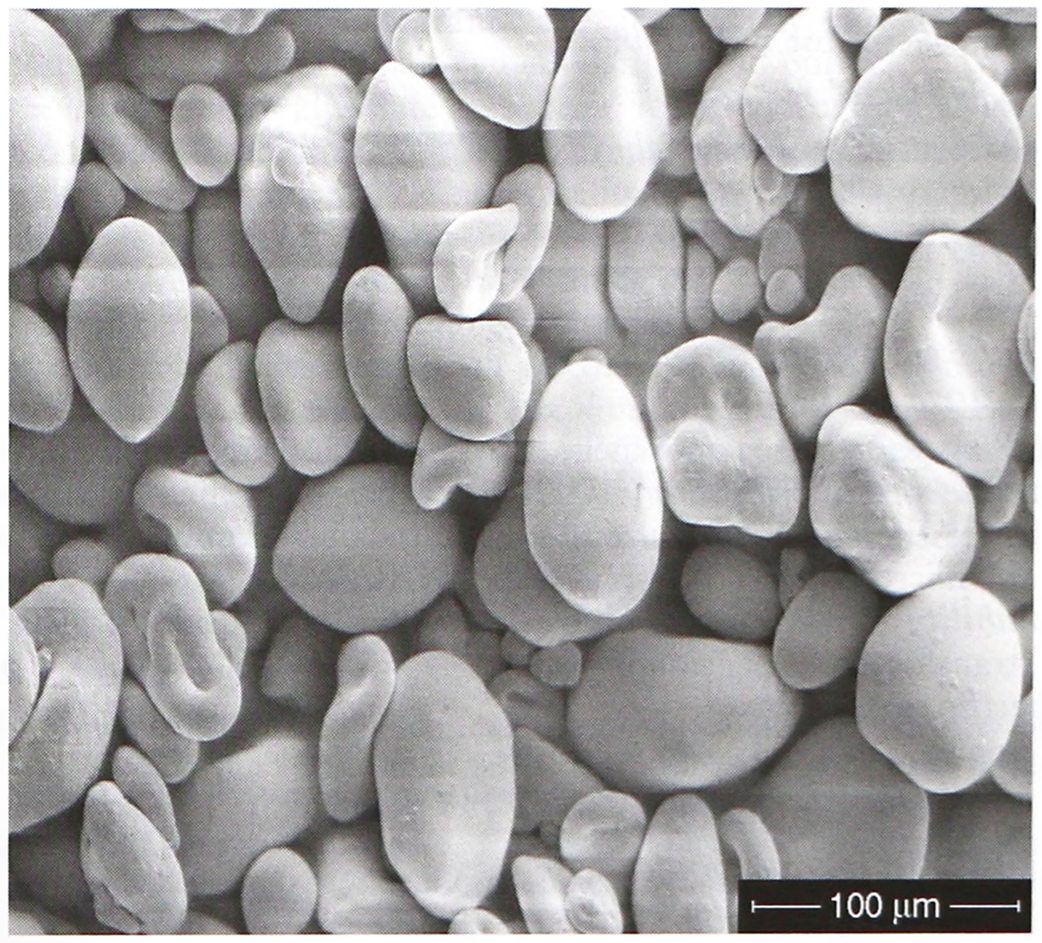
8 Description

Sodium starch glycolate occurs as a white or almost white, free-flowing, and very hygroscopic powder. The PhEur 9.2 states that when examined under a microscope it is seen to consist of: granules, irregularly shaped, ovoid or pear-shaped, 30–100 µm in size, or rounded, 10–35 µm in size; compound granules consisting of 2–4 components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

9 Pharmacopeial Specifications

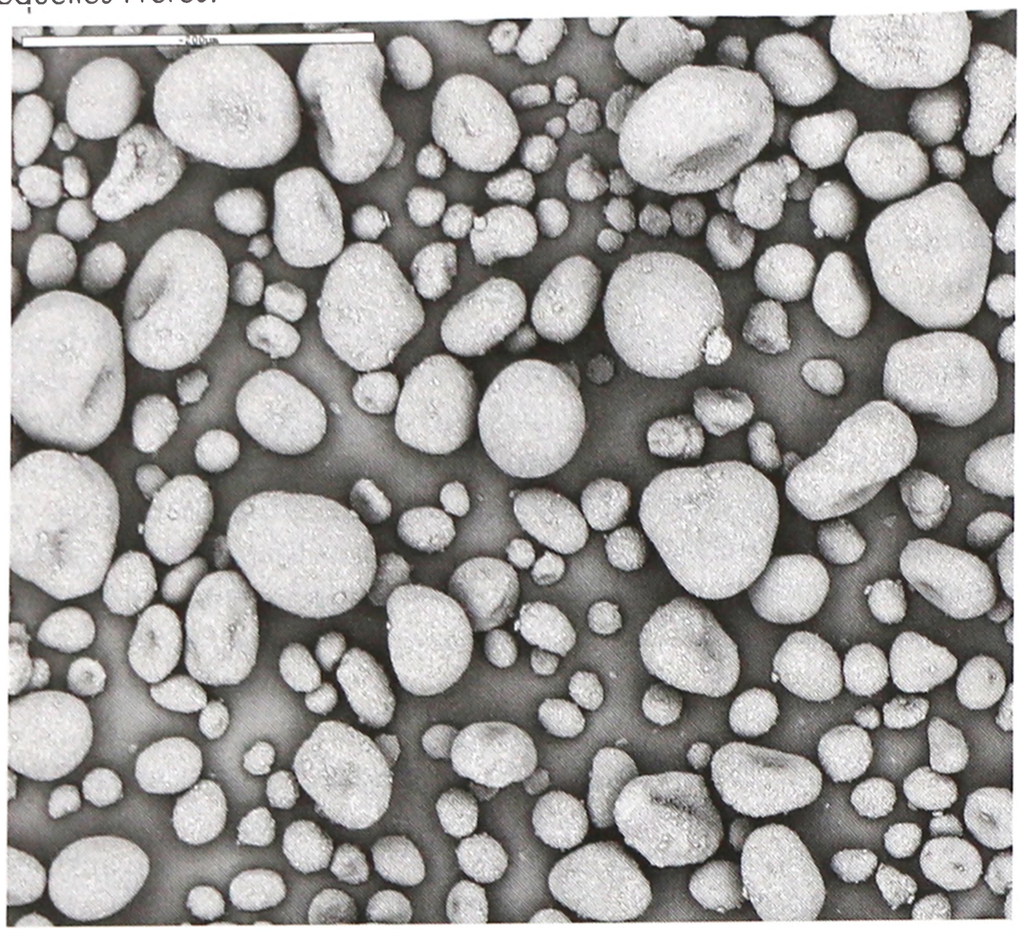
The pharmacopeial specifications for sodium starch glycolate have undergone harmonization of many attributes for PhEur, and USP–NF.

See Table I. *See also* Section 18.



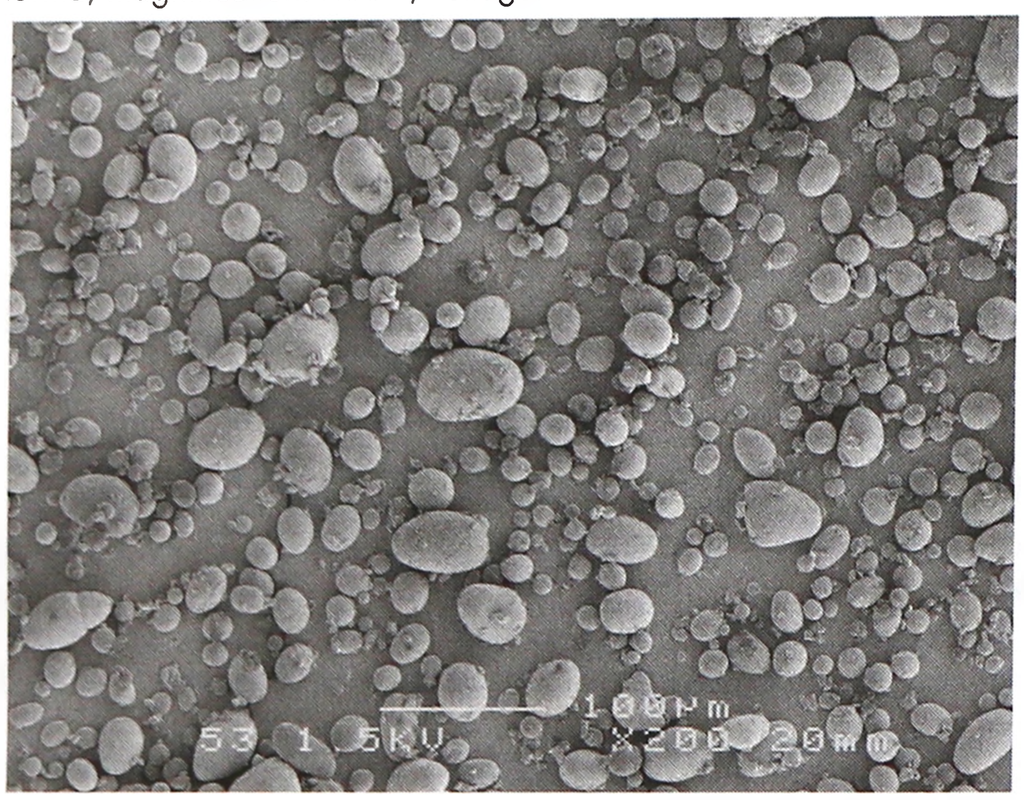
10 Typical Properties

Acidity/alkalinity *See* Section 9.



Density (bulk)

0.75 g/cm^3 for *Explotab*;
0.756 g/cm^3 for *Glycolys*;
0.81 g/cm^3 for *Primojel*;
0.67 g/cm^3 for *Tablo*.



SEM 1: Excipient: sodium starch glycolate (*Explotab*); manufacturer: JRS Pharma; magnification: 300×; voltage: 5 kV.

SEM 2: Excipient: sodium starch glycolate (*Glycolys*); manufacturer: Roquettes Frères.

SEM 3: Excipient: sodium starch glycolate (*Primojel*); manufacturer: DFE Pharma; magnification: 200×; voltage: 1.5 kV.

S

Density (tapped)

0.88 g/cm^3 for *Explotab*;
0.945 g/cm^3 for *Glycolys*;
0.98 g/cm^3 for *Primojel*;
0.83 g/cm^3 for *Tablo*.

Density (true)

1.51 g/cm^3 for *Explotab*;
1.56 g/cm^3 for *Primojel*;
1.49 g/cm^3 for *Tablo*.

Melting point Does not melt, but chars at approximately 200°C.

Particle size distribution 100% of particles less than 106 µm in size. Average particle size (d_{50}) is 38 µm and 42 µm for *Primojel* by microscopy and sieving, respectively.

Solubility Practically insoluble in methylene chloride. It gives a translucent suspension in water.

Specific surface area

0.202 m^2/g for *Explotab*;
0.24 m^2/g for *Glycolys*;
0.185 m^2/g for *Primojel*;
0.335 m^2/g for *Tablo*.

SEM 4: Excipient: sodium starch glycolate (*Vivastar P*); manufacturer: JRS Pharma; magnification: 300×; voltage: 5 kV.

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Swelling capacity In water, sodium starch glycolate swells to up to 300 times its initial volume.

Viscosity (dynamic) ≤200 mPa s (200 cP) for a 4% w/v aqueous dispersion; viscosity is 4.26 mPa s for a 2% w/v aqueous dispersion (depending on source and grade).

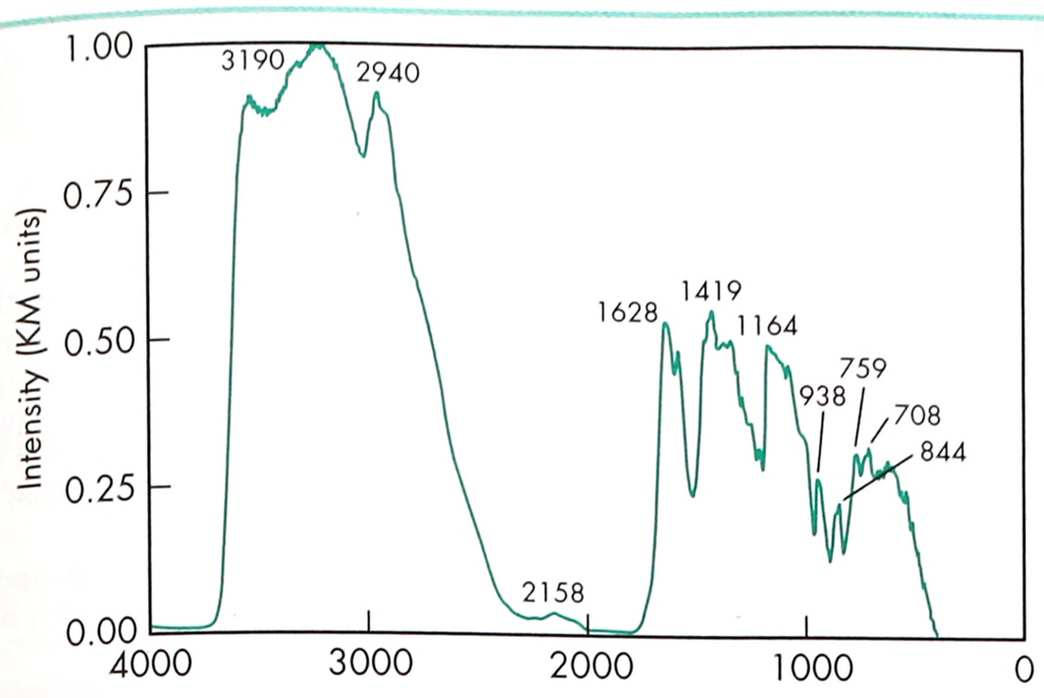

Figure 1: Infrared spectrum of sodium starch glycolate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

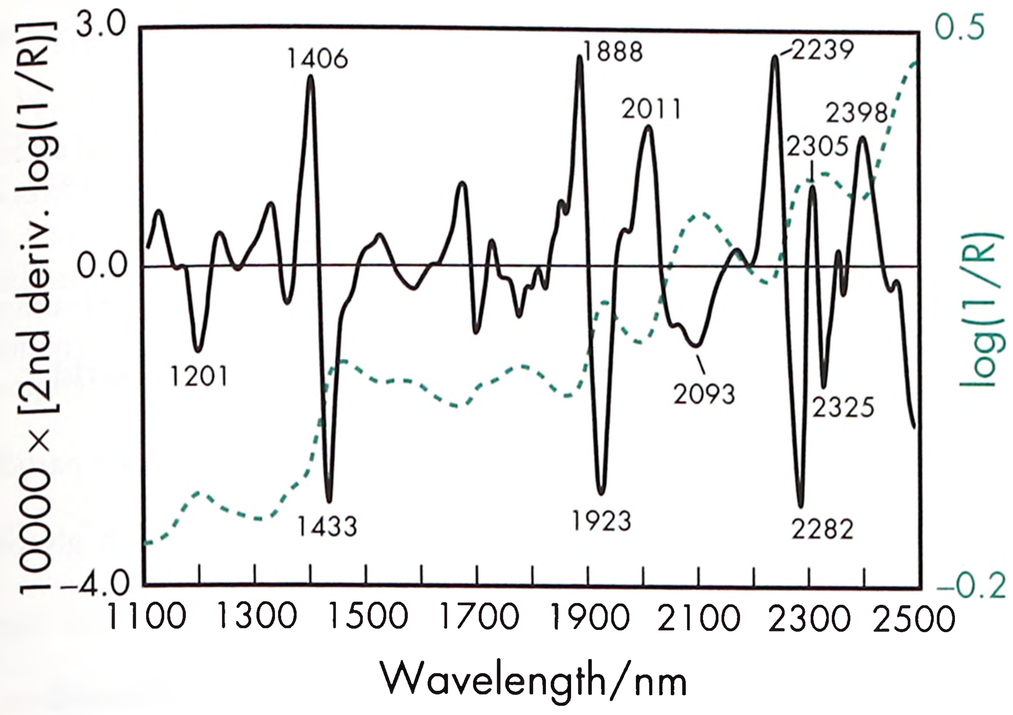

Figure 2: Near-infrared spectrum of sodium starch glycolate measured by reflectance.

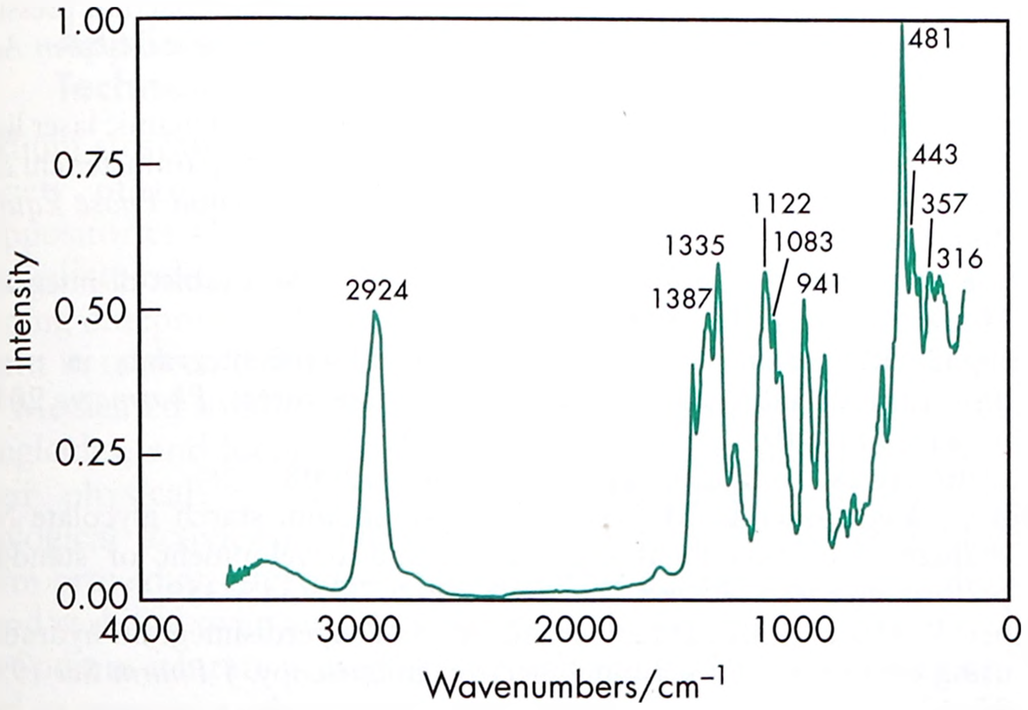

Figure 3: Raman spectrum of sodium starch glycolate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Tablets prepared with sodium starch glycolate have good storage properties.[22–24] Sodium starch glycolate is stable although very hygroscopic, and should be stored in a well-closed container in order to protect it from wide variations of humidity and temperature, which may cause caking.

The physical properties of sodium starch glycolate remain unchanged for up to three years if it is stored at moderate temperatures and humidity.

12 Incompatibilities

Sodium starch glycolate is incompatible with ascorbic acid.[25]

13 Method of Manufacture

Sodium starch glycolate is a substituted derivative of potato starch. Typically, commercial products are also crosslinked using either sodium trimetaphosphate (Types A and B) or dehydration (Type C).[26]

Starch is carboxymethylated by reacting it with sodium chloroacetate in an alkaline, nonaqueous medium, typically denatured ethanol or methanol, followed by neutralization with citric acid, acetic acid, or some other acid. *Vivastar P* is manufactured in methanolic medium, and *Explotab* in ethanolic medium.

14 Safety

Sodium starch glycolate is widely used in oral pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material. However, oral ingestion of large quantities may be harmful.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Sodium starch glycolate may be irritant to the eyes; eye protection and gloves are recommended. A dust mask or respirator is recommended for processes that generate a large quantity of dust.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Pregelatinized starch; starch.

18 Comments

Sodium starch glycolate has undergone harmonization of many attributes for PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The physical properties of sodium starch glycolate, and hence its effectiveness as a disintegrant, are affected by the degree of crosslinkage, extent of carboxymethylation, and purity.[27,28]

Sodium starch glycolate has been reported to interact with glycopeptide antibiotics,[29,30] basic drugs, and increase the photostability of norfloxacin.[31] The solubility of the formulation matrix and mode of incorporation in wet granulation can affect the disintegration time; disintegration times can be slower in tablets containing high levels of soluble excipients.[32]

Commercially, sodium starch glycolate is available in a number of speciality grades, e.g. low pH (*Explotab Low pH*, *Glycolys Low pH*); low viscosity (*Explotab CLV*, *Glycolys LV*); low solvent (*Vivastar PSF*); and low moisture *Glycolys LM*.

A specification for sodium starch glycolate is included in the *Japanese Pharmaceutical Excipients* (JPE).[33]

Sodium Stearate

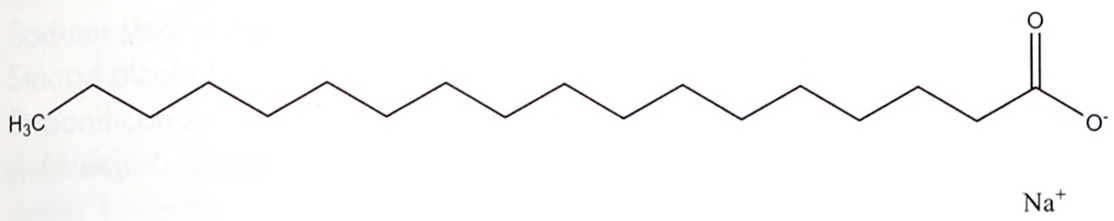
1 Nonproprietary Names

BP: Sodium Stearate
PhEur: Sodium Stearate
USP–NF: Sodium Stearate

2 Synonyms

Kemilub ES; natrii stearas; octadecanoic acid, sodium salt; *Prodhygine*; stearic acid, sodium salt; *STELLIESTERS SE 5S*.

3 Chemical Name and CAS Registry Number



Sodium octadecanoate [822-16-2]

4 Empirical Formula and Molecular Weight

$C_{18}H_{35}NaO_2$ 306.5

The USP 40–NF 35 S1 describes sodium stearate as a mixture of sodium stearate and sodium palmitate, which together constitute not less than 90% of the total content. Sodium stearate contains small amounts of the sodium salts of other fatty acids.

5 Structural Formula

6 Functional Category

Emulsifying agent; gelling agent; glidant; modified-release agent; stiffening agent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium stearate is used as an emulsifying and stiffening agent in a variety of topical creams[1] and rectal preparations (Glycerin Suppositories USP). It is used as a tablet and capsule lubricant in immediate-release tablets and gastro-resistant capsules both containing omeprazole. It is also used as a glidant and modified-release agent in tablets. It is used in the preparation of microemulsions.[2]

Medicated solidified sodium stearate sticks containing vitamins, fungicides, and local anesthetics have been extensively studied for their physical[3] and rheological[4] properties, stability,[5] and biological activity *in vitro* and in animals.[6] The stick dosage form proved as effective as the ointment dosage form, and showed good stability over an 18-month period.

Sodium stearate is used as a gelling agent in deodorant sticks,[7,8] and in cosmetics, shampoos, and bubble baths.

8 Description

Sodium stearate occurs as a white or yellowish fine powder, greasy to the touch with a slight, tallow-like odor.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Boiling point 359.4°C at 760 mmHg.
Flash point 162.4°C
Melting point 205–255°C

Table I: Pharmacopeial specifications for sodium stearate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Freezing point/solidification temperature	≥ 53°C	—
Acid value	195–210	196–211
Iodine value	—	≤4.0
Loss on drying	≤ 5%	≤ 5.0%
Acidity	+	+
Chlorides	≤ 0.2%	—
Sulfates	≤ 0.3%	—
Nickel	≤ 5 ppm	—
Microbial contamination		
Aerobic microbial count	10^3 cfu/g	—
Yeasts and molds	10^2 cfu/g	—

Sodium	7.4–8.5%	—
Stearic acid	≥ 40%	≥ 40%
Sum of stearic and palmitic acids	≥ 90%	≥ 90%

pH 10–11 for a 5% aqueous solution.
Solubility Slightly soluble in water, glycols, and ethanol (96%) at room temperature but readily dissolves on heating.
Specific gravity 1.02

11 Stability and Storage Conditions

Store in a well-closed container in a cool, dry place, protected from light. Keep away from sources of ignition.

12 Incompatibilities

Sodium stearate is incompatible with strong acids and oxidizing agents.

13 Method of Manufacture

Sodium stearate is prepared by reacting stearic acid with an equimolar portion of sodium hydroxide.[9]

14 Safety

Sodium stearate is generally nonirritating to skin although irritation has been reported after prolonged contact.[10] Ingestion may cause nausea, vomiting, and diarrhea. Momentary eye irritation is common. Irritant to respiratory tract and occupational asthma has been reported.[10]

LD_{50} (rabbit, skin): > 3 g/kg[11]
LD_{50} (rat, oral): > 5 g/kg[11]
LD_{Lo} (dog, IV): 0.01 g/kg[11–13]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, sodium stearate emits toxic and flammable fumes.

Eye protection and gloves are recommended. Sodium stearate may be harmful on inhalation and should be used in a well-ventilated environment; a respirator is recommended. In the US, the OSHA limit is 15 mg/m^3 for total dust for sodium stearate.[13] The

American Conference of Governmental Industrial Hygienists (ACGIH) TLV is 10 mg/m^3 for total dust for stearates.[11,13]

16 Regulatory Status

Included in the FDA Inactive Ingredient Database (oral, immediate and modified-release tablets). Included in nonparenteral medicines licensed in the UK (immediate-release tablets and gastroresistant capsules). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium stearate; magnesium stearate; zinc stearate.

18 Comments

Sodium stearate has been investigated as an adjunct to tobramycin microparticulate powders as pulmonary formulations in dry powder inhalers.[14] The presence of sodium stearate had a direct influence on the aerosol performance. In addition, preliminary analysis of the toxic effect of sodium stearate on a cell line showed no effect on cell viability compared to the pure drug. The pulmonary powders showed no overt toxicity to lung cells.

Sodium stearate has also been investigated in semisolid oleaginous ointment bases for ophthalmic use.[15]

Studies have shown that sodium stearate induces platelet aggregation,[16] which is probably the reason why intravenous infusion is known to cause massive thrombosis in dogs.[17]

Therapeutically, sodium stearate has been used in sycosis and other skin diseases.[9]

A specification for sodium stearate is contained in the *Japanese Pharmaceutical Excipients* (JPE).[18]

The EINECS number for sodium stearate is 212-490-5.

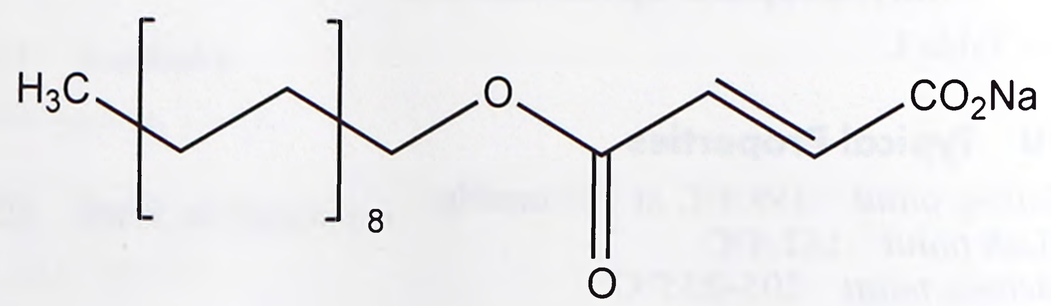
Sodium Stearyl Fumarate

1 Nonproprietary Names

BP: Sodium Stearyl Fumarate
PhEur: Sodium Stearyl Fumarate
USP–NF: Sodium Stearyl Fumarate

2 Synonyms

Fumaric acid, octadecyl ester, sodium salt; *Lubripharm*; natrii stearylis fumaras; *Pruv*; sodium monostearyl fumarate.



3 Chemical Name and CAS Registry Number

2-Butenedioic acid, monooctadecyl ester, sodium salt [4070-80-8]

4 Empirical Formula and Molecular Weight

$C_{22}H_{39}NaO_4$ 390.5

5 Structural Formula

6 Functional Category

Tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium stearyl fumarate is used as a lubricant in capsule and tablet formulations at concentrations of 0.5–2.0% w/w.[1–9] It is also used in certain food applications; *see* Section 16.

8 Description

Sodium stearyl fumarate for use as a pharmaceutical tablet lubricant occurs as a fine, white powder comprising agglomerates of flat, hexagonal-shaped particles about 5–10 μm in diameter.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium stearyl fumarate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Water	≤5.0%	≤5.0%
Lead	—	≤10 ppm
Heavy metals	—	≤20 ppm
Related substances	≤5.0%	—
Sodium stearyl maleate	—	≤0.25%

Solvent	Solubility at 20°C unless otherwise stated
Acetone	Practically insoluble
Chloroform	Practically insoluble
Ethanol	Practically insoluble
Methanol	Slightly soluble
Water	1 in 20 000 at 25°C 1 in 10 at 80°C 1 in 5 at 90°C

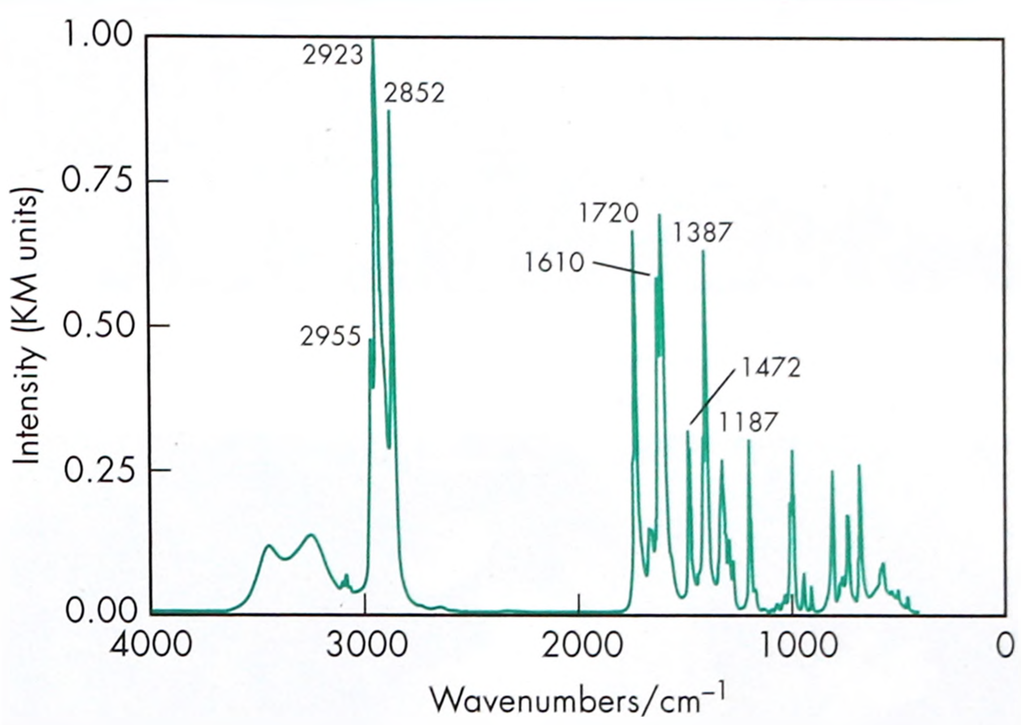

Figure 1: Infrared spectrum of sodium stearyl fumarate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

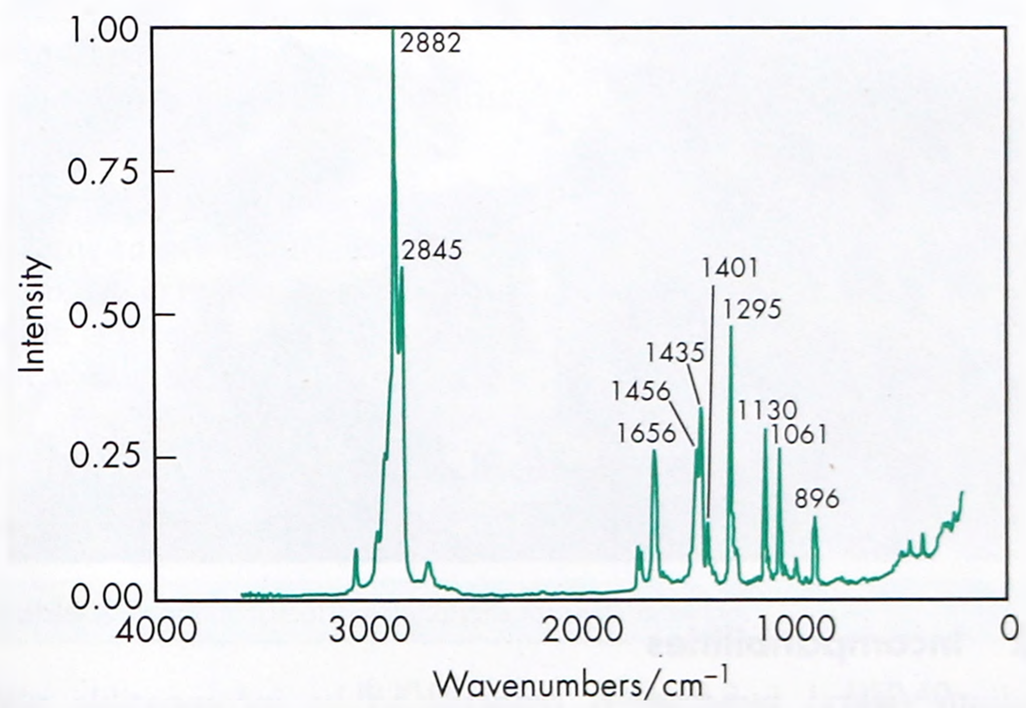

Figure 2: Raman spectrum of sodium stearyl fumarate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

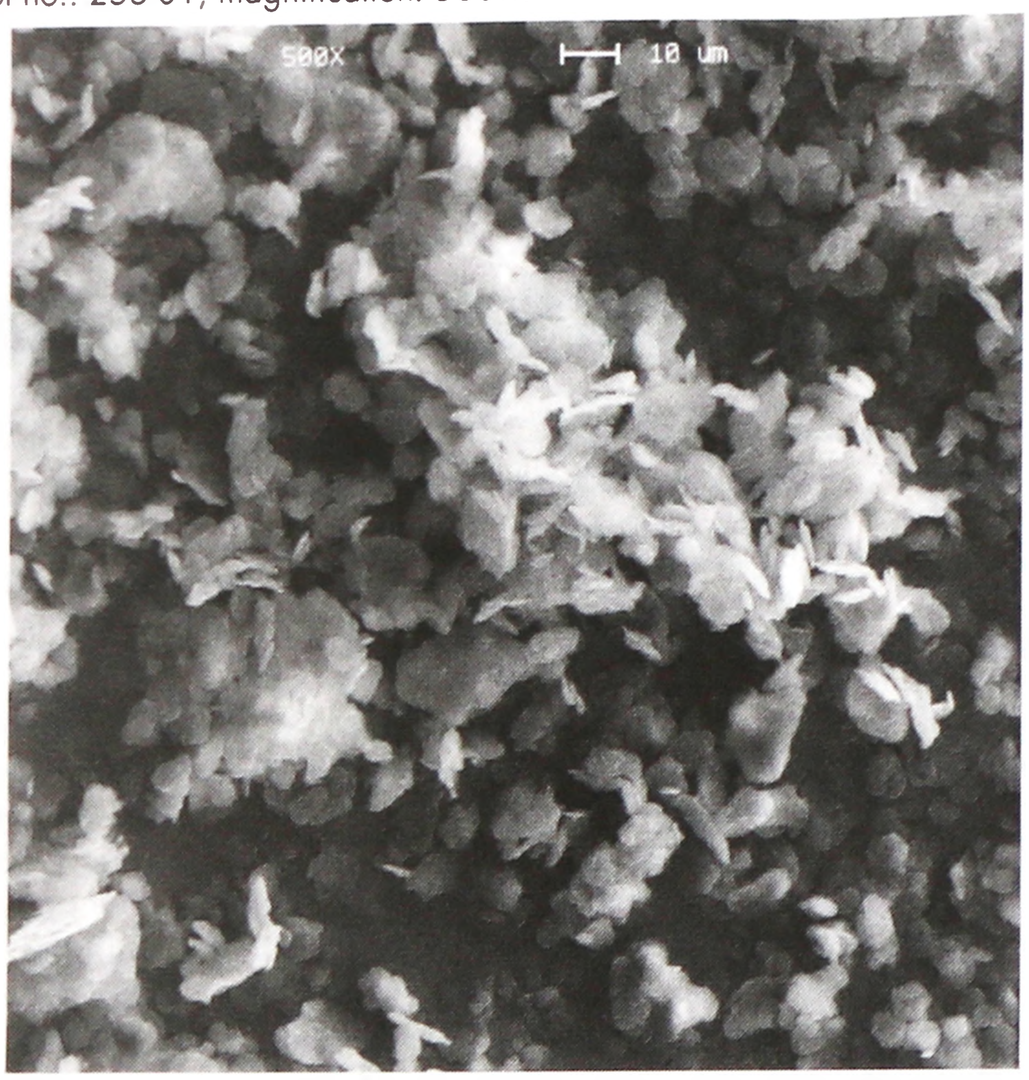
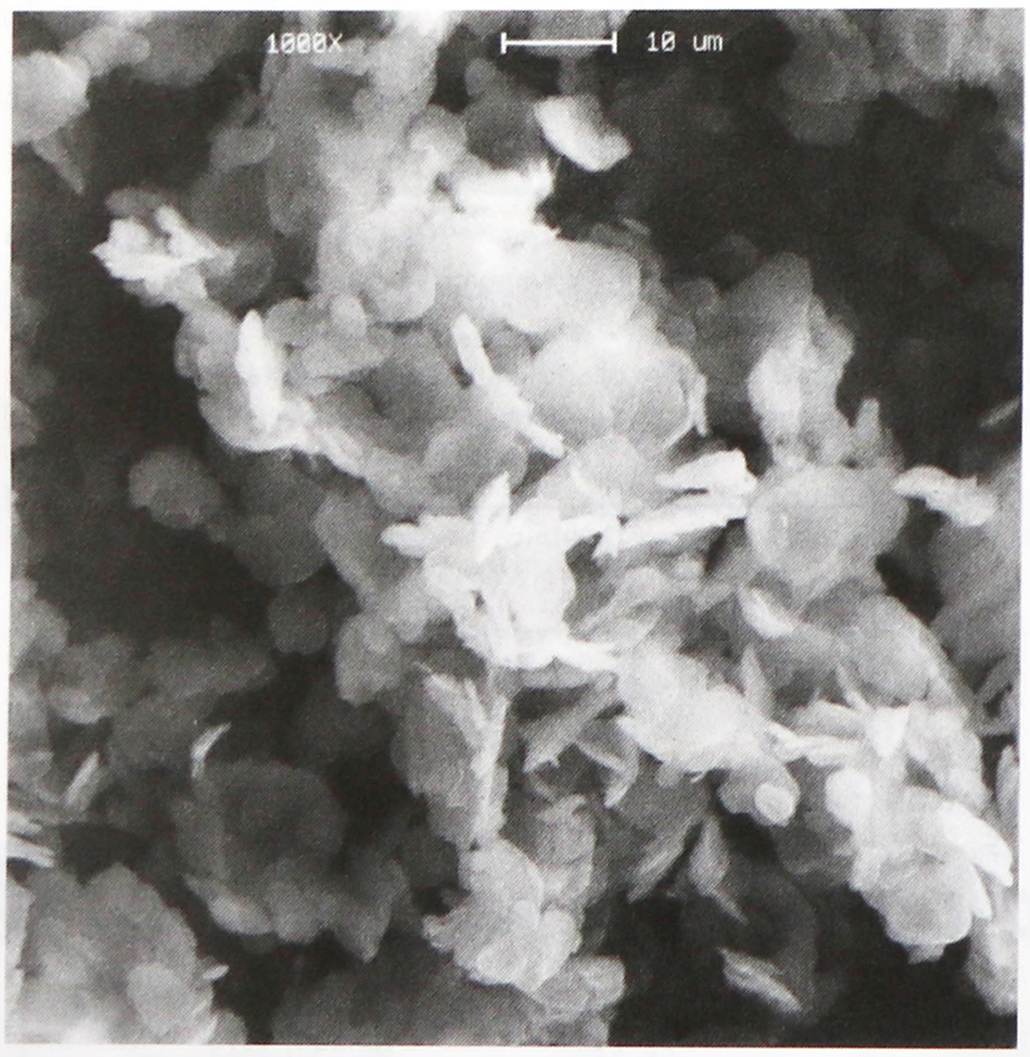


11 Stability and Storage Conditions

At ambient temperature, sodium stearyl fumarate is stable for up to 3 years when stored in amber glass bottles with polyethylene screw caps.



The bulk material should be stored in a well-closed container in a cool, dry place.

S

SEM 2: Excipient: sodium stearyl fumarate; manufacturer: JRS Pharma LP; lot no.: 255-01; magnification: 500×.

SEM 3: Excipient: sodium stearyl fumarate; manufacturer: JRS Pharma LP; lot no.: 255-01; magnification: 1000×.

12 Incompatibilities

Sodium stearyl fumarate is reported to be incompatible with chlorhexidine acetate.[10] Since it is a sodium salt, it will also undergo the typical incompatibilities of sodium salts especially at higher water activities. Primary amines can interact with the olefinic double bond of the fumarate moiety to form an adduct in a manner analogous to a Michael addition.

13 Method of Manufacture

Stearyl alcohol is reacted with maleic anhydride in stoichiometric ratio to form monostearyl maleate. The product of this reaction then undergoes an isomerization step to form the monostearyl fumarate, followed by salt formation to produce sodium stearyl fumarate.

14 Safety

Sodium stearyl fumarate is used in oral pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material.

Metabolic studies of sodium stearyl fumarate in the rat and dog indicated that approximately 80% was absorbed and 35% was rapidly metabolized. The fraction absorbed was hydrolyzed to stearyl alcohol and fumaric acid, with the stearyl alcohol further oxidized to stearic acid. In the dog, sodium stearyl fumarate that was not absorbed was excreted unchanged in the feces within 24 hours.[11]

Stearyl alcohol and stearic acid are naturally occurring constituents in various food products, while fumaric acid is a normal constituent of body tissue. Stearates and stearyl citrate have been reviewed by the WHO and an acceptable daily intake for stearyl citrate has been set at up to 50 mg/kg body-weight.[12] The establishment of an acceptable daily intake for stearates[12] and fumaric acid[13] was thought unnecessary.

Disodium fumarate has been reported to have a toxicity not greatly exceeding that of sodium chloride.[14,15]

See Fumaric Acid, Stearic Acid, and Stearyl Alcohol for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium stearyl fumarate should be handled in a well-ventilated environment; eye protection is recommended.

16 Regulatory Status

GRAS listed. Permitted by the FDA for direct addition to food for human consumption as a conditioning or stabilizing agent in various bakery products, flour-thickened foods, dehydrated potatoes, and processed cereals up to 0.2–1.0% by weight of the food. Included in nonparenteral medicines licensed in the UK. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Sodium stearyl fumarate can exist as two polymorphic forms; as small hexagonal plates or as needle crystals. The plate form is used as a tablet lubricant. Sodium stearyl fumarate is less hydrophobic than magnesium stearate or stearic acid and has less of a retardant effect on drug dissolution than magnesium stearate.

A specification for sodium stearyl fumarate is contained in the *Food Chemicals Codex* (FCC).[16]

A specification for sodium stearyl fumarate is included in the *Japanese Pharmaceutical Excipients* (JPE).[17]

The EINECS number for sodium stearyl fumarate is 223-781-1. The PubChem Compound ID (CID) for sodium stearyl fumarate is 23665634.

USP–NF: Sodium Sulfite

2 Synonyms

Disodium sulfite; exsiccated sodium sulfite; E221; natrii sulfis anhydricus; natrii sulfis siccatus; sulfurous acid disodium salt.

3 Chemical Name and CAS Registry Number

Sodium sulfite [7757-83-7]

4 Empirical Formula and Molecular Weight

Na_2SO_3 126.04

5 Structural Formula

See Section 4.

6 Functional Category

Antimicrobial preservative; antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium sulfite is used as an antioxidant in applications similar to those for sodium metabisulfite.[1] It is also an effective antimicrobial preservative, particularly against fungi at low pH (0.1% w/v of sodium sulfite is used). Sodium sulfite is used in cosmetics, food products, and pharmaceutical applications such as parenteral formulations, inhalations, oral formulations, and topical preparations.

See also Sodium Metabisulfite.

8 Description

Sodium sulfite occurs as an odorless white powder or hexagonal prismatic crystals. Note that the commercially available sodium sulfite is often presented as a white to tan- or pink-colored powder that would not conform to the pharmacopeial specification.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium sulfite.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Characters	+	+	–
Identification	+	+	+
Appearance of solution	–	+	+
Heavy metals	≤20 ppm	–	≤10 ppm
Arsenic	≤4 ppm	–	–
Iron	–	≤10 ppm	≤10 ppm
Selenium	–	≤10 ppm	≤10 ppm
Thiosulfates	+	≤0.1%	≤0.1%
Zinc	–	≤25 ppm	≤25 ppm
Assay	≥97%	95.0–100.5%	95.0–100.5%

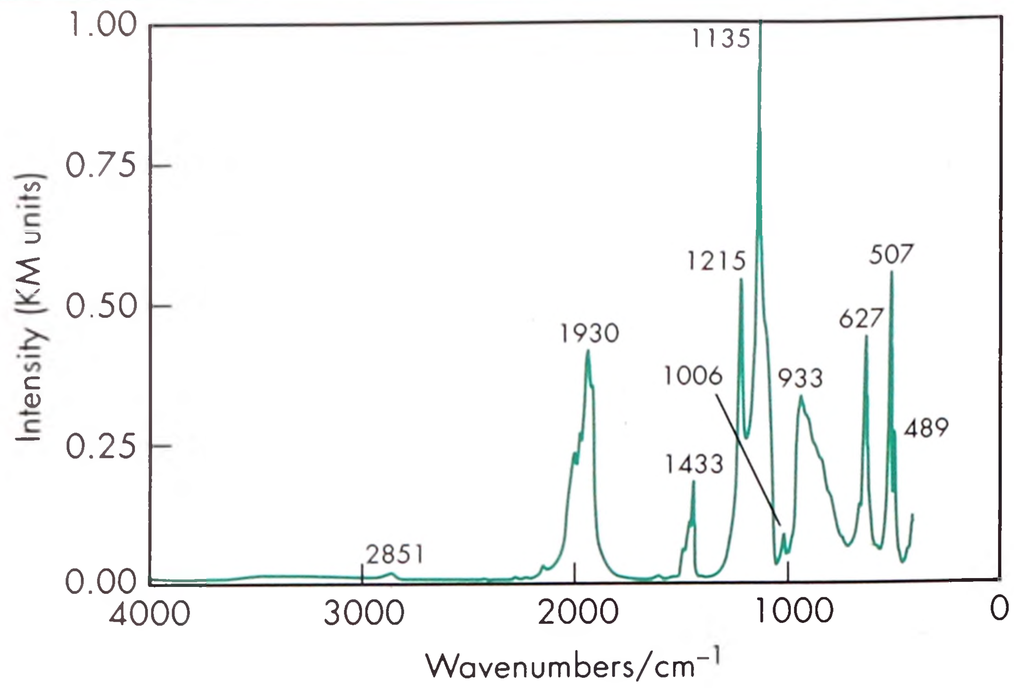

Figure 1: Infrared spectrum of sodium sulfite measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

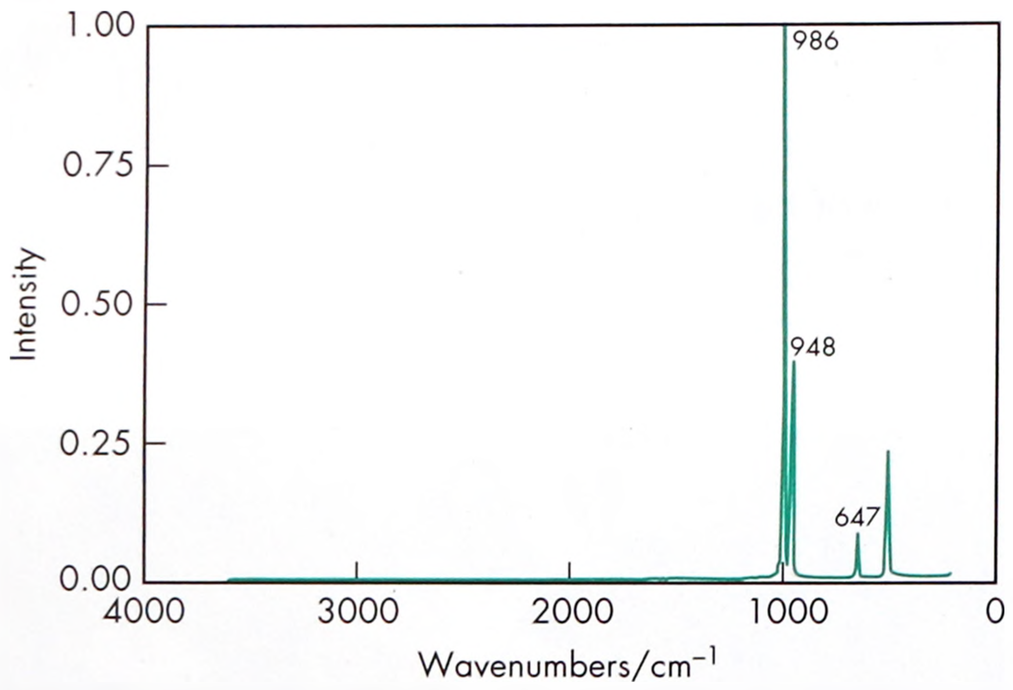

Figure 2: Raman spectrum of sodium sulfite measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

10 Typical Properties

Acidity/alkalinity pH = 8.5–10.5 in aqueous solution at 25°C.
Density 2.630 g/cm^3
Hygroscopicity Hygroscopic.
Solubility Soluble 1 in 3.2 parts of water; soluble in glycerin; practically insoluble in ethanol (96%), acetone, and most other organic solvents.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

Sodium sulfite should be stored in a well-closed container in a cool, dry place, away from incompatible products. It is stable in dry air at ambient temperatures or at 100°C, but undergoes rapid oxidation to sodium sulfate in moist air. In solution, sodium sulfite is slowly oxidized to sulfate by dissolved oxygen; strong acids lead to formation of sulfurous acid/sulfur dioxide. On heating, sodium sulfite decomposes liberating sulfur oxides.

12 Incompatibilities

Sodium sulfite is incompatible with acids, oxidizing agents, many proteins, and vitamin B_1.

See also Sodium Metabisulfite.

13 Method of Manufacture

Sodium bisulfite is prepared by reacting sulfur dioxide gas with aqueous sodium hydroxide or sodium carbonate. The solid material is obtained by evaporation of water. Further neutralization with sodium hydroxide or sodium carbonate while keeping the temperature above 33.6°C leads to crystallization of the anhydrous sodium sulfite (below this temperature the heptahydrate form is obtained).

14 Safety

Sodium sulfite is widely used in food and pharmaceutical applications as an antioxidant and antimicrobial preservative. It is generally regarded as relatively nontoxic and nonirritant when used as an excipient.[2,3] However, contact dermatitis and hypersensitivity reactions have been reported, some of which are occasionally severe.[4–6] In the UK, the acceptable daily intake of sodium sulfite and other sulfites used in foodstuffs has been set at up to 3.5 mg/kg body-weight, calculated as sulfur dioxide (SO_2).[7] The WHO has set an acceptable daily intake of sodium sulfite, and other sulfites, at up to 0.7 mg/kg body-weight, calculated as sulfur dioxide (SO_2).[8]

See also Potassium Metabisulfite for more safety information regarding the sulfites in general.

LD_{50} (mouse, IP): 0.950 g/kg[9]
LD_{50} (mouse, IV): 0.130 g/kg
LD_{50} (mouse, oral): 0.820 g/kg
LD_{50} (rabbit, IV): 0.065 g/kg
LD_{50} (rabbit, oral): 1.181 g/kg
LD_{50} (rat, IV): 0.115 g/kg
LD_{50} (rat, oral): 3.56 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in FDA Inactive Ingredients Database (epidural, IM, IV, and SC injections; inhalation solution; ophthalmic solutions; oral syrups and suspensions; otic solutions; topical creams and emulsions). Included in parenteral and nonparenteral medicines licensed in the UK.

17 Related Substances

Sodium sulfite heptahydrate; sodium metabisulfite; sulfur dioxide.

Sodium sulfite heptahydrate

Synonyms Natrii sulfis heptahydricus
CAS number [7785-83-7]
Molecular weight 252.15
Description Colorless crystals.
Density 1.56 g/cm^3
Solubility 1 in 1.6 of water; 1 in 30 of glycerin; sparingly soluble in ethanol (95%).
Comments Sodium sulfite heptahydrate is included in the PhEur 9.2. The heptahydrate is unstable, oxidizing in the air to the sulfate.

18 Comments

Like all sulfites, sodium sulfite is not recommended for use in foods that are a source of thiamin, owing to the instability of the vitamin in their presence. Such foods include meat, raw fruits and vegetables, fresh potatoes, and foods that are a source of vitamin B_{12}.

A specification for sodium sulfite is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for sodium sulfite is 231-821-4. The PubChem Compound ID (CID) for sodium sulfite is 24437.

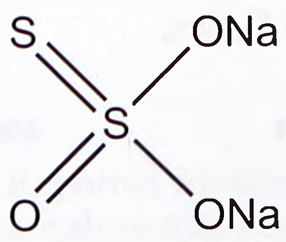
Sodium Thiosulfate

1 Nonproprietary Names

BP: Sodium Thiosulphate
JP: Sodium Thiosulfate Hydrate
PhEur: Sodium Thiosulfate
USP–NF: Sodium Thiosulfate

2 Synonyms

Ametox; disodium thiosulfate; disodium thiosulfate pentahydrate; natrii thiosulfas; natrium thiosulfuricum; sodium hyposulfite; sodium subsulfite; *Sodothiol*; *Sulfothiorine*; thiosulfuric acid disodium salt.



3 Chemical Name and CAS Registry Number

Sodium thiosulfate anhydrous [7772-98-7]
Sodium thiosulfate pentahydrate [10102-17-7]

4 Empirical Formula and Molecular Weight

$Na_2S_2O_3$ 158.11 (for anhydrous)
$Na_2S_2O_3 \cdot 5H_2O$ 248.2 (for pentahydrate)

5 Structural Formula

6 Functional Category

Antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium thiosulfate is used as an antioxidant in pharmaceuticals (ophthalmic, intravenous, and oral preparations).

8 Description

Sodium thiosulfate occurs as odorless and colorless crystals, a crystalline powder or granules. It is efflorescent in dry air and deliquescent in moist air.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity Aqueous solution practically neutral at pH 6.5–8.0 (pentahydrate).
Density 1.69 g/cm^3 (pentahydrate)
Hygroscopicity Slightly deliquesces in moist air (pentahydrate).
Melting point 48°C (pentahydrate)
Solubility Soluble in water; practically insoluble in ethanol (95%).

11 Stability and Storage Conditions

Sodium thiosulfate decomposes on heating. The bulk powder should be stored in a cool place, and the container should be kept

S

SEM 1: Excipient: sodium thiosulfate; magnification: 100×; voltage: 10 kV.

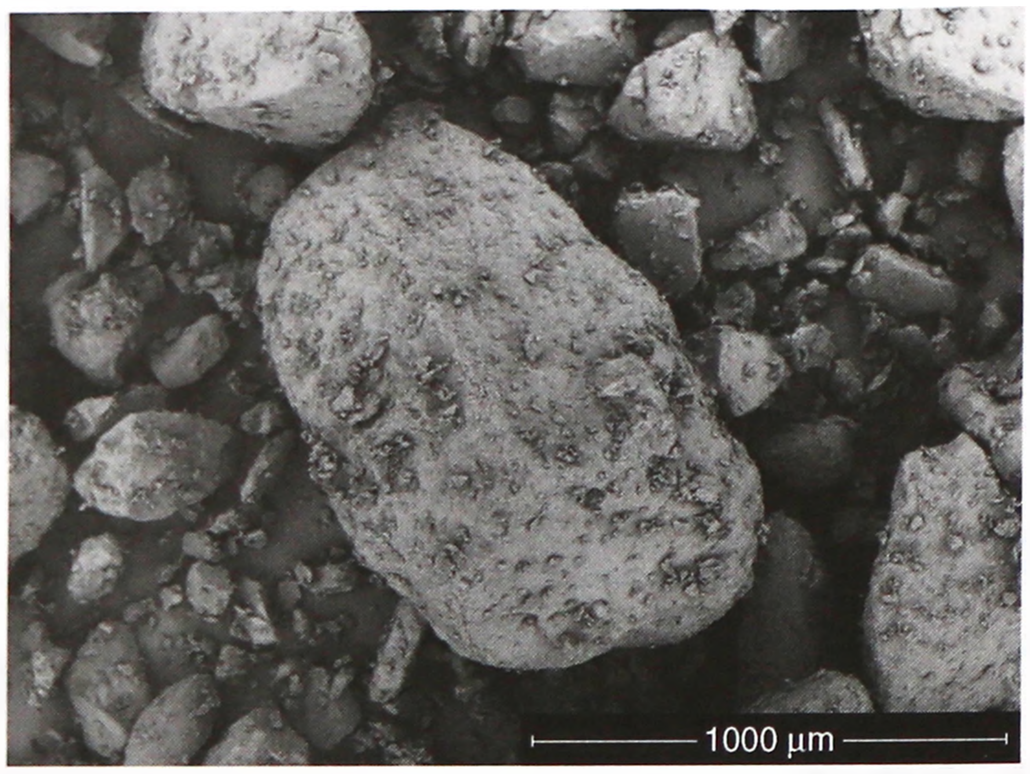


Table 1: Pharmacopeial specifications for sodium thiosulfate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—

tightly closed in a dry and well-ventilated place. It should not be stored near acids.

S

12 Incompatibilities

Sodium thiosulfate is incompatible with iodine, with acids, and with calcium, lead, mercury, and silver salts. It may reduce the activity of some preservatives, including bronopol, phenylmercuric salts, and thimerosal.[1]

13 Method of Manufacture

On an industrial scale, sodium thiosulfate is produced chiefly from liquid waste products of sodium sulfide or sulfur dye manufacture. Small-scale synthesis is done by boiling an aqueous solution of sodium sulfite with sulfur.[2,3]

14 Safety

Sodium thiosulfate is used in ophthalmic, intravenous, and oral pharmaceutical preparations. Apart from osmotic disturbances, sodium thiosulfate is relatively nontoxic. It is moderately toxic by the subcutaneous route and mildly irritating to respiratory tract and skin. Large oral doses have a cathartic action.[1] The WHO has set an acceptable daily intake of sodium thiosulfate at up to 0.7 mg/kg body-weight, calculated as sulfur dioxide (SO_2).[4]

LD_{50} (mouse, IP): 5.6 g/kg[5]
LD_{50} (mouse, IV): 2.4 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Wear eye protection. Protective gloves are recommended for prolonged or repeated contact use. Hazardous products (sulfur oxides) are formed when heated to decomposition.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (IV solutions; ophthalmic solutions and suspensions; oral capsules, solutions, and tablets). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Sodium thiosulfate has been used as an antidote to cyanide poisoning.[6,7] Thiosulfate acts as a sulfur donor for the conversion of cyanide to thiocyanate (which can then be safely excreted in the urine), catalyzed by the enzyme rhodanase.

Therapeutically, sodium thiosulfate has been shown to produce clinical improvement of calciphylaxis lesions in adults with chronic kidney disease.[8] It has also been used for its antifungal properties[1] and as a reagent in analytical chemistry.

There is a specification for sodium thiosulfate in the *Food Chemicals Codex* (FCC).[9]

The EINECS number for sodium thiosulfate is 231-867-5. The PubChem Compound ID (CID) for sodium thiosulfate is 24477 and for the pentahydrate is 61475.

3 Chemical Name and CAS Registry Number

(*E*,*E*)-Hexa-2,4-dienoic acid [110–44–1] and [22500-92-1]

4 Empirical Formula and Molecular Weight

$C_6H_8O_2$ 112.13

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Sorbic acid is an antimicrobial preservative[1,2] with antibacterial and antifungal properties used in pharmaceuticals and enteral preparations. Generally, it is used at concentrations of 0.05–0.2% in oral and topical pharmaceutical formulations, especially those containing nonionic surfactants. Sorbic acid has been used in pluronic lecithin organogel formulations investigated for topical drug delivery[3] and is also used with proteins, enzymes, gelatin, and vegetable gums.[4] It has been shown to be an effective preservative for promethazine hydrochloride solutions in a concentration of 1 g/L.[5]

Sorbic acid is primarily used as an antifungal agent, although it also possesses antibacterial properties. The optimum antibacterial activity is obtained at pH 4.5; and practically no activity is observed above pH 6.[6,7] Sorbic acid has limited stability and activity against bacteria and is thus frequently used in combination with other antimicrobial preservatives or glycols, when synergistic effects appear to occur.[8]

8 Description

Sorbic acid occurs as a tasteless, white to yellow-white crystalline powder with a faint characteristic odor.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Antimicrobial activity Reported minimum inhibitory concentrations (MICs) at pH 6 are shown in Table II.[9]

Methanol	1 in 8
Propylene glycol	1 in 19
Water	1 in 400 at 30°C
	1 in 26 at 100°C

11 Stability and Storage Conditions

Sorbic acid is sensitive to oxidation, particularly in the presence of light; oxidation occurs more readily in aqueous solution than in the solid form. Sorbic acid may be stabilized by phenolic antioxidants such as 0.02% propyl gallate.[8]

Sorbic acid is combustible when exposed to heat or flame. When heated to decomposition, it emits acrid smoke and irritating fumes. The bulk material should be stored in a well-closed container, protected from light, at a temperature not exceeding 40°C.

12 Incompatibilities

Sorbic acid is incompatible with bases, oxidizing agents, and reducing agents. Some loss of antimicrobial activity occurs in the presence of nonionic surfactants and plastics. Oxidation is catalyzed by heavy-metal salts. Sorbic acid will also react with sulfur-containing amino acids, although this can be prevented by the addition of ascorbic acid, propyl gallate, or butylhydroxytoluene.

When stored in glass containers, the solution becomes very pH sensitive; therefore, preparations using sorbic acid as a preservative should be tested for their microbial purity after prolonged periods of storage.

Aqueous solutions of sorbic acid without the addition of antioxidants are rapidly decomposed when stored in polypropylene, polyvinylchloride, and polyethylene containers.

13 Method of Manufacture

Naturally occurring sorbic acid may be extracted as the lactone (parasorbic acid) from the berries of the mountain ash *Sorbus aucuparia* L. (Fam. Rosaceae). Synthetically, sorbic acid may be prepared by the condensation of crotonaldehyde and ketene in the presence of boron trifluoride; by the condensation of crotonaldehyde and malonic acid in pyridine solution; or from 1,1,3,5-tetraalkoxyhexane. Fermentation of sorbaldehyde or sorbitol with bacteria in a culture medium has also been used.

14 Safety

Sorbic acid is used as an antimicrobial preservative in oral and topical pharmaceutical formulations and is generally regarded as a nontoxic material. However, adverse reactions to sorbic acid and potassium sorbate, including irritant skin reactions[10–13] and allergic hypersensitivity skin reactions (which are less frequent), have been reported.[14–16]

Other adverse reactions that have been reported include exfoliative dermatitis due to ointments that contain sorbic acid,[17] and allergic conjunctivitis caused by contact lens solutions preserved with sorbic acid.[18]

No adverse reactions have been described after systemic administration of sorbic acid, and it has been reported that it can be ingested safely by patients who are allergic to sorbic acid.[19] However, perioral contact urticaria has been reported.[13]

The WHO has set an estimated total acceptable daily intake for sorbic acid, calcium sorbate, potassium sorbate, and sodium

sorbate, expressed as sorbic acid, at up to 25 mg/kg bodyweight.[20,21]

The Cosmetic Ingredient Review Expert Panel has assessed sorbic acid and concluded that the material is safe as used in cosmetic formulations in present practices of use and concentration.[22]

Animal toxicological studies have shown no mammalian carcinogenicity or teratogenicity for sorbic acid consumed at up to 10% of the diet.[23]

LD_{50} (mouse, IP): 2.82 g/kg[24]
LD_{50} (mouse, oral): 3.20 g/kg[24]
LD_{50} (mouse, SC): 2.82 g/kg[24]
LD_{50} (rat, oral): 7.36 g/kg[24]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sorbic acid can be irritant to the skin, eyes, and respiratory system. Eye protection, gloves, and a dust mask or respirator are recommended.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (ophthalmic solutions; oral capsules, solutions, syrups, tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the EAFUS list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium sorbate; potassium sorbate; sodium sorbate.

Calcium sorbate

Empirical formula $C_{12}H_{14}O_4Ca$
Synonyms E203
Molecular weight 262.33
CAS number [7492-55-9]
Appearance White, odorless, tasteless, crystalline powder.
Solubility Soluble 1 in 83 parts of water; practically insoluble in fats.
Comments The EINECS number for calcium sorbate is 231-321-6.

Sodium sorbate

Empirical formula $C_6H_7O_2Na$
Synonyms E201; sodium (*E*,*E*)-hexa-2,4-dienoate.
Molecular weight 134.12
CAS number [42788-83-0]
Appearance Light, white, crystalline powder.
Solubility Soluble 1 in 3 parts of water.
Comments The EINECS number for sodium sorbate is 231-819-3.

18 Comments

Sorbic acid is also used as an antimicrobial preservative in foods and cosmetics.

The *trans*,*trans*-isomer of sorbic acid is the commercial product. A specification for sorbic acid is contained in the *Food Chemicals Codex* (FCC).[25]

The EINECS number for sorbic acid is 203-768-7. The PubChem Compound ID (CID) for sorbic acid includes 643460 and 1550734.

Sorbitan Esters (Sorbitan Fatty Acid Esters)

1 Nonproprietary Names

BP: Sorbitan Laurate
Sorbitan Oleate
Sorbitan Palmitate
Sorbitan Sesquioleate
Sorbitan Stearate
Sorbitan Trioleate

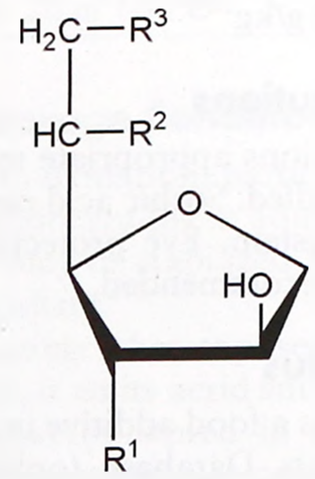
JP: Sorbitan Sesquioleate

PhEur: Sorbitan Laurate
Sorbitan Oleate
Sorbitan Palmitate
Sorbitan Sesquioleate
Sorbitan Stearate
Sorbitan Trioleate

USP–NF: Sorbitan Monolaurate (sorbitan, esters monodecanoate)
Sorbitan Monooleate
Sorbitan Monopalmitate
Sorbitan Monostearate
Sorbitan Sesquioleate
Sorbitan Trioleate

2 Synonyms

See Table I.



3 Chemical Names and CAS Registry Numbers

See Table II.

4 Empirical Formula and Molecular Weight

See Table III.

5 Structural Formula

$R^1 = R^2 = OH$, $R^3 = R$ (see below) for sorbitan monoesters
$R^1 = OH$, $R^2 = R^3 = R$ for sorbitan diesters
$R^1 = R^2 = R^3 = R$ for sorbitan triesters
where R = $(C_{17}H_{35})COO$ for isostearate
$(C_{11}H_{23})COO$ for laurate
$(C_{17}H_{33})COO$ for oleate
$(C_{15}H_{31})COO$ for palmitate
$(C_{17}H_{35})COO$ for stearate
The sesquiesters are equimolar mixtures of monoesters and diesters.

Table I: Synonyms of selected sorbitan esters.

Name	Synonym
Sorbitan monoisostearate	1,4-Anhydro-D-glucitol, 6-isooctadecanoate; anhydrosorbitol monoisostearate; *Arlacel 987*; *Crill 6*; *Montane 70*; sorbitan isostearate.
Sorbitan monolaurate	*Alkamuls SML*; *Arlacel 20*; *Armotan ML*; *Crill 1*; *Dehymuls SML*; E493; *Emsorb 2515*; *Glycomul L*; *Hodag SML*; *Liposorb L-80*; *Montane 20*; *Protachem SMLLiposorb L*; *Montane 20*; *Protachem SML*; *Sorbester P12*; *Sorbirol L*; sorbitan, esters, monodecanoate; sorbitan laurate; sorbitani lauras; *Span 20*; *Tego SML*.
Sorbitan monooleate	*Ablunol S-80*; *Alkamuls SMO*; *Arlacel 80*; *Armotan MO*; *Capmul O*; *Crill 4*; *Crill 50*; *Dehymuls SMO*; *Drewmulse SMO*; *Drewsorb 80K*; E494; *Emsorb 2500*; *Glycomul O*; *Hodag SMO*; *Lamesorb SMO*; *Liposorb O*; *Montane 80*; *Nikkol SO-10*; *Nissan Nonion OP-80R*; *Norfox Sorbo S-80*; *Polycon S80 K*; *Proto-sorb SMO*; *Protachem SMO*; *S-Maz 80K*; *Sorbester P17*; *Sorbirol O*; sorbitan, esters, mono(Z)-9-octadecanoate; sorbitan oleate; sorbitani oleas; *Sorgen 40*; *Sorgon S-40-H*; *Span 80*; *Tego SMO*.
Sorbitan monopalmitate	1,4-Anhydro-D-glucitol, 6-hexadecanoate; *Ablunol S-40*; *Arlacel 40*; *Armotan MP*; *Crill 2*; *Dehymuls SMP*; E495; *Glycomul P*; *Hodag SMP*; *Lamesorb SMP*; *Liposorb P*; *Montane 40*; *Nikkol SP-10*; *Nissan Nonion PP-40R*; *Protachem SMP*; *Proto-sorb SMP*; *Sorbester P16*; *Sorbirol P*; sorbitan, esters, monohexadecanoate; sorbitan palmitate; sorbitani palmitas; *Span 40*.
Sorbitan monostearate	*Ablunol S-60*; *Alkamuls SMS*; 1,4-Anhydro-D-glucitol, 6-octadecanoate; anhydrosorbitol monostearate; *Arlacel 60*; *Armotan MS*; *Atlas 110K*; *Capmul S*; *Crill 3*; *Dehymuls SMS*; *Drewmulse SMS*; *Drewsorb 60K*; *Durtan 6O*; *Durtan 60K*; E491; *Famodan MS Kosher*; *Glycomul S FG*; *Glycomul S KFG*; *Hodag SMS*; *Lamesorb SMS*; *Liposorb S*; *Liposorb SC*; *Liposorb S-K*; *Montane 60*; *Nissan Nonion SP-60R*; *Norfox Sorbo S-60FG*; *Polycon S60K*; *Protachem SMS*; *Prote-sorb SMS*; *S-Maz 60K*; *S-Maz 60KHS*; *Sorbester P18*; *Sorbirol S*; sorbitan, esters, monooctadecanoate; sorbitan stearate; sorbitani stearas; *Sorgen 50*; *Span 60*; *Span 60K*; *Span 60 VS*; *Tego SMS*.
Sorbitan sesquiisostearate	*Protachem SQI*.
Sorbitan sesquioleate	*Arlacel C*; *Arlacel 83*; *Crill 43*; *Glycomul SOC*; *Hodag SSO*; *Liposorb SQO*; *Montane 83*; *Nikkol SO-15*; *Nissan Nonion OP-83RAT*; *Protachem SOC*; sorbitani sesquioleas; *Sorgen 30*; *Sorgen S-30-H*.
Sorbitan trilaurate	*Span 25*.
Sorbitan trioleate	*Ablunol S-85*; *Arlacel 85*; *Crill 45*; *Glycomul TO*; *Hodag STO*; *Liposorb TO*; *Montane 85*; *Nissan Nonion OP-85R*; *Protachem STO*; *Prote- sorb STO*; *S-Maz 85K*; *Sorbester P37*; sorbitani trioleas; *Span 85*; *Tego STO*.
Sorbitan tristearate	*Alkamuls STS*; *Crill 35*; *Crill 41*; *Drewsorb 65K*; E492; *Famodan TS Kosher*; *Glycomul TS KFG*; *Hodag STS*; *Lamesorb STS*; *Liposorb TS*; *Liposorb TS-K*; *Montane 65*; *Protachem STS*; *Proteo-sorb STS*; *Sorbester P38*; *Span 65*; *Span 65K*.

Table II: Chemical name and CAS Registry Number of selected sorbitan esters.

Name	Chemical name	CAS number
Sorbitan diisostearate	Sorbitan diisooctadecanoate	[68238-87-9]
Sorbitan dioleate	(*Z,Z*)-Sorbitan di-9-octadecanoate	[29116-98-1]
Sorbitan monolaurate	Sorbitan monododecanoate	[1338-39-2]
Sorbitan monoisostearate	Sorbitan monoisooctadecanoate	[71902-01-7]
Sorbitan monooleate	(*Z*)-Sorbitan mono-9-octadecenoate	[1338-43-8]
Sorbitan monopalmitate	Sorbitan monohexadecanoate	[26266-57-9]
Sorbitan monostearate	Sorbitan mono-octadecanoate	[1338-41-6]
Sorbitan sesquiisostearate	Sorbitan sesquiisooctadecanoate	[71812-38-9]
Sorbitan sesquioleate	(*Z*)-Sorbitan sesqui-9-octadecenoate	[8007-43-0]
Sorbitan sesquistearate	Sorbitan sesqui-octadecanoate	[51938-44-4]
Sorbitan triisostearate	Sorbitan triisooctadecanoate	[54392-27-7]
Sorbitan trioleate	(*Z,Z,Z*)-Sorbitan tri-9-octadecenoate	[26266-58-0]
Sorbitan tristearate	Sorbitan tri-octadecanoate	[26658-19-5]

Table III: Empirical formula and molecular weight of selected sorbitan esters.

Name	Formula	Molecular weight
Sorbitan diisostearate	$C_{42}H_{80}O_7$	697
Sorbitan dioleate	$C_{42}H_{76}O_7$	693
Sorbitan monoisostearate	$C_{24}H_{46}O_6$	431
Sorbitan monolaurate	$C_{18}H_{34}O_6$	346
Sorbitan monooleate	$C_{24}H_{44}O_6$	429
Sorbitan monopalmitate	$C_{22}H_{42}O_6$	403
Sorbitan monostearate	$C_{24}H_{46}O_6$	431
Sorbitan sesquiisostearate	$C_{33}H_{63}O_{6.5}$	564
Sorbitan sesquioleate	$C_{33}H_{60}O_{6.5}$	561
Sorbitan sesquistearate	$C_{33}H_{63}O_{6.5}$	564
Sorbitan triisostearate	$C_{60}H_{114}O_8$	964
Sorbitan trioleate	$C_{60}H_{108}O_8$	958
Sorbitan tristearate	$C_{60}H_{114}O_8$	964

6 Functional Category

Dispersing agent; emulsifying agent; nonionic surfactant; solubilizing agent; suspending agent; vaccine adjuvant.

7 Applications in Pharmaceutical Formulation or Technology

Sorbitan monoesters are a series of mixtures of partial esters of sorbitol and its mono- and di-anhydrides with fatty acids. Sorbitan diesters are a series of mixtures of partial esters of sorbitol and its monoanhydride with fatty acids.

Sorbitan esters are widely used in cosmetics, food products, and pharmaceutical formulations as lipophilic nonionic surfactants. They are mainly used in pharmaceutical formulations as emulsifying agents in the preparation of creams, emulsions, and ointments for topical application. When used alone, sorbitan esters produce stable water-in-oil emulsions and microemulsions, but are frequently used in combination with varying proportions of a polysorbate to produce water-in-oil or oil-in-water emulsions or creams of varying consistencies.

Sorbitan esters have been studied in self-emulsifying drug delivery systems for poorly soluble compounds.[1] They have also been studied in drug-loaded vesicular and particulate delivery systems for oral and topical treatments, and as vaccine adjuvants.[2–5]

Sorbitan monolaurate, sorbitan monopalmitate and sorbitan trioleate have also been used at concentrations of 0.01–0.05% w/v in the preparation of an emulsion for intramuscular administration. *See* Table IV.

Table IV: Uses of sorbitan esters.

Use	Concentration (%)
Emulsifying agent	
Used alone in water-in-oil emulsions	1–15
Used in combination with hydrophilic emulsifiers in oil-in-water emulsions	1–10
Used to increase the water-holding properties of ointments	1–10
Nonionic surfactant	
For insoluble, active constituents in lipophilic bases	0.1–3
Solubilizing agent	
For poorly soluble, active constituents in lipophilic bases	1–10
For insoluble, active constituents in lipophilic bases	0.1–3

8 Description

Sorbitan esters occur as cream- to amber-colored liquids or solids with a distinctive odor and taste; *see* Table V.

Table V: Appearance of selected sorbitan esters.

Name	Appearance
Sorbitan monoisostearate	Yellow viscous liquid
Sorbitan monolaurate	Yellow viscous liquid
Sorbitan monooleate	Yellow viscous liquid
Sorbitan monopalmitate	Cream solid
Sorbitan monostearate	Cream solid
Sorbitan sesquioleate	Amber viscous liquid
Sorbitan trioleate	Amber viscous liquid
Sorbitan tristearate	Cream/yellow solid

9 Pharmacopeial Specifications

See Table VI.

10 Typical Properties

Acid value *see* Table VII.
Density *see* Table VII.
Flash point >149°C
HLB value *see* Table VII.
Hydroxyl value *see* Table VII.
Iodine number *see* Table VII.
Melting point *see* Table VII.
Moisture content *see* Table VIII.
Pour point *see* Table VII.
Saponification value *see* Table VIII.
Solubility Sorbitan esters are generally soluble or dispersible in oils; they are also soluble in most organic solvents. In water, although insoluble, they are generally dispersible.
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Gradual soap formation occurs with strong acids or bases; sorbitan esters are stable in weak acids or bases.

Sorbitan esters should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Sorbitol is dehydrated to form a hexitan (1,4-sorbitan), which is then esterified with the desired fatty acid.

14 Safety

Sorbitan esters are widely used in cosmetics, food products, and oral and topical pharmaceutical formulations, and are generally regarded as nontoxic and nonirritant materials. However, there have been reports of hypersensitive skin reactions following the topical application of products containing sorbitan esters.[6–9]

The WHO has set an estimated acceptable daily intake of sorbitan monopalmitate, monostearate, and tristearate,[10] and of sorbitan monolaurate and monooleate[11] at up to 25 mg/kg bodyweight calculated as total sorbitan esters.

Sorbitan monolaurate LD_{50} (rat, oral): 33.6 g/kg[12]

Sorbitan monooleate LD_{50} (rat, oral): >39.8 g/kg[13]

Sorbitan monostearate LD_{50} (rat, oral): 31 g/kg[14]

Very mildly toxic by ingestion. Reproductive effects have been reported in controlled animal studies.[12]

Sorbitan sesquioleate LD_{50} (rat, oral): >39.8 g/kg[13]

Sorbitan trioleate LD_{50} (rat, oral): >39.8 g/kg[13]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, the sorbitan esters emit acrid smoke and irritating fumes. Eye protection and gloves are recommended.

16 Regulatory Status

Certain sorbitan esters are accepted as food additives in the UK. Sorbitan esters are included in the FDA Inactive Ingredients Database (inhalations; IM injections; ophthalmic, oral, topical, rectal, and vaginal preparations). Sorbitan esters are used in nonparenteral medicines licensed in the UK. Sorbitan esters are included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyoxyethylene sorbitan fatty acid esters.

18 Comments

Specifications for sorbitan monolaurate, sorbitan monooleate, sorbitan monopalmitate, sorbitan monostearate, and sorbitan tristearate are contained in the *Food Chemicals Codex* (FCC).[14]

5 Structural Formula

6 Functional Category

Humectant; plasticizing agent; sweetening agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Sorbitol is widely used as an excipient in pharmaceutical formulations. It is also used extensively in cosmetics and food products; *see* Table I.

Sorbitol is used as a diluent in tablet formulations prepared by either wet granulation or direct compression.[1–6] It is particularly

useful in chewable tablets owing to its pleasant, sweet taste and cooling sensation. Sorbitol has been studied for use in fast disintegrating tablets and pellets[7–9] and dry powder inhaler formulations.[10] It has been shown to increase the strength of methylcellulose gel formulations.[11] In capsule formulations it is used as a plasticizer for gelatin. Sorbitol has been used as a plasticizer in film formulations.[12,13]

In liquid preparations[14] sorbitol is used as a vehicle in sugar-free formulations, for example in drugs,[15] vitamins,[16,17] and antacid suspensions. Furthermore, sorbitol is used as an excipient in liquid parenteral biologic formulations.[18] It has also been shown to be a suitable carrier to enhance the *in vitro* dissolution rate of indometacin.[19] In syrups it is effective in preventing crystallization around the cap of bottles. Sorbitol is additionally used in injectable[20] and topical preparations.

Table I: Uses of sorbitol.

Use	Concentration (%)
Humectant	3–15
IM injections	10–25
Moisture control agent in tablets	3–10
Oral solutions	20–35
Oral suspensions	70
Plasticizer for gelatin and cellulose	5–20
Prevention of 'cap locking' in syrups and elixirs	15–30
Substitute for glycerin and propylene glycol	25–90
Tablet binder and filler	25–90
Toothpastes	20–60
Topical emulsions	2–18

8 Description

Sorbitol is D-glucitol. It is a hexahydric alcohol related to mannose and is isomeric with mannitol.

Sorbitol occurs as an odorless, white or almost colorless, crystalline, hygroscopic powder. Four crystalline polymorphs and one amorphous form of sorbitol have been identified that have slightly different physical properties, e.g. melting point.[3] Sorbitol is available in a wide range of grades and polymorphic forms, such as granules, flakes, or pellets that tend to cake less than the powdered form and have more desirable compression characteristics. Sorbitol has a pleasant, cooling, sweet taste and has approximately 50–60% of the sweetness of sucrose.

(a) ≤4 USP–NF Endotoxin Units per g for parenteral dosage forms having a concentration of less than 100 g of sorbitol per L and ≤2.5 USP–NF Endotoxin Units per g for parenteral dosage forms having a concentration of 100 g or more of sorbitol per L.

10 Typical Properties

Acidity/alkalinity pH = 4.5–7.0 for a 10% w/v aqueous solution.

Compressibility Compression characteristics and the degree of lubrication required vary, depending upon the particle size and grade of sorbitol used. The spray-dried forms of sorbitol afford greater compression characteristics than standard grades of sorbitol.

Density 1.49 g/cm^3

Density (bulk)

0.448 g/cm^3;

0.6–0.7 g/cm^3 for *Sorbitab SD 250*;

0.5–0.6 g/cm^3 for *Sorbitab SD 500*.

Density (tapped)

0.400 g/cm^3;

0.7 g/cm^3 for *Sorbitab SD 250*;

0.6 g/cm^3 for *Sorbitab SD 500*.

Density (true) 1.507 g/cm^3

Flowability Flow characteristics vary depending upon the particle size and grade of sorbitol used. Fine powder grades tend to be poorly flowing, while granular grades have good flow properties.

Heat of solution −110.9 J/g (−26.5 cal/g)

Melting point

Anhydrous form: 110–112°C;

Gamma polymorph: 97.7°C;

Metastable form: 93°C.

Moisture content Sorbitol is a very hygroscopic powder and relative humidities greater than 60% at 25°C should be avoided

S

when sorbitol is added to direct-compression tablet formulas. *See also* Figure 1.

Osmolarity A 5.48% w/v aqueous solution of sorbitol hemihydrate is iso-osmotic with serum.

Particle size distribution Particle size distribution varies depending upon the grade of sorbitol; *see* Table III. For fine powder grades, typically 87% <125 μm in size; for granular grades, 22% <125 μm, 45% between 125 and 250 μm, and 33% between 250 and 590 μm. Individual suppliers' literature should be consulted for further information.

Solubility *see* Table IV. *See also* Section 17.

Spectroscopy

IR spectrum *see* Figure 2.

NIR spectrum *see* Figure 3.

Raman spectrum *see* Figure 4.

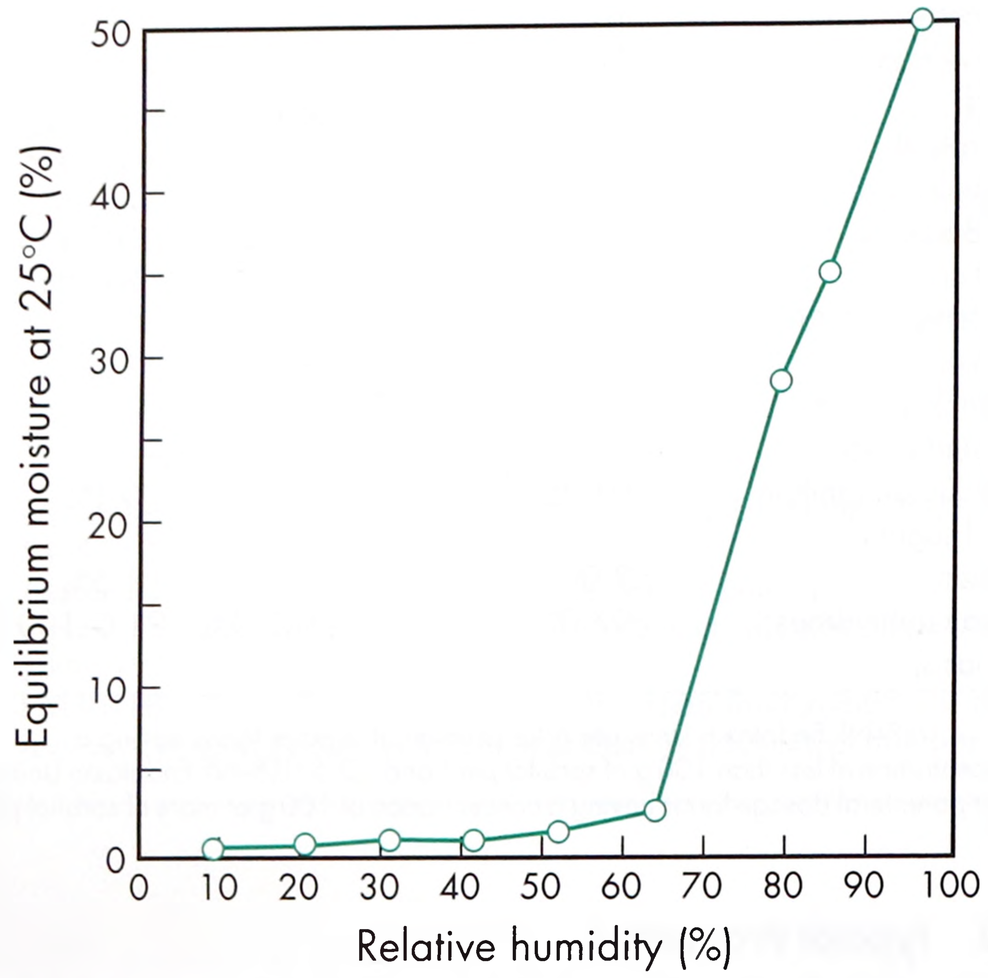

Figure 1: Equilibrium moisture content of sorbitol USP–NF.

S

Table III: Mean particle sizes for various grades of sorbitol.

Grade	Mean particle size (μm)
Neosorb P100T	140
Neosorb P20/60	650
Neosorb P30/60	480
Neosorb P60	220
Neosorb P60W	260
Sorbitab SD 250	250
Sorbitab SD 500	500

Table IV: Solubility of sorbitol.

Solvent	Solubility at 20°C
Chloroform	Practically insoluble
Ethanol (95%)	1 in 25
Ethanol (82%)	1 in 8.3
Ethanol (62%)	1 in 2.1
Ethanol (41%)	1 in 1.4
Ethanol (20%)	1 in 1.2
Ethanol (11%)	1 in 1.14
Ether	Practically insoluble
Methanol	Slightly soluble
Water	1 in 0.5

11 Stability and Storage Conditions

Sorbitol is chemically relatively inert and is compatible with most excipients. It is stable in air in the absence of catalysts and in cold, dilute acids and alkalis. Sorbitol does not darken or decompose at elevated temperatures or in the presence of amines. It is nonflammable, noncorrosive, and nonvolatile.

Although sorbitol is resistant to fermentation by many microorganisms, a preservative should be added to sorbitol solutions. Solutions may be stored in glass, plastic, aluminum, and stainless

steel containers. Solutions for injection may be sterilized by autoclaving.

The bulk material is hygroscopic and should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Sorbitol will form water-soluble chelates with many divalent and trivalent metal ions in strongly acidic and alkaline conditions. Addition of liquid polyethylene glycols to sorbitol solution, with vigorous agitation, produces a waxy, water-soluble gel with a melting point of 35–40°C. Sorbitol solutions also react with iron oxide to become discolored.

Sorbitol increases the degradation rate of penicillins in neutral and aqueous solutions.[21]

13 Method of Manufacture

Sorbitol occurs naturally in the ripe berries of many trees and plants. It was first isolated in 1872 from the berries of the Mountain Ash (*Sorbus americana*).

Industrially, sorbitol is prepared by high-pressure hydrogenation with a copper–chromium or nickel catalyst, or by electrolytic reduction of glucose and corn syrup. If cane or beet sugars are used as a source, the disaccharide is hydrolyzed to dextrose and fructose prior to hydrogenation.

14 Safety

Sorbitol is widely used in a number of pharmaceutical products and occurs naturally in many edible fruits and berries. It is absorbed more slowly from the gastrointestinal tract than sucrose and is metabolized in the liver to fructose and glucose. Its caloric value is approximately 16.7 J/g (4 cal/g). Sorbitol is better tolerated by diabetics than sucrose and is widely used in many sugar-free liquid vehicles. However, it is not considered to be unconditionally safe for diabetics.

Reports of adverse reactions to sorbitol are largely due to its action as an osmotic laxative when ingested orally,[22–24] which may be exploited therapeutically. Ingestion of large quantities of sorbitol (>20 g/day in adults) should therefore be avoided.

Sorbitol is not readily fermented by oral microorganisms and has little effect on dental plaque pH; hence, it is generally considered to be noncariogenic.[25]

Sorbitol is generally considered to be more irritating than mannitol.

LD_{50} (mouse, IV): 9.48 g/kg[26]
LD_{50} (mouse, oral): 17.8 g/kg
LD_{50} (rat, IV): 7.1 g/kg
LD_{50} (rat, SC): 29.6 g/kg

15 Handling Precautions

Sorbitol may be harmful if ingested in great quantities. It may be irritant to the eyes. Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, gloves, and a dust mask or respirator are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (intra-articular and IM injections; nasal; oral capsules, solutions, suspensions, syrups and tablets; rectal, topical, and vaginal preparations). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Maltitol solution; mannitol; xylitol.

18 Comments

Sorbitol may be substituted for sucrose to prepare 70–90% w/v syrups.

Several different grades of sorbitol, with different polymorphic form, particle size, and other physical characteristics are commercially available, e.g. *Neosorb* (Roquette Frères). Pyrogen-free grades are also available from some suppliers.

Sorbitol is also available in liquid form and occurs as a clear, colorless, syrupy liquid, which is miscible with water (*see* Table V). Liquid sorbitol is an aqueous solution of a hydrogenated, partly hydrolyzed starch. Partially dehydrated sorbitol solutions are also available, which are produced by partial dehydration of liquid sorbitol. *Sorbo* sorbitol solution (Corn Products Specialty Ingredients) is used as a bulking agent, sweetener and humectant. *Sorbitol Special* (SPI Pharma) is a noncrystallizing polyol solution used for soft gelatin capsules. The USP 40–NF 35 S1 and JP XVII list sorbitol solution. The BP 2017 and PhEur 9.2 also include partially dehydrated liquid sorbitol, liquid sorbitol (crystallizing), and liquid sorbitol (non-crystallizing).

A study has shown that sorbitol may affect the bioavailability/bioequivalence of drugs by increasing gastrointestinal fluid influx and motility, which reduces time for drug absorption. It may also be employed as a cathartic in the management of poisoning.[27] Sorbitol may also be used analytically as a marker for assessing liver blood flow,[28] and therapeutically as an osmotic laxative.

A specification for sorbitol is contained in the *Food Chemicals Codex* (FCC).[29]

The EINECS number for sorbitol is 200-061-5. The PubChem Compound ID (CID) for sorbitol includes 5780 and 82170.

Table V: Physical properties of sorbitol in water solutions.

Concentration (% w/w) at 25°C	Density (g/cm^3) at 25°C	Viscosity (mPa s) at 25°C	Refractive index	Freezing point (°C)

Soybean Oil

1 Nonproprietary Names

BP: Refined Soya Oil
JP: Soybean Oil
PhEur: Soya-Bean Oil, Refined
USP–NF: Soybean Oil

2 Synonyms

Aceite de soja; *Calchem IVO-114*; *Lipex 107*; *Lipex 200*; *Shogun CT*; soiae oleum raffinatum; soja bean oil; soyabean oil; soya bean oil.

3 Chemical Name and CAS Registry Number

Soybean oil [8001-22-7]

4 Empirical Formula and Molecular Weight

A typical analysis of refined soybean oil indicates the composition of the acids, present as glycerides, to be: linoleic acid 50–57%; linolenic acid 5–10%; oleic acid 17–26%; palmitic acid 9–13%; and stearic acid 3–6%. Other acids are present in trace quantities.[1]

5 Structural Formula

See Sections 4 and 8.

6 Functional Category

Oleaginous vehicle; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Emulsions containing soybean oil have also been used as vehicles for the oral and intravenous administration of drugs;[2,3] drug

substances that have been incorporated into such emulsions include amphotericin,[4–6] diazepam, retinoids,[7] vitamins,[8] poorly water-soluble steroids,[9,10] fluorocarbons,[11,12] ibuprofen,[13] and insulin.[14]

8 Description

The USP 40–NF 35 S1 describes soybean oil as the refined fixed oil obtained from the seeds of the soya plant *Glycine max* Merr. (Fabaceae); if an antoxidant is added, the name and quantity must be specified on the label. The PhEur 9.2 defines refined soybean oil as the fatty oil obtained from the seeds of *Glycine max* (L.) Merr. (*G. hispida* (Moench) Maxim.) by extraction and subsequent refining; it may contain a suitable antioxidant. The PhEur 9.2 also includes a monograph for hydrogenated soybean oil. *See* Vegetable Oil, hydrogenated, type I.

Soybean oil is a clear, pale-yellow colored, odorless or almost odorless liquid, with a bland taste that solidifies between −10 and −16°C.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for soybean oil.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	—	+	+
Characters	—	+	—

Brassicasterol	—	≤0.3%	≤0.3%
Water	—	≤0.1%	≤0.1%

(a) In soybean oil intended for parenteral use.

10 Typical Properties

Autoignition temperature 445°C
Density 0.916–0.922 g/cm^3 at 25°C
Flash point 282°C
Freezing point −10 to −16°C
Hydroxyl value 4–8
Interfacial tension 50 mN/m (50 dynes/cm) at 20°C.
Refractive index n_D^{25} = 1.471–1.475
Solubility Practically insoluble in ethanol (95%) and water; miscible with ether, carbon disulfide, chloroform, ether, and light petroleum.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Surface tension 25 mN/m (25 dynes/cm) at 20°C.
Viscosity (dynamic)

172.9 mPa s (172.9 cP) at 0°C;
99.7 mPa s (99.7 cP) at 10°C;
50.09 mPa s (50.09 cP) at 25°C;
28.86 mPa s (28.86 cP) at 40°C.

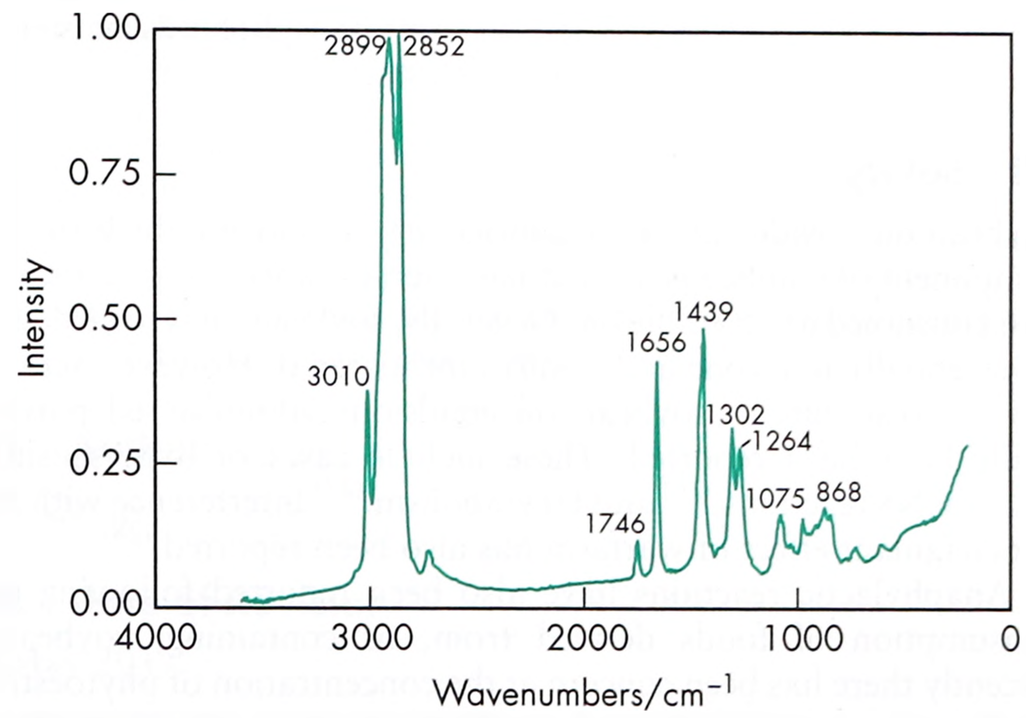

Figure 2: Raman spectrum of soybean oil measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Soybean oil is a stable material if protected from atmospheric oxygen.

The formation of undesirable flavors in soybean oil is accelerated by the presence of 0.01 ppm copper and 0.1 ppm iron, which act as catalysts for oxidation; this can be minimized by the addition of chelating agents.

Prolonged storage of soybean oil emulsions, particularly at elevated temperatures, can result in the formation of free fatty acids, with a consequent reduction in the pH of the emulsion; degradation is minimized at pH 6–7. However, soybean oil emulsions are stable at room temperature if stored under nitrogen in a light-resistant glass container. Plastic containers are permeable to oxygen and should not be used for long-term storage since oxidative degradation can occur.

The stability of soybean oil emulsions is considerably influenced by other additives in a formulation.[15–21]

Soybean oil should be stored in a well-filled, airtight, light-resistant container at a temperature not exceeding 25°C.

12 Incompatibilities

Soybean oil emulsions have been reported to be incompatible at 25°C with a number of materials including calcium chloride, calcium gluconate, magnesium chloride, phenytoin sodium, and tetracycline hydrochloride.[22] Lower concentrations of these materials, or lower storage temperatures, may result in improved compatibility. The source of the material may also affect compatibility; for example, while one injection from a particular manufac-

S

turer might be incompatible with a fat emulsion, an injection with the same amount of active drug substance from another manufacturer might be compatible.

Amphotericin B has been reported to be incompatible with soybean oil containing fat emulsions under certain conditions.[23]

Soybean oil emulsions are also incompatible with many other drug substances, IV infusion solutions, and ions (above certain concentrations).

When plastic syringes are used to store soybean oil emulsion, silicone oil may be extracted into the emulsion; swelling of the syringe components may also occur, resulting in the necessity for increased forces to maintain the motion of the plunger.[24]

13 Method of Manufacture

Obtained by solvent extraction using petroleum hydrocarbons, or to a lesser extent by expression using continuous screw-press operations, of the seeds of either *Glycine max* (Leguminosae) or *Glycine soja* (Leguminosae). The oil is refined, deodorized, and clarified by filtration at about 0°C. Any phospholipids or sterols present are removed by refining with alkali.

14 Safety

Soybean oil is widely used intramuscularly as a drug vehicle or as a component of emulsions used in parenteral nutrition regimens; it is also consumed as an edible oil. Generally, soybean oil is regarded as an essentially nontoxic and nonirritant material. However, serious adverse reactions to soybean oil emulsions administered parenterally have been reported. These include cases of hypersensitivity,[25] CNS reactions,[26] and fat embolism.[27] Interference with the anticoagulant effect of warfarin has also been reported.[28]

Anaphylactic reactions have also been reported following the consumption of foods derived from, or containing, soybeans. Recently there has been concern at the concentration of phytoestrogens in some soy-derived products. Administration of soy protein to humans has resulted in significantly decreased serum lipid concentrations.[29]

In 1999, the UK Medical Devices Agency announced the voluntary withdrawal of a breast implant that contained soybean oil. The decision was taken because not enough was known at that time about the long-term safety and the rate of breakdown of the soybean oil in the filling and its possible effects on the body.[30]

LD_{50} (mouse, IV): 22.1 g/kg[31]

LD_{50} (rat, IV): 16.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Spillages of soybean oil are slippery and should be covered with an inert absorbent material prior to disposal.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IV injections and emulsion injections; oral capsules, tablets, and chewable tablets; topical lotions and solutions). Included in nonparenteral (oral capsules, tablets, chewable tablets, effervescent tablets and granules, solutions; topical bath additives; transdermal patches) and parenteral (emulsions for IV injection or infusion) medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Canola oil; corn oil; cottonseed oil; peanut oil; sesame oil; sunflower oil.

18 Comments

The stability of soybean oil emulsions may be readily disturbed by the addition of other materials, and formulations containing soybean oil should therefore be evaluated carefully for their compatibility and stability.

In pharmaceutical preparations, soybean oil emulsions are primarily used as a fat source in total parenteral nutrition (TPN) regimens.[32] Although other oils, such as peanut oil, have been used for this purpose, soybean oil is now preferred because it is associated with fewer adverse reactions.

In addition, soybean oil has been used in the formulation of many drug delivery systems such as liposomes,[33] microspheres,[34] dry emulsions,[35] self-emulsifying systems,[36,37] microemulsions,[38,39] nanoemulsions[40,41] and nanocapsules,[40] solid-in-oil suspensions,[42] and multiple emulsions.[43] In the formation of organogels, 12-hydroxystearic acid has been suggested as a gelator for soybean oil.[44]

Soybean oil may also be used in cosmetics and is consumed as an edible oil. As soybean oil has emollient properties, it is used as a bath additive in the treatment of dry skin conditions.

A specification for soybean oil (hydrogenated) is contained in the USP 40–NF 35 S1 and the *Food Chemicals Codex* (FCC).[45]

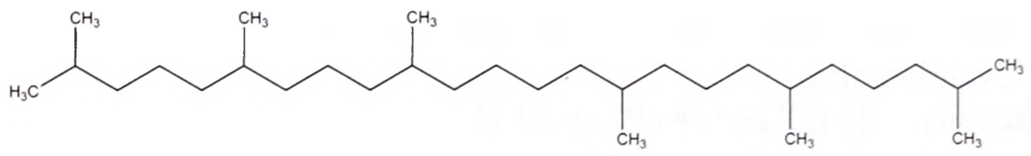
Squalane

1 Nonproprietary Names

BP: Squalane
PhEur: Squalane
USP–NF: Squalane

2 Synonyms

Carolane; *Cosbiol*; dodecahydrosqualene; *Fitoderm*; perhydrosqualene; *Phytolane LS*; *Robane*; spinacane; squalanum; *Vitabiosol*; *Wax-O-Sol*.



3 Chemical Name and CAS Registry Number

2,6,10,15,19,23-Hexamethyltetracosane [111-01-3]

4 Empirical Formula and Molecular Weight

$C_{30}H_{62}$ 422.8

5 Structural Formula

6 Functional Category

Emollient; ointment base; penetration enhancer.

7 Applications in Pharmaceutical Formulation or Technology

Squalane is included in topical pharmaceutical preparations to increase skin permeability owing to its miscibility with human sebum. It is also used as a carrier of lipid-soluble drugs in suppositories.

Squalane is used as a vaccine adjuvant[1–4] and as a component of nanoemulsions and microemulsions that have been developed for oral, nasal, and transdermal pharmaceutical applications.[5–8]

Squalane is also used as an emollient in cosmetics, hair, and shaving products.

8 Description

Squalane is a saturated derivative of squalene, which is a constituent of human sebum. The USP 40–NF 35 S1 describes squalane as a saturated hydrocarbon obtained by hydrogenation of squalene, an aliphatic triterpene occurring in some fish oils. The PhEur 9.2 states that squalane may be of vegetable (unsaponifiable matter of olive oil) or animal (shark liver oil) origin.

Squalane occurs as a colorless, almost odorless, transparent oil.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for squalane.

Test	PhEur 9.2	USP 40–NF 35 S1
Characters	+	–
Identification	+	+
Appearance	+	–
Specific gravity	≈0.815	0.807–0.810
Refractive index	1.450–1.454	1.4510–1.4525
Acid value	≤0.2	≤0.2
Iodine value	≤4.0	≤4.0
Saponification value	≤3.0	≤2.0
Nickel	≤1 ppm	–
Total ash	≤0.5%	≤0.5%
Chromatographic purity	–	≥97%
Assay	96.0–103.0%	–

10 Typical Properties

Boiling point
≈350°C at 760 mmHg;
263°C at 10 mmHg;
248°C at 5 mmHg;
210–215°C at 1 mmHg;
176°C at 0.05 mmHg.

Density ≈ 0.815 g/cm^3; 0.817 g/cm^3 at 200°C for *Phytolane LS*

Flash point 218–230°C; 230°C for *Carolane*

Melting point −38°C

Solubility Practically insoluble in water and ethanol (96%); very slightly soluble in dehydrated alcohol; miscible with chloroform, ether, and with most fats and oils; freely soluble in acetone and cyclohexane.

Viscosity 34 mPa s (34 cP) at 20°C

S

11 Stability and Storage Conditions

Stable under normal temperatures and pressures. Store in a cool, dry, well-ventilated area away from incompatible substances, and in airtight containers.

12 Incompatibilities

Squalane is incompatible with oxidizing agents.

13 Method of Manufacture

Squalane is prepared by complete hydrogenation of squalene. Commercial grades are obtained by direct hydrogenation of shark liver oil and may contain some batyl alcohol. It can also be isolated from the unsaponifiable fraction of olive oil by extraction, followed by hydrogenation.

14 Safety

Squalane is generally considered to be a safe material. The Cosmetic Ingredient Review (CIR) Expert Panel have assessed squalane and concluded that the material is safe as used in cosmetics and personal care products.[9]

Squalane may cause irritation to the skin, eyes, and respiratory tract. It may also cause gastrointestinal irritation. Studies have shown that squalane oil-in-water emulsions can elicit both humoral and cellular immune responses.[5]

LD_{50} (IV, mouse) 1.8 g/kg[10]

LD_{50} (oral, mouse) 5.0 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, squalane emits acrid smoke and irritating vapors.[11] Avoid contact with eyes, and skin, and avoid ingestion and inhalation. Protective clothing and safety goggles are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical emulsions, creams, and solutions). Included in the Canadian Natural Health Products Ingredients Database. Included in nonparenteral medicines licensed in the UK.

17 Related Substances

—

18 Comments

Squalane has been investigated for inducing bone formation in a protein delivery system and was found to be effective for the slow local release of bone morphogenetic protein from gelatin capsules.[12]

Due to its animal origin, shark squalane is increasingly less attractive to cosmetic markets, although it is still dominant in Asian markets due to higher yields and lower costs than its olive oil counterpart. Thus, in addition to olive-sourced squalane, other alternative and renewable sources are being investigated by cosmetic manufacturers, and a method to distinguish between plant- or animal-derived samples has been developed.[13,14]

The EINECS number for squalane is 203-825-6. The PubChem Compound ID (CID) is 8089.

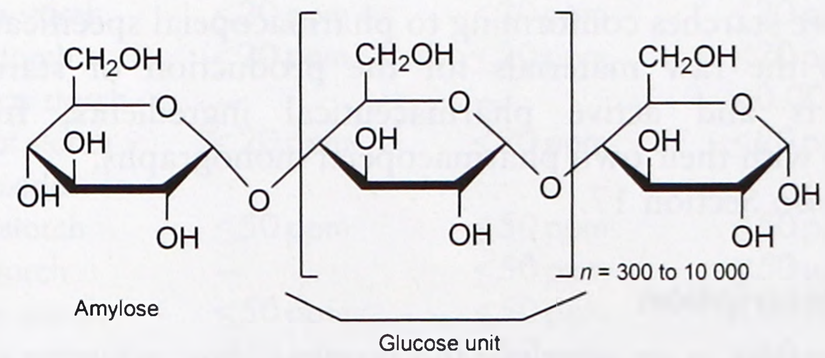
3 Chemical Name and CAS Registry Number

Starch [9005-25-8]

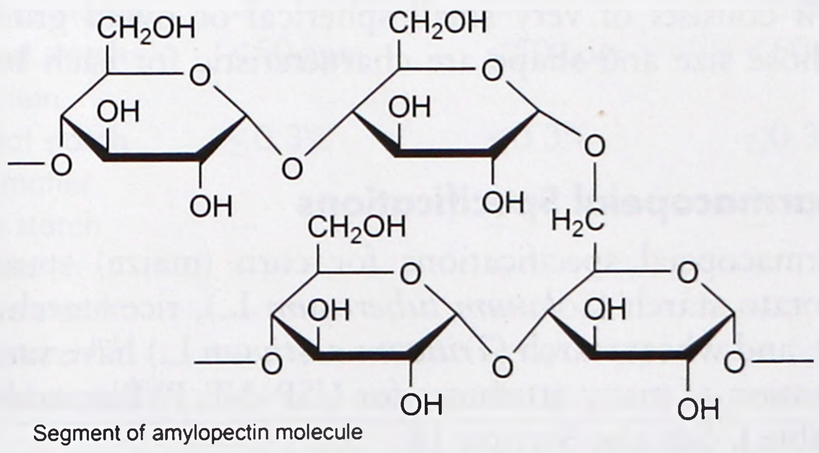
4 Empirical Formula and Molecular Weight



$(C_6H_{10}O_5)_n$ where n = 300–10 000.

Starch consists of linear amylose and branched amylopectin, two polysaccharides based on α-(D)-glucose. Both polymers are organized in a semicrystalline structure, and in the starch granule, amylopectin forms the crystalline portion. The exact structure of starch is not yet fully understood. The different configurations of these molecules result in different behavior in cold aqueous solutions. Amylose (only linear 1,4 bonds) shows a high tendency for crystallization (retrogradation) resulting in insoluble adducts, whereas amylopectin (branched polymer) shows slow gelation, forming opaque and highly viscous preparations after some days.

See also Sections 5 and 10.



The molecular weight depends on the origin and the nature of the starch. It can range between 50 and 500 million Da, with amylopectin having a higher molecular weight than amylose.

5 Structural Formula

Amylose

Glucose unit

Segment of amylopectin molecule

6 Functional Category

Tablet and capsule binder; tablet and capsule diluent; tablet and capsule disintegrant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Starch is a versatile excipient used primarily in oral solid-dosage formulations where it is utilized as a binder, diluent, and disintegrant.

As a diluent, starch is used for the preparation of standardized triturates of colorants, potent drugs, and herbal extracts, facilitating subsequent mixing or blending processes in manufacturing operations. Starch is also used in dry-filled capsule formulations for volume adjustment of the fill matrix,[1] and to improve powder flow, especially when using dried starches. Starch quantities of 3–10% w/w can act as an antiadherent and glidant in tableting and capsule filling.

In tablet formulations, freshly prepared starch paste is used at a concentration of 3–20% w/w (usually 5–10%, depending on the starch type) as a binder for wet granulation. The required binder ratio should be determined by optimization studies, using parameters such as tablet friability and hardness, disintegration time, and drug dissolution rate.[2]

Starch is one of the most commonly used tablet and capsule disintegrants at concentrations of 3–25% w/w;[3–8] a typical concentration is 15%. When using starch, a prior granulation step is required in most cases to avoid problems with insufficient flow and segregation. However, starch that is not pregelatinized does not compress well and tends to increase tablet friability and capping if used in high concentrations.[9,10] Balancing the elastic properties of starch with adapted excipients has been shown to improve the compaction properties in tableting.[11,12]

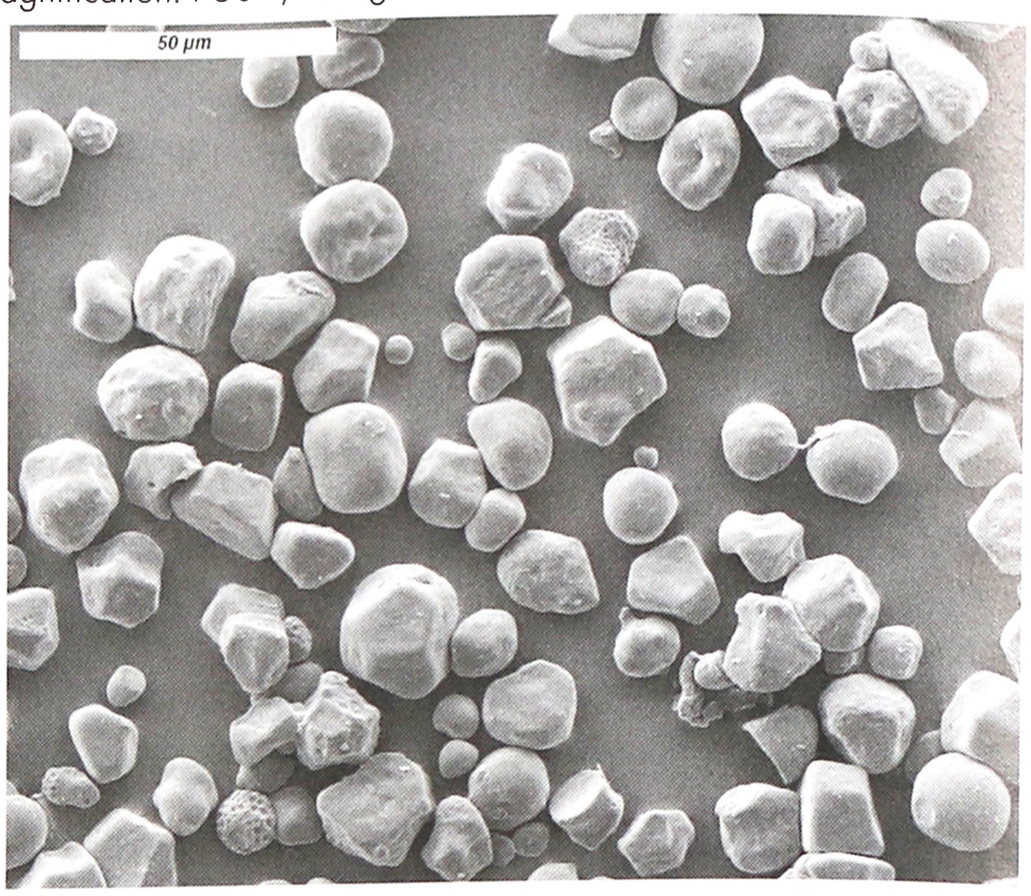
Starch, particularly the fine powders of rice and wheat starch, is also used in topical preparations for its absorbency of liquids. Starch paste is used in ointment formulations, usually in the presence of higher ratios of glycerin.

Starch has been investigated for use as an excipient in site-specific drug delivery systems.[13,14,15] Starches are useful carriers for amorphous drug preparations, and have been investigated as pellets with immediate or delayed drug release obtained, for example, by melt extrusion.[16,17,18] Extruded starch has also been investigated to prepare capsule shells as an alternative to gelatin capsules.[19] Some specific starch varieties, especially waxy corn starch and high amylose corn starch, have been identified as candidates to replace MCC in extrusion/spheronization processes.[20,21,22]

Native starches conforming to pharmacopeial specifications are used as the raw materials for the production of starch-based excipients and active pharmaceutical ingredients, frequently covered with their own pharmacopeial monographs.

See also Section 17.

8 Description



Starch occurs as an odorless and tasteless, fine, white to off-white powder. It consists of very small spherical or ovoid granules or grains whose size and shape are characteristic for each botanical variety.

9 Pharmacopeial Specifications

The pharmacopeial specifications for corn (maize) starch (*Zea mays*), potato starch (*Solanum tuberosum* L.), rice starch (*Oryza sativa* L.), and wheat starch (*Triticum aestivum* L.) have undergone harmonization of many attributes for USP–NF, PhEur, and JP.

See Table I. *See also* Section 18.

S

10 Typical Properties

Acidity/alkalinity Aqueous dispersions of starch usually have a pH in the range 4.0–8.0. Starch does not exhibit a significant self-buffering capacity.

Amylose content

24% for corn starch;

0–2% for corn starch (waxy);

35% for pea starch (from wrinkled pea);

20% for potato starch;

19% for rice starch;

17% for tapioca starch;

25% for wheat starch.

Density (bulk) (depending on the industrial process and humidity)

0.45–0.58 g/cm^3 for corn starch;[23]

0.57 g/cm^3 for potato starch;[23]

≈0.50 g/cm^3 for wheat starch.

Density (tapped) (depending on the industrial process and humidity)

0.69–0.77 g/cm^3 for corn starch;[23]

0.85 g/cm^3 for potato starch;[23]

≈0.76 g/cm^3 for wheat starch.

Density (true) 1.502 g/cm^3 for corn and wheat starch; 1.487 g/cm^3 for potato starch.

Flowability Commercial starch is generally cohesive and has poor flow characteristics. The flow properties depend on the moisture content,[23,24] and drying can result in a free-flowing material.

Gelatinization temperature (DSC (peak); 20% w/w in water)

71°C for corn starch;

62°C for pea starch;

64°C for potato starch;

68°C for rice starch;

59°C for wheat starch.

Gelatinization causes the rupture of the starch grains and is an irreversible loss of the structure of the starch particle.[25]

Moisture content All starches are hygroscopic and absorb atmospheric moisture to reach the equilibrium humidity.[26–28] The approximate equilibrium moisture is characteristic for each starch. At 50% relative humidity:

12% for corn starch;

14% for pea starch;

18% for potato starch;

14% for rice starch;

13% for wheat starch.

Excessively dried starches with a humidity lower than the equilibrium humidity, are commercially available. These products should be stored in hermetically sealed containers to maintain their low moisture content. *See also* Figure 1.

Particle size distribution

Corn starch: 2–32 μm; average particle diameter 13 μm;

Pea starch: 5–90 μm; average particle diameter 30 μm;

Potato starch: 10–100 μm; average particle diameter 46 μm;

Rice starch: 2–20 μm; average particle diameter 5 μm;

Tapioca starch: 5–35 μm; average particle diameter 13 μm;

Wheat starch: 2–45 μm; bimodal particle size distribution, peak values approx. 2 μm and 20 μm.

See also Figure 2.

Solubility Practically insoluble in cold ethanol (96%) and in cold water. Starch swells instantaneously in water by about 5–10% at 37°C.[3] Starch becomes soluble in hot water at temperatures above the gelatinization temperature. Starches are partially soluble in dimethylsulfoxide and dimethylformamide.

Specific surface area 0.40–0.54 m^2/g for corn starch.[29]

Spectroscopy

IR spectrum *see* Figure 3.

NIR spectra *see* Figures 4, 5, 6, and 7.

Raman spectrum *see* Figure 8.

Viscosity (dynamic) Nonmodified starches are not the preferred polymer for regulating the viscosity of pharmaceutical preparations, except for clinical nutrition products. This is due to the physical and microbial instability of starch paste. In food applications, starch contributes to higher viscosity via the

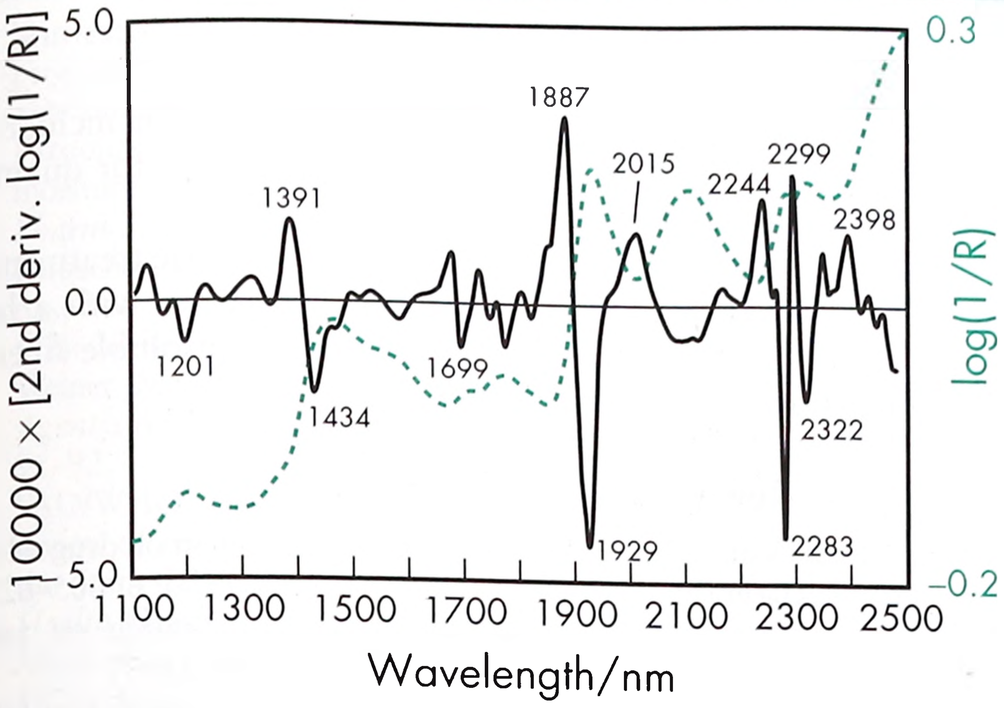

Figure 4: Near-infrared spectrum of starch measured by reflectance.

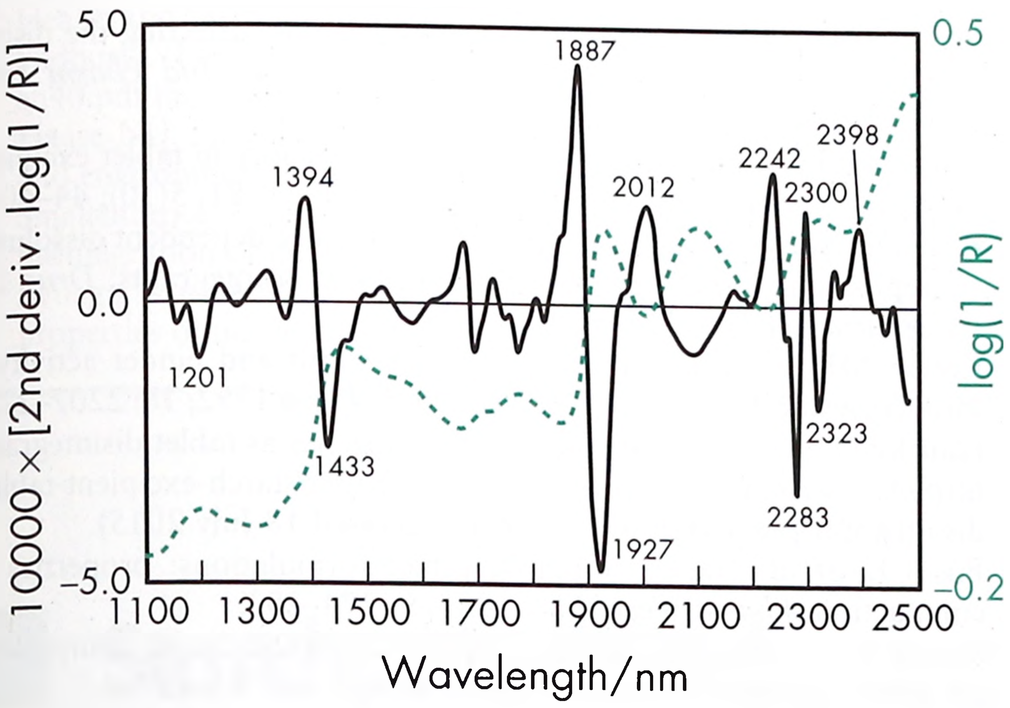

Figure 5: Near-infrared spectrum of corn starch measured by reflectance.

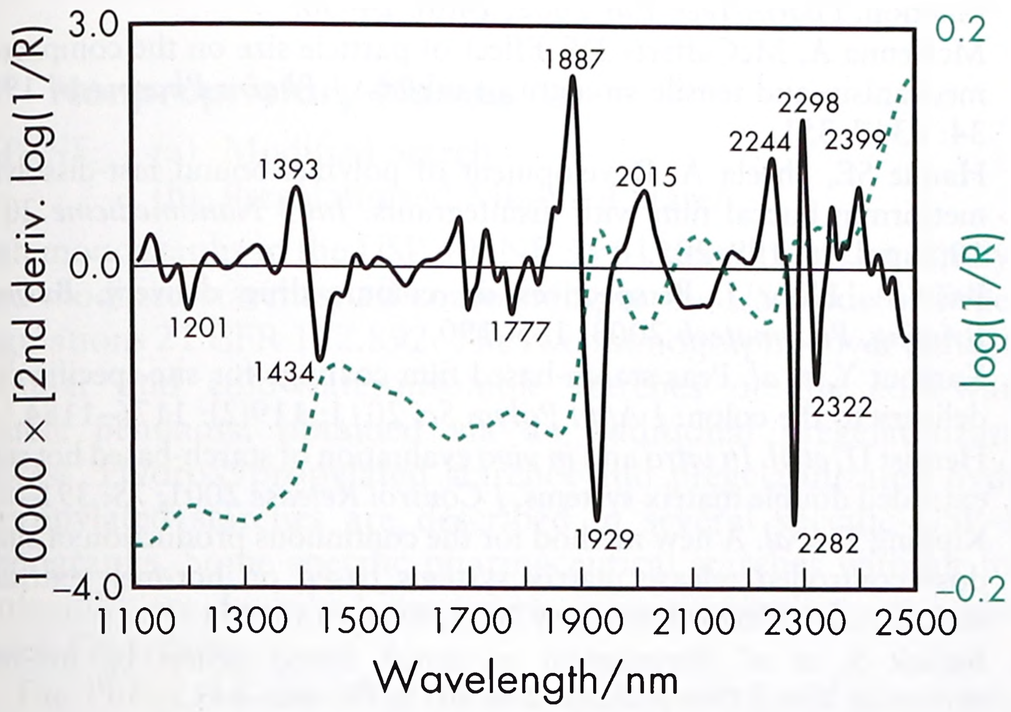

Figure 6: Near-infrared spectrum of rice starch measured by reflectance.

volume effect of the swollen particles and not with its dynamic viscosity. The viscosities of starch paste, obtained and measured under similar conditions may be ranked as follows: potato starch >> tapioca starch > corn starch. Note that aqueous starch dispersions show significant rheopexy, especially at concentrations above 40% w/w.

11 Stability and Storage Conditions

Dry starch is stable if protected from high humidity. Starch is considered to be chemically and microbiologically inert under normal storage conditions. Starch solutions or pastes are physically unstable and are readily degraded by microorganisms; they should

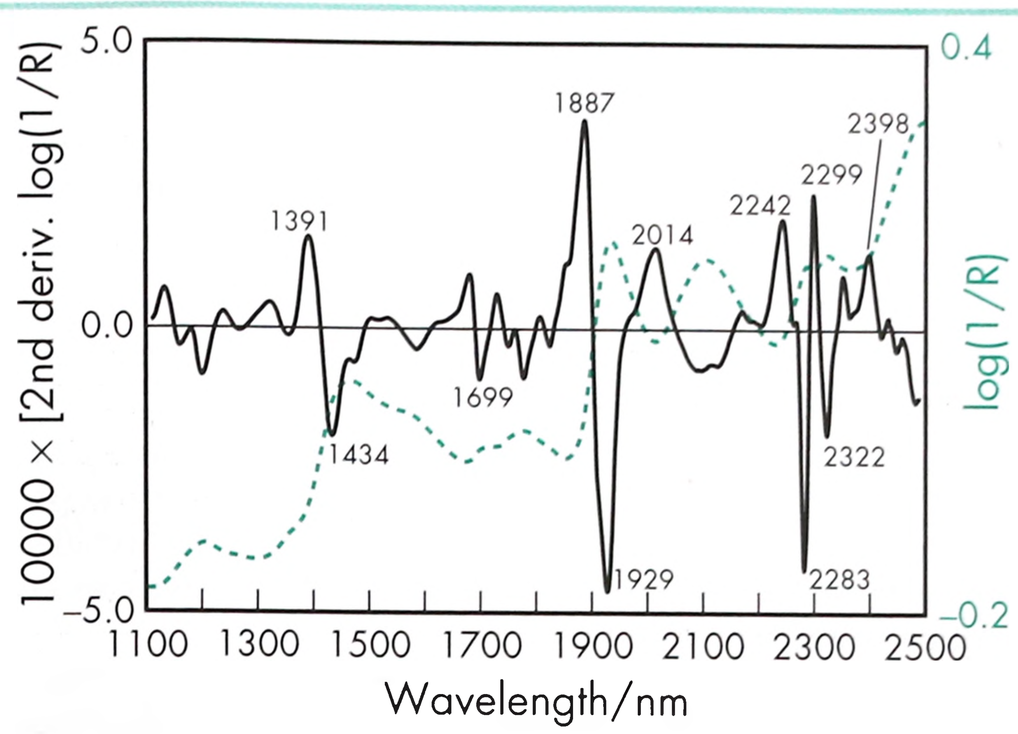

Figure 7: Near-infrared spectrum of wheat starch measured by reflectance.

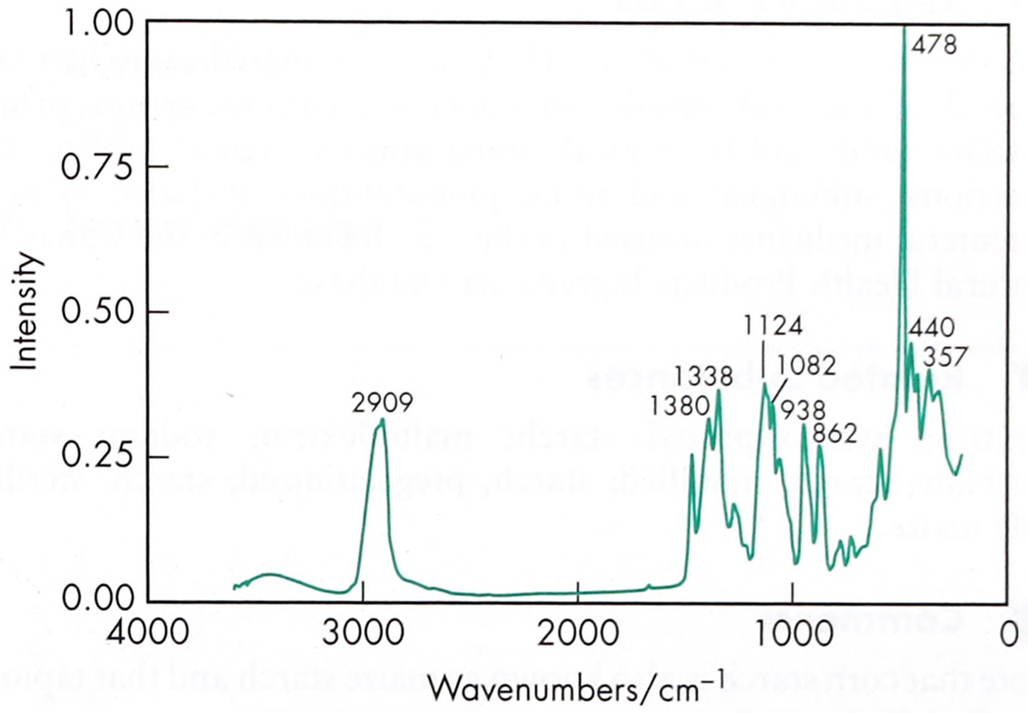

Figure 8: Raman spectrum of corn starch measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

therefore be freshly prepared when used for wet granulation. Starch should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Starch is incompatible with strongly oxidizing substances. Colored inclusion compounds are formed with iodine.

13 Method of Manufacture

Starch is extracted from plant sources with specific processes according to the botanical origin. Typical production steps are steeping (corn), wet milling (corn, potato), dry milling (wheat), followed by sieving and/or physical separation with hydrocyclones. The last production step is usually a centrifugal separation from the starch slurry followed by drying with hot air. The starch separation process may use sulfur dioxide or peroxides as a processing aid, improving the starch refining process and the microbial quality of the final product.

14 Safety

Starch is an edible food substance, considered a food ingredient and not a food additive. It is regarded as an essentially nontoxic and nonirritant material.[30] Starch is therefore widely used as an excipient in pharmaceutical formulations.

Both amylose and amylopectin have been evaluated as safe and without limitation for daily intake.[31] Allergic reactions to starch are extremely rare and individuals apparently allergic to one particular starch may not experience adverse effects with a starch

from a different botanical source. The wheat proteins (gluten) are problematic for conditions such as celiac disease.

Contamination of surgical wounds with the starch glove powder used by surgeons has resulted in the development of granulomatous lesions.[32]

LD_{50} (mouse, IP): 6.6 g/kg[33]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and a dust mask are recommended. Excessive dust generation should be avoided to minimize the risks of explosion. The minimal explosive concentration of corn starch is 30–60 g/m^3 air.

In the UK, the long-term (8-hour TWA) workplace exposure limits for starch are 10 mg/m^3 for total inhalable dust and 4 mg/m^3 for respirable dust.[34]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (buccal tablets, oral capsules, powders, suspensions, syrups, drops, pastilles, and tablets; topical preparations; vaginal tablets; IM injections; sublingual and rectal preparations). Included in non-parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dextrin; hydroxypropyl starch; maltodextrin; sodium starch glycolate; starch, modified; starch, pregelatinized; starch, sterilizable maize.

18 Comments

Note that corn starch is also known as maize starch and that tapioca starch is also known as cassava or manioc starch.

The individual monographs for corn starch, potato starch, rice starch and wheat starch have undergone harmonization for USP–NF, PhEur and JP. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

S

Starch is isolated from vegetable sources. Pure starch should only contain traces of foreign matter (e.g. plant tissue fragments) and no traces of starches other than from the declared botanical origin. Inside their crystalline structure, starch particles contain smaller quantities of lipids (0–0.8%) and proteins (0–0.5%). For each starch variety, the content is relatively stable and typical. Starches from different plant sources differ in particle size, humidity, and their amylose/amylopectin ratio (*see also* Section 10). The amylose content of each botanical origin content is rather stable and independent of climatic conditions.[35] Differences in the physical properties of the various starches mean that they are not automatically interchangeable in a given pharmaceutical application.[36]

Corn starch is also available in a naturally white variety (extra white corn starch), containing low levels of carotenoids (especially lutein and zeaxanthin). This starch variety is extracted from specific and nongenetically modified organism hybrids of *Zea mays* L.

Corn starch exists with specific non-genetically modified varieties having other amylose contents: waxy with about 0–2% amylose and high amylose with 50–70% amylose, both used for their specific physicochemical and nutritive properties.

Bleached starches are considered as modified (oxidized) starches. They are not interchangeable with nontreated starches for regulatory and technical reasons.[37]

The use of granular starch in direct compression applications could also be improved by compounding. Lactose–starch and mannitol–starch compounds[38] have been introduced on the market, using starch for improving the tableting process and the faster disintegration of the tablets produced.[29,39]

The pharmacopeial monographs for starch do not include an assay for starch content. Possible analytical methods for quantification are polarimetric[40] or enzymatic tests.[41]

Starch, particularly rice starch, has been used in the treatment of children's diarrheal diseases. Specific starch varieties with a high amylose content (resistant starches) are used as insoluble fiber in clinical nutrition.

Starch, Modified

1 Nonproprietary Names

USP–NF: (a) Modified Starch
(b) Pregelatinized Modified Starch

Both monographs in the USP 40–NF 35 S1 describe a vast family of food modified starches, all conforming to the US Code of Federal Regulations 21 CFR 172.892. The two monographs cover either the granular and cold-water-insoluble starches or the cold-water-soluble pendants, obtained via an additional pregelatinization process. Hydroxypropylated starches and pregelatinizated hydroxypropylated starches are described in several specific USP–NF monographs. Some specific pharmaceutical starches without food conformity are described in separate monographs (e.g. *see* Sodium Starch Glycolate).

The PhEur 9.2 describes only hydroxypropylated (food modified) starches in a dedicated monograph (*see* Hydroxypropyl Starch).

2 Synonyms

Amprac; amylum modificatum; *C*Pharm*; *Capsul*; *Clearam*; *Cleargum*; E1401–1452; *Hi-Cap*; *Instant Pure-Cote*; *Lycoat*; *Pure-Cote*; *Pure-Gel*; *Purity*; *Purity Gum*; *Uni-Pure*.

According to the International Numbering System (INS) for Food Additives[1] the following starches should comply with food legal regulations:

1400 Dextrin roasted starch
1401 Acid-treated starch
1402 Alkaline-treated starch
1403 Bleached starch
1404 Oxidized starch
1405 Starches, enzyme-treated
1410 Monostarch phosphate
1412 Distarch phosphate
1413 Phosphated distarch phosphate
1414 Acetylated distarch phosphate
1420 Starch acetate
1422 Acetylated distarch adipate
1440 Hydroxypropyl starch
1442 Hydroxypropyl distarch phosphate
1450 Starch sodium octenyl succinate
1451 Acetylated oxidized starch

3 Chemical Name and CAS Registry Number

The chemical name and the corresponding CAS number depend on the botanical origin of the starch and the nature of the chemical modification(s). Some examples are given in this nonexhaustive list:

Acetylated distarch adipate, waxy corn basis [63798-35-6]
Acid-treated corn starch [65996-63-6]
Acid-treated waxy corn starch [68909-37-5]
Distarch phosphate, waxy corn basis [55963-33-2]
Oxidized waxy corn starch [65996-62-5]
Sodium octenyl succinate starch [66829-29-6]

4 Empirical Formula and Molecular Weight

$(C_6H_{10}O_5)_n$ where n = 300–10 000

The USP 40–NF 35 S1 describes modified starch as starch modified by chemical means. Food starch may be acid-modified, bleached, oxidized, esterified, etherified, or treated enzymatically to change its functional properties (21 CFR 172.892).

The USP 40–NF 35 S1 describes pregelatinized modified starch as modified starch that has been chemically or mechanically processed, or both, to rupture all or part of the granules to produce a product that swells in cold water.

Moderate chemical modification of food modified starches does not affect the basic structure of starch. Granular products maintain the semicrystalline nature of the starch granule. Crosslinking reactions significantly increase the molecular weight of modified starches. *See also* Section 18.

5 Structural Formula

See Section 4.

6 Functional Category

Capsule shell material; coating agent; emulsion stabilizing agent; emulsifying agent; modified-release agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Modified starches with low viscosity are used in pharmaceutical preparations as binders for wet granulation. Some types of modified starch are used for their film-forming properties in nonfunctional and functional film coatings[2] or as wall-forming material in capsules and soft capsules.

Modified starches have also been developed as viscosity-increasing agents and texture modifiers in various food applications, and therefore are used as thickening agents and stabilizers in emulsions.[3] They are also valuable additives in the production of jellies with or without gelatin.

Amphiphilic octenyl succinate starches (E1450) are widely used as emulsifying agents for the manufacture of vitamins and herbal extracts, and in flavor encapsulation.[3–6]

Pregelatinized modified starches are soluble in cold water or swell with development of high viscosity, and are occasionally used as viscosity-increasing agents in syrups.

S

8 Description

Modified starch occurs as an odorless and tasteless, fine, white to off-white powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for modified starch and pregelatinized starch

Test	USP 40–NF 35 S1
Identification	+
Microbial limits	
Modified starch	+
pH	3.0–9.0
Loss on drying	
Modified corn starch	≤15.0%
Modified wheat starch	≤15.0%
Modified tapioca starch	≤18.0%
Modified potato starch	≤21.0%
Pregelatinized modified starch	≤15.0%
Residue on ignition	≤1.5%
Iron	
Modified starch	≤20 ppm
Oxidizing substances	
Modified starch	≤0.018%
Pregelatinized modified starch	+
Sulfur dioxide	
Modified starch	≤50 ppm
Pregelatinized modified starch	≤0.005%

10 Typical Properties

Density Depends on the nature of the starch and mainly on the industrial process used for preparation, especially for pregelatinized products.

Gelatinization temperature Chemical modification has a major influence on the gelatinization of starches. So-called 'stabilization' typically decreases the gelatinization temperature owing to the weakening of the crystalline structure of the starch particles, whereas crosslinking causes the opposite effect (*see also* Section 18).

Moisture content All starches (granular or pregelatinized) are hygroscopic and absorb atmospheric moisture to reach the equilibrium humidity.

Particle size distribution Chemically modified granular starches preserve the particle size and microscopic image of the starch raw material (*see also* Starch). The particle size of pregelatinized modified starches is determined by the technical production process.

Solubility Granular modified starches are practically insoluble in cold ethanol (96%) and in cold water. Pregelatinized starches are at least partially soluble in cold water and do typically develop viscosity. All food modified starches preserve the hydrophilic characteristics of native starch.

Viscosity (dynamic) The viscosity of starch is correlated with the botanical origin of the starch and chemical modification(s). Food modified starches for viscosity or texture adjustment are typically crosslinked and stabilized products (*see also* Section 18).

11 Stability and Storage Conditions

Modified starch is considered to be chemically and microbiologically inert under normal storage conditions. Store in an airtight container in a cool, dry place.

12 Incompatibilities

Modified starch is incompatible with strongly oxidizing substances. Colored inclusion compounds are formed with iodine.

13 Method of Manufacture

The most common production method is chemical modification in starch slurry. The nature of the reactive(s) and the specific reaction conditions are determined by the product in synthesis. A double modification may be carried out when authorized in the food regulations. An additional reduction of the starch viscosity, or 'thinning', is possible, e.g. via an acid hydrolysis.

After modification, starch particles are separated from the aqueous reaction medium (e.g. via filtration or centrifugation), washed and dried. Chemical reactions may alternatively be done in dry phase, e.g. in an extruder.

Pregelatinized modified starch is prepared by cooking and drying a starch paste on steam-heated rollers. A starch slurry or paste is dried on the surface of these drums and removed for milling to the desired particle size. An alternative process is so-called 'spray cooking', which produces instant-swelling starches. These starches keep their initial particle size and form, but swell immediately in contact with cold water.

14 Safety

Modified starch is regarded as an essentially nontoxic and nonirritant material. The Joint FAO/WHO Expert Committee on Food Additives (JECFA),[7] the European Commission Science Committee on Food (EC/SCF),[8] and the Food and Drug Administration (FDA),[9] have evaluated the safety of starch derivatives, resulting in an acceptable daily intake of 'not specified'.

LD_{50} (cat, oral): >9 g/kg[10]
LD_{50} (mouse, oral): >24 g/kg
LD_{50} (rat, oral): >35 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye protection and a dust mask are recommended. Excessive dust generation should be avoided to minimize the risks of explosion.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets; powders for suspension). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. In the US, all modified food starches are considered as edible food additives, and are authorized for nearly all applications. The pharmaceutical authorization of modified starch is correlated with FDA regulations.[9]

Food products for the EU market containing starch derivatives must comply with purity criteria as defined by food regulations,[11] should be labeled with the group category 'modified starch', and do not require an E-number. In the EU, E1400, E1401, E1402, E1403, and E1405 are not considered as food additives, and thus they do not need to be labeled 'modified starches'.[12]

The labeling of the botanical source of the starch is compulsory if it contains gluten.

17 Related Substances

Dextrin; hydroxypropyl starch; sodium starch glycolate; starch; starch, pregelatinized.

18 Comments

The chemical modification of starch, along with its botanical origin, has a major impact on its physicochemical properties.[13,14] Chemical modification may also influence the digestion speed, and therefore physiological response to administration.[15] The maximum permitted level of chemical modification depends on the nature of the substitution.[7,11]

Starch chemists differentiate between two basic starch modifications:

Stabilization A monofunctional substitution (e.g., esterification or etherification) on the starch hydroxyl groups with low substitution level. This stabilization improves the physical stability of the starch paste by steric hindrance of the starch retrogradation.

Crosslinking Starch chains are chemically linked with very small amounts of bi- or multifunctional reagents. Crosslinked starches are more resistant to swelling and gelatinization. These starches have better heat stability during the cooking process in food preparation, and they better resist shear forces.

Cold-water-soluble starch derivatives have been investigated as controlled-release agents in hydrophilic matrix systems.[16–21] Amphiphilic octenyl succinate starches (E1450) have also been investigated as wetting agents and alternatives to commonly used solubilizing or emulsifying agents in ophthalmic formulations.[22] Starches and starch derivatives are increasingly being investigated in the development of nanoparticles[23] and in targeted drug preparations.[24]

Dry-Flo (Ingredion) is a specially processed modified starch used as an absorbing and lubricating agent in a variety of dermal and pharmaceutical products. It is the hydrophobic aluminum salt of octenylsuccinate starch, authorized in Europe as E1452[25] for vitamin processing, and is not covered by the USP–NF monographs for Modified Starch or Pregelatinized Modified Starch.

Pregelatinized modified starches are also used as thickening agents for food in case of dysphagia due to better resistance against salivary amylases.[26]

A specification for modified food starch is included in the *Food Chemicals Codex* (FCC).[27]

Starch, Pregelatinized

1 Nonproprietary Names

BP: Pregelatinised Starch
PhEur: Starch, Pregelatinised
USP–NF: Pregelatinized Starch

2 Synonyms

Amylum pregelificatum; compressible starch; *C*PharmGel*; *Instastarch*; *Lycatab C*; *Lycatab PGS*; *Merigel*; *National 78-1551*; *Pharma-Gel*; *Prejel*; *Sepistab ST200*; *Spress B820*; *Starch 1500 G*; *Tablitz*; *Unipure LD*; *Unipure WG220*.

3 Chemical Name and CAS Registry Number

Pregelatinized starch [9005-25-8]

4 Empirical Formula and Molecular Weight

$(C_6H_{10}O_5)_n$ where n = 300–1000.

Pregelatinized starch is a starch that has been chemically and/or mechanically processed to rupture all or part of the starch granules. Both fully and partially pregelatinized grades are commercially available. Partial pregelatinization renders the starch flowable and directly compressible. Full pregelatinization produces a cold-water soluble starch that can be used as a wet granulation binder. Typically, pregelatinized starch contains 5% of free amylose, 15% of free amylopectin, and 80% unmodified starch.

The USP 40–NF 35 S1 does not specify the botanical origin of the original starch, but the PhEur 9.2 specifies that pregelatinized starch is obtained from maize (corn), potato, or rice starch. *See also* Starch and Section 13. Normally the fully pregelatinized starch contains 20–30% amylose and the rest amylopectin, which is about the same ratio (1 : 3) as for the partially pregelatinized form. There are ways to increase the amylose portion.[1]

5 Structural Formula

See Starch.

6 Functional Category

Tablet and capsule binder; tablet and capsule diluent; tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology

Partially pregelatinized starch is a modified starch used in oral capsule and tablet formulations as a binder, diluent,[2,3] and disintegrant.[4]

In comparison to starch, partially pregelatinized starch may be produced with enhanced flow and compression characteristics such that the pregelatinized material may be used as a tablet binder in dry-compression or direct compression processes.[5–10] In such processes, pregelatinized starch is self-lubricating. However, when it is used with other excipients it may be necessary to add a lubricant to a formulation. Although magnesium stearate 0.25% w/w is commonly used for this purpose, concentrations greater than this may have adverse effects on tablet strength and dissolution. Therefore, stearic acid is generally the preferred lubricant with pregelatinized starch.[11]

Partially pregelatinized starch is used in oral dry powder hard capsule formulations. Fully pregelatinized starches can be used to make soft capsules, shells, and coatings as well as binders in tablets. Both partially and fully pregelatinized starch may also be used in wet granulation processes.[12] *See* Table I. Pregelatinized starch has also be shown to be useful as a binder in orally disintegrating tablets.[13]

8 Description

Pregelatinized starch occurs as a moderately coarse to fine, white to off-white colored powder. It is odorless and has a slight characteristic taste.

Examination of fully pregelatinized starch as a slurry in cold water, under a polarizing microscope, reveals no significant ungelatinized granules, i.e. no 'maltese crosses' characteristic of the starch birefringence pattern. Examination of samples suspended in glycerin shows characteristic forms depending upon the method

Table I: Uses of pregelatinized starch.

Use	Concentration (%)
Diluent (hard gelatin capsules)	5–75
Tablet binder (direct compression)	5–20
Tablet binder (wet granulation)	5–10
Tablet disintegrant	5–10

of drying used during manufacture: either irregular chunks from drum drying or thin plates. Partially pregelatinized starch (e.g. *Starch 1500G* and *Sepistab ST200*) show retention of birefringence patterns typical of unmodified starch granules.

9 Pharmacopeial Specifications

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for pregelatinized starch.

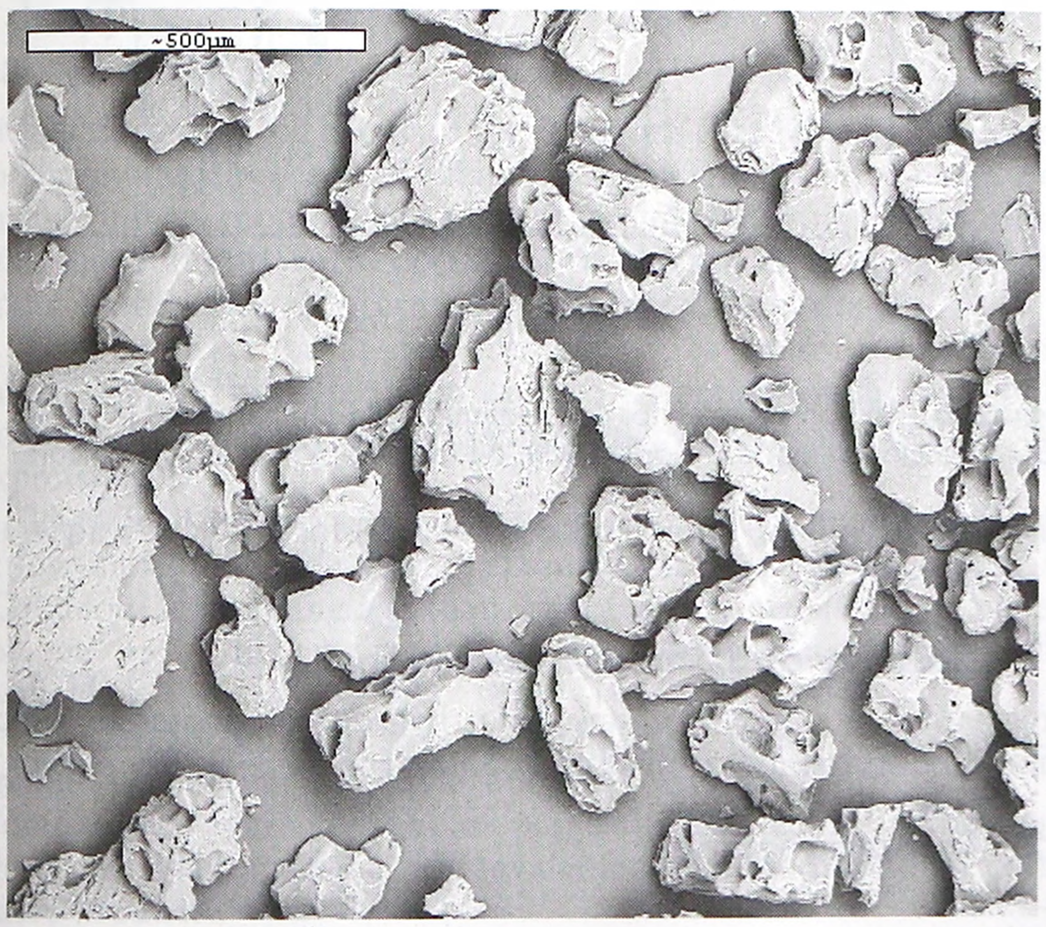
Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
pH (10% w/v slurry)	4.5–7.0	4.5–7.0
Iron	≤20 ppm	≤20 ppm
Oxidizing substances	+	+
Sulfur dioxide	≤50 ppm	≤80 ppm
Microbial limits	+	+
Loss on drying	≤15.0%	≤14.0%
Residue on ignition	–	≤0.5%
Foreign matter	+	–
Sulfated ash	≤0.6%	–

10 Typical Properties

Acidity/alkalinity pH = 4.5–7.0 for a 10% w/v aqueous dispersion.

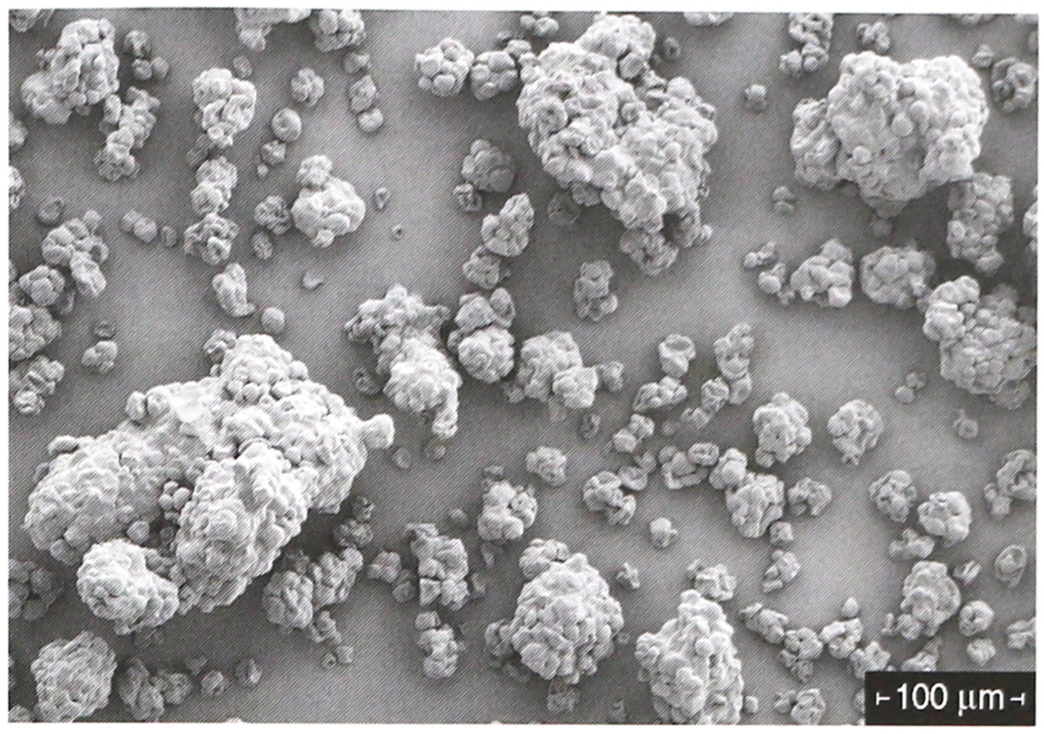
Angle of repose 40.7°[6]

Density (bulk) 0.586 g/cm^3



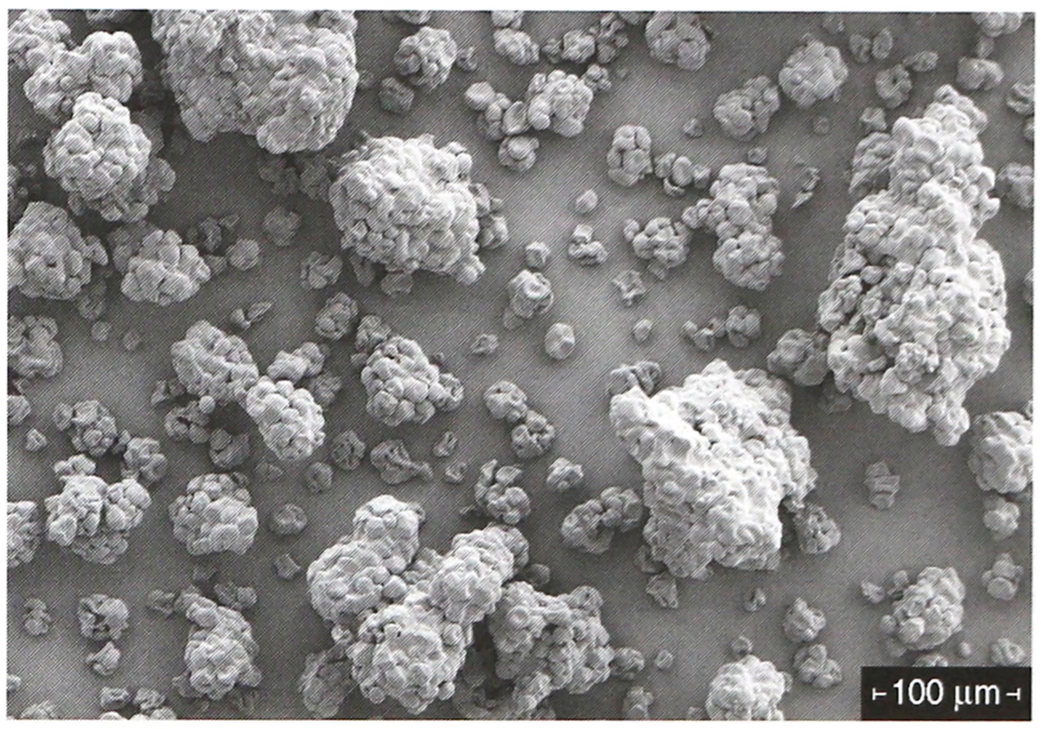
Density (tapped) 0.879 g/cm^3

Density (true) 1.516 g/cm^3

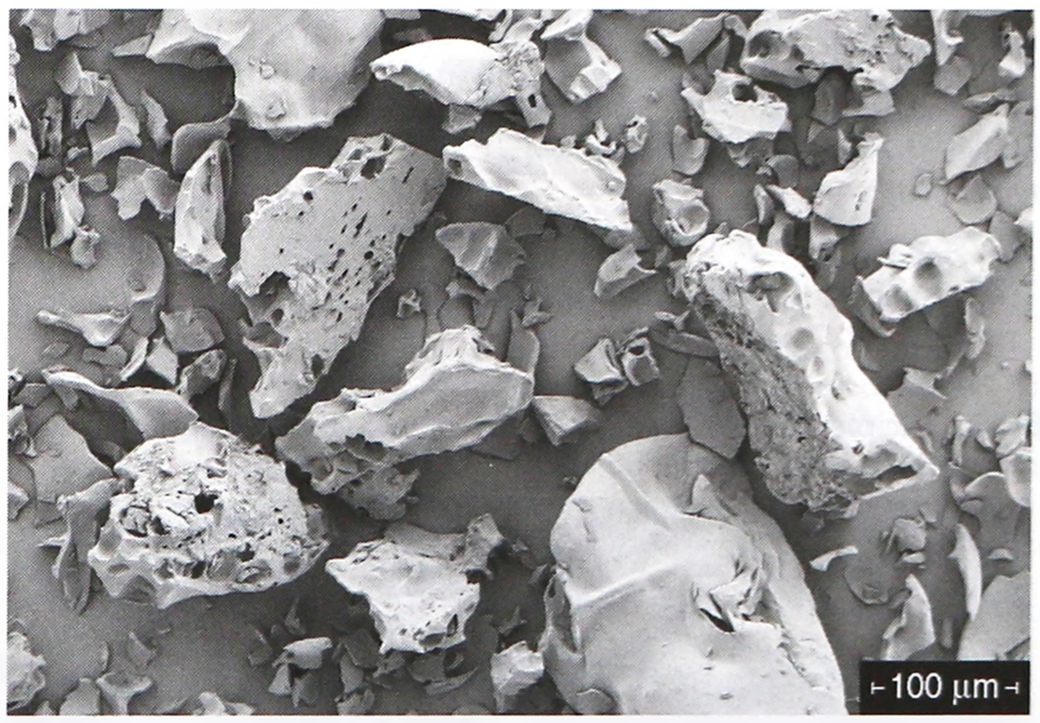


Flowability 18–23% (Carr compressibility index)[14]

Moisture content Pregelatinized maize starch is hygroscopic.[10,15,16] *See also* Figure 1.



SEM 1: Excipient: *Lycatab PGS*; manufacturer: Roquette Frères.



SEM 2: Excipient: pregelatinized starch; manufacturer: Cargill; magnification: 200×; voltage: 3 kV.

SEM 3: Excipient: pregelatinized starch; manufacturer: Cargill; magnification: 200×; voltage: 3 kV.

SEM 4: Excipient: pregelatinized starch; manufacturer: Cargill; magnification: 200×; voltage: 3 kV.

Particle size distribution 30–150 µm, median diameter 52 µm. For partially pregelatinized starch, greater than 90% through a US #100 mesh (149 µm); and less than 0.5% retained on a US #40 mesh (420 µm).

Solubility Practically insoluble in organic solvents. Slightly soluble to soluble in cold water, depending upon the degree of pregelatinization. Pastes can be prepared by sifting the pregelatinized starch into stirred, cold water. Cold-water-soluble matter for partially pregelatinized starch is 10–20%.

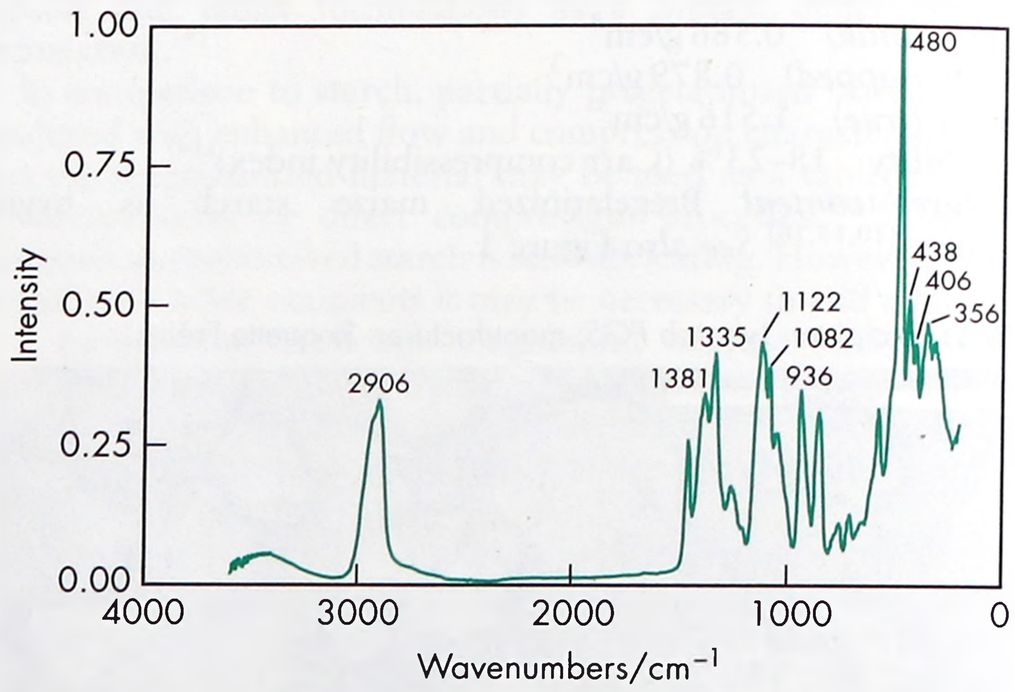

Figure 5: Raman spectrum of pregelatinized starch measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Viscosity (dynamic) 8–10 mPa s (8–10 cP) for a 2% w/v aqueous dispersion at 25°C.

11 Stability and Storage Conditions

Pregelatinized starch is a stable but hygroscopic material, which should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Food-grade pregelatinized starches are prepared by heating an aqueous slurry containing up to 42% w/w of starch at 62–72°C. Chemical additives that may be included in the slurry are gelatinization aids (salts or bases) and surfactants, added to control rehydration or minimize stickiness during drying. After heating, the slurry may be spray-dried, roll-dried, extruded, or drum-dried. In the last case, the dried material may be processed to produce a desired particle size range.

Pharmaceutical grades of fully pregelatinized starch use no additives and are prepared by spreading an aqueous suspension of ungelatinized starch on hot drums where gelatinization and subsequent drying take place. Partially pregelatinized starch is produced by subjecting moistened starch to mechanical pressure. The resultant material is ground and the moisture content is adjusted to specifications.

It has been established that the source of the starch will affect the nature of the product after pregelatinization.[17]

14 Safety

Pregelatinized starch and ungelatinized starch are widely used in oral solid-dosage formulations. Pregelatinized starch is generally regarded as a nontoxic and nonirritant excipient. However, oral consumption of large amounts of pregelatinized starch may be harmful.

See Starch for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and a dust mask are recommended. Excessive dust generation should be avoided to minimize the risks of explosions.

In the UK, the long-term (8-hour TWA) workplace exposure limits for starch are 10 mg/m^3 for total inhalable dust and 4 mg/m^3 for respirable dust.[18]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral capsules, suspensions, and tablets; vaginal preparations). Included in nonparenteral medicines licensed in the UK.

17 Related Substances

Corn starch and pregelatinized starch, coprocessed; pregelatinized hydroxypropyl starch; starch; starch, modified; starch, sterilizable maize.

18 Comments

Pregelatinized starch is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Pregelatinized starch has been shown to cause a decrease in mRNA production in tissue culture systems, which may hold potential for excipient–drug interactions by repression of CYP3A4 expression.[19]

The USP 40–NF 35 S1 also lists pregelatinized modified starch. A low-moisture grade of pregelatinized starch, *Starch 1500 LM* (Colorcon), containing less than 7% of water, specifically intended for use as a diluent in capsule formulations is commercially available.[11]

Sepistab ST200 (Seppic) is described as an agglomerate of starch granules consisting of native and pregelatinized corn starch.[20] Compression characteristics of pregelatinized starches from sorghum and plantain have been evaluated against traditional corn-based products.[21]

StarCap 1500 (Colorcon) is a coprocessed mixture of pregelatinized starch and corn starch promoted for use in dry-powder, hard-capsule fillings; *see* Corn Starch and Pregelatinized Starch.

A specification for partly pregelatinized starch is contained in the *Japanese Pharmaceutical Excipients* (JPE).[22]

Starch, Sterilizable Maize

1 Nonproprietary Names

USP–NF: Absorbable Dusting Powder

2 Synonyms

Biosorb; double-dressed, white maize starch; *Fluidamid R444*; *Keoflo ADP*; *Meritena*; modified starch dusting powder; *Pure-Dent*; starch-derivative dusting powder; sterilizable corn starch.

3 Chemical Name and CAS Registry Number

Sterilizable maize starch

4 Empirical Formula and Molecular Weight

$(C_6H_{10}O_5)_n$ where n = 300–1000.

Sterilizable maize starch is a modified corn (maize) starch that may also contain up to 2.0% of magnesium oxide.

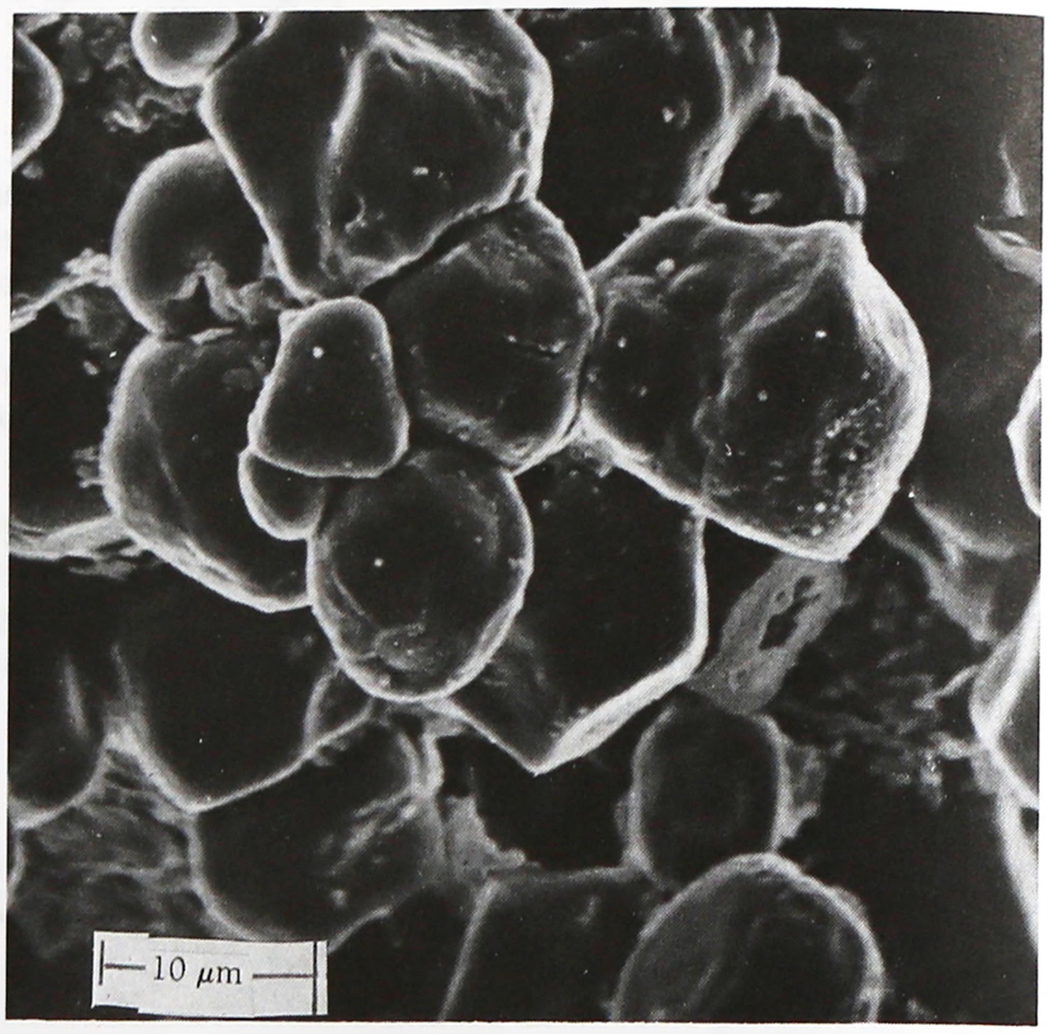
See also Starch.

5 Structural Formula

See Starch.

6 Functional Category

Lubricant.



7 Applications in Pharmaceutical Formulation or Technology

Sterilizable maize starch is a chemically or physically modified corn (maize) starch that does not gelatinize on exposure to moisture or steam sterilization. Sterilizable maize starch is primarily used as a lubricant for examination and surgeons' gloves, although because of safety concerns unlubricated gloves are now generally recommended; *see* Section 14. It is also used as a vehicle for medicated dusting powders.

8 Description

Sterilizable maize starch occurs as an odorless, white, free-flowing powder. Particles may be rounded or polyhedral in shape.

SEM 1: Excipient: sterilizable maize starch; manufacturer: Ingredion Incorporated; magnification: 2000×.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sterilizable maize starch.

Test	USP 40–NF 35 S1
Identification	+
Stability to autoclaving	+
Sedimentation	+
pH (1 in 10 suspension)	10.0–10.8
Loss on drying	≤12%
Residue on ignition	≤3.0%
Magnesium oxide	≤2.0%
Heavy metals	≤0.001%

10 Typical Properties

Acidity/alkalinity pH = 9.5–10.8 for a 10% w/v suspension at 25°C.
Density 1.48 g/cm^3
Density (bulk) 0.47–0.59 g/cm^3
Density (tapped) 0.64–0.83 g/cm^3
Flowability 24–30% (Carr compressibility index)[1]
Moisture content 10–15%
Particle size distribution 6–25 μm; median diameter is 16 μm.
Solubility Very slightly soluble in chloroform and ethanol (95%); practically insoluble in water.
Specific surface area 0.50–1.15 m^2/g

11 Stability and Storage Conditions

Sterilizable maize starch may be sterilized by autoclaving at 121°C for 20 minutes, by ethylene oxide, or by irradiation.[2]

Sterilizable maize starch should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Corn starch (maize starch) is physically or chemically modified by treatment with either phosphorus oxychloride or epichlorhydrin so that the branched-chain and straight-chain starch polymers cross-link. Up to 2.0% of magnesium oxide may also be added to the starch.

See also Starch.

14 Safety

Sterilizable maize starch is primarily used as a lubricant for surgeons' gloves and as a vehicle for topically applied dusting powders.

Granulomatous reactions, peritonitis and inflammation at operation sites have been attributed to contamination with surgical glove powders containing sterilizable maize starch. In addition, glove powder may be a risk factor in the development of latex allergy. As a consequence, it has been suggested that the use of sterilizable maize starch in latex gloves should be prohibited.[3–13] Furthermore, the FDA have now proposed to ban powdered medical and surgical gloves.[14,15]

See also Starch.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and a dust mask are recommended. Excessive dust generation should be avoided to minimize the risks of explosions.

In the UK, the long-term (8-hour TWA) occupational exposure limits for starch are 10 mg/m^3 for total inhalable dust and 4 mg/m^3 for respirable dust.[16]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Starch; starch, pregelatinized.

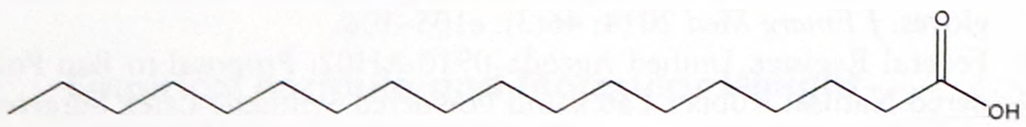
3 Chemical Name and CAS Registry Number



Octadecanoic acid [57-11-4]

4 Empirical Formula and Molecular Weight

$C_{18}H_{36}O_2$ 284.47 (for pure material)

The USP 40–NF 35 S1 describes stearic acid as a mixture of stearic acid ($C_{18}H_{36}O_2$) and palmitic acid ($C_{16}H_{32}O_2$). The PhEur 9.2 and USP 40–NF 35 S1 contain a single monograph for stearic acid but define stearic acid 50, stearic acid 70, and stearic acid 95 as containing specific amounts of stearic acid ($C_{18}H_{36}O_2$); *see* Section 9. The USP 40–NF 35 S1 also contains a monograph for purified stearic acid; *see* Section 17.

5 Structural Formula

6 Functional Category

Emulsifying agent; solubilizing agent; tablet and capsule lubricant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Stearic acid is widely used in oral and topical pharmaceutical formulations. It is mainly used in oral formulations as a tablet and capsule lubricant;[1–3] *see* Table I, although it may also be used as a binder[4] or in combination with shellac as a tablet coating. It has also been suggested that stearic acid may be used in enteric tablet coatings and as a sustained-release drug carrier.[5]

In topical formulations, stearic acid is used as an emulsifying and solubilizing agent. When partially neutralized with alkalis or triethanolamine, stearic acid is used in the preparation of creams.[6,7] The partially neutralized stearic acid forms a creamy base when mixed with 5–15 times its own weight of aqueous liquid, the appearance and plasticity of the cream being determined by the proportion of alkali used.

Stearic acid is used as the hardening agent in glycerin suppositories.

Stearic acid has been used in the preparation of inhalation formulations.[8,9] It has also been used in the production of stable nanoparticles for various topical and oral formulations (emulsions, oral liquids, creams, gels).[10–15] Also, it has been used in sustained release formulations.[16–20]

Enalapril is unstable when mixed with some excipients; this instability can be corrected by incorporating stearic acid in the formulation.[21]

Table I: Uses of stearic acid.

Use	Concentration (%)
Ointments and creams	1–20
Tablet lubricant	1–3

8 Description

Stearic acid occurs as a hard, white or faintly yellow-colored, somewhat glossy, crystalline solid or a white or yellowish white powder. It has a slight odor (with an odor threshold of 20 ppm) and taste suggesting tallow.

See also Section 13.

9 Pharmacopeial Specifications

The pharmacopeial specifications for stearic acid have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

10 Typical Properties

Acid value 195–212
Boiling point 383°C
Density (bulk) ≈0.537 g/cm^3
Density (tapped) 0.571 g/cm^3
Density (true) 0.980 g/cm^3; 0.847 g/cm^3 at 70°C
Flash point 113°C (closed cup)
Melting point 67–70°C
Moisture content Contains practically no water.
Partition coefficient Log (oil : water) = 8.2
Refractive index 1.43 at 80°C
Saponification value 200–220

SEM 1: Excipient: stearic acid, 95% (*Emersol 153*); manufacturer: Emery Industries; lot no.: 18895; magnification: 120×; voltage: 10 kV.

SEM 2: Excipient: stearic acid, food grade (*Emersol 6332*); manufacturer: Emery Industries; lot no.: 18895; magnification: 120×; voltage: 10 kV.

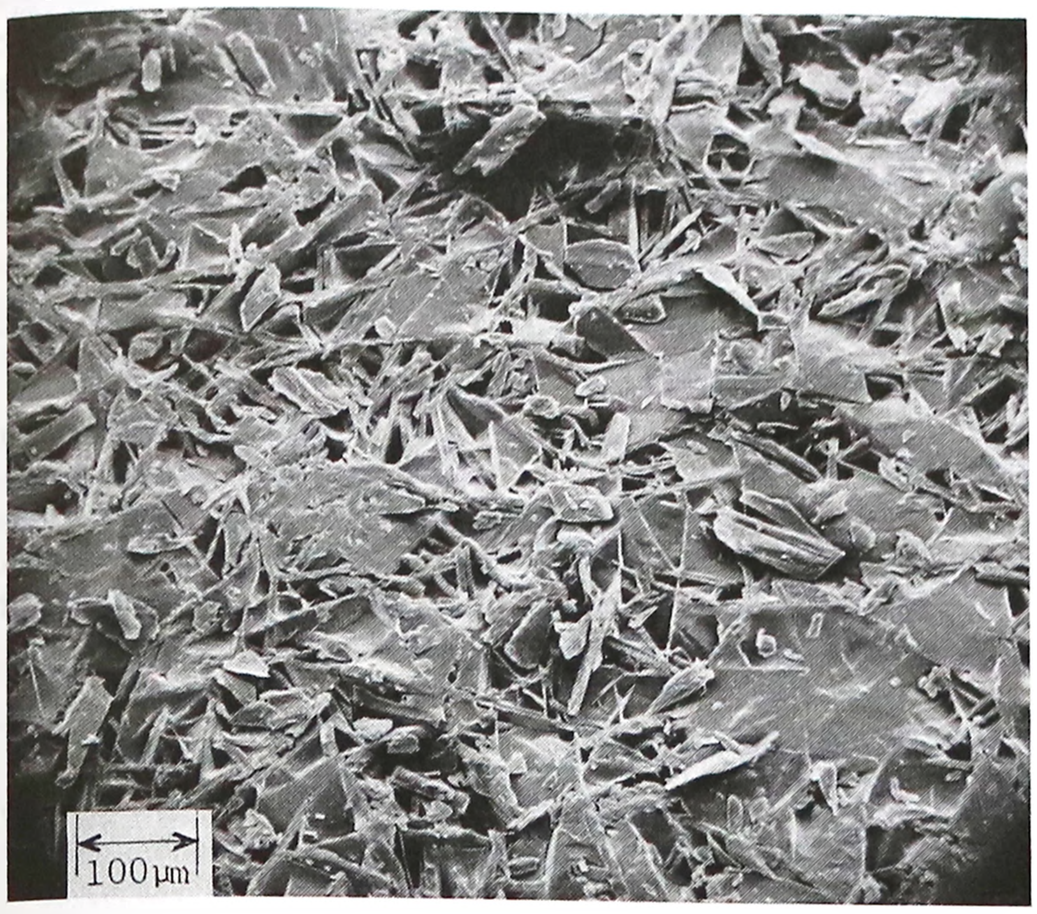


Table II: Pharmacopeial specifications for stearic acid.

Industrene 8718	87	64.5–67.5	196–201	≤2.0	196–202	≤1.5

material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Stearic acid is incompatible with most metal hydroxides and may be incompatible with bases, reducing agents, and oxidizing agents.

Ointment bases made with stearic acid may show evidence of drying out or lumpiness due to such a reaction when compounded with zinc or calcium salts.

A number of differential scanning calorimetry studies have investigated the compatibility of stearic acid with drugs. Although such laboratory studies have suggested incompatibilities, e.g. with naproxen,[23] they may not necessarily be applicable to formulated products.

Stearic acid has been reported to cause pitting in the film coating of tablets applied using an aqueous film-coating technique; the pitting was found to be a function of the melting point of the stearic acid.[24]

13 Method of Manufacture

Stearic acid is manufactured by hydrolysis of fat by continuous exposure to a countercurrent stream of high-temperature water and fat in a high-pressure chamber. The resultant mixture is purified by vacuum steam distillation and the distillates are then separated using selective solvents.

Stearic acid may also be manufactured by the hydrogenation of cottonseed and other vegetable oils; by the hydrogenation and subsequent saponification of olein followed by recrystallization from alcohol; and from edible fats and oils by boiling with sodium hydroxide, separating any glycerin, and decomposing the resulting soap with sulfuric or hydrochloric acid. The stearic acid is then subsequently separated from any oleic acid by cold expression.

Stearic acid is derived from edible fat sources unless it is intended for external use, in which case nonedible fat sources may be used. The USP 40–NF 35 S1 states that stearic acid labeled solely for external use is exempt from the requirement that it be prepared from edible sources. Stearic acid may contain a suitable antioxidant such as 0.005% w/w butylated hydroxytoluene.

14 Safety

Stearic acid is widely used in oral and topical pharmaceutical formulations; it is also used in cosmetics and food products. Stearic acid is generally regarded as a nontoxic and nonirritant material. However, consumption of excessive amounts may be harmful.

LD_{50} (mouse, IV): 23 mg/kg[25]

LD_{50} (rat, IV): 21.5 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Stearic acid dust may be irritant to the skin, eyes, and mucous membranes. Eye protection, gloves, and a dust respirator are recommended. Stearic acid is combustible.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe (fatty acids). Included in the FDA Inactive Ingredients Database (sublingual tablets; oral capsules, solutions, suspensions, and tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium stearate; magnesium stearate; polyoxyethylene stearates; purified stearic acid; zinc stearate.

Purified stearic acid

Empirical formula $C_{18}H_{36}O_2$
Molecular weight 284.47
CAS number [57-11-4]
Synonyms Octadecanoic acid
Acid value 195–200
Boiling point 361°C
Density 0.847 g/cm^3 at 70°C
Flash point 196°C
Iodine number ≤1.5
Melting point 66–69°C
Refractive index n_D^{80} = 1.4299
Solubility Soluble 1 in 5 parts benzene, 1 in 6 parts carbon tetrachloride, 1 in 2 parts chloroform, 1 in 15 parts ethanol, 1 in 3 parts ether; practically insoluble in water.
Vapor density (relative) 9.80 (air = 1)
Comments The USP 40–NF 35 S1 describes purified stearic acid as a mixture of stearic acid ($C_{18}H_{36}O_2$) and palmitic acid ($C_{16}H_{32}O_2$), which together constitute not less than 96.0% of the total content. The content of $C_{18}H_{36}O_2$ is no less than 90.0% of the total.

18 Comments

Stearic acid has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Stearic acid is the most common of the long-chain fatty acids and is found in many foods, such as beef fat, and cocoa butter. It is widely used in soaps, cosmetics, foods, food packaging, deodorant sticks, toothpastes and as a softener in rubber. It adds the pearly effect to shampoos, liquid soaps and cosmetics. It is also the source of the scent in crayons.

A wide range of different grades of stearic acid are commercially available that have varying chemical compositions and hence different physical and chemical properties; *see* Table III.[26] Stearic acid is highly soluble in structurally diverse solvents. Stearic acid/solvent packing within a 24.8 Å^3 cubic volume explains the stoichiometry of stearic acid solubility at multiple temperatures in multiple solvents.[27]

In one study the release of an active drug in a formulation containing stearic acid was independent of compression pressure in the range 1–7 tons; the particle size of the stearic acid did have a significant influence on the drug release.[28]

S

A potential application of stearic acid is in the preparation of 'cushioning pellets', composed of stearic acid : microcrystalline cellulose (4 : 1 w/w). The use of these pellets may avoid rupture of the coating of pellets during the compression step of manufacturing.[29] A similar approach was used for mesalamine delayed release where stearic acid protected the coated mesalamine beads.[30]

If stearic acid is intended for external use only, the labelling so indicates; *see* Section 13.

Stearic acid is also widely used in cosmetics and food products. A specification for stearic acid is contained in the *Food Chemicals Codex* (FCC).[31]

The EINECS number for stearic acid is 200-313-4.

Stearyl Alcohol

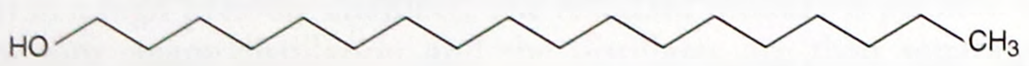
1 Nonproprietary Names

BP: Stearyl Alcohol
JP: Stearyl Alcohol
PhEur: Stearyl Alcohol
USP–NF: Stearyl Alcohol

2 Synonyms

Alcohol stearylicus; *Alfol 18*;*Cachalot*; *Crodacol S95*;decyl octyl alcohol; 1-hydroxyoctadecane; *Hyfatol 18-95*; *Hyfatol 18-98*; *Kolliwax SA*; *Lanette 18*; *Lipocol S*; *Nacol 18-94*; *Nacol 18-98*; *Nacol 18-99*; 1-octadecanol; *n*-octadecanol; octadecyl alcohol; *Rita SA*; *Speziol C18 Pharma*; stearic alcohol; *Stearol*; *Stenol*; *Tego Alkanol 18*; *Vegarol 1898*;*Vegarol 1895*.

3 Chemical Name and CAS Registry Number



1-Octadecanol [112-92-5]

4 Empirical Formula and Molecular Weight

$C_{18}H_{38}O$ 270.48 (for pure material)

The PhEur 9.2 describes stearyl alcohol as a mixture of solid alcohols containing not less than 95% of 1-octadecanol, $C_{18}H_{38}O$ of animal or vegetable origin. The USP 40–NF 35 S1 states that stearyl alcohol contains not less than 90% and not more than 102% of 1-octadecanol, the remainder consisting chiefly of related alcohols.

5 Structural Formula

6 Functional Category

Emollient; emulsifying agent; stiffening agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Stearyl alcohol is used in topical and vaginal pharmaceutical creams and ointments as a stiffening agent. By increasing the viscosity of an emulsion, stearyl alcohol increases its stability. Stearyl alcohol also has some emollient and weak emulsifying properties, and is used to increase the water-holding capacity of ointments, e.g. petrolatum.

Stearyl alcohol is used in modified-release oral capsules and tablets,[1–4] and suppositories.[5,6] It has been studied for use in microspheres,[7,8] gastroretentive[9] and vaginal hydrogel drug-delivery systems.[10] It has also been investigated as a transdermal penetration enhancer[11,12] and as an alternative to cholesterol as a membrane-stabilizing agent for liposomes.[13]

8 Description

Stearyl alcohol occurs as hard, white, waxy pieces, flakes, or granules with a slight characteristic odor and bland taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for stearyl alcohol.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

10 Typical Properties

Autoignition temperature 450°C
Boiling point 210.5°C at 2 kPa (15 mmHg)
Flash point 191°C (open cup)
Freezing point 55–57°C
Melting point 59.4–59.8°C for the pure material.
Refractive index n_D^{60} = 1.4388 at 60°C
Solidification point 56–59°C for *Nacol 18-98*; 55–58°C for *Speziol C18 Pharma*.
Solubility Soluble in chloroform, ethanol (95%), ether, hexane, propylene glycol, benzene, acetone, and vegetable oils; practically insoluble in water.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Vapor pressure 133.3 Pa (1 mmHg) at 150.3°C

11 Stability and Storage Conditions

Stearyl alcohol is stable to acids and alkalis and does not usually become rancid. It should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Stearyl alcohol is incompatible with strong oxidizing agents and strong acids.

13 Method of Manufacture

Historically, stearyl alcohol was prepared from sperm whale oil but is now largely prepared synthetically by reduction of ethyl stearate with lithium aluminum hydride.

14 Safety

Stearyl alcohol is generally considered to be an innocuous, nontoxic material. However, adverse reactions to stearyl alcohol present in topical preparations have been reported. These include contact urticaria and hypersensitivity reactions, which are possibly due to impurities contained in stearyl alcohol rather than stearyl alcohol itself.[14–18]

The probable lethal oral human dose is greater than 15 g/kg.

LD_{50} (rat, oral): 20 g/kg[19]

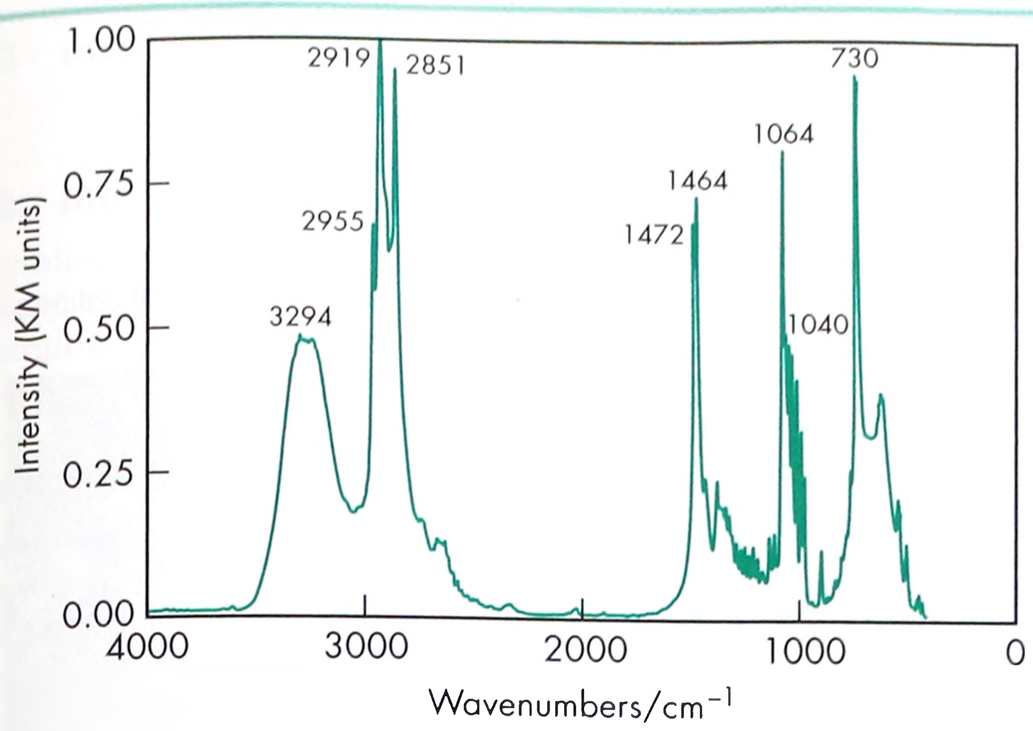

Figure 1: Infrared spectrum of stearyl alcohol measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

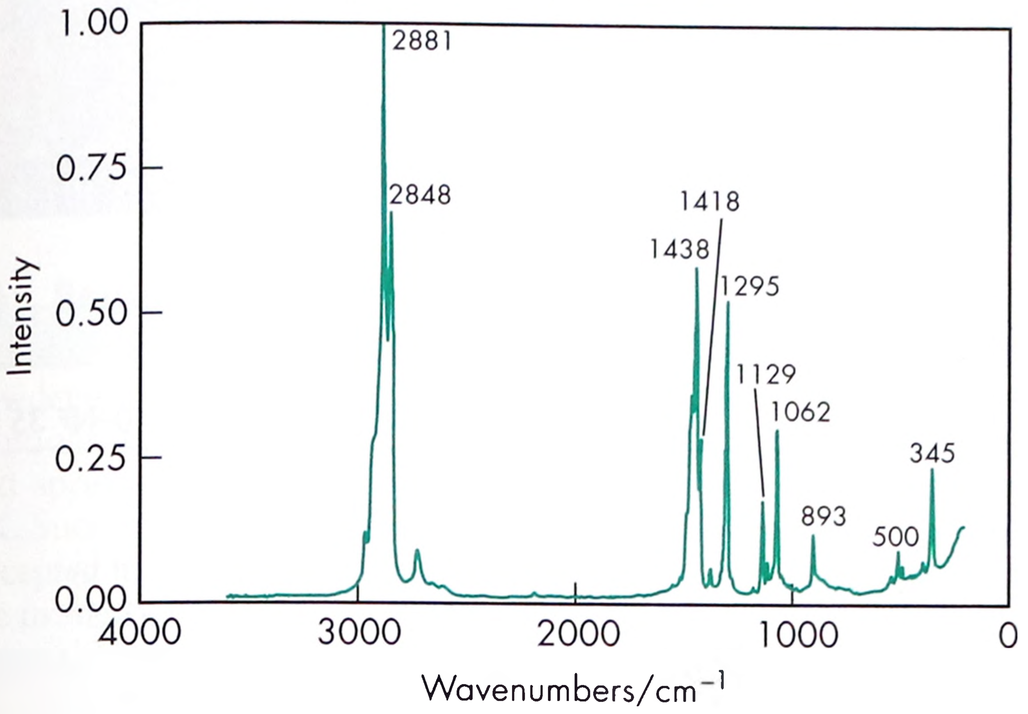

Figure 2: Raman spectrum of stearyl alcohol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Stearyl alcohol is not a fire hazard, although it will burn and may give off noxious fumes containing carbon monoxide.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets; rectal, topical, and vaginal preparations). Included in the EAFUS database. Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cetostearyl alcohol; cetyl alcohol.

18 Comments

Stearyl alcohol is also used as a stiffening agent in cosmetic formulations.[20,21]

The EINECS number for stearyl alcohol is 204-017-6. The PubChem Compound ID (CID) for stearyl alcohol is 8221.

Sucralose

1 Nonproprietary Names

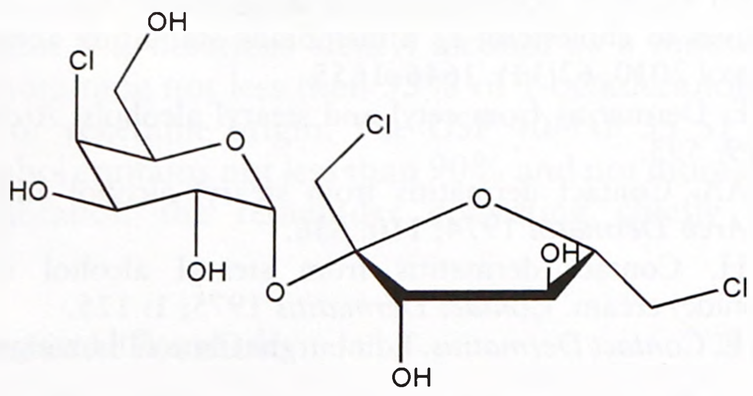
BP: Sucralose

PhEur: Sucralose

USP–NF: Sucralose

2 Synonyms

Cukren; E955; *Nevella*; *Splenda*; sucralosa; sucralosum; *SucraPlus*; *Sucre X*; TGS; 1′,4′,6′-trichlorogalactosucrose; 4,1′,6′-trichloro-4,1′,6′-trideoxy-*galacto*-sucrose; *Unisweet*.



3 Chemical Name and CAS Registry Number

1,6-Dichloro-1,6-dideoxy-β-D-fructofuranosyl-4-chloro-4-deoxy-α-D-galactopyranoside [56038-13-2]

4 Empirical Formula and Molecular Weight

$C_{12}H_{19}Cl_3O_8$ 397.64

5 Structural Formula

6 Functional Category

Sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Sucralose is used as a sweetening agent in pharmaceutical formulations. It is used alone or in combination with flavoring agents to mask the bitterness of oral formulations and nasal sprays. Sucralose has a sweetening power approximately 300–1000 times that of sucrose and has no aftertaste. The usual concentration for use in food products is 0.03–0.24%.

8 Description

Sucralose occurs as a white to off-white colored, free-flowing, crystalline powder.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 5–6 (10% w/v aqueous solution at 20°C)
Density (bulk) 0.35 g/cm^3
Density (tapped) 0.62 g/cm^3
Density (true) 1.63 g/cm^3
Melting point 130°C (for anhydrous crystalline form); 36.5°C (for pentahydrate).
Particle size distribution 90% <12 µm in size for the powder grade (Tate & Lyle).
Partition coefficient log P = −0.51 (octanol : water)
Refractive index 1.33 to 1.37
Solubility Freely soluble in ethanol (95%), methanol, and water (0.283 g/mL at 20°C); slightly soluble in ethyl acetate.
Specific rotation $[\alpha]_D^{20}$ = +84.0° to +87.5° (1% w/v aqueous solution); +68.2° (1.1% w/v solution in ethanol).
Viscosity 0.6–3.8 mPa s (0.6–3.8 cP) (10–60% w/w in water at 20–60°C).

SEM 1: Excipient: sucralose; manufacturer: Tate & Lyle; magnification: 1000×; voltage 3.0 kV.

Table I: Pharmacopeial specifications for sucralose.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Specific rotation	+84.0° to +87.5°	+84.0° to +87.5°
Water	≤2.0%	≤2.0%
Residue on ignition	≤0.7%	≤0.7%
Heavy metals	—	≤10 ppm
Limit of hydrolysis products	—	≤0.1%
Limit of methanol	—	≤0.1%
Limit of impurities[a]	≤0.1%	—
Related compounds	≤0.5%	≤0.5%
Assay (dried basis)	98.0–102.0%	98.0–102.0%

(a) PhEur 9.2 lists impurities as 1,6-dichloro-1,6-dideoxy-β-D-fructofuranose and 4-chloro-4-deoxy-α-D-galactopyranose.

11 Stability and Storage Conditions

Sucralose is a relatively stable material. In aqueous solution, at highly acidic conditions (pH <3), and at high temperatures (≥35°C), it is hydrolyzed to a limited extent, producing 4-chloro-4-deoxygalactose and 1,6-dichloro-1,6-dideoxyfructose. In food products, sucralose remains stable throughout extended storage periods, even at low pH. However, it is most stable at pH 5–6.

Sucralose should be stored in a well-closed container in a cool, dry place, at a temperature not exceeding 21°C. Sucralose, when heated at elevated temperatures, may break down with the release of carbon dioxide, carbon monoxide, and minor amounts of hydrogen chloride.

12 Incompatibilities

—

13 Method of Manufacture

Sucralose may be prepared by a variety of methods that involve the selective substitution of three sucrose hydroxyl groups by chlorine. Sucralose can also be synthesized by the reaction of sucrose (or an acetate) with thionyl chloride.

14 Safety

Sucralose is generally regarded as a nontoxic and nonirritant material and is approved, in a number of countries, for use in food products. Following oral consumption, sucralose is mainly unabsorbed and is excreted in the feces.[1–3]

The WHO has set an acceptable daily intake for sucralose of up to 15 mg/kg body-weight.[4]

LD_{50} (mouse, oral): >16 g/kg
LD_{50} (rat, oral): >10 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral films, powder and effervescent tablets for solutions, granules suspensions, solutions, tablets and lozenges, troche; buccal gums; nasal solutions and sprays). Included in nonparenteral medicines licensed in the UK. Sucralose is included in the EAFUS list compiled by the FDA. Accepted for use as a food additive in Europe. It is also accepted for use in many other countries worldwide. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sucrose.

18 Comments

Sucralose is also used as a sweetening agent in beverages and foods. The sweetening effect of sucralose is not reduced by heating, and food products containing sucralose may be subjected to high-temperature processes such as pasteurization, sterilization, UHT processing and baking. Sucralose is often blended with maltodextrin or dextrose as bulking agents in its granular form.

Sucralose has no nutritional value, is noncariogenic, does not promote dental caries, and produces no glycemic response.

A specification for sucralose is contained in the *Food Chemicals Codex* (FCC).[5]

The EINECS number for sucralose is 259-952-2. The PubChem Compound ID (CID) for sucralose includes 71485 and 5066234.

Sucrose

1 Nonproprietary Names

BP: Sucrose

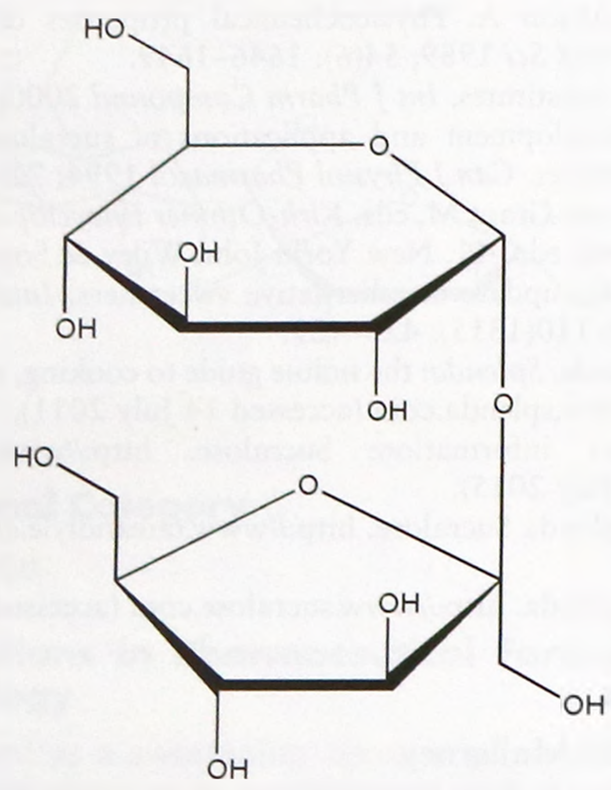
JP: Sucrose

PhEur: Sucrose

USP–NF: Sucrose

2 Synonyms

Beet sugar; cane sugar; α-D-glucopyranosyl-β-D-fructofuranoside; *Compressuc PS*; refined sugar; saccharose; saccharosum; saccharum; sucrosum; sugar.



3 Chemical Name and CAS Registry Number

β-D-fructofuranosyl-α-D-glucopyranoside [57-50-1]

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30

5 Structural Formula

6 Functional Category

Coating agent; cryoprotectant; suspending agent; sweetening agent; tablet and capsule binder; tablet and capsule diluent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Sucrose is widely used in oral pharmaceutical formulations.

Sucrose syrup, containing 50–67% w/w sucrose, is used in tableting as a binding agent for wet granulation. In the powdered form, sucrose serves as a dry binder (2–20% w/w) or as a bulking agent and sweetener in chewable tablets and lozenges.[1–4] Tablets that contain large amounts of sucrose may harden to give poor disintegration. Sucrose is also used as a filler in freeze-dried orally disintegrating tablets.[5] Sucrose syrups are used as tablet-coating agents at concentrations between 50% and 67% w/w. With higher concentrations, partial inversion of sucrose occurs, which makes sugar coating difficult.

Sucrose syrups are also widely used as vehicles in oral liquid-dosage forms to enhance palatability or to increase viscosity.[6,7]

Sucrose has been used as a cryoprotectant and effective stabilizer in lyophilized formulations of liposomal, nanoparticulate and self-microemulsifying drug delivery systems.[8–12]

Directly compressible sucrose is available in a range of particle sizes.[13,14]

See Table I.

Table I: Uses of sucrose.

Use	Concentration (% w/w)
Syrup for oral liquid formulations	67
Sweetening agent	67
Tablet binder (dry granulation)	2–20
Tablet binder (wet granulation)	50–67
Tablet coating (syrup)	50–67

8 Description

Sucrose is a sugar obtained from sugar cane (*Saccharum officinarum* Linné (Fam. Gramineae)), sugar beet (*Beta vulgaris* Linné (Fam. Chenopodiaceae)), and other sources. It contains no added substances. Sucrose occurs as colorless crystals, as crystalline masses or blocks, or as a white crystalline powder; it is odorless and has a sweet taste.

9 Pharmacopeial Specifications

The pharmacopeial specifications for sucrose have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for sucrose.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

11 Stability and Storage Conditions

Sucrose has good stability at room temperature and at moderate relative humidity. It absorbs up to 1% moisture, which is released upon heating at 90°C. Sucrose caramelizes when heated to temperatures above 160°C. Dilute sucrose solutions are liable to fermentation by microorganisms but resist decomposition at higher

S

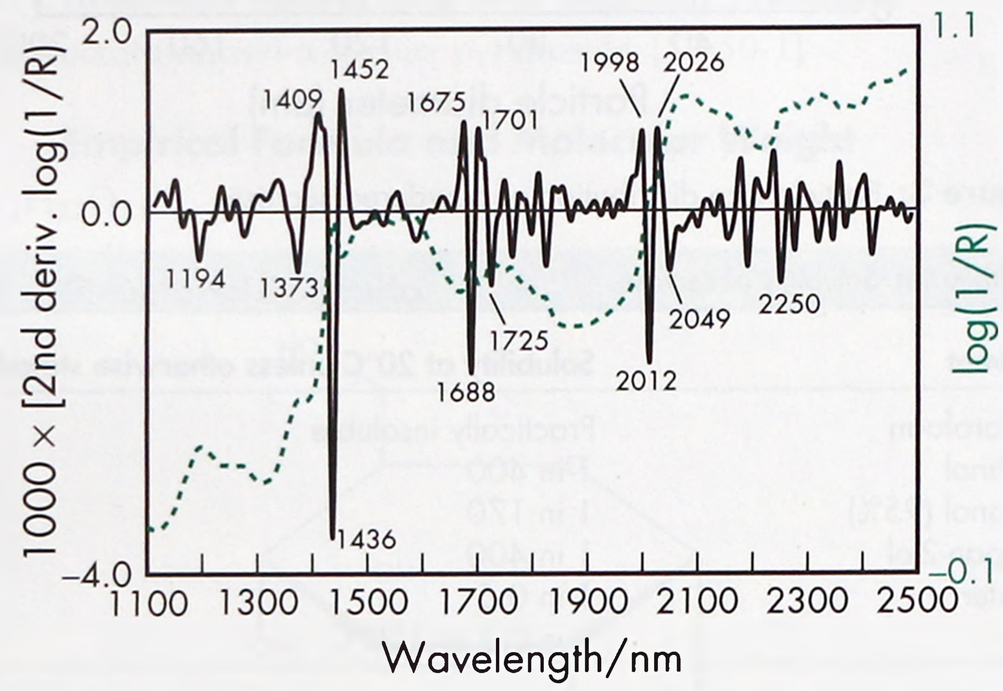

Figure 5: Near-infrared spectrum of sucrose measured by reflectance.

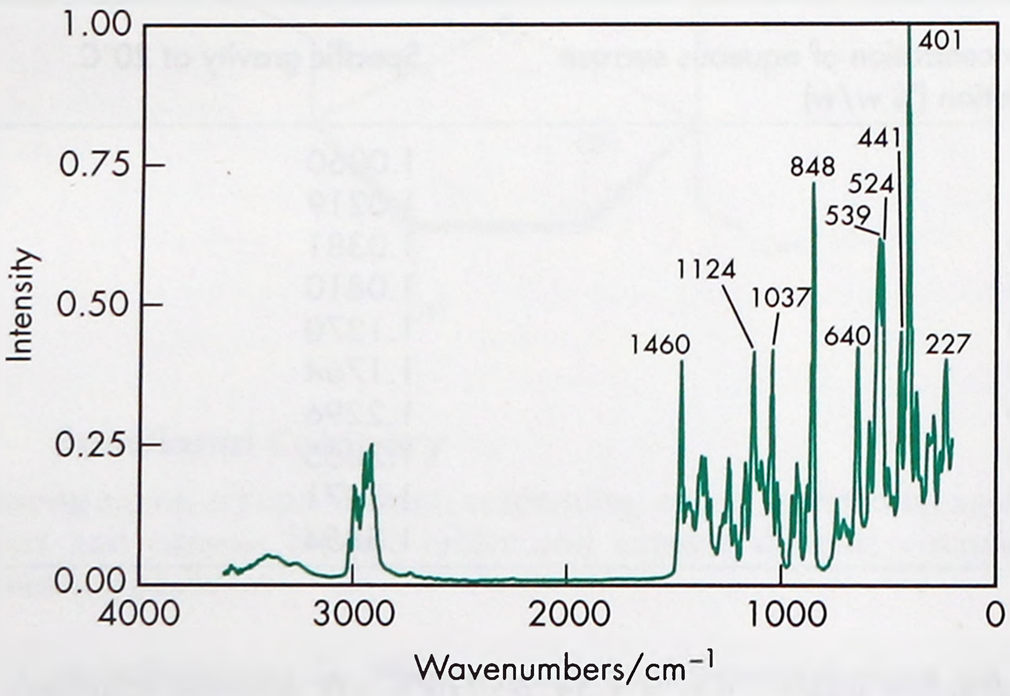

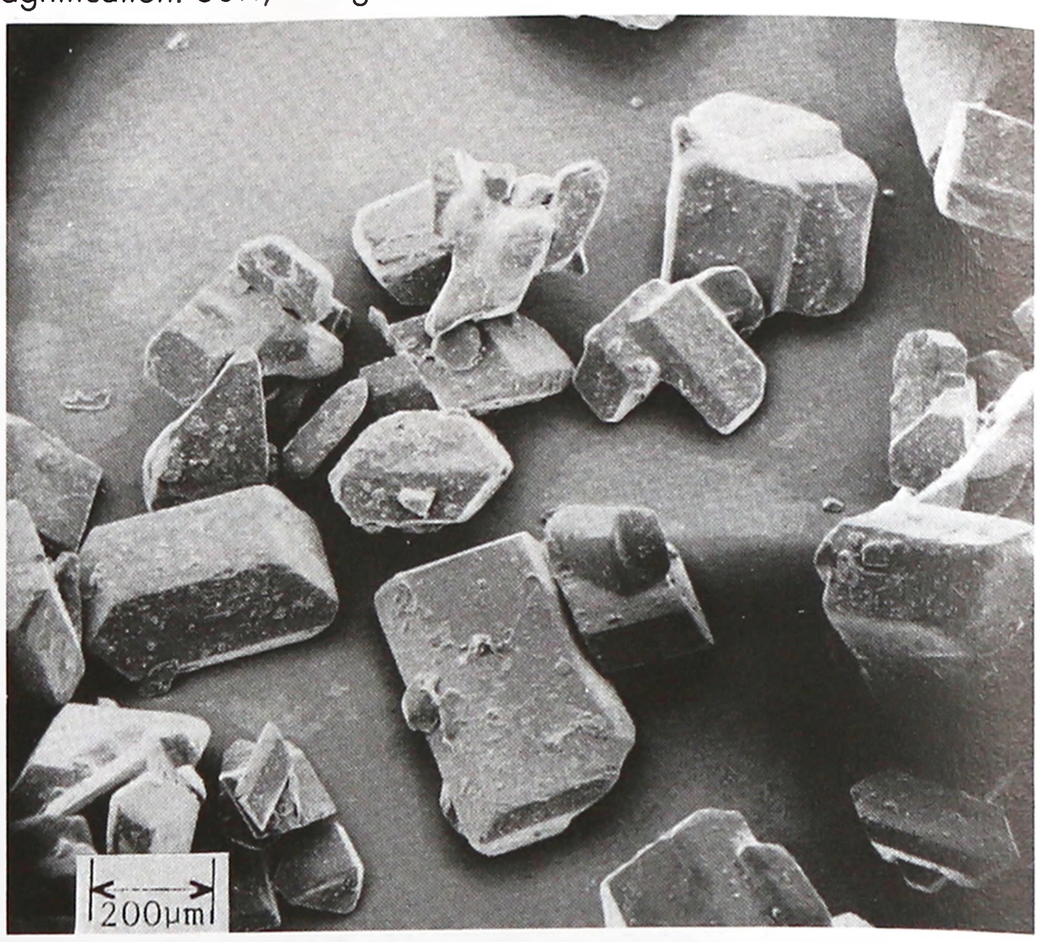

Figure 6: Raman spectrum of sucrose measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

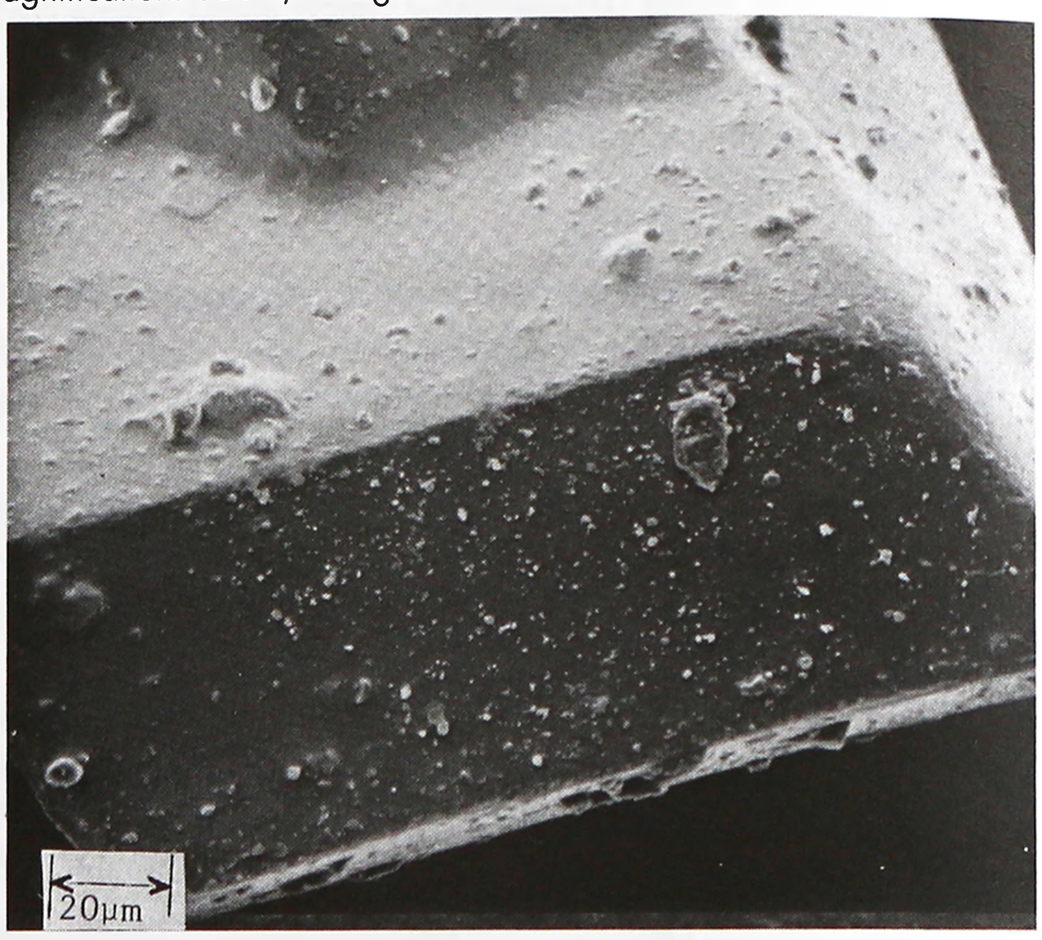
concentrations, e.g. above 60% w/w concentration. Aqueous solutions may be sterilized by autoclaving or filtration.



When sucrose is used as a base for medicated confectionery, the cooking process, at temperatures rising from 110 to 145°C, causes some inversion to form dextrose and fructose (invert sugar). The fructose imparts stickiness to confectionery but prevents cloudiness due to graining. Inversion is accelerated particularly at temperatures above 130°C and by the presence of acids.

The bulk material should be stored in a well-closed container in a cool, dry place.

SEM 1: Excipient: sucrose; manufacturer: Western Sugar; lot no.: 1-2-80; magnification: 60×; voltage: 10 kV.

SEM 2: Excipient: sucrose; manufacturer: Western Sugar; lot no.: 1-2-80; magnification: 600×; voltage: 10 kV.

12 Incompatibilities

Powdered sucrose may be contaminated with traces of heavy metals, which can lead to incompatibility with active ingredients, e.g. ascorbic acid. Sucrose may also be contaminated with sulfite from the refining process. With high sulfite content, color changes can occur in sugar-coated tablets; for certain colors used in sugar-coating the maximum limit for sulfite content, calculated as sulfur, is 1 ppm. In the presence of dilute or concentrated acids, sucrose is hydrolyzed or inverted to dextrose and fructose (invert sugar). Sucrose may attack aluminum closures.[16]

13 Method of Manufacture

Sucrose is obtained from the sugar cane plant, which contains 15–20% sucrose, and sugar beet, which contains 10–17% sucrose. Juice from these sources is heated to coagulate water-soluble proteins, which are removed by skimming. The resultant solution is

then decolorized with an ion-exchange resin or charcoal and concentrated. Upon cooling, sucrose crystallizes out. The remaining solution is concentrated again and yields more sucrose, brown sugar, and molasses.

14 Safety

Sucrose is hydrolyzed in the small intestine by the enzyme sucrase to yield dextrose and fructose, which are then absorbed. When administered intravenously, sucrose is excreted unchanged in the urine.

Although sucrose is very widely used in foods and pharmaceutical formulations, sucrose consumption is a cause of concern and should be monitored in patients with diabetes mellitus or other metabolic sugar intolerance.[17]

Sucrose is also considered to be more cariogenic than other carbohydrates since it is more easily converted to dental plaque. For this reason, its use in oral pharmaceutical formulations is declining.

Although sucrose has been associated with obesity, renal damage, and a number of other diseases, conclusive evidence linking sucrose intake with some diseases could not be established.[18,19] It was, however, recommended that sucrose intake in the diet should be reduced.[19]

LD_{50} (mouse, IP): 14 g/kg[20]
LD_{50} (rat, oral): 29.7 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. In the UK, the workplace exposure limit for sucrose is 10 mg/m^3 long-term (8-hour TWA) and 20 mg/m^3 short-term.[21]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (injections; oral capsules, solutions, suspensions, syrups, and tablets; topical and rectal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Compressible sugar; confectioner's sugar; invert sugar; sugar spheres.

Invert sugar

Empirical formula $C_6H_{12}O_6$
Molecular weight 180.16
CAS number [8013-17-0]
Comments An equimolecular mixture of dextrose and fructose prepared by the hydrolysis of sucrose with a suitable mineral acid such as hydrochloric acid. Invert sugar may be used as a stabilizing agent to help prevent crystallization of sucrose syrups and graining in confectionery. A 10% aqueous solution is also used in parenteral nutrition.

18 Comments

Sucrose has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

For typical boiling points of sucrose syrups, without inversion of the sugar, *see* Table V.

Sucrose is widely used in foods and confectionery. Therapeutically sugar pastes are used to promote wound healing.[22,23]

A specification for sucrose is contained in the *Food Chemicals Codex* (FCC).[24]

The EINECS number for sucrose is 200-334-9. The PubChem Compound ID (CID) for sucrose includes 5988 and 1115.

Table V: Boiling points of sucrose syrups.

Sucrose concentration (% w/v)	Boiling point (°C)
50	101.5
60	103
64	104
72	105.5
75	107
77.5	108.5
80	110.5

Residue on ignition	≤0.1%
Melting temperature	≥78°C
Acidity	+
Assay (anhydrous basis)	98.0–100.5%

10 Typical Properties

Boiling point 260°C
Flash point 307.3°C
Melting point 89°C (decomposes above 285°C)
Refractive index 1.47
Solubility Very soluble in methanol and chloroform; soluble in ethanol (95%) and ether; very slightly soluble in water; *see also* Table II.

Table II: Solubility of sucrose octaacetate.

Solvent	Solubility at 20°C
Acetone	1 in 0.3
Benzene	1 in 0.6
Ethanol (95%)	1 in 11
Acetic acid, glacial	1 in 0.7
Toluene	1 in 0.5
Water	1 in 1100

Specific gravity 1.28 at 20°C (water = 1)
Specific rotation $[\alpha]_D^{25.4} = +58.5°$

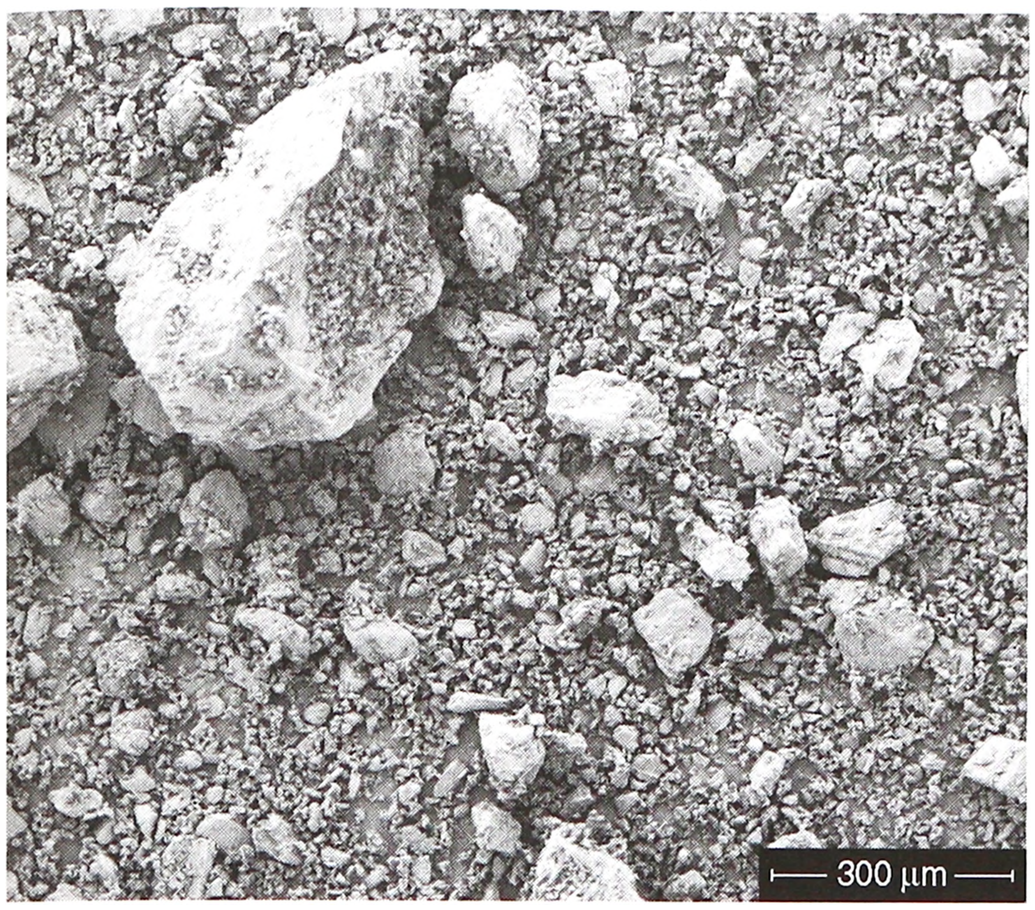
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

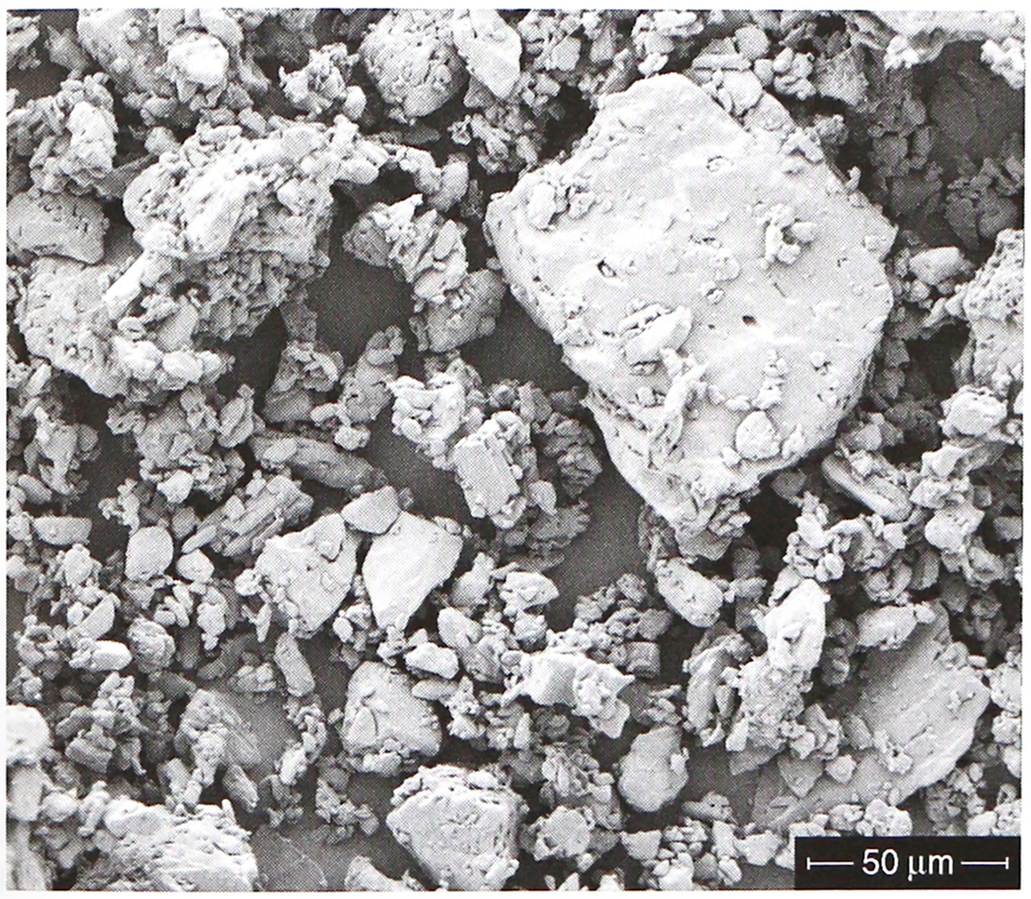
11 Stability and Storage Conditions

Sucrose octaacetate is a stable material and should be stored in a well-closed, airtight container. Store in a cool (2–8°C), dry place; moisture may cause instability.



12 Incompatibilities

Sucrose octaacetate is incompatible with strong oxidizing agents.



13 Method of Manufacture

Sucrose octaacetate is typically produced by chemical synthesis; one reported synthetic method is by pyridine-catalyzed acetylation of sucrose.[1,2]

SEM 1: Excipient: sucrose octaacetate; manufacturer: Sigma-Aldrich Inc.; lot no.: RS33841'08; magnification: 100×; voltage: 5 kV.

SEM 2: Excipient: sucrose octaacetate; manufacturer: Sigma-Aldrich Inc.; lot no.: RS33841'08; magnification: 500×; voltage: 5 kV.

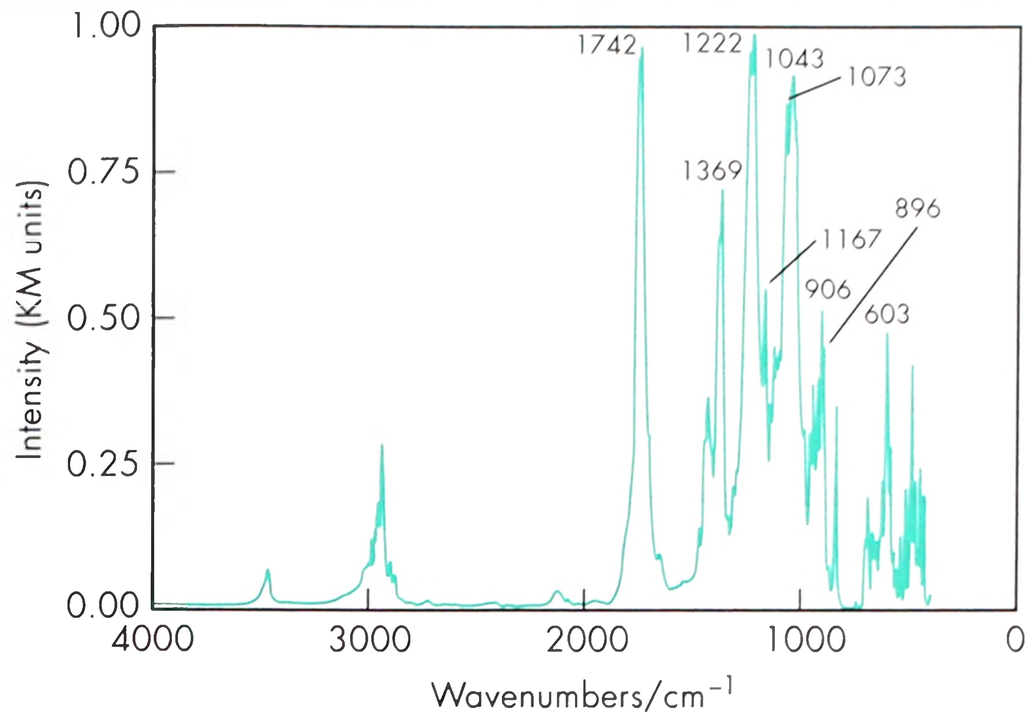


Figure 1: Infrared spectrum of sucrose octaacetate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

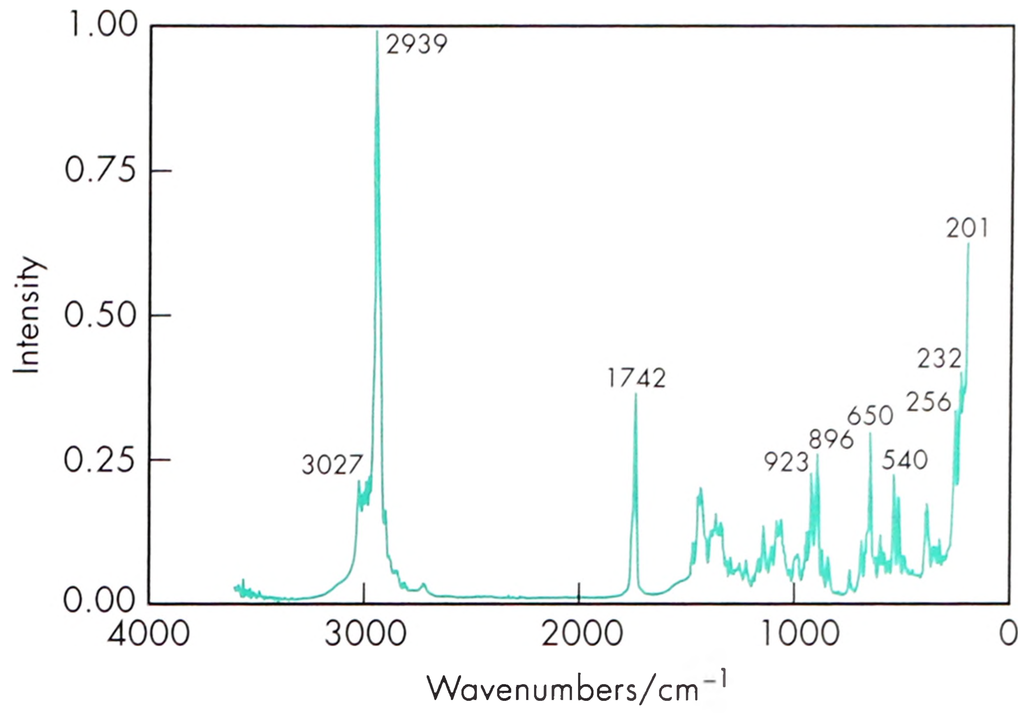

Figure 2: Raman spectrum of sucrose octaacetate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

14 Safety

Sucrose octaacetate is considered slightly hazardous in cases of skin contact (irritant), ingestion, or inhalation.

LD_{50} (rabbit, skin): >5 g/kg

LD_{50} (rat, oral): >5 g/kg[3]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, sucrose octaacetate emits acrid smoke and irritating vapors. Compatible chemical-resistant gloves and eye safety goggles are recommended. Respiratory protection is not required, but dust masks may be used for protection from nuisance levels of dust.

16 Regulatory Status

Included in the EAFUS database. Approved by the FDA as both a direct and an indirect food additive. Included in the Canadian Natural Health Products Ingredients Database.

As there is a lack of adequate data, any over the counter drug product containing ingredients offered for use as a nail-biting or thumb-sucking deterrent (including sucrose octaacetate) cannot be generally recognized as safe and effective.[4]

17 Related Substances

Denatonium benzoate; sodium acetate; sucrose.

18 Comments

Sucrose octaacetate is a naturally occurring substance that has been isolated from plant material: the root of *Clematis japonica* contains 0.15% of sucrose octaacetate by dry weight. At a concentration of 0.06% sucrose octaacetate renders sugar too bitter for human consumption.[5] It is used as a denaturant in cosmetics, and as a flavoring agent in food products.

The EINECS number for sucrose octaacetate is 204-772-1. The PubChem Compound ID (CID) for sucrose octaacetate is 219904.

Sucrose Palmitate

1 Nonproprietary Names

BP: Sucrose Monopalmitate

PhEur: Sucrose Monopalmitate

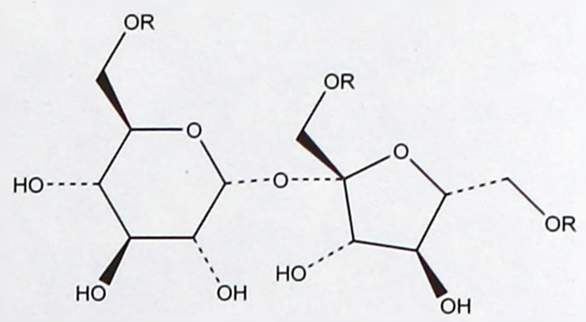
USP-NF: Sucrose Palmitate

S

2 Synonyms

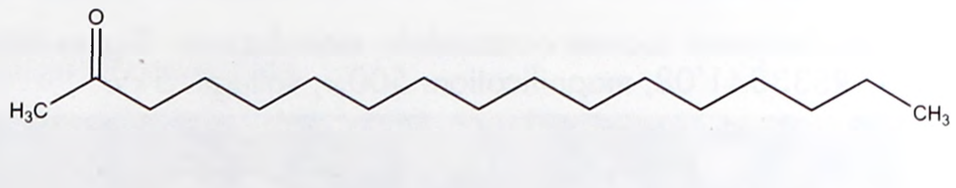
2-[3,4-Dihydroxy-2,5-bis(hydroxymethyl)oxolan-2-yl]oxy-6-(hydroxymethyl)oxane-3,4,5-triol, hexadecanoic acid; E473; α-D-glucopyranoside, β-D-fructofuranosyl, monohexadecanoate; *Ryoto* sacchari monopalmitas; *Sisterna PS750-C*; *STELLIESTERS SE 15P*; sucrose hexadecanoate; sucrose palmitate; *Surfhope SE Cosme*; *Surfhope SE Pharma*.

3 Chemical Name and CAS Registry Number



[6-[3,4-Dihydroxy-2,5-bis(hydroxymethyl)oxolan-2-yl]oxy-3,4,5-trihydroxyoxan-2-yl]methyl hexadecanoate [26446-38-8]

4 Empirical Formula and Molecular Weight



$C_{28}H_{52}O_{12}$ 580.17

The USP 40–NF 35 S1 and PhEur 9.2 describe sucrose palmitate as a mixture of sucrose monoesters, mainly sucrose monopalmitate, containing variable quantities of mono-, di-, tri-, and polyesters.

5 Structural Formula

R = H or

6 Functional Category

Dispersing agent; emulsifying agent; nonionic surfactant; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Sucrose palmitate is used for the stabilization of emulsions as a surfactant or cosurfactant.[1–3] It has also been used as a solubilizing agent, and has been reported to improve the solubility of felodipine in a controlled-release composition.[4]

Sucrose palmitate has been used as an absorption enhancer for oral delivery of poorly absorbed drugs through the intestinal mucosa.[5] It has excellent skin compatibility properties and has been shown to impove the skin permeation of acyclovir when applied topically as an o/w cream.[6]

Sucrose palmitate has demonstrated temperature-dependent viscoelastic gel-forming properties, which can be exploited for the

formulation of temperature-sensitive controlled drug delivery systems.[7] It has been used as a tablet matrix-forming agent along with microcrystalline cellulose and has shown slight retardation of drug release of two model drugs, theophylline monohydrate and ibuprofen.[8]

Sucrose palmitate is used in many cosmetic formulations such as creams and lotions, lipsticks, antiperspirant, and bath products. It provides good foam quality and excellent skin mildness, emolliency, and moisturizing properties. In general, it is used in cosmetic applications between 0.5% and 5%.

8 Description

Sucrose palmitate occurs as a white or almost white, tasteless, odorless, unctuous powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sucrose palmitate.

Test	PhEur 9.2	USP 40–NF 35 S1

25°C	D	S
75°C	S	S

I = insoluble; D = dispersible; S = soluble.

13 Method of Manufacture

Sucrose palmitate is obtained by transesterification of palmitic acid methyl esters of edible tallow or hydrogenated edible tallow or edible vegetable oils with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step.

Ethyl acetate, methyl ethyl ketone or dimethyl sulfoxide and isobutyl alcohol (2-methyl-1-propanol) may be used in the preparation of sucrose fatty acid esters.[9]

14 Safety

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) has reviewed the safety of sucrose fatty acid esters and recommended an acceptable daily intake of up to 30 mg/kg. Sucrose fatty acid esters may have a laxative effect at higher doses.[10]

Sucrose palmitate is nonirritant for the skin and eyes. Acute toxicity performed in rats and mice with an oral dose totalling 20 g/kg, administered in 10 equally divided doses at 30 to 60 minute intervals produced no deaths.[11]

LD_{50} (mouse, oral): > 2g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Dust formation should be avoided. Eye protection and gloves are recommended.

16 Regulatory Status

Accepted for use as a food additive in US, Europe, and Japan. Included in the FDA Inactive Ingredients Database (oral; powder for suspension). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sucrose monolaurate; sucrose stearate.

Sucrose monolaurate

Empirical formula $C_{24}H_{44}O_{12}$
Molecular weight 524.6
CAS number [25339-99-5]

Appearance Occurs as a white powder.

S

Solubility Soluble in water
Comments Used as an emulsifier for pharmaceutical emulsions and aids solubilization.

18 Comments

Sucrose palmitate has shown a promising stabilizing effect on the droplet size of a soya bean oil nanoemulsion when used in combination with phosphatidyl choline and sodium palmitate.[12] It has also been investigated for the formulation of niosomes for peroral vaccine delivery.[13]

Ryoto sugar ester is widely used in foods such as wheat products, dairy products, bread and bakery products, confectionery, and packed beverages.

The EINECS number of sucrose palmitate is 247-706-7. The PubChem Compound ID (CID) for sucrose palmitate is 518683.

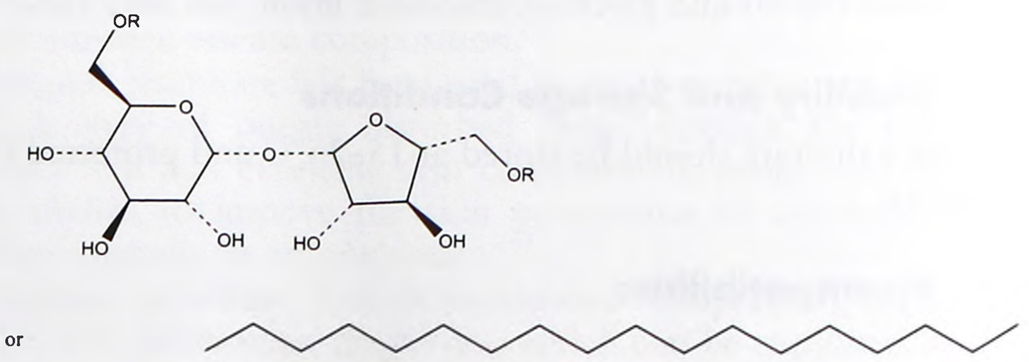
Sucrose monostearate [25168-73-4]
Sucrose distearate [27195-16-0]
Sucrose tristearate [27923-63-3]

4 Empirical Formula and Molecular Weight



$C_{30}H_{56}O_{12}$ (sucrose monostearate) 608.72
$C_{48}H_{90}O_{13}$ (sucrose distearate) 875.22
$C_{66}H_{124}O_{14}$ (sucrose tristearate) 1141.68

Sucrose stearate, a sucrose fatty acid ester, is a nonionic surfactant with a sugar substituent, sucrose, as the polar head group and stearic acids as apolar groups. Sucrose has eight free hydroxyl groups and can therefore be esterified with up to eight fatty acids to form esters ranging from monoesters to octaesters.

The USP 40–NF 35 S1 and PhEur 9.2 describe sucrose stearate as a mixture of sucrose esters, mainly sucrose stearate, obtained by transesterification of stearic acid methyl esters derived from vegetable origin with sucrose. It contains variable quantities of mono-, di-, tri,- and polyesters.

The mono- and diesters requirements differ for Type I and Type II sucrose stearate in the USP–NF, and Type I, Type II, and Type III sucrose stearate in the PhEur.

5 Structural Formula

6 Functional Category

Dispersing agent; emulsifying agent; modified-release agent; nonionic surfactant; solubilizing agent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Sucrose stearate is used as an emulsifying and dispersing agent, and as an aid for solubilization in pharmaceutical skin preparations. It coats the interfaces of an emulsion very efficiently, leading to emulsions that are exceptionally heat stable.

Sucrose stearate has been studied as a skin penetration enhancer to provide a useful vehicle for delivery of active ingredients to the skin.[1–6]

Sucrose stearate has been found to be a promising excipient for use in oral drug delivery formulations as a lubricant, disintegrant, and a controlled-release agent, and has been shown to sustain the release of drugs with various solubilities from matrix tablet systems.[7] It has also been shown to improve the plasticity and compressibility of powder mixtures. The sustained-release properties of sucrose stearate are attributed to its swelling characteristics, which could be further related to their chemical composition and hydrophilic–lipophilic properties.

Sucrose stearate, having various HLB values, may also be used to influence the rate of dissolution of drugs, where a low HLB value has been found to reduce the ejection force sufficiently during the tableting process, and may serve as an alternative to magnesium stearate. The addition of sucrose stearate with a high HLB value has been shown to contribute to the fast disintegration of tablets when formulated using a homogenous mixture of drug/sucrose stearate/microcrystalline cellulose and directly compressed with croscarmellose sodium and xylitol.[8,9] Sucrose distearate has been shown to act as an amphiphilic solubilizer that improves the solubilization capacity of discrete o/w or w/o type microemulsions.[10]

Sucrose stearate has demonstrated temperature-dependent viscoelastic gel-forming properties, which may be exploited for the formulation of thermosensitive controlled drug delivery systems.[11,12] The gelling of sucrose stearate is temperature- and concentration-dependent giving gel structures stronger than sucrose palmitate.[11] Sucrose stearate has also been explored as a droplet stabilizer for the preparation of polymeric microspheres.[13,14] Increasing concentrations of sucrose stearate resulted in increased surface porosity of the microspheres.[13]

Sucrose stearate has been used to develop controlled-release proniosome-derived niosomes for the nebulizable delivery of cromolyn sodium. The HLB values had a pronounced effect on the drug release and the nebulization efficiency.[15] *In vitro* inhalation properties[16] and the fine particle fraction[17] of a dry powder inhalation drug formulation have been found to increase when the lactose carrier particles were surface covered with sucrose tristearate.

Sucrose stearate is used in many cosmetic formulations such as skin care creams, shampoos, shower gels, and toothpaste due to its foam quality, emolliency, and moisturizing properties. It is also used as an emulsifying agent in the food industry.

8 Description

Sucrose stearate occurs as a white or almost white, tasteless, unctuous powder.

11 Stability and Storage Conditions

Sucrose stearate should be stored at room temperature and protected from humidity.

12 Incompatibilities

—

13 Method of Manufacture

Sucrose stearate is obtained by transesterification of stearic acid methyl esters derived from vegetable origin with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step.

Ethyl acetate or methyl ethyl ketone or dimethyl sulfoxide and isobutyl alcohol (2-methyl-1-propanol) may be used in the preparation of sucrose fatty acid esters.[18]

14 Safety

Sucrose stearate is a nontoxic, nonionic carbohydrate-based surfactant, widely used in the pharmaceutical, food and cosmetic industries.

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) has reviewed the safety of sucrose fatty acid esters and recommended an acceptable daily intake of up to 30 mg/kg. Sucrose fatty acid esters may have a laxative effect at higher doses.[19]

Acute toxicity performed in rats and mice with an oral dose totalling 20 000 mg/kg, administered in 10 equally divided doses at 30 to 60 min intervals produced no deaths.[20] Sucrose stearate is nonirritant to the skin and slightly irritant to the eyes.

LD_{50} (mice, oral): > 2.0 g/kg

NOAEL (rat): approx. 2.0 g/kg/day[21]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Dust formation should be avoided. Eye protection and gloves are recommended.

16 Regulatory Status

Accepted for use as a food additive in the US, Europe, and Japan. Included in the FDA Inactive Ingredients Database (oral capsules, tablets for extended-release or sustained action); sucrose distearate (topical emulsions and creams). Included in nonparenteral medicines licensed in the UK. Sucrose stearate, sucrose distearate, and sucrose tristearate are included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sucrose monolaurate; sucrose palmitate.

18 Comments

Sucrose fatty acid esters, such as sucrose stearate, have been shown to improve the activity of lipase inhibitors.[18]

Only sucrose mono, di and tri- stearates are available commercially. *Ryoto* sugar ester is widely used in foods such as wheat products, dairy products, bread and bakery products, confectionery and packed beverages.

A specification for sucrose esters of fatty acids is contained in the *Japanese Pharmaceutical Excipients* (JPE).[22]

The EINECS numbers for sucrose stearate are 246-705-9 (monostearate), 248-317-5 (distearate), and 248-731-6 (tristearate). The PubChemID numbers for sucrose stearate are 5360773 (monostearate) and 5360827 (distearate).

Sugar, Compressible

1 Nonproprietary Names

BP: Compressible Sugar
USP–NF: Compressible Sugar

2 Synonyms

Compressuc; *Comprima*; *Di-Pac*; direct compacting sucrose; directly compressible sucrose; *Nu-Tab*.

3 Chemical name and CAS Registry Number

See Sections 4 and 18.

4 Empirical Formula and Molecular Weight

The BP 2017 and USP 40–NF 35 S1 state that compressible sugar contains not less than 95.0% and not more than 98.0% of sucrose ($C_{12}H_{22}O_{11}$) on the dried basis. It may contain starch, maltodextrin, or invert sugar, and may contain a suitable lubricant.

5 Structural Formula

See Section 4.

6 Functional Category

Sweetening agent; tablet and capsule binder; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Compressible sugar is used primarily in the preparation of direct-compression chewable tablets. Its tableting properties can be influenced by changes in moisture level;[1] *see* Table I for typical uses.

8 Description

Compressible sugar is a free-flowing, sweet-tasting, white powder (or crystalline agglomerates).

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Compaction profile *see* Figure 1.
Flowability Free flowing
Density (bulk) 0.609–0.673 g/cm^3 for *Di-Pac*.
Hygroscopicity Moisture content of *Di-Pac* depends on factors such as temperature, pressure, relative humidity, and time of exposure to a given environment.[3] Up to 80% relative humidity at 20°C, water uptake is typically <1% w/w.
Melting point 186°C for *Di-Pac*.
Particle size distribution For *Di-Pac*, 3% maximum retained on a #40 (425 µm) mesh; 75% minimum through a #100 (150 µm) mesh; 5% maximum through #200 (75 µm) mesh.

Table I: Uses of compressible sugar.

Use	Concentration (wt%)
Dry binder in tablet formulations	5–20
Filler in chewable tablets	20–60
Filler in tablets	20–60
Sweetener in chewable tablets	10–50

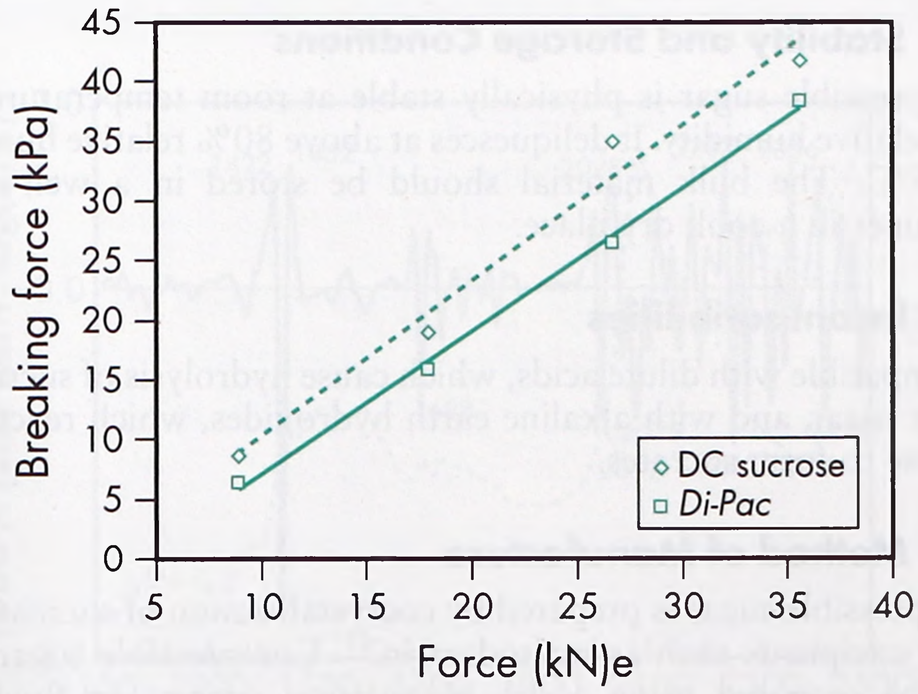

Figure 1: Tablet breaking force as a function of compaction force for *Di-Pac* (SPI Polyols) and directly compressible (DC) sucrose. Compaction conditions: 1.5 g, 5/8 inch flat-faced bevelled edge, 0.5% magnesium stearate. Adapted from Bowe KE, 1998[2] with permission.

SEM 1: Excipient: compressible sugar; manufacturer: SPI Polyols; magnification: 100×. Reproduced from Bowe KE, 1998[2] with permission.

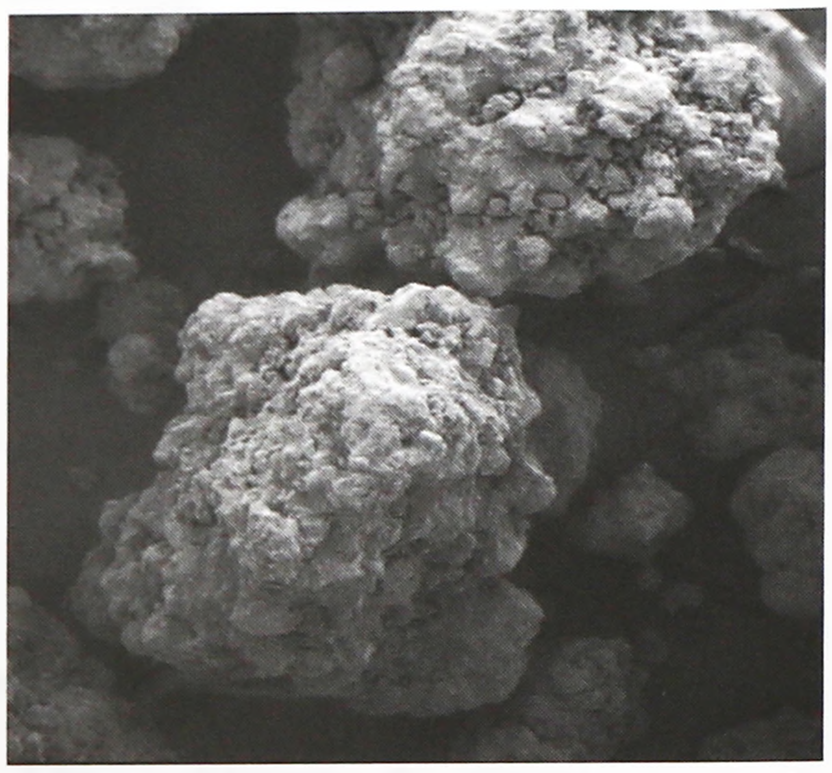

Table II: Pharmacopeial specifications for compressible sugar.

Test	BP 2017	USP 40–NF 35 S1
Identification	+	+
Calcium	+	+
Chloride	≤125 ppm	≤0.014%
Lead	≤0.5 ppm	—
Heavy metals	—	≤5 µg/g
Total dextrose, fructose, maltose, and lactose	—	≤5%
Loss on drying	0.25–1.0%	≤1.0%
Residue on ignition	—	≤0.1%
Microbial contamination		
Aerobic microbial count	—	$\leq 10^3$ cfu/g
Yeasts and molds	—	$\leq 10^2$ cfu/g
Sulfate	≤100 ppm	≤0.010%
Specific rotation		
Uninverted solution	—	62.6°–73.4°
Acid-inverted solution	—	Levorotatory
Assay	95.0–98.0%	95.0–98.0%

Solubility The sucrose portion is soluble in water.
Specific surface area 0.13–0.14 m^2/g for *Di-Pac*.

11 Stability and Storage Conditions

Compressible sugar is physically stable at room temperature and low relative humidity. It deliquesces at above 80% relative humidity at 25°C. The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Incompatible with dilute acids, which cause hydrolysis of sucrose to invert sugar, and with alkaline earth hydroxides, which react with sucrose to form sucrates.

13 Method of Manufacture

Compressible sugar is prepared by cocrystallization of sucrose with other excipients such as maltodextrin.[1] Compressible sugar may also be prepared using a dry granulation process or fluid bed granulation process.

14 Safety

Compressible sugar is generally regarded as a relatively nontoxic and nonirritant material. *See also* Sucrose.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. *See also* Sucrose.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Confectioner's sugar; sucrose; sugar spheres; *Sugartab*.

Sugartab

Appearance *Sugartab* (JRS Pharma) is a compressible sugar that does not conform to the USP 40–NF 35 S1 specification. It is an agglomerated sugar product containing approximately 90–93% sucrose, the balance being invert sugar.
Density (bulk) 0.60 g/cm^3
Density (tapped) 0.69 g/cm^3
Flowability 42.7 g/s
Moisture content 0.20–0.57%.
Particle size distribution 30% through a #20 (850 µm) mesh; 3% through a #30 (600 µm) mesh.

S

Sugar, Confectioner's

1 Nonproprietary Names

USP–NF: Confectioner's Sugar

2 Synonyms

Icing sugar; powdered sugar.

3 Chemical Name and CAS Registry Number

See Section 4.

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes confectioner's sugar as a mixture of sucrose ($C_{12}H_{22}O_{11}$) and corn starch that has been ground to a fine powder; it contains not less than 95.0% sucrose calculated on the dried basis.

5 Structural Formula

See Section 4 and Sucrose.

6 Functional Category

Coating agent; sweetening agent; tablet and capsule diluent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Confectioner's sugar is used in pharmaceutical formulations when a rapidly dissolving form of sugar is required for flavoring or sweetening. It is used as a diluent in solid-dosage formulations when a small particle size is necessary to achieve content uniformity in blends with finely divided active ingredients. In solutions, at high concentrations (70% w/v), confectioner's sugar provides increased viscosity along with some preservative effects. Confectioner's sugar is also used in the preparation of sugar-coating solutions and in wet granulations as a binder/diluent. *See* Table I.

Table I: Uses of confectioner's sugar.

Use	Concentration (%)
Sweetening agent in tablets	10–20
Tablet diluent	10–50

See also Section 18.

8 Description

Confectioner's sugar occurs as a sweet-tasting, fine, white, odorless powder.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Density (bulk) 0.465 g/cm^3
Density (tapped) 0.824 g/cm^3
Moisture content 0.1–0.31%
Particle size distribution Various grades with different particle sizes are commercially available, e.g. 6X, 10X, and 12X grades of confectioner's sugar from the Domino Sugar Corp. Mean particle size is 14.3 μm.

For 6X, 94% through a #200 (75 μm) mesh.

For 10X, 99.9% through a #100 (150 μm) mesh and 97.5% through a #200 (75 μm) mesh.

For 12X, 99% through a #200 (75 μm) mesh and 96% through a #325 (45 μm) mesh.

Solubility The sucrose portion is water-soluble while the starch portion is insoluble in water, although it forms a cloudy solution.

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Confectioner's sugar is stable in air at moderate temperatures but may caramelize and decompose above 160°C. It is more hygroscopic than granular sucrose. Microbial growth may occur on dry storage if adsorbed moisture is present or in dilute aqueous solutions.

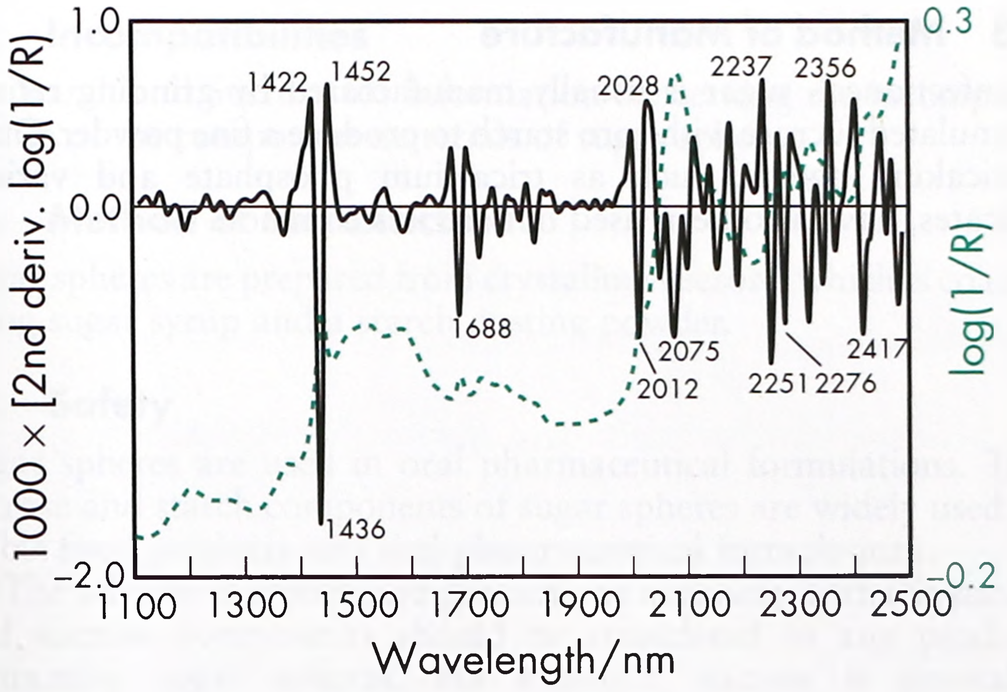
Confectioner's sugar should be stored in a well-closed container in a cool, dry place.

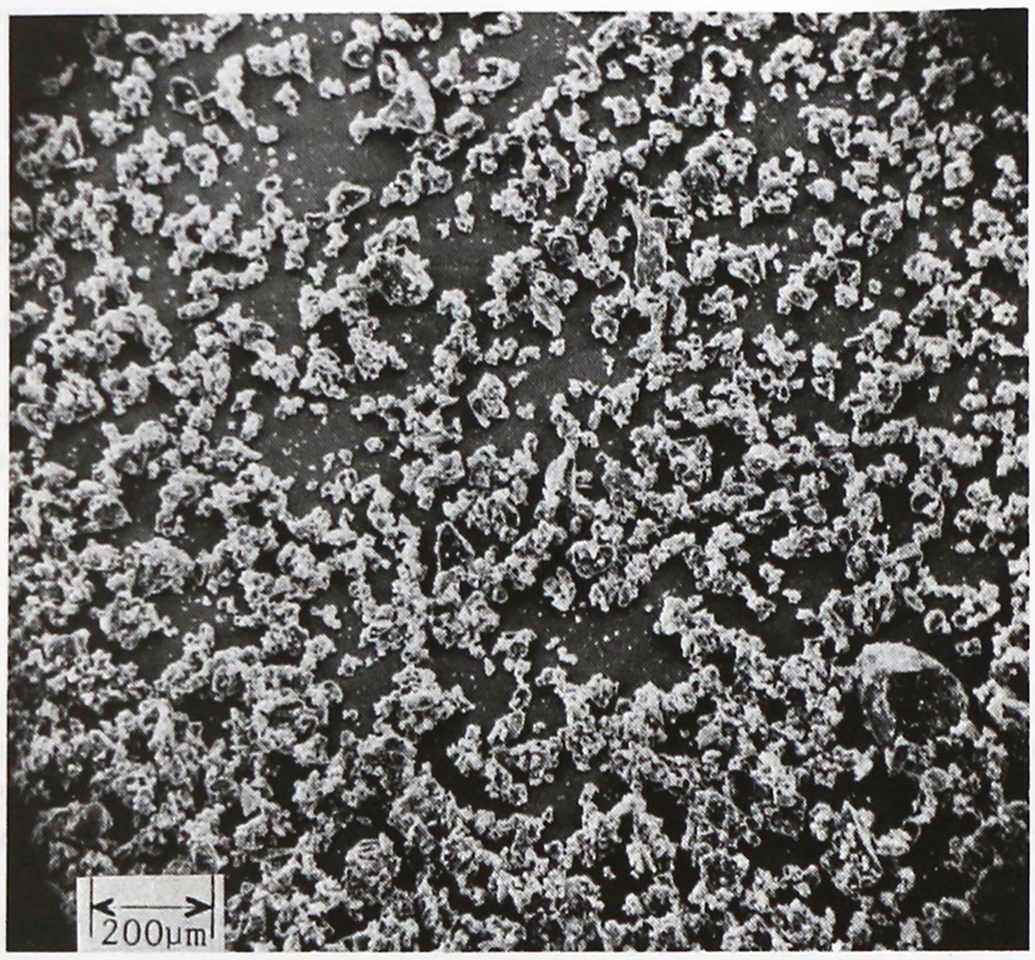
12 Incompatibilities

Confectioner's sugar is incompatible with dilute acids, which cause the hydrolysis of sucrose to invert sugar. It is also incompatible with alkaline earth hydroxides, which react with sucrose to form sucrates.

Table II: Pharmacopeial specifications for confectioner's sugar.

Test	USP 40–NF 35 S1
Identification	+
Chloride	≤0.014%
Calcium	+
Heavy metals	≤5 μg/g
Loss on drying	≤1.0%
Microbial contamination	
Aerobic microbial count	≤10^3 cfu/g
Yeasts and molds	≤10^2 cfu/g
Residue on ignition	≤0.08%
Specific rotation	≥+62.6°
Sulfate	≤0.006%
Assay	≤95.0%





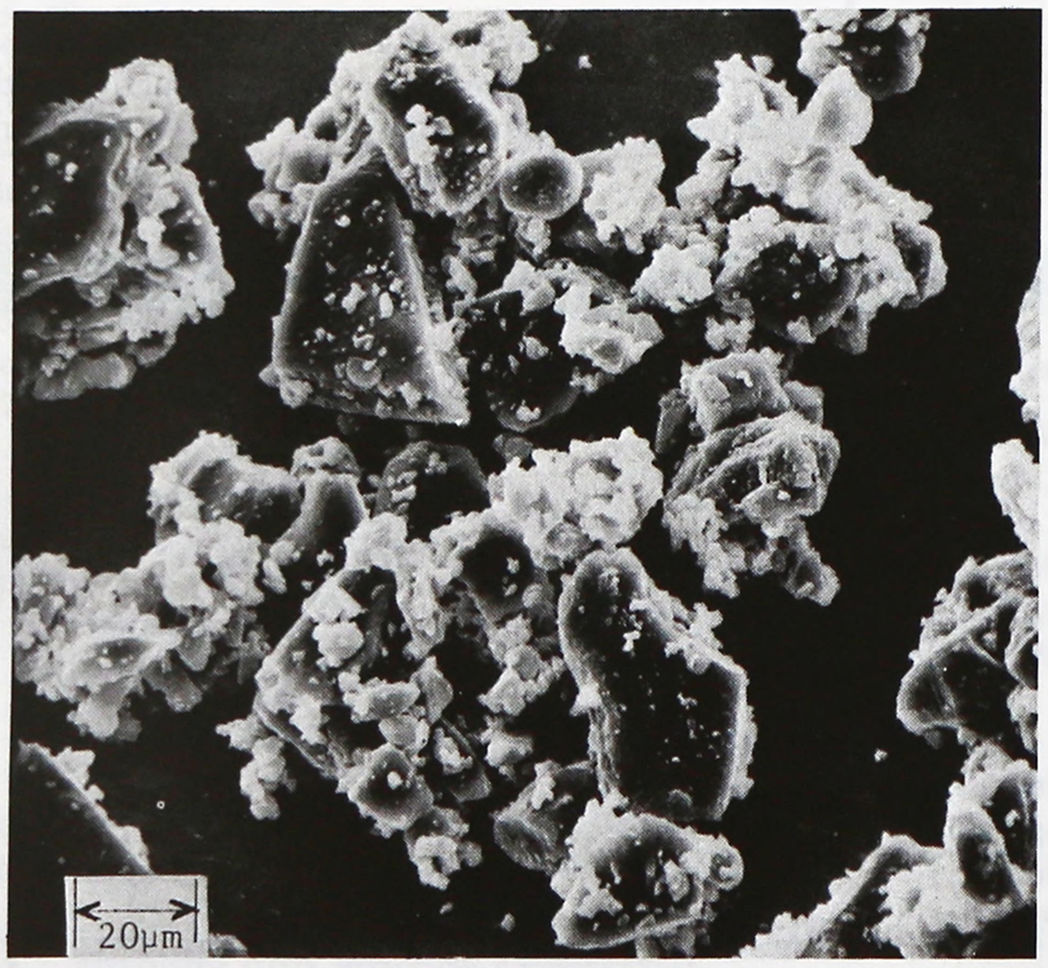


Figure 1: Near-infrared spectrum of confectioner's sugar measured by reflectance.

SEM 1: Excipient: confectioner's sugar; manufacturer: Frost; lot no.: 101A-1; magnification: 60×; voltage: 20 kV.

SEM 2: Excipient: confectioner's sugar; manufacturer: Frost; lot no.: 101A-1; magnification: 600×; voltage: 20 kV.

13 Method of Manufacture

Confectioner's sugar is usually manufactured by grinding refined granulated sucrose with corn starch to produce a fine powder. Other anticaking agents, such as tricalcium phosphate and various silicates, have also been used but are less common.

14 Safety

Confectioner's sugar is used in confectionery and oral pharmaceutical formulations. It is generally regarded as a relatively nontoxic and nonirritant material. *See also* Sucrose.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. *See also* Sucrose.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (capsules and tablets). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Compressible sugar; sucrose; sugar spheres.

18 Comments

Confectioner's sugar is not widely used in pharmaceutical formulations because the poor flow characteristics prevent its use in direct-compression blends. However, confectioner's sugar is used when a smooth mouth feel or a rapidly dissolving sweetener is required, and when a milled/micronized active ingredient must be blended with a diluent of similar particle size for powders or wet granulations.

Low-starch grades of confectioner's sugar containing 0.01% w/w starch are also commercially available.

Sugar Spheres

1 Nonproprietary Names

BP: Sugar Spheres

PhEur: Sugar Spheres

USP–NF: Sugar Spheres

2 Synonyms

Non-pareil; non-pareil seeds; *Nu-Core*; *Nu-Pareil PG*; sacchari sphaerae; sugar seeds; *Suglets*.

3 Chemical Name and CAS Registry Number

—

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Sugar spheres are mainly used as inert cores in capsule and tablet formulations, particularly multiparticulate sustained-release formulations.[1–4] They form the base upon which a drug is coated, usually followed by a release-modifying polymer coating.

Alternatively, a drug and matrix polymer may be coated onto the cores simultaneously. The active drug is released over an extended period either via diffusion through the polymer or through to the controlled erosion of the polymer coating.

Complex drug mixtures contained within a single-dosage form may be prepared by coating the drugs onto different batches of sugar spheres with different protective polymer coatings.

8 Description

The USP 40–NF 35 S1 describes sugar spheres as approximately spherical granules of a labeled nominal-size range with a uniform diameter and containing not less than 62.5% and not more than 91.5% of sucrose, calculated on the dried basis. The remainder is chiefly starch.

The PhEur 9.2 states that sugar spheres contain not more than 92% of sucrose calculated on the dried basis. The remainder consists of corn (maize) starch and may also contain starch hydrolysates and color additives. The diameter of sugar spheres varies from 200 to 2000 µm, and the upper and lower limits of the size of the sugar spheres are stated on the label.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sugar spheres.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Heavy metals	—	≤5 µg/g
Loss on drying	≤5.0%	≤4.0%
Microbial contamination		
Aerobic microbial count	$\leq 10^3$ cfu/g	$\leq 10^3$ cfu/g
Yeasts and molds	$\leq 10^2$ cfu/g	$\leq 10^2$ cfu/g
Particle size distribution	+	+
Residue on ignition	≤0.2%	≤0.25%
Specific rotation	—	+41° to +61°
Assay (sucrose — dried basis)	≤92%	62.5–91.5%

10 Typical Properties

Density

1.57–1.59 g/cm^3 for *Suglets* less than 500 µm in size;

1.55–1.58 g/cm^3 for *Suglets* more than 500 µm in size.

Flowability <10 seconds, free flowing.

Particle size distribution Sugar spheres are of a uniform diameter. The following sizes are commercially available from various suppliers (US standard sieves):

45–60 mesh (250–355 µm)

40–50 mesh (300–425 µm)

35–45 mesh (355–500 µm)

35–40 mesh (420–500 µm)

30–35 mesh (500–600 µm)

25–30 mesh (610–710 µm)

20–25 mesh (710–850 µm)

18–20 mesh (850–1000 µm)

16–20 mesh (850–1180 µm)

14–18 mesh (1000–1400 µm)

Solubility Solubility in water varies according to the sucrose-to-starch ratio. The sucrose component is freely soluble in water, whereas the starch component is practically insoluble in cold water.

Specific surface area

0.1–0.2 m^2/g for *Suglets* less than 500 µm in size;

>0.2 m^2/g for *Suglets* more than 500 µm in size.

11 Stability and Storage Conditions

Sugar spheres are stable when stored in a well-closed container in a cool, dry place.

12 Incompatibilities

See Starch and Sucrose for information concerning the incompatibilities of the component materials of sugar spheres.

13 Method of Manufacture

Sugar spheres are prepared from crystalline sucrose, which is coated using sugar syrup and a starch dusting powder.

14 Safety

Sugar spheres are used in oral pharmaceutical formulations. The sucrose and starch components of sugar spheres are widely used in edible food products and oral pharmaceutical formulations.

The adverse reactions and precautions necessary with the starch and sucrose components should be considered in any product containing sugar spheres. For example, sucrose is generally regarded as more cariogenic than other carbohydrates, and in higher doses is also contraindicated in diabetic patients.

See Starch and Sucrose for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK and Europe. The sucrose and starch components of sugar spheres are individually approved for use as food additives in Europe and the USA.

17 Related Substances

Compressible sugar; confectioner's sugar; microcrystalline cellulose spheres; *NPTAB*; starch; sucrose.

Microcrystalline cellulose spheres

Comments Microcrystalline cellulose spheres are prepared from microcrystalline cellulose by spherization. They are available from several manufacturers and in different sizes, and the size grades can vary between the different manufacturers. Typical size grades available are:

120–230 mesh (63–125 μm);
70–140 mesh (106–212 μm);
30–100 mesh (150–300 μm);
45–70 mesh (212–355 μm);
35–45 mesh (355–500 μm);
25–35 mesh (500–710 μm);
18–25 mesh (710–1000 μm);
14–18 mesh (1000–1400 μm).

NPTAB

Appearance *NPTAB* (NP Pharm) is a compressible sugar that does not conform to the USP 40–NF 35 S1 specification. It is an agglomerated sugar product containing not more than 92% sucrose, the balance being corn (maize) starch.

Density 1.55–1.59 g/cm^3 (varies with particle size)
Flowability <10% (Carr compressibility index)
Particle size distribution

NPTAB 190 (180–212 μm);
NPTAB 220 (212–250 μm);
NPTAB 270 (250–300 μm);
NPTAB 320 (300–350 μm).

18 Comments

In addition, sugar spheres have been used as inert cores in sustained-release formulations, which also contain kaolin and talc.

Sugar spheres are also used in confectionery products.

S Sulfur Dioxide

1 Nonproprietary Names

USP–NF: Sulfur Dioxide

2 Synonyms

E220; sulfur(IV) oxide; sulfurous anhydride; sulfurous oxide.

3 Chemical Name and CAS Registry Number

Sulfur dioxide [7446-09-5]

4 Empirical Formula and Molecular Weight

SO_2 64.06

5 Structural Formula

See Section 4.

6 Functional Category

Antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sulfur dioxide is used as an antioxidant for pharmaceutical injections.

8 Description

Sulfur dioxide occurs as a colorless gas or liquid at room temperature and pressure, with a strong, suffocating, pungent odor. It is noncombustible and is a strong reducing agent.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Boiling point −10.0°C at 760 mmHg
Melting point −75.5°C
Solubility *see* Table II.
Specific gravity 1.434 at 0°C

Table I: Pharmacopeial specifications for sulfur dioxide.

Test	USP 40–NF 35 S1
Water	≤2.0%
Nonvolatile residue	≤0.0025%
Sulfuric acid	≤0.002%
Assay	≥97.0%

Table II: Solubility of sulfur dioxide.

Solvent	Solubility at 20°C unless otherwise stated
Acetic acid	Soluble
Chloroform	Soluble
Ethanol 95%	1 in 4
Ether	Soluble
Methanol	1 in 3
Water	1 in 5.7 at 0°C 1 in 8.4 at 15°C 1 in 11.8 at 25°C 1 in 15.6 at 35°C

Vapor density 2.264 at 0°C (air = 1.0)
Vapor pressure 338.4 kPa (2538 mmHg) at 21.1°C

11 Stability and Storage Conditions

Sulfur dioxide is noncorrosive and stable when dry. It is usually stored under pressure in cylinders, and should be kept in a cool, dry, well-ventilated area, away from flammable materials.

12 Incompatibilities

Sulfur dioxide reacts vigorously with strong alkalis and oxidizing agents. The moist gas corrodes most metals. Sulfur dioxide is incompatible with chlorates, fluorine, interhalogens, powdered metals, metal oxides, metal acetylides, sodium hydroxide, and diethyl zinc. It is also incompatible with thiamine and gelatin.

See further details under Sodium Metabisulfite.

13 Method of Manufacture

Sulfur dioxide can be made by burning sulfur, or by roasting sulfide ores such as pyrites, sphalerite, and cinnabar.

14 Safety

Sulfur dioxide is used in food and pharmaceutical products. However, in large amounts, sulfur dioxide gas is highly irritant to the eyes, skin, and mucous membranes. Inhalation can lead to severe irritation of the respiratory tract. Direct contact with the liquid form may cause frostbite. Sulfur dioxide and sulfites may also cause allergic reactions and asthma.[1–3] In rabbits, sulfur dioxide causes mild to moderate irritation to the skin, and mild to severe irritation to the eyes. In the UK, the acceptable daily intake of sulfur dioxide used in foodstuffs has been set at up to 3.5 mg/kg body-weight.[4] The WHO has set an acceptable daily intake of sulfur dioxide at up to 0.7 mg/kg body-weight.[5]

LC_{50} (mouse, inhalation): 3000 ppm[6]
LC_{50} (rat, inhalation): 2520 ppm

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Sulfur dioxide forms sulfurous acid on contact with water. When heated to decomposition, it emits toxic fumes of sulfur oxide gases. Avoid inhalation and contact with eyes and skin.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IV infusions; injection solutions) and the Canadian Natural Health Products Ingredients Database. Also included in nonparenteral products licensed in the UK.

17 Related Substances

Potassium metabisulfite; sodium metabisulfite; sodium sulfite.

18 Comments

The US Environmental Protection Agency (EPA) has strengthened the primary National Ambient Air Quality Standard (NAAQS) for sulfur dioxide whereby the revised standard will improve public health protection, especially for children, the elderly, and people with asthma.[7]

Sulfur dioxide is also used as a preservative in the food and cosmetics industries.

Sulfur dioxide is a byproduct of cement manufacture. A specification for sulfur dioxide is contained in the *Food Chemicals Codex* (FCC).[8]

The EINECS number for sulfur dioxide is 231-195-2. The PubChem Compound ID (CID) for sulfur dioxide is 1119.

Sulfuric Acid

1 Nonproprietary Names

BP: Sulphuric Acid
PhEur: Sulphuric Acid
USP–NF: Sulfuric Acid

2 Synonyms

Acidum sulfuricum; E513; hydrogen sulfate; oil of vitriol.

3 Chemical Name and CAS Registry Number

Sulfuric acid [7664-93-9]

4 Empirical Formula and Molecular Weight

H_2SO_4 98.08

5 Structural Formula

See Section 4.

6 Functional Category

Acidulant.

7 Applications in Pharmaceutical Formulation or Technology

Sulfuric acid is used as an acidulant in a variety of pharmaceutical and food preparations. It may also be used to prepare dilute sulfuric acid for use as an excipient. Sulfuric acid has been used in parenteral, oral, topical, and ophthalmic pharmaceutical formulations.

8 Description

Sulfuric acid occurs as a clear, colorless, odorless, oily liquid. It is very corrosive and has a great affinity for water.

The USP 40–NF 35 S1 specifies that sulfuric acid contains not less than 95% and not more than 98%, by weight, of H_2SO_4; the remainder is water. *See also* Section 9.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sulfuric acid.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Residue on ignition	–	≤0.005%
Chloride	≤50 ppm	≤50 ppm
Arsenic	≤1 ppm	≤1 ppm
Heavy metals	–	≤5 ppm
Weight per mL	≈1.84	–
Iron	≤25 ppm	–
Nitrate	+	–
Reducing substances	–	+
Assay (of H_2SO_4)	95.0–100.5%	95.0–98.0%

10 Typical Properties

Boiling point
≈290°C for H_2SO_4 (95%–98% w/w);
330°C for H_2SO_4 (100% w/w).
Density ≈1.84 g/cm^3 at 20°C
Dissociation constant
$pK_{a1} = -3.00$;
$pK_{a2} = 1.99$.
Freezing point
10°C for H_2SO_4 (100% w/w);
3°C for H_2SO_4 (98% w/w);
−32°C for H_2SO_4 (93% w/w).
Solubility Miscible with ethanol and water.
Vapor density 3.4 (air = 1.0)
Vapor pressure <0.3 mmHg at 20°C

11 Stability and Storage Conditions

Sulfuric acid is stable but very corrosive and hygroscopic. It will draw moisture from the atmosphere. Sulfuric acid should be stored in a tightly closed container in an explosion-proof area. Containers should be stored out of direct sunlight and away from heat. Avoid heat and moisture. Isolate from incompatible materials. *See also* Section 12.

12 Incompatibilities

Avoid storage in close proximity to water, most common metals, organic materials, strong reducing agents, combustible materials, strong bases, carbonates, sulfides, cyanides, strong oxidizing agents, and carbides.

Sulfuric acid is a powerful oxidizer and may ignite or explode on contact with many materials.

It can react violently with the evolution of a large amount of heat. Oxides of sulfur and hydrogen can be generated during reactions.

Great care must be exercised when mixing with other liquids. Always add sulfuric acid to the diluent with great caution.

13 Method of Manufacture

Sulfuric acid may be prepared industrially by either the contact process or the chamber process.[1,2]

Contact Process

$$2SO_2 + O_2 \rightarrow 2SO_3$$

$$SO_3 + H_2O \rightarrow H_2SO_4$$

Chamber Process

$$2NO + O_2 \rightarrow 2NO_2$$

$$NO_2 + SO_2 + H_2O \rightarrow H_2SO_4 + NO$$

14 Safety

Sulfuric acid is widely used in a variety of pharmaceutical formulations. Although concentrated sulfuric acid is very corrosive, it is normally used well diluted in formulations. Concentrated sulfuric acid will react violently with water and much heat is generated. When diluting sulfuric acid, the acid should always be added to the other liquid with great caution.

The concentrated solution is extremely corrosive and can cause severe damage or necrosis on contact with the eyes and skin.

Ingestion may cause severe injury or death. Inhalation of concentrated vapors can cause serious lung damage.

LD_{50} (rat, oral): 2.14 g/kg[3]

15 Handling Precautions

Caution should be exercised when handling sulfuric acid and suitable protection against inhalation and spillage should be made. Respiratory protection may not be required where adequate ventilation exists. Eye protection (safety goggles and face shield), rubber gloves, and apron are recommended, depending on the circumstances and quantity of sulfuric acid handled. Do not dilute spills of concentrated acid with water since an exothermic reaction will occur. Spills should be neutralized with soda ash or lime. Splashes on the skin and eyes should be treated by immediate and prolonged washing (10–15 minutes) with large amounts of water, and medical attention should be sought. Do not neutralize acid in contact with skin or eyes as the exothermic reaction can increase the severity of the burn. Remove contaminated clothing immediately.

Fumes can cause irritation or permanent damage to the eyes, nose, and respiratory system; prolonged exposure to fumes may damage the lungs.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM, IV, and IP injections; inhalation solutions, irrigation solutions, nasal, ophthalmic solutions and suspensions; oral solutions; topical emulsions and creams). Included in nonparenteral and parenteral medicines licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database.

The United Nations Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances (1988) lists sulfuric acid as a chemical frequently used in the illicit manufacture of narcotic drugs or psychotropic substances.[4] In the US, sulfuric acid is included in the list of essential or precursor chemicals established pursuant to the Chemical Diversion and Trafficking Act. Accordingly, transactions of sulfuric acid such as imports, exports, sales, and transfers are subject to regulation and monitoring by the Drug Enforcement Administration.[5]

17 Related Substances

Dilute sulfuric acid; fuming sulfuric acid.

Dilute sulfuric acid

Density 1.062–1.072 g/cm^3

Comments

Prepared by adding 104 g of sulfuric acid to 896 g of purified water with constant stirring and cooling. Dilute sulfuric acid contains between 9.5% and 10.5% w/w of H_2SO_4.

Fuming sulfuric acid

Synonyms Oleum.

Comments

Fuming sulfuric acid consists of H_2SO_4 with free sulfur trioxide (SO_3). It is prepared by adding sulfur trioxide to sulfuric acid. Available in grades containing up to about 80% free SO_3.

Fuming sulfuric acid is a colorless or slightly colored, viscous liquid that emits choking fumes of sulfur trioxide. It is extremely corrosive and should be handled with great care and stored in tightly closed glass-stoppered bottles.

18 Comments

Sulfuric acid may be used to prepare dilute sulfuric acid, which, in addition to its use as an excipient, has some therapeutic use for the treatment of gastric hypoacidity, as an astringent in diarrhea, or to stimulate appetite.

A specification for sulfuric acid is contained in the *Food Chemicals Codex* (FCC).[6]

The EINECS number for sulfuric acid is 231-639-5. The PubChem Compound ID (CID) for sulfuric acid is 1118.

S

Sunflower Oil

1 Nonproprietary Names

BP: Refined Sunflower Oil
PhEur: Sunflower Oil, Refined
USP–NF: Sunflower Oil

2 Synonyms

Helianthi annui oleum raffinatum; *Helianthus annuus* oil; huile de tournesol; oleum helianthi; sunflower seed oil.

3 Chemical Name and CAS Registry Number

Sunflower oil [8001-21-6]

4 Empirical Formula and Molecular Weight

See Section 5.

5 Structural Formula

Sunflower oil is classified as an oleic–linoleic acid oil. Its composition includes linoleic acid (66%), oleic acid (21.3%), palmitic acid (6.4%), arachidic acid (4.0%), stearic acid (1.3%), and behenic acid (0.8%).

The USP 40–NF 35 S1 describes sunflower oil as a refined fixed oil obtained from the seeds of *Helianthus annuus* Linné (Fam. Asteraceae alt. Compositae). It may contain a suitable antioxidant.

The PhEur 9.2 describes sunflower oil as the refined fatty oil obtained from the seeds of *Helianthus annuus* C. by mechanical expression or by extraction. A suitable antioxidant may be added.

6 Functional Category

Emollient; solvent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Sunflower oil is used as a carrier or diluent in oral and topical pharmaceutical formulations. Organogel formation with sunflower oil has also been investigated to prevent oil leaching from within microparticles, improving drug entrapment efficiency in controlled drug applications.[1]

Sunflower oil with marked oxidative stability is particularly suitable for the manufacture of sunscreen formulations.[2]

See also Section 18.

8 Description

Sunflower oil occurs as a clear, light yellow-colored liquid with a bland, agreeable taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sunflower oil.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Acid value	≤0.5	+
Peroxide value	≤10.0	≤10.0 mEq/kg
Unsaponifiable matter	≤1.5%	≤1.0%
Alkaline impurities	+	+
Iodine value	–	+
Refractive index	≈1.474	–
Heavy metals	–	≤10 ppm
Relative density	≈0.921	–
Water	≤0.1%	≤0.1%
Composition of fatty acids	+	+
Palmitic acid	4.0–9.0%	–
Stearic acid	1.0–7.0%	–
Oleic acid	14.0–40.0%	–
Linoleic acid	48.0–74.0%	–

10 Typical Properties

Boiling point 40–60°C
Density 0.915–0.919 g/cm^3
Flash point >260°C (open cup)
Hydroxyl value 14–16
Iodine number 125–140
Melting point −18°C
Refractive index
n_D^{25} = 1.472–1.474;
n_D^{40} = 1.466–1.468.
Vapor density >1 (air = 1)
Vapor pressure <0.05 mmHg at 300°C
Solubility Miscible with benzene, chloroform, carbon tetrachloride, diethyl ether, and light petroleum; practically insoluble in ethanol (96%) and water.

11 Stability and Storage Conditions

Sunflower oil should be stored in an airtight, well-filled container, protected from light. Stability may be improved by the addition of an antioxidant such as butylated hydroxytoluene. Sunflower oil forms a 'skin' after being exposed to air for 2–3 weeks.

12 Incompatibilities

Sunflower oil is incompatible with strong oxidizing agents. The oxidative stability of sunflower oil is reduced in the presence of iron oxides and zinc oxide.[3]

13 Method of Manufacture

Sunflower oil is obtained from the fruits and seeds (achenes) of the sunflower, *Helianthus annuus* (Compositae), by mechanical means or by extraction.

14 Safety

Sunflower oil is widely used in food products and on its own as an edible oil. It is also used extensively in cosmetics and topical formulations, and is generally regarded as a relatively nontoxic and nonirritant material.

The Cosmetic Ingredients Review Expert Panel evaluated *Helianthus annuus* (sunflower) seed oil and concluded that it is safe for use in cosmetic formulations in present practices of use and concentration.[4]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, sunflower oil emits acrid smoke and irritating fumes.

16 Regulatory Status

Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Corn oil; cottonseed oil; peanut oil; sesame oil; soybean oil.

18 Comments

Sunflower oil is widely used as an edible oil, primarily in oleomargarine. Although not GRAS listed, sunflower oil is listed by the FDA as an indirect additive used in food contact substances. High oleic acid content sunflower oil with good oxidative stability and emollient properties is commercially available for use in cosmetic formulations.[5]

Sunflower oil should be labeled to indicate the name and concentration of any antioxidant added, and also whether the oil was obtained by mechanical expression or extraction.

Therapeutically, sunflower oil is used to provide energy and essential fatty acids for parenteral nutrition. Studies have shown that sunflower oil may be used in intramuscular injections without inducing tissue damage.[6]

A specification for sunflower oil (unhydrogenated) is contained in the *Food Chemicals Codex* (FCC).[7]

The EINECS number for sunflower oil is 232-273-9.

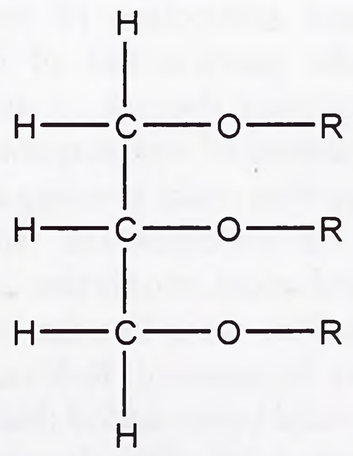
Suppository Bases, Hard Fat

1 Nonproprietary Names

BP: Hard Fat
PhEur: Hard Fat
USP–NF: Hard Fat

2 Synonyms

Adeps neutralis; adeps solidus; *Akosoft*; *Cremao CS-34*; *Cremao CS-36*; *DUB PP*; *Gelucire 43/01*; hydrogenated vegetable glycerides; *Massa Estarinum*; *Massupol*; *Novata*; semisynthetic glycerides; *Suppocire*; *Wecobee*; *Witepsol*.



3 Chemical Name and CAS Registry Number

Hard fat triglyceride esters

4 Empirical Formula and Molecular Weight

Hard fat suppository bases consist mainly of mixtures of the triglyceride esters of the higher saturated fatty acids ($C_8H_{17}COOH$ to $C_{18}H_{37}COOH$) along with varying proportions of mono- and diglycerides. Special grades may contain additives such as beeswax, lecithin, polysorbates, ethoxylated fatty alcohols, and ethoxylated partial fatty glycerides.

5 Structural Formula

where R = H or $OC(CH_2)_nCH_3$; n = 7–17

Not all R groups can be H at the same time.

6 Functional Category

Suppository base.

7 Applications in Pharmaceutical Formulation or Technology

The primary application of hard fat suppository bases, or semisynthetic glycerides, is as a vehicle for the rectal or vaginal administration of a variety of drugs, either to exert local effects or to achieve systemic absorption.

Selection of a suppository base cannot usually be made in the absence of knowledge of the physicochemical properties and intrinsic thermodynamic activity of the drug substance. Other drug-related factors that can affect release and absorption and

which must therefore be considered are the particle size distribution of insoluble solids, the oil : water partition coefficient, and the dissociation constant. The displacement value should also be known, as well as the ratio of drug to base. Properties of the suppository base that may or may not be modified by the drug, or that can influence drug release, are the melting characteristics, chemical reactivity, and rheology. The presence of additives in the suppository base can also affect suppository performance.

Melting characteristics

Fatty-based suppositories intended for systemic use should liquefy at just below body temperature. Softening or dispersion may be adequate for suppositories intended for local action or modified release. High-melting-point bases may be indicated for fat-soluble drugs that tend to depress the melting point of bases or for suppositories used in warm climates. Drugs that dissolve in bases when hot may create problems if they deposit as crystals of different form or increased size on cooling or on storage. Low-melting-point bases, particularly those that melt to liquids of low viscosity, can be of value when large volumes of insoluble substances are to be incorporated; there is a risk of sedimentation in such instances. An important factor during processing is the time required for setting. This is affected by the temperature difference between the melting point and the solidification point.[1,2]

Chemical reactivity

Although the use of bases with low hydroxyl values (low partial ester content) is indicated to minimize the risk of interaction with chemically reactive compounds, formulators should be aware that hydroxyl values are also related to hydrophilic properties, which, in turn, can modify both release and absorption rates. Bases with low hydroxyl values tend to be less plastic than those with higher values and, if cooled rapidly, may become excessively brittle. Peroxide values give a measure of the resistance of the base to oxidation and are a guide to the onset of rancidity.

Rheology

The viscosity of the melted base can affect the uniformity of distribution of suspended solids during manufacture. It can also influence the release and absorption of the drug in the rectum. Further reduction in the particle size of insoluble solids is the method of choice to minimize the risk of sedimentation. However, the presence of a high content of fine suspended particles is likely to increase viscosity. It may also make pouring difficult, delay melting, and induce brittleness on solidification. Additives are sometimes included to modify rheological properties and to maintain homogeneity, e.g. microcrystalline wax, but the extent of their effect on drug release should first be assessed. Release from a base in which viscosity has been enhanced by an added thickener may vary and be related to the aqueous solubility of the drug itself. Solid fat additives have been investigated to prolong the drug release rate by increasing the apparent viscosity of the suppository base with minimal change to the melting point.[3]

Additives

Some grades of commercial bases already contain additives, and these are usually identified by the manufacturers by means of suitable letters and numbers. Additives may also be incorporated by formulators. Properties of suppositories that have been modified and additives or types of additives that have been used are shown in Table I. Water is undesirable as an additive because it enhances hydrolysis and the potential for a chemical reaction between constituents of the suppository. In low concentration, water plays little part in drug release and can serve as a medium for microbial growth.

Hard fat suppository bases have also been investigated for the formation of solid lipid nanoparticles for oral and topical applications.[4–6]

Table I: Selected suppository additives.

Property	Additive
Dispersants (release and/or absorption enhancers)	Surfactants
Hygroscopicity (reduced)	Colloidal silicon dioxide
Hardeners (or increasing melting point)	Beeswax Cetyl alcohol Stearic acid Stearyl alcohol Aluminum monostearate (or di- and tristearate) Bentonite Magnesium stearate Colloidal silicon dioxide
Plasticizers (or decreasing melting point)	Glyceryl monostearate Myristyl alcohol Polysorbate 80 Propylene glycol

8 Description

A white or almost white, practically odorless, waxy, brittle mass. When heated to 50°C it melts to give a colorless or slightly yellowish liquid.

11 Stability and Storage Conditions

Hard fat suppository bases are fairly stable toward oxidation and hydrolysis, with the iodine value being a measure of their resistance to oxidation and rancidity. Water content is usually low and deterioration due to hygroscopicity rarely occurs.

Melting characteristics, hardness, and drug-release profiles alter with time, and the melting point may rise by more than 1.0°C after storage for several months. Owing to the complexity of bases, elucidation of the mechanisms that induce these changes on aging is difficult. Evidence has been presented[7] that supports a finite transition from amorphous to crystalline forms in which polymorphism may or may not contribute, whereas other workers have found melting point changes to be closely associated with the conversion of triglycerides to more stable polymorphic forms.[8] Before melting point determinations are made, bases are 'conditioned' to a stable crystalline form.

Suppository bases should be stored protected from light in an airtight container at a temperature at least 5°C less than their stated melting point. Refrigeration is usually recommended for molded suppositories.

Suppositories that are not effectively packaged may develop a 'bloom' of powdery crystals at the surface. This is usually due to the presence of high-melting-point components in the base and can often be overcome by using a different base. Alternatively, the base can be precrystallized prior to pouring, since the crystals will cause a quick and complete crystallization into its end crystal form. This process is called 'tempering.'

12 Incompatibilities

Incompatibilities with suppository bases are not now extensively reported in the literature. The occurrence of a chemical reaction between a hard fat suppository base and a drug is relatively rare, but any potential for such a reaction may be indicated by the magnitude of the hydroxyl value of the base. The risk of hydrolysis of aspirin, for example, may be reduced by the use of a base with a low hydroxyl value (<5) and, additionally, by minimization of the water content of both the base and the aspirin.

There is evidence that aminophylline reacts with the glycerides in some hard fat bases to form diamides. On aging or exposure to elevated temperatures, degradation is accompanied by hardening and suppositories tend to exhibit a marked increase in melting point. The ethylenediamine content is also reduced.[9,10]

Certain fat-soluble medications, such as chloral hydrate, may depress the melting point when incorporated into a base. Similarly, when large amounts of an active substance, either solid or liquid, have to be dispersed into a base, the rheological characteristics of the resultant suppository may be changed, with concomitant effects on release and absorption. Careful selection of bases or the inclusion of additives may therefore be necessary.

13 Method of Manufacture

The most common method of manufacture involves the hydrolysis of natural vegetable oils such as coconut or palm kernel oil, followed by fractional distillation of the free fatty acids produced. The C_8 to C_{18} fractions are then hydrogenated and reesterified under controlled conditions with glycerin to form a mixture of tri-, di-, and monoglycerides of the required characteristics and hydroxyl value. This process is used for *Witepsol*.

In an alternative procedure, coconut or palm kernel oil is directly hydrogenated and then subjected to an interesterification either with itself or with glycerin to form a mixture of tri-, di-, and monoglycerides of the required characteristics and hydroxyl value, e.g. *Suppocire*.

14 Safety

Suppository bases are generally regarded as nontoxic and nonirritant materials when used in rectal formulations. However, animal studies have suggested that some bases, particularly those types with a high hydroxyl value, may be irritant to the rectal mucosa.[11]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. There is a slight fire hazard on exposure to heat or flame.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (rectal and oral preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Glycerin; medium-chain triglycerides; polyethylene glycol; theobroma oil.

Theobroma oil

CAS number [8002-31-1]
Synonyms Cocoa butter; oleum cacao; oleum theobromatis.
Appearance A yellowish or white, brittle solid with a slight odor of cocoa.
Melting point 31–34°C
Solubility Freely soluble in chloroform, ether, and petroleum spirit; soluble in boiling ethanol; slightly soluble in ethanol (95%).
Stability and storage conditions Heating theobroma oil to more than 36°C during the preparation of suppositories can result in an appreciable lowering of the solidification point owing to the formation of metastable states; this may lead to difficulties in the setting of the suppository. Theobroma oil should be stored at a temperature not exceeding 25°C.
Comments Theobroma oil is a fat of natural origin used as a suppository base. It comprises a mixture of the triglycerides of saturated and unsaturated fatty acids, in which the unsaturated acid is preferentially situated on the 2-position of the glyceride. Theobroma oil is also a major ingredient of chocolate.

18 Comments

A specification for hard fat is included in the *Japanese Pharmaceutical Excipients* (JPE).[12]

The UNII code for hard fat is 8334LX7S21.

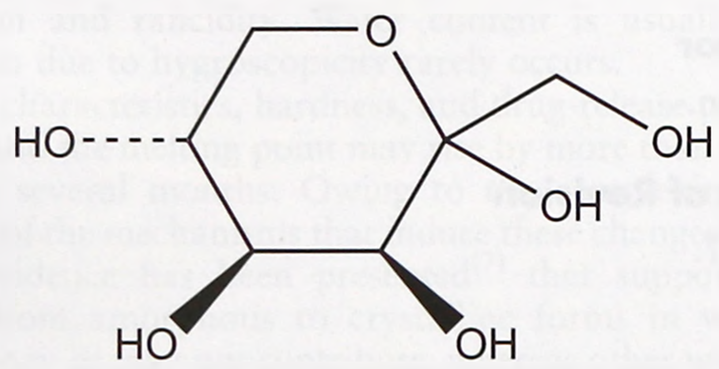
Tagatose

1 Nonproprietary Names

USP–NF: Tagatose

2 Synonyms

D-*lyxo*-Hexulose; (3*S*,4*S*,5*R*)-2-(hydroxymethyl)oxane-2,3,4,5-tetrol; *Naturlose*; D-tagatose; tagatosum.



3 Chemical Name and CAS Registry Number

(3*S*,4*S*,5*R*)-1,3,4,5,6-pentahydroxyhexan-2-one [87-81-0]

4 Empirical Formula and Molecular Weight

$C_6H_{12}O_6$ 180.16

5 Structural Formula

6 Functional Category

Sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Tagatose is used as a sweetening agent in beverages, foods, and pharmaceutical applications.[1] A 10% solution of tagatose is about 92% as sweet as a 10% sucrose solution.[2] It is a low-calorie sugar with approximately 38% of the calories of sucrose per gram. It occurs naturally in low levels in milk products.[2] Like other sugars (fructose, glucose, sucrose), it is also used as a bulk sweetener, humectant, texturizer, and stabilizer, and may be used in dietetic foods with a low glycemic index.[3,4]

8 Description

Tagatose is a white, anhydrous crystalline solid. It is a carbohydrate, a ketohexose, an epimer of D-fructose inverted at C-4. It can exist in several tautomeric forms.[5,6]

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for tagatose.

Test	USP 40–NF 35 S1
Identification	+
Specific rotation	−4° to −7°
Melting range	133–144°C
Microbial limits	
Aerobic bacteria	≤1000 cfu/g
Molds and yeast	≤100 cfu/g
Water	≤0.5%
Total ash	≤0.1%
Lead	≤1 ppm
Assay (dried basis)	≥98.0%

10 Typical Properties

Hygroscopicity Crystalline D-tagatose has low hygroscopicity similar to that of sucrose.
Melting point 132–135°C
Solubility Very soluble in water: 1 in 0.7 parts water (58% w/w) at 21°C. Slightly soluble in ethanol: 1 in 5000 parts ethanol.

11 Stability and Storage Conditions

Tagatose is stable under pH conditions typically encountered in foods (pH >3).[7] It is a reducing sugar and undergoes the Maillard reaction.

Tagatose is stable under typical storage conditions. It caramelizes at elevated temperature.

12 Incompatibilities

A Maillard-type condensation reaction is likely to occur between tagatose and compounds with a primary amine group to form brown or yellow-brown colored Amidori compounds. Reducing sugars will also interact with secondary amines to form an imine, but without any accompanying yellow-brown discoloration.[7]

13 Method of Manufacture

Tagatose is obtained from D-galactose by isomerization under alkaline conditions in the presence of calcium.

14 Safety

Tagatose is safe for use in food and beverages. It has been used in pharmaceutical products.[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Excessive generation of dust, or inhalation of dust, should be avoided.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral and rectal solutions). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

DL-Tagatose; L-tagatose.

DL-Tagatose

Empirical formula $C_6H_{12}O_6$
CAS number [17598-81-1]
Synonyms *lyxo*-2-Hexulose

L-Tagatose

Empirical formula $C_6H_{12}O_6$
CAS number [17598-82-2]

Melting point 134–135°C
Specific rotation $\alpha_D^{16} = +1°$ (2% aqueous solution)
Comments Sweetening agent for pharmaceutical and personal aid products.

18 Comments

The EINECS number for tagatose is 201-772-3. The PubChem Compound ID (CID) for tagatose is 92092.

Talc

1 Nonproprietary Names

BP: Purified Talc
JP: Talc
PhEur: Talc
USP–NF: Talc

2 Synonyms

Altalc; E553b; hydrous magnesium calcium silicate; hydrous magnesium silicate; *Imperial*; *Luzenac Pharma*; magnesium hydrogen metasilicate; *Magsil Osmanthus*; *Magsil Diamond*; *Magsil Star*; powdered talc; purified French chalk; *Purtalc*; soapstone; steatite; *Superiore*; talcum.

3 Chemical Name and CAS Registry Number

Talc [14807-96-6]

4 Empirical Formula and Molecular Weight

Talc is a purified, hydrated, magnesium silicate, approximating to the formula $Mg_6(Si_2O_5)_4(OH)_4$. It may contain small, variable amounts of aluminum silicate and iron.

5 Structural Formula

See Section 4.

6 Functional Category

Anticaking agent; glidant; tablet and capsule diluent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Talc was once widely used in oral solid dosage formulations as a lubricant, glidant, and diluent, *see* Table I,[1–3] although today it is less commonly used. However, it is widely used as a dissolution retardant in the development of controlled-release products.[4–6] Talc is also used as a lubricant in tablet formulations,[7] in a novel powder coating for extended-release pellets,[8] and as an adsorbent.[9] It is also used as an anti-tacking agent in coating of beads and tablets.

In topical preparations, talc is used as a dusting powder, although it should not be used to dust surgical gloves; *see* Section 14. Talc is a natural material; it may therefore frequently contain microorganisms and should be sterilized when used as a dusting powder; *see* Section 11.

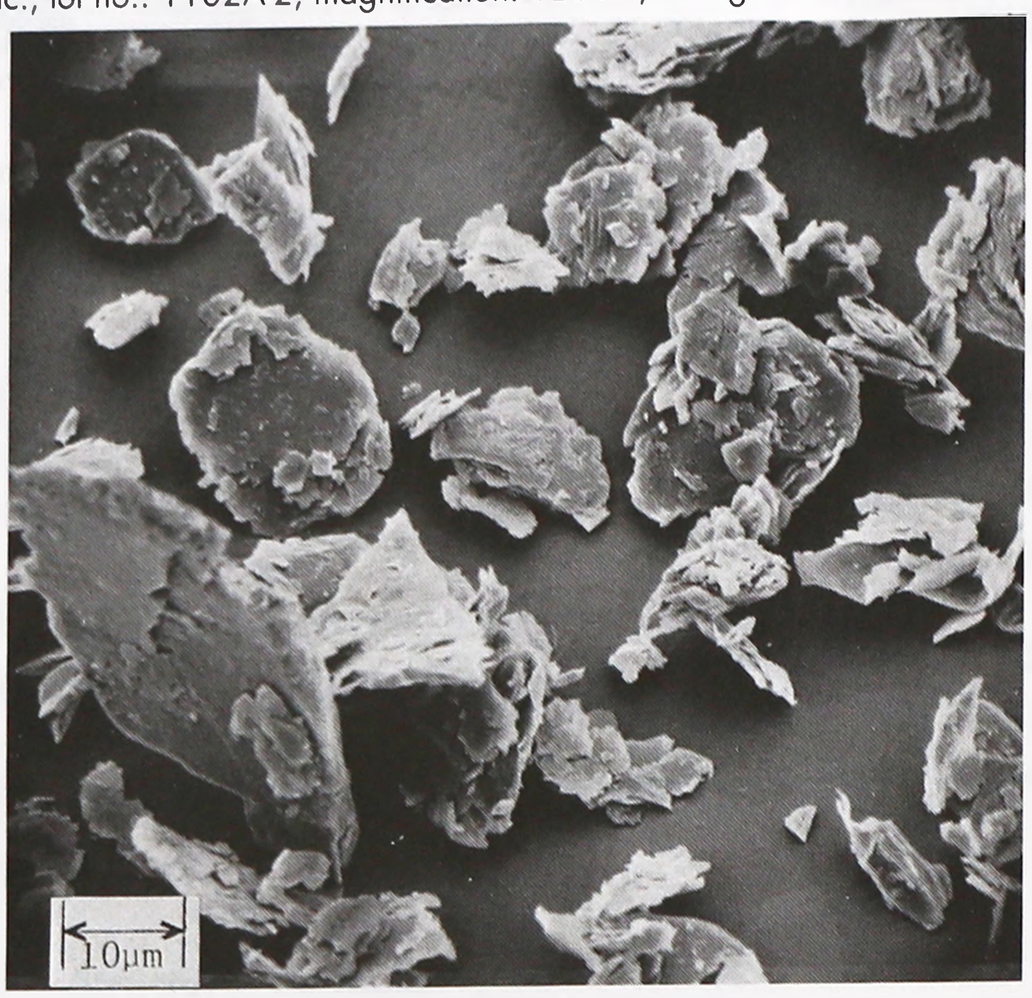
Talc continues to be widely used in coatings, and the ratio of talc to polymer is important in the release rate of a drug from coated beads.[10] Talc has also been shown to be useful in oral disintegrating tablets as it is insensitive to tablet hardness unlike other lubricants.[11]

Talc is additionally used to clarify liquids and is also used in cosmetics and food products, mainly for its lubricant properties.

Table I: Uses of talc.

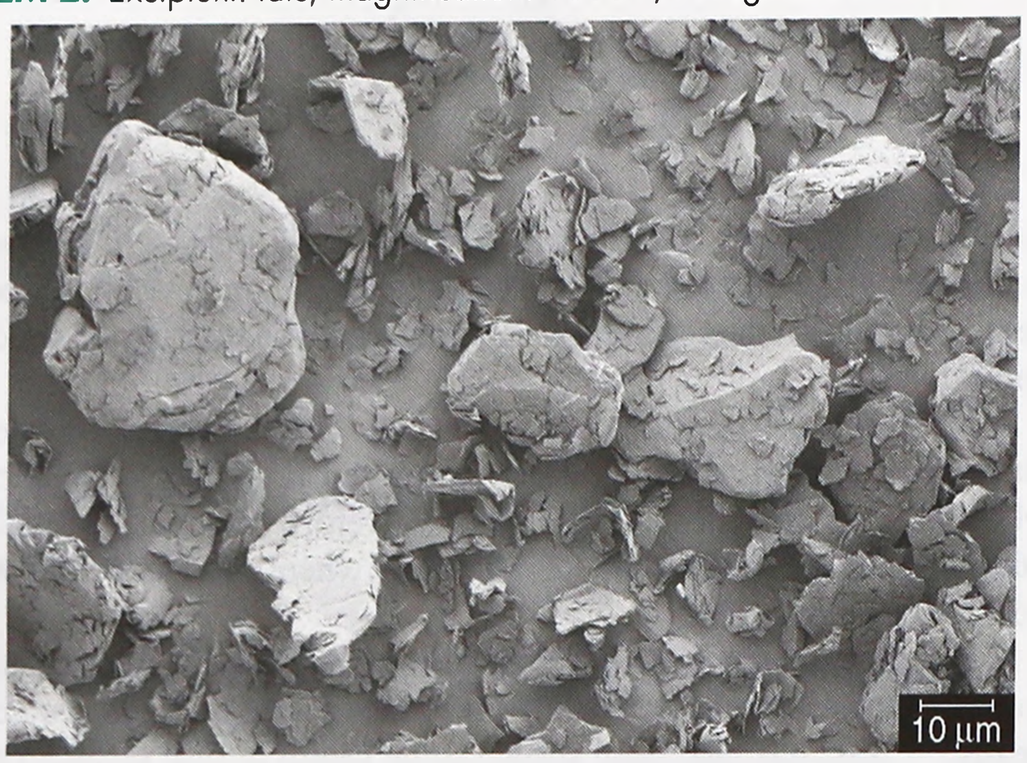
Use	Concentration (%)
Dusting powder	90.0–99.0
Glidant and tablet lubricant	1.0–10.0
Tablet and capsule diluent	5.0–30.0
Anti-tacking agent in coating systems	5.0–20.0

8 Description



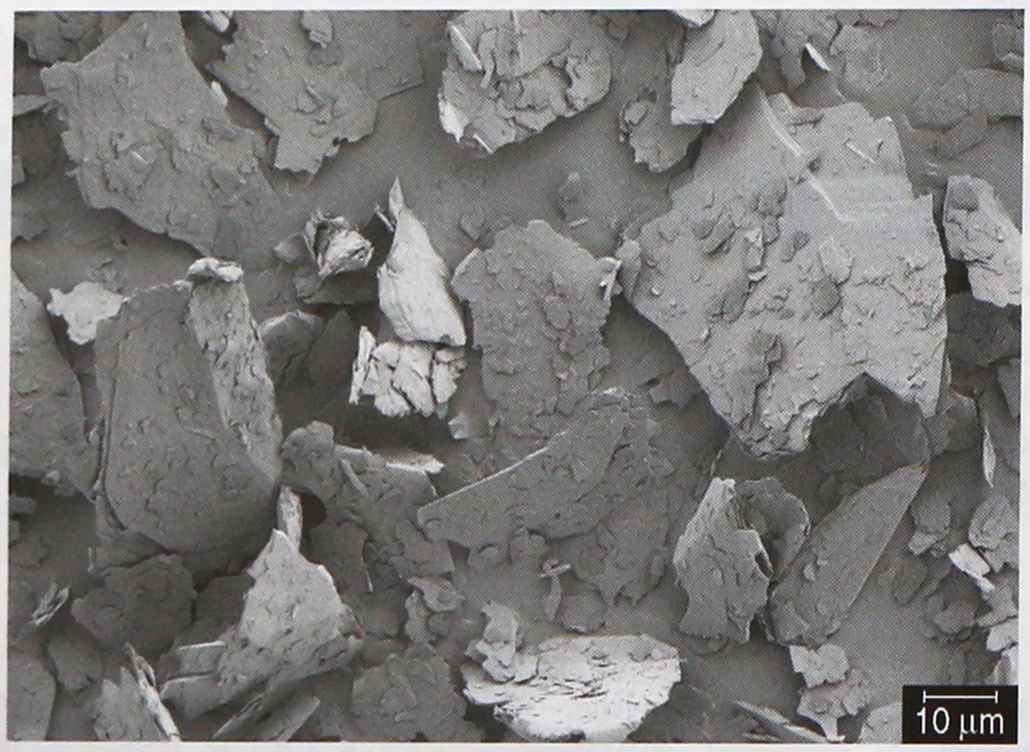
Talc occurs as a very fine, white to grayish-white, odorless, impalpable, unctuous, crystalline powder. It adheres readily to the skin and is soft to the touch and free from grittiness.

9 Pharmacopeial Specifications



The pharmacopeial specifications for talc have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.



SEM 1: Excipient: talc (*Purtalc*); manufacturer: Charles B Chrystal Co., Inc.; lot no.: 1102A-2; magnification: 1200×; voltage: 10 kV.

SEM 2: Excipient: talc; magnification: 1000×; voltage: 3 kV.

SEM 3: Excipient: talc; magnification: 1000×; voltage: 3 kV.

10 Typical Properties

Acidity/alkalinity pH = 7–10 for a 20% w/v aqueous dispersion.
Hardness (Mohs) 1.0–1.5
Moisture content Talc absorbs insignificant amounts of water at 25°C and relative humidities up to about 90%.

Table II: Pharmacopeial specifications for talc.

Particle size distribution Varies with the source and grade of material. Two typical grades are ≥99% through a 74 μm (#200 mesh) or ≥99% through a 44 μm (#325 mesh).
Refractive index n_D^{20} = 1.54–1.59
Solubility Practically insoluble in dilute acids and alkalis, organic solvents, and water.
Specific gravity 2.7–2.8
Specific surface area 2.41–2.42 m^2/g
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Talc is a stable material and may be sterilized by heating at 160°C for not less than 1 hour. It may also be sterilized by exposure to ethylene oxide or gamma irradiation.[12]

Talc should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Incompatible with quaternary ammonium compounds.

13 Method of Manufacture

Talc is a naturally occurring hydropolysilicate mineral found in many parts of the world including Australia, China, Italy, India, France, and the US.[13]

The purity of talc varies depending on the country of origin. For example, Italian types are reported to contain calcium silicate as the contaminant; Indian types contain aluminum and iron oxides; French types contain aluminum oxide; and American types contain calcium carbonate (California), iron oxide (Montana), aluminum and iron oxides (North Carolina), or aluminum oxide (Alabama).[14]

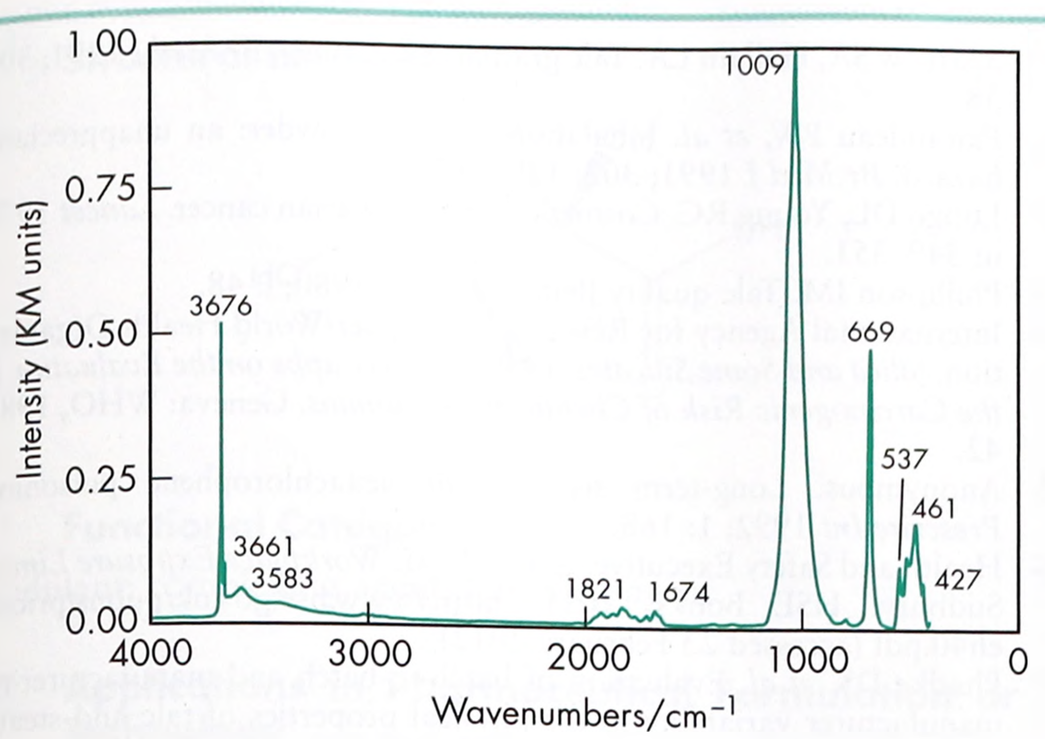

Figure 1: Infrared spectrum of talc measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

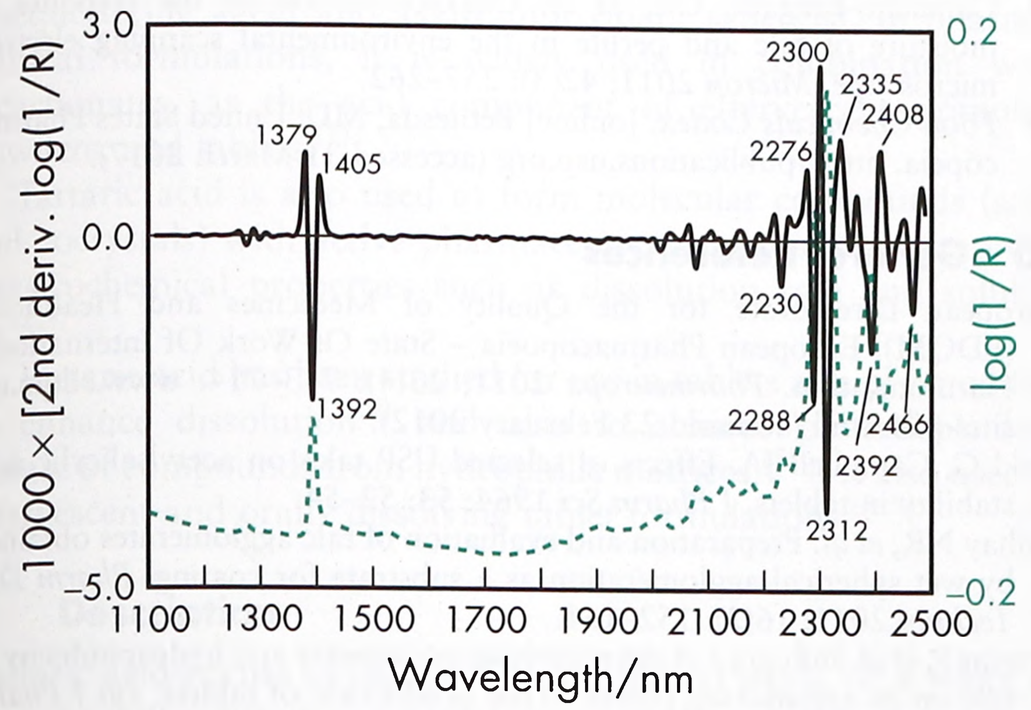

Figure 2: Near-infrared spectrum of talc measured by reflectance.

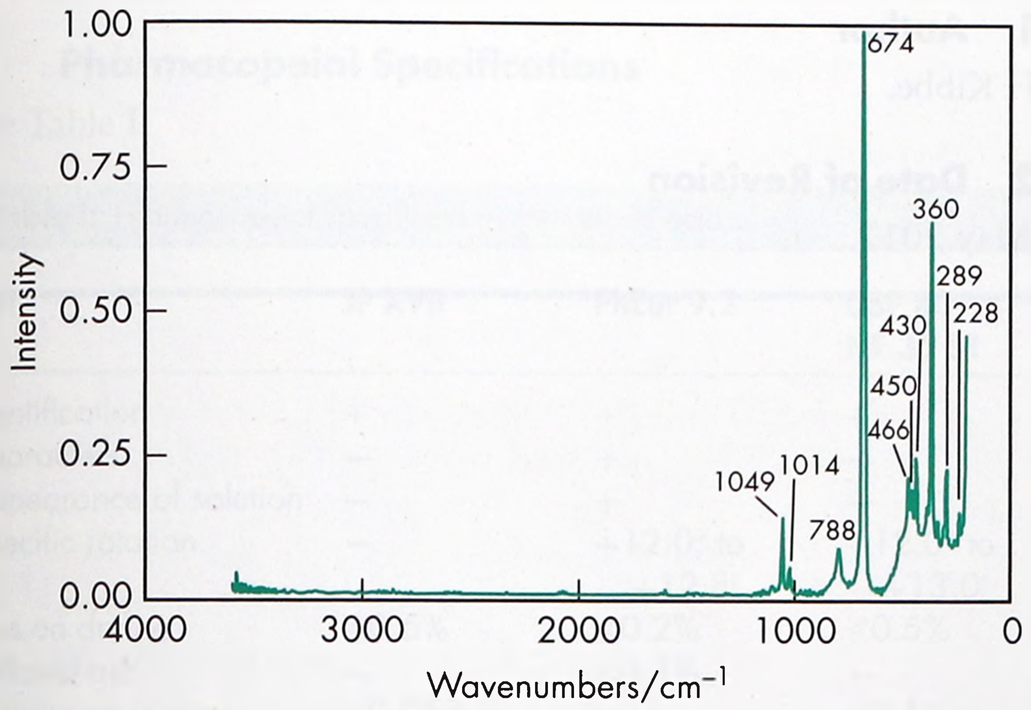

Figure 3: Raman spectrum of talc measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Naturally occurring talc is mined and pulverized before being subjected to flotation processes to remove various impurities such as asbestos (tremolite); carbon; dolomite; iron oxide; and various other magnesium and carbonate minerals. Following this process, the talc is finely powdered, treated with dilute hydrochloric acid, washed with water, and then dried. The processing variables of agglomerated talc strongly influence its physical characteristics.[15–17]

14 Safety

Talc is used mainly in tablet and capsule formulations. Talc is not absorbed systemically following oral ingestion and is therefore regarded as an essentially nontoxic material. However, intranasal or intravenous abuse of products containing talc can cause granulomas in body tissues, particularly the lungs.[18–20] Contamination of wounds or body cavities with talc may also cause granulomas; therefore, it should not be used to dust surgical gloves. Inhalation of talc causes irritation and may cause severe respiratory distress in infants;[21] *see also* Section 15.

Although talc has been extensively investigated for its carcinogenic potential, and it has been suggested that there is an increased risk of ovarian cancer in women using talc, the evidence is inconclusive.[22,23] However, talc contaminated with asbestos has been proved to be carcinogenic in humans, and asbestos-free grades should therefore be used in pharmaceutical products.[24]

Also, long-term toxic effects of talc contaminated with large quantities of hexachlorophene caused serious irreversible neurotoxicity in infants accidentally exposed to the substance.[25]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Talc is irritant if inhaled and prolonged excessive exposure may cause pneumoconiosis.

In the UK, the workplace exposure limit for talc is 1 mg/m^3 of respirable dust long-term (8-hour TWA).[26] Eye protection, gloves, and a respirator are recommended.

16 Regulatory Status

Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (buccal tablets; oral capsules and tablets; rectal and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Bentonite; magnesium aluminum silicate; magnesium silicate; magnesium trisilicate.

18 Comments

Talc has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Various grades of talc are commercially available that vary in their chemical composition depending upon their source and method of preparation.[13,27,28] The nature of the interactions between talc in various dosage formulations and moisture can be evaluated using Environmental Scanning Electron Microscopes.[29]

Talc derived from deposits that are known to contain associated asbestos is not suitable for pharmaceutical use. Tests for amphiboles and serpentines should be carried out to ensure that the product is free of asbestos.

A specification for talc is contained in the *Food Chemicals Codex* (FCC).[30]

The EINECS number for talc is 238-877-9. The PubChem Compound ID (CID) for talc includes 26924, 443754 and 16211421.

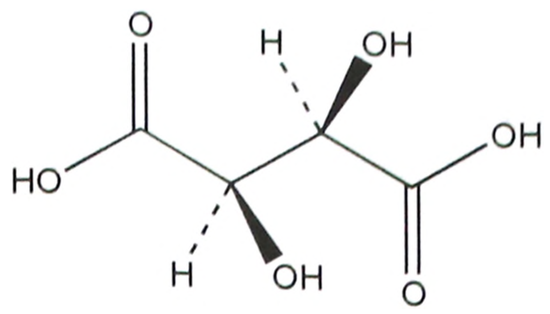
Tartaric Acid

1 Nonproprietary Names

BP: Tartaric Acid
JP: Tartaric Acid
PhEur: Tartaric Acid
USP–NF: Tartaric Acid

2 Synonyms

Acidum tartaricum; dextrotartaric acid; L-(+)-2,3-dihydroxybutanedioic acid; (2*R*,3*R*)-2,3-dihydroxybutane-1,4-dioic acid; 1,2-dihydroxyethane-1,2-dicarboxylic acid; 2,3-dihydroxysuccinic acid; *d*-α,β-dihydroxysuccinic acid; E334; succinic acid, 2,3-dihydroxy; (2*R*,3*R*)-tartaric acid; *d*-tartaric acid; L-(+)-tartaric acid; threaric acid.



3 Chemical Name and CAS Registry Number

[*R*-(*R**,*R**)]-2,3-Dihydroxybutanedioic acid [87-69-4]

4 Empirical Formula and Molecular Weight

$C_4H_6O_6$ 150.09

5 Structural Formula

6 Functional Category

Acidulant; complexing agent; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Tartaric acid is used in beverages, confectionery, food products, and pharmaceutical formulations as an acidulant. It may also be used as a sequestering agent and as an antioxidant synergist. In pharmaceutical formulations, it is widely used in combination with bicarbonates, as the acid component of effervescent granules, powders, and tablets.[1]

Tartaric acid is also used to form molecular compounds (salts and cocrystals) with active pharmaceutical ingredients to improve physicochemical properties such as dissolution rate and solubility.[2,3]

Tartaric acid has been studied for use in tablets as a pH modifier to enhance dissolution[4] and also to achieve pH-independent release of compounds from hydrophilic matrices.[5] It is also used in effervescent and orally dissolving tablet formulations.[6–9]

8 Description

Tartaric acid occurs as colorless monoclinic crystals, or a white or almost white crystalline powder. It is odorless, with an extremely tart taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for tartaric acid.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—
Appearance of solution	—	+	—
Specific rotation	—	+12.0° to +12.8°	+12.0° to +13.0°
Loss on drying	≤0.5%	≤0.2%	≤0.5%
Sulfated ash	—	≤0.1%	—
Residue on ignition	≤0.05%	—	≤0.1%
Chloride	—	≤100 ppm	—

Heavy metals	≤10 ppm	—	≤10 ppm
Arsenic	≤1 ppm	—	—
Assay (dried basis)	≥99.7%	99.5–101.0%	99.7–100.5%

10 Typical Properties

Acidity/alkalinity pH = 2.2 (0.1 N solution)
Density 1.76 g/cm^3
Dissociation constant
pK_{a1} = 2.98 at 25°C;
pK_{a2} = 4.34 at 25°C.
Heat of combustion 1151 kJ/mol (275.1 kcal/mol)
Heat of fusion 32.3 kJ/mol[10]
Heat of Solution -13.8 kJ/mol (3.30 kcal/mol)[11]
Melting point 168–170°C
Osmolarity A 3.9% w/v aqueous solution is isoosmotic with serum.
Solubility *see* Table II.

Table II: Solubility of tartaric acid.

Solvent	Solubility at ≈25°C unless otherwise stated
Chloroform	Practically insoluble
Ethanol	1 in 3
Ether	1 in 250
Glycerin	Soluble
Methanol	1 in 1.7
Propan-1-ol	1 in 10.5
Water	Very soluble

Specific heat 1.20 J/g (0.288 cal/g) at 20°C.
Specific rotation $[\alpha]_D^{20}$ = +12.0° (20% w/v aqueous solution).
Spectroscopy
NIR spectrum *see* Figure 1.

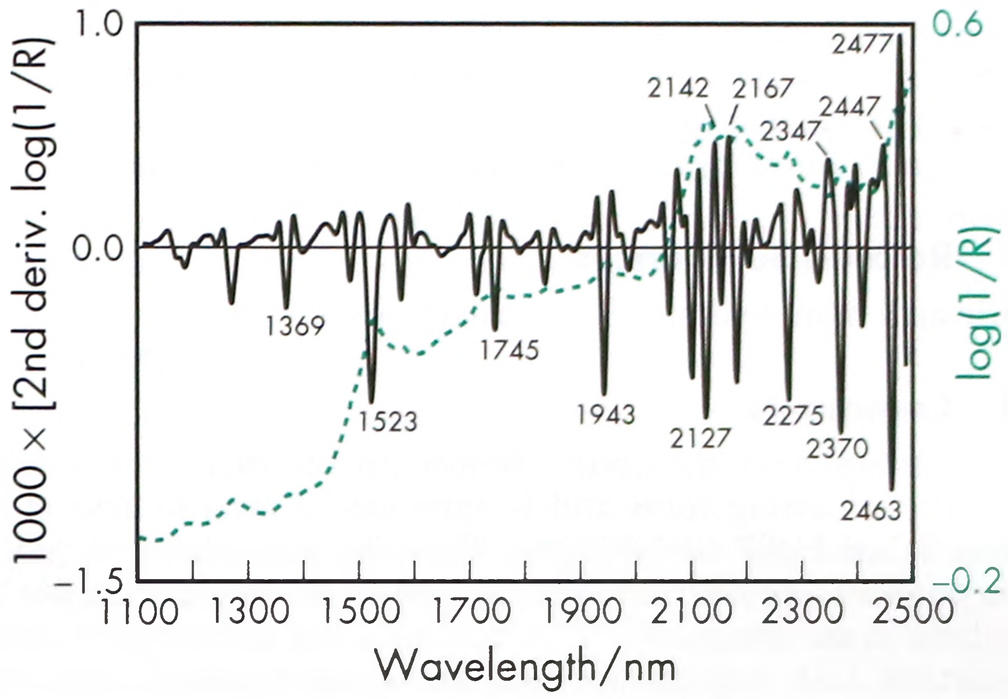

Figure 1: Near-infrared spectrum of tartaric acid measured by reflectance.

11 Stability and Storage Conditions

The bulk material is stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Tartaric acid is incompatible with silver and reacts with metal carbonates and bicarbonates (a property exploited in effervescent preparations).

13 Method of Manufacture

Tartaric acid occurs naturally in many fruits as the free acid or in combination with calcium, magnesium, and potassium.

Commercially, L-(+)-tartaric acid is manufactured from potassium tartrate (cream of tartar), a by-product of wine making. Potassium tartrate is treated with hydrochloric acid, followed by the addition of a calcium salt to produce insoluble calcium tartrate. This precipitate is then removed by filtration and reacted with 70% sulfuric acid to yield tartaric acid and calcium sulfate.

14 Safety

Tartaric acid is widely used in food products and oral, topical, and parenteral pharmaceutical formulations. It is generally regarded as a nontoxic and nonirritant material; however, strong tartaric acid solutions are mildly irritant and if ingested undiluted may cause gastroenteritis. *See also* section 18.

An acceptable daily intake for L-(+)-tartaric acid has not been set by the WHO, although an acceptable daily intake of up to 30 mg/kg body-weight for monosodium L-(+)-tartrate has been established.[12]

LD_{50} (mouse, IV): 0.49 g/kg[13]
LD_{Lo} (dog, oral): 5 g/kg[13]
LD_{Lo} (rabbit, oral): 5 g/kg[13]
LD_{Lo} (rat, oral): 7.5 g/kg[14]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Tartaric acid may be irritating to the eyes; eye protection and rubber or plastic gloves are recommended. When heated to decomposition, tartaric acid emits acrid smoke and fumes.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM and IV injections; oral solutions, syrups and tablets; sublingual tablets; topical films and patches; rectal and vaginal preparations). Included in the EAFUS database and listed on the TSCA inventory. Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Citric acid monohydrate; fumaric acid; malic acid.

18 Comments

L-(+)-Tartaric acid, the optical isomer usually encountered, is the naturally occurring form and is specified as tartaric acid in the PhEur 9.2 and USP 40–NF 35 S1. The Raman and Infrared spectra of crystalline L-(+)-Tartaric acid as well as its crystal structure are available in the literature.[15,16] Other forms of tartaric acid include DL-tartaric acid, mesotartaric acid and (2S,3S)-tartaric acid. Note that DL-tartaric acid is composed of an equimolar mixture of the two diasteromers and has a different toxicological profile than L-(+)-tartaric acid, and is not approved for use in foodstuffs and pharmaceuticals.[17]

A specification for tartaric acid is contained in the *Food Chemicals Codex* (FCC).[18]

The EINECS number for tartaric acid is 201-766-0.

Ethylenediaminetetraacetic acid tetrasodium salt dihydrate [10378-23-1]

Ethylenediaminetetraacetic acid tetrasodium salt tetrahydrate [13235-36-4]

4 Empirical Formula and Molecular Weight

$C_{10}H_{12}N_2Na_4O_8$	380.17
$C_{10}H_{12}N_2Na_4O_8 \cdot H_2O$	398.19
$C_{10}H_{12}N_2Na_4O_8 \cdot 2H_2O$	416.20
$C_{10}H_{12}N_2Na_4O_8 \cdot 4H_2O$	452.23

5 Structural Formula

6 Functional Category

Antimicrobial preservative; complexing agent.

7 Applications in Pharmaceutical Formulation or Technology

Tetrasodium edetate is used as a complexing agent in pharmaceutical formulations. It reacts with most divalent and trivalent metallic ions to form soluble metal chelates, and is used as an antioxidant synergist. Tetrasodium edetate has been used at concentrations between 0.01–0.2% w/v.

Tetrasodium edetate has been investigated as an antimicrobial for the prevention of biofilm formation.[1,2]

See also Edetic Acid, and Edetate Disodium.

8 Description

Tetrasodium edetate occurs as a white crystalline powder.

9 Pharmacopeial Specifications

—

10 Typical Properties

Acidity/alkalinity pH = 11.3 for a 1% w/v aqueous solution
Autoignition temperature >200°C
Density (Bulk) 1.27 g/cm^3
Melting point >300°C with decomposition
Solubility Freely soluble in water (1 in 1)

11 Stability and Storage Conditions

Tetrasodium edetate and other edetate salts are more stable than edetic acid (*see* Edetic Acid).

Store in tightly closed containers in a cool, dry, and well-ventilated place.

12 Incompatibilities

Tetrasodium edetate is incompatible with strong oxidizing agents and strong bases.

See also Edetic Acid, and Edetate Disodium.

13 Method of Manufacture

Tetrasodium edetate is produced by reacting a basic solution of ethylenediamine with formaldehyde and sodium or hydrogen cyanide, followed by hydrolysis to form the salt. Alternatively, excess sodium hydroxide can be used in the reaction.[3]

14 Safety

Tetrasodium edetate is used in oral pharmaceutical formulations and as a food additive. Adverse skin reactions have been reported due to contact with tetrasodium edetate in cosmetics.[4]

The Cosmetic Ingredient Review Expert Panel has assessed tetrasodium edetate and concluded that the material is safe as used in cosmetic formulations.[3]

See also Edetic Acid and Section 18.

LD_{50} (rats, IP): >2.0 g/kg[3]

LD_{50} (mouse, IP): 0.33 g/kg[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Tetrasodium edetate may cause serious eye irritation and is mildly irritant to the skin.[6] Avoid skin and eye contact, and dust formation; eye protection, gloves, and a dust mask are recommended.

When heated to decomposition, tetrasodium edetate emits toxic fumes including ammonia and nitrogen oxides.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (inhalations; injections; ophthalmic preparations; oral capsules and tablets; topical preparations). Included in nonparental medicines licensed in the UK. Included as a food additive in the 'EAFUS' list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Edetate calcium disodium; edetate disodium; edetic acid.

18 Comments

Tetrasodium edetate is also used as a complexing agent in cosmetics and foods. The name 'sodium edetate' has been used in the literature for various sodium salts of edetic acid.

Significant reductions in bone, liver and muscle tissue calcium content have been observed in mice administered oral tetrasodium edetate. Additionally, magnesium content in the bone and liver tissue, and zinc content in the kidney, liver and muscle tissue was significantly reduced.[7]

The EINECS number for tetrasodium edetate hydrate is 200-573-9. The PubChem Compound ID (CID) for tetrasodium edetate is 6144.

Thaumatin

1 Nonproprietary Names

None adopted.

2 Synonyms

E957; katemfe; *Talin*; taumatin; taumatina; thalin; thaumatine; thaumatins; thaumatins protein.

3 Chemical Name and CAS Registry Number

Thaumatin [53850-34-3]

4 Empirical Formula and Molecular Weight

See Section 5.

5 Structural Formula

Thaumatin is a mixture of five thaumatin proteins: thaumatins I, II, III, and a and b, where thaumatins I and II predominate. Thaumatins I and II consist of almost identical sequences of amino acids. There are no unusual side-chains or peptide linkages, and there are no end-group substitutions.

6 Functional Category

Flavor enhancer; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Thaumatin is a naturally occurring intense sweetening agent approximately 2000–3000 times as sweet as sucrose. It has a delayed-onset taste profile and long (up to one hour) licorice-like aftertaste. It is used extensively in food applications as a sweetening agent and flavor enhancer, and has potential for use in pharmaceutical applications such as oral suspensions.[1]

8 Description

Thaumatin occurs as a pale-brown colored, odorless, hygroscopic powder with an intensely sweet taste.

9 Pharmacopeial Specifications

—

10 Typical Properties

Solubility *see* Table I.

Table I: Solubility of thaumatin.

Solvent	Solubility at 25°C unless otherwise stated
Acetone	Practically insoluble
Ethanol (95%)	Soluble
Glycerin	Soluble
Propylene glycol	Soluble
Water	1 in 5 at pH 3

11 Stability and Storage Conditions

Thaumatin is stable in aqueous solutions at pH 2–8. It is also heat-stable at less than pH 5.5 (e.g. during baking, canning, pasteurizing, or UHT processes).

12 Incompatibilities

—

13 Method of Manufacture

Thaumatin is a naturally occurring intense sweetener isolated from the fruit of the African plant *Thaumatococcus daniellii* (Benth).[2] Commercially, thaumatin is produced by aqueous extraction under reduced pH conditions followed by other physical processes such as reverse osmosis.

14 Safety

Thaumatin is accepted for use in food products either as a sweetener or as a flavor modifier in a number of areas including Europe and Australia. It is also used in oral hygiene products such as mouthwashes and toothpastes, and has been proposed for use in oral pharmaceutical formulations. Thaumatin is generally regarded as a relatively nontoxic and nonirritant material when used as an excipient. In Europe, because of its lack of toxicity, an ADI has been set of 'not specified'.[3,4]

LD_{50} (mouse, oral): >20 g/kg[4]

LD_{50} (rat, oral): >20 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the EAFUS database. Accepted for use as a food additive in Europe. Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

The typical thaumatin level used in foods is 0.5–3 ppm, although higher levels are used in certain applications such as chewing gum. Synergistic effects with other intense sweeteners such as acesulfame potassium and saccharin occur. The extensive disulfide crosslinking within thaumatin maintains the tertiary structure of the polypeptide: cleavage of just one disulfide bridge has been shown to result in the loss of the sweet taste of thaumatin.[5]

As thaumatin is a protein it has some calorific value; however, in food products and pharmaceutical formulations the quantities used are so small that the calorific value is insignificant.

A specification for thaumatin is included in the *Japanese Pharmaceutical Excipients* (JPE)[6] and the *Food Chemicals Codex* (FCC);[7] *see* Table II.

The EINECS number for thaumatin is 258-822-2.

Table II: FCC[7] and JPE[6] specifications for thaumatin

Test	FCC 10 S2	JPE 2004
Description	+	+
Identification	+	+
pH	—	2.5–4.0
Clarity and color of solution	—	+
Aluminum	≤0.01%	≤100 ppm
Arsenic	—	≤2 ppm
Lead	≤3 mg/kg	—
Heavy Metals	—	≤20 ppm
Carbohydrates	≤3.0%	≤3.0%
Loss on drying	≤9.0%	≤9.0%
Residue on ignition	≤2.0%	≤1.0%
Specific absorption	11.5–13.0	12.0–12.5
Assay (dried basis)		
Protein	≥93%	—
Nitrogen	—	15–18% nitrogen

Thimerosal

1 Nonproprietary Names

BP: Thiomersal

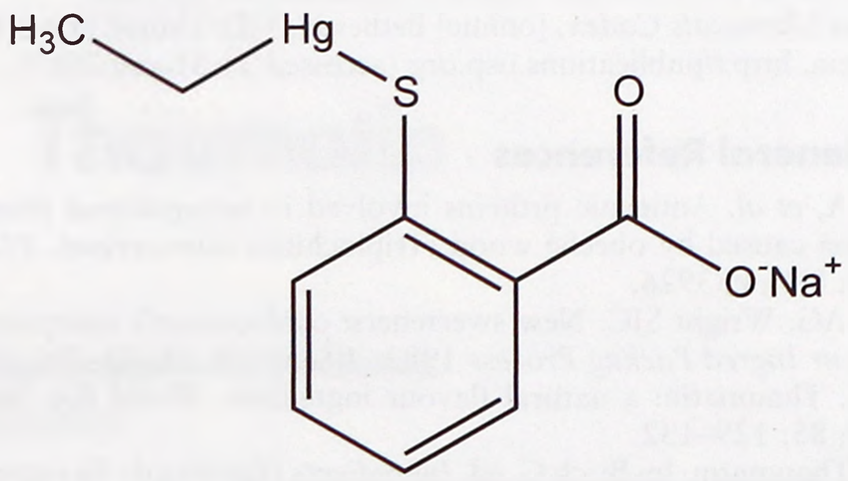
PhEur: Thiomersal

USP–NF: Thimerosal

2 Synonyms

Benzoic acid; 2-mercapto-, mercury complex; [(*o*-carboxyphenyl)thio]ethylmercury sodium salt; elcide; ethyl (2-mercaptobenzoato-*S*)-mercury, sodium salt; ethyl (sodium *o*-mercaptobenzoato)mercury; mercurothiolate; merzonin sodium; sodium ethylmercurithiosalicylate; thiomersalate; thiomersalum.

3 Chemical Name and CAS Registry Number



Ethyl[2-mercaptobenzoato(2–)-*O*,*S*]-mercurate(1–) sodium [54-64-8]

4 Empirical Formula and Molecular Weight

$C_9H_9HgNaO_2S$ 404.81

Thimerosal contains approximately 49% mercury by weight.[1]

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Thimerosal has been used as an antimicrobial preservative in biological and pharmaceutical preparations since the 1930s;[2] *see* Table I.

Table I: Uses of thimerosal.

Use	Concentration (%)
IM, IV, SC injections	0.01
Ophthalmic solutions	0.001–0.15
Ophthalmic suspensions	0.001–0.004
Otic preparations	0.001–0.01
Topical preparations	0.01

8 Description

Thimerosal occurs as a light cream-colored crystalline powder with a slight, characteristic metallic odor and taste.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for thimerosal.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance of solution	+	—
Melting point	103–115°C	—
pH	6.0–8.0	—
Inorganic mercury compounds	≤0.70%	—
Loss on drying	≤0.5%	≤0.5%
Ether-soluble substances	—	≤0.8%
Mercury ions	—	≤0.70%
Readily carbonizable substances	—	+
Assay (dried basis)	97.0–101.0%	97.0–101.0%

10 Typical Properties

Acidity/alkalinity pH = 6.7 for a 1% w/v aqueous solution at 20°C.

Antimicrobial activity Thimerosal is bactericidal at acidic pH, bacteriostatic and fungistatic at alkaline or neutral pH. Thimerosal is not effective against spore-forming organisms. *See also* Section 12. For reported minimum inhibitory concentrations (MICs), *see* Table III.[3]

Table III: Reported minimum inhibitory concentrations (MICs) for thimerosal.[3]

Microorganism	MIC (μg/mL)
Aspergillus niger	128.0
Candida albicans	32.0
Escherichia coli	4.0
Klebsiella pneumoniae	4.0
Penicillium notatum	128.0
Pseudomonas aeruginosa	8.0
Pseudomonas cepacia	8.0
Pseudomonas fluorescens	4.0
Staphylococcus aureus	0.2

Density (bulk) $<0.33\ g/cm^3$

Dissociation constant $pK_a = 3.05$ at 25°C.

Melting point 232–233°C with decomposition.

Solubility Freely soluble in water; soluble 1 in 8 of ethanol (95%); practically insoluble in benzene, ether, and methylene chloride.

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

Thimerosal is stable at normal temperatures and pressures; exposure to light may cause discoloration.

Aqueous solutions may be sterilized by autoclaving but are sensitive to light. The rate of oxidation in solutions is increased by the presence of trace amounts of copper and other metals. Edetic acid or edetates may be used to stabilize solutions but have been reported to reduce the antimicrobial efficacy of thimerosal solutions; *see* Section 12.

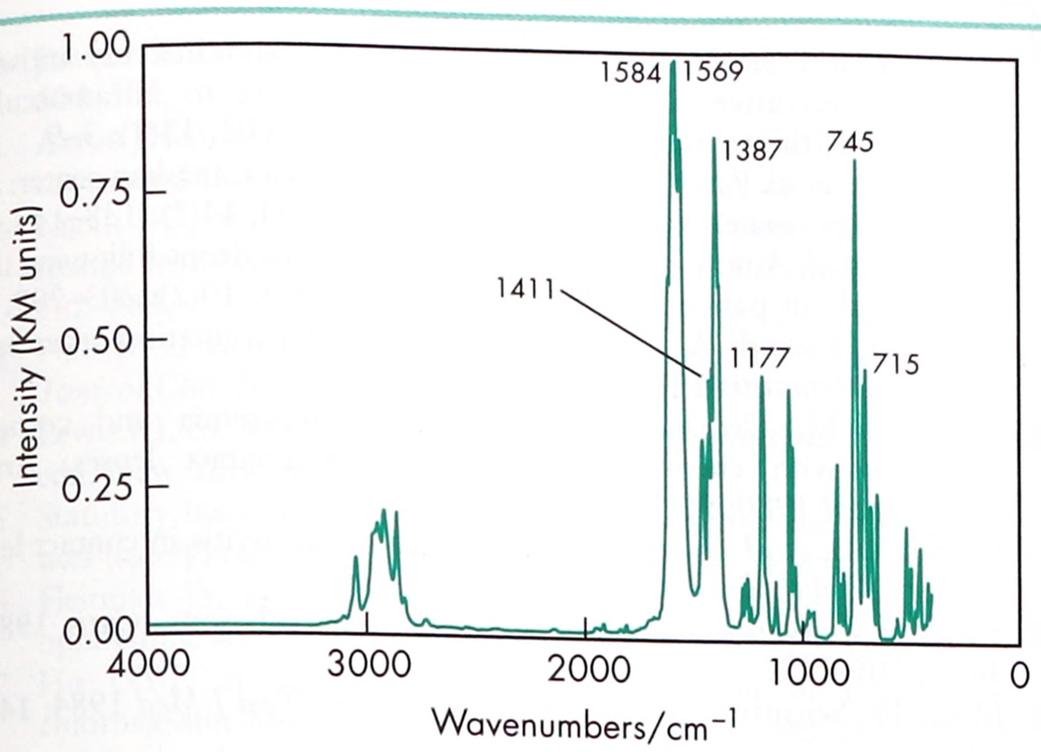


Figure 1: Infrared spectrum of thimerosal measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

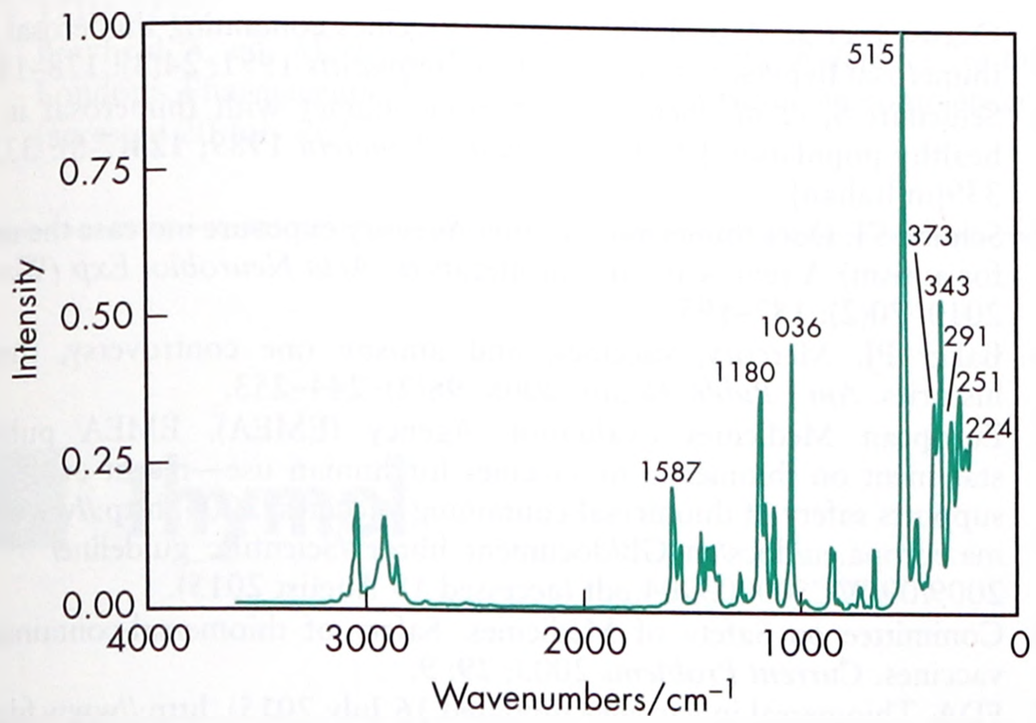

Figure 2: Raman spectrum of thimerosal measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

The solid material should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Incompatible with aluminum and other metals, strong oxidizing agents such as peroxides, permanganates, and nitric acid, strong acids and bases, sodium chloride solutions,[4] lecithin, phenylmercuric compounds, quaternary ammonium compounds, thioglycolate, and proteins. The presence of sodium metabisulfite, edetic acid, and edetates in solutions can reduce the preservative efficacy of thimerosal.[5]

In solution, thimerosal may be adsorbed by plastic packaging materials, particularly polyethylene. It is strongly adsorbed by treated or untreated rubber caps that are in contact with solutions.[6,7]

When it was used with cyclodextrin, the effectiveness of thimerosal was reduced; however, this was related to the lipid nature of the other ingredients in the preparation.[8]

13 Method of Manufacture

Thimerosal is prepared by the interaction of ethyl mercuric chloride, or hydroxide, with thiosalicylic acid and sodium hydroxide, in ethanol (95%).

14 Safety

Thimerosal is widely used as an antimicrobial preservative in parenteral and topical pharmaceutical formulations. However, concern over the use of thimerosal in pharmaceuticals has increased as a result of a greater awareness of the toxicity of mercury and other associated mercury compounds.[9,10] Thimerosal is an irritant to the skin and mucous membranes, and may be systemically absorbed through the skin and upper respiratory tract.

The increasing number of reports of adverse reactions, particularly hypersensitivity,[11–13] to thimerosal and doubts as to its effectiveness as a preservative have led to suggestions that it should not be used as a preservative in eye drops[14] or vaccines.[15]

Adverse reactions to thimerosal used to preserve contact lens solutions have also been reported to include ocular redness, irritation, reduced lens tolerance, and conjunctivitis.[16–18] One estimate suggests that approximately 10% of contact lens wearers may be sensitive to thimerosal.[19] An interaction between orally administered tetracyclines and thimerosal, which resulted in varying extents of ocular irritation, has also been reported in patients using a contact lens solution preserved with thimerosal.[20]

Although not all thimerosal-sensitive patients develop adverse reactions to vaccines containing thimerosal, there is potential risk. Patch testing in humans and animal experiments have suggested that 0.1% w/v thimerosal can sensitize children.[21] The incidence of sensitivity to thimerosal appears to be increasing; a study of 256 healthy subjects showed approximately 6% with positive sensitivity.[22]

Controversially, some have claimed a connection between the use of thimerosal in vaccines and the apparent rise in the incidence of autism.[23,24] However, recent studies have shown no association between thimerosal exposure and autism.[25–30] In both Europe and the US, regulatory bodies have recommended that thimerosal in vaccines be phased out.[31–33] More recent studies assessing the safety of thimerosal in vaccines have, however, suggested that while the risk of hypersensitivity reactions is present, the relative risk of neurological harm in infants is negligible given the quantities of thimerosal present in vaccines.[34–37] Regulatory bodies in Europe and the US have therefore updated their advice on the use of thimerosal in vaccines by stating that while it would be desirable for thimerosal to not be included in vaccines and other formulations, the benefits of vaccines far outweigh any risks of adverse effects associated with their use.[25–28]

Thimerosal has also been associated with false-positive reactions to old tuberculin,[38] ototoxicity,[39] and an unusual reaction to aluminum[40] in which a patient suffered a burn 5 cm in diameter at the site of an aluminum foil diathermy electrode after preoperative preparation of the skin with a 0.1% w/v thimerosal solution in ethanol (50%). Investigations showed that considerable heat was generated when such a solution came into contact with aluminum.

Serious adverse effects and some fatalities have been reported following the parenteral and topical use of products containing thimerosal. Five fatal poisonings resulted from the use of 1000 times the normal concentration of thimerosal in a chloramphenicol preparation for intramuscular injection.[41] Ten out of 13 children died as a result of treatment of umbilical hernia (omphalocele) with a topical tincture of thimerosal.[42] It has therefore been recommended that organic mercurial disinfectants should be restricted or withdrawn from use in hospital since absorption occurs readily through intact membranes. In a case of attempted suicide, a 44-year-old man drank 83 mg/kg of a thimerosal-containing solution. Despite spontaneously vomiting after 15 minutes, gastric lavage and administration of chelating agents on hospital admission, serious symptoms ultimately ending in coma occurred. The patient survived and after 5 months treatment made a full recovery except for sensory defects in two toes.[43]

LD_{50} (mouse, oral): 91 mg/kg[44]
LD_{50} (rat, oral): 75 mg/kg
LD_{50} (rat, SC): 98 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Thimerosal should be handled in a well-ventilated environment. Eye protection, gloves, and a respirator are recommended.

Chemical decomposition may cause the release of toxic fumes containing oxides of carbon, sulfur, and mercury in addition to mercury vapor.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM, IV, and SC injections [powder, for sustained action]; ophthalmic, otic, and topical preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

In the UK, the use of thimerosal in cosmetics is limited to 0.003% w/w (calculated as mercury) as a preservative in shampoos and hair-creams, which contain nonionic emulsifiers that would render other preservatives ineffective. The total permitted concentration (calculated as mercury) when mixed with other mercury compounds is 0.007% w/w.[45]

17 Related Substances

Phenylmercuric acetate; phenylmercuric borate; phenylmercuric nitrate.

18 Comments

Some variation between the results obtained when comparing different thimerosal assay methods has been reported.[46,47]

Recent studies have indicated that the removal of preservatives from hepatitis B vaccine does not adversely affect its immunogenicity both in the short and in the longer term.[48]

Therapeutically, thimerosal is occasionally used as a bacteriostatic and fungistatic mercurial antiseptic, which is usually applied topically at a concentration of 0.1% w/w.[49] However, its use is declining owing to its toxicity and effects on the environment.

Thimerosal is also used in cosmetics (*see* Section 16) and to preserve soft contact lens solutions.

The EINECS number for thimerosal is 200-210-4. The PubChem Compound ID (CID) for thiomersal is 16684434.

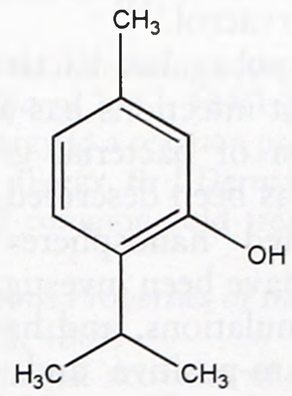
Thymol

1 Nonproprietary Names

BP: Thymol
JP: Thymol
PhEur: Thymol
USP–NF: Thymol

2 Synonyms

Acido trimico; 3-*p*-cymenol; *p*-cymen-3-ol; *Flavinol*; 3-hydroxy-*p*-cymene; 3-hydroxy-1-methyl-4-isopropylbenzene; *Intrasol*; isopropyl cresol; isopropyl-*m*-cresol; 6-isopropyl-*m*-cresol; isopropyl metacresol; 2-isopropyl-5-methylphenol; 1-methyl-3-hydroxy-4-isopropylbenzene; 5-methyl-2-isopropylphenol; 5-methyl-2-(1-methylethyl) phenol; *Medophyll*; *p*-cymen-3-ol; thyme camphor; thymic acid; *m*-thymol; thymolum; timol.



3 Chemical Name and CAS Registry Number

Thymol [89-83-8]
m-Thymol [3228-03-3]

4 Empirical Formula and Molecular Weight

$C_{10}H_{14}O$ 150.24

5 Structural Formula

6 Functional Category

Antioxidant; flavoring agent; penetration enhancer.

7 Applications in Pharmaceutical Formulation or Technology

Thymol is a phenolic antiseptic, which has antibacterial and antifungal activity. *See* Section 10. However, it is not suitable for use as a preservative in pharmaceutical formulations because of its low aqueous solubility.

Thymol is used as a skin penetrant and has been shown to enhance the *in vitro* percutaneous absorption of a number of drugs, including 5-fluorouracil,[1] piroxicam,[2] propranolol,[3] naproxen,[4] and tamoxifen.[5] Studies have also demonstrated that the melting point of lidocaine is significantly lowered when it is mixed with thymol.[6,7]

Thymol is a true antioxidant and has been used at concentrations of 0.01% as an antioxidant for halothane, trichloroethylene, and tetrachloroethylene. The antioxidant activity of thymol[8,9] and thymol analogues[8] has been described.

T

Thymol is also used as a synthetic flavoring agent in pharmaceutical formulations. It has been investigated for use in a copolymer complex with β-cyclodextrin to improve its aqueous solubility, dissolution rate, bioavailability, and palatability.[10]

8 Description

Thymol occurs as colorless or often large translucent crystals, or as a white crystalline powder with a herbal odor (aromatic and thyme-like) and a pungent caustic taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for thymol.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Melting range	49–51°C	48–52°C	48–51°C
Appearance of solution	–	+	–
Acidity	–	+	–
Related substances	–	+	–
Residue on evaporation	≤0.05%	≤0.05%	≤0.05%
Other phenols	+	–	–
Assay	≥98.0%	–	99.0–101.0%

10 Typical Properties

Acidity/alkalinity A 4% solution in ethanol (50%) is neutral to litmus; a 1% solution in water has a pH of 7.

Antimicrobial activity The antimicrobial activity of thymol against eight oral bacteria has been studied *in vitro*. Inhibitory activity was noted against almost all organisms, and a synergistic effect was observed for combinations of thymol and eugenol, and of thymol and carvacrol.[11]

The activity of thymol against bacteria commonly involved in upper respiratory tract infections has also been shown.[12] The continued suppression of bacterial growth following limited exposure to thymol has been described.[13]

Thymol-encapsulated nanospheres at concentrations of 0.078–0.625 mg/mL have been investigated for use as preservatives in cosmetic formulations, and have been shown to be as effective against Gram-positive and Gram-negative bacteria compared with methylparaben, which is routinely used at concentrations of 4.0 mg/mL.[14]

Boiling point . About 233°C

Density 0.97 g/cm^3 at 25°C; has a greater density than water, but when liquefied by fusion is less dense than water.

Dissociation constant pK_a = 10.6 at 20°C

Melting point 48–51°C, but, once melted, remains liquid at a considerably lower temperature.

Partition coefficient Log *P* (octanol : water) = 3.3

Phenol coefficient About 50

Refractive index

n_D^{25} = 0.15204;

n_D^{20} = 0.15227.

Solubility Soluble 1 in 0.7–1.0 of chloroform; 1 in 1 of ethanol (95%); 1 in 1.5 of ether, glacial acetic acid; 1 in 1.7–2.0 of olive oil; 1 in 1000 of water. Freely soluble in essential oils, fixed oils, and fats. Sparingly soluble in glycerin. Dissolves in dilute solutions of alkali hydroxides, forming salts that have increased solubility but whose solutions darken on standing.

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

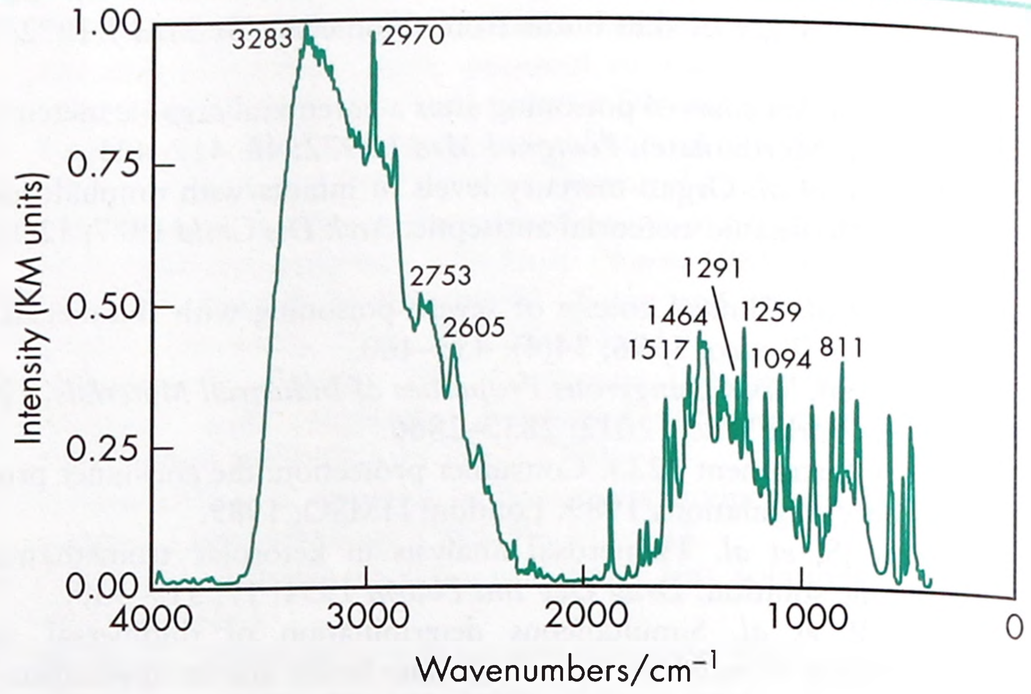


Figure 1: Infrared spectrum of thymol measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

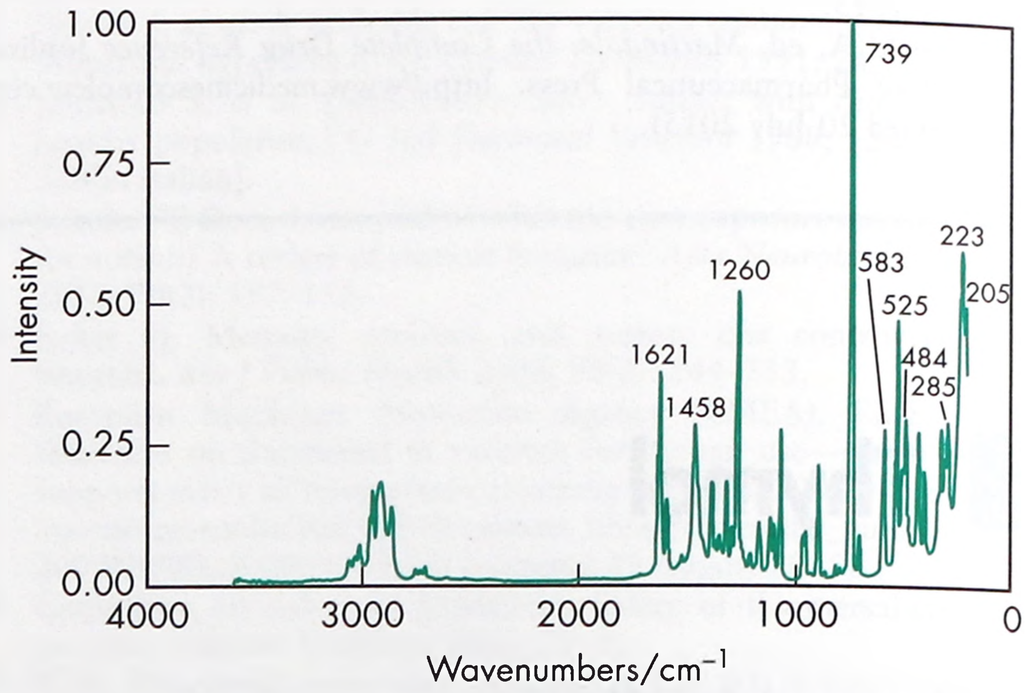

Figure 2: Raman spectrum of thymol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Vapor pressure 1.0 mmHg at 64°C

Volatility Appreciable volatility at 100°C; volatile in water vapor at 25°C.

11 Stability and Storage Conditions

Thymol should be stored in well-closed, light-resistant containers, in a cool, dry, place. Thymol is affected by light.

12 Incompatibilities

Thymol is incompatible with iodine, alkalis, and oxidizing agents. It liquefies, or forms soft masses, on trituration with acetanilide, antipyrine, camphor, monobromated camphor, chloral hydrate, menthol, phenol, or quinine sulfate. The antimicrobial activity of thymol is reduced in the presence of proteins.

13 Method of Manufacture

Thymol is obtained from the volatile oil of thyme (*Thymus vulgaris* Linné (Fam. Labiatae)) by fractional distillation followed by extraction and recrystallization. Thyme oil yields about 20–30% thymol. Thymol may also be produced synthetically from *p*-cymene, menthone, or piperitone, or by the interaction of *m*-cresol with isopropyl chloride.

14 Safety

Thymol is used in cosmetics, foods, and pharmaceutical applications as an excipient. However, thymol may be irritating when

inhaled or following contact with the skin or eyes, and has been associated with a report of contact allergy.[15] It may also cause abdominal pain and vomiting, and sometimes stimulation followed by depression of the central nervous system following oral consumption; fats and alcohol increase absorption and aggravate symptoms.

Respiratory arrest, attributed to acute nasal congestion and edema, has been reported in a 3-week-old patient due to the erroneous intranasal application of *Karvol*, a combination product that includes thymol. The patient recovered, but it was recommended that inhalation decongestants should not be used in children under the age of 5 years.[16]

LD_{50} (mouse, IV): 0.1 g/kg[17]
LD_{50} (mouse, oral): 0.64 g/kg[17]
LD_{50} (rat, oral): 0.98 g/kg[17]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

When thymol is heated to decomposition, carbon dioxide and carbon monoxide are formed. Special precautions should be taken to avoid inhalation, or contact with the skin or eyes. Eye protection and gloves are recommended.

16 Regulatory Status

Although not GRAS listed, thymol is listed as a food additive in the EAFUS list compiled by the FDA. Included in the FDA Inactive Ingredients Database (inhalation, liquid; oral, powder for solution). Included in nonparenteral medicines (oral lozenges; capsules for inhalation, inhalation drops; topical creams and ointments) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Menthol.

18 Comments

Thymol is a more powerful disinfectant than phenol, but its low water solubility, its irritancy to tissues, and its inactivation by organic material, such as proteins, limit its use as a disinfectant. Thymol is chiefly used as a deodorant in antiseptic mouthwashes, gargles, and toothpastes, such as in Compound Thymol Glycerin BP, in which it has no antiseptic action. It is included in food, perfume, and cosmetic products.

The inhalation of thymol, in combination with other volatile substances, is used to alleviate the symptoms of colds, coughs, and associated respiratory disorders. Externally, thymol has been used in dusting powders for the treatment of fungal skin infections; thymol has been shown to have synergistic antifungal effects when combined with ketoconazole.[18] Thymol was formerly used in the treatment of hookworm infections but has now been superseded by less toxic substances.

In dentistry, thymol has been mixed with phenol and camphor to prepare cavities before filling, and mixed with zinc oxide to form a protective cap for dentine. Thymol has also been used as a pesticide and fungicide.

A specification for thymol is included in the *Food Chemicals Codex* (FCC).[19]

The EINECS number for thymol is 201-944-8. The PubChem Compound ID (CID) for thymol is 6989.

Titanium Dioxide

1 Nonproprietary Names

BP: Titanium Dioxide

JP: Titanium Oxide

PhEur: Titanium Dioxide

USP–NF: Titanium Dioxide

2 Synonyms

Anatase titanium dioxide; brookite titanium dioxide; E171; *Hombitan AFDC*; *Hombitan FF-Pharma*; *Kronos 1171*; pigment white 6; *Pretiox AV-01-FG*; rutile titanium dioxide; *Tioxide*; *TiPure*; titanic anhydride; titanii dioxidum; *Tronox*.

3 Chemical Name and CAS Registry Number

Dioxotitanium [13463-67-7]

4 Empirical Formula and Molecular Weight

TiO_2 79.88

5 Structural Formula

See Section 4.

6 Functional Category

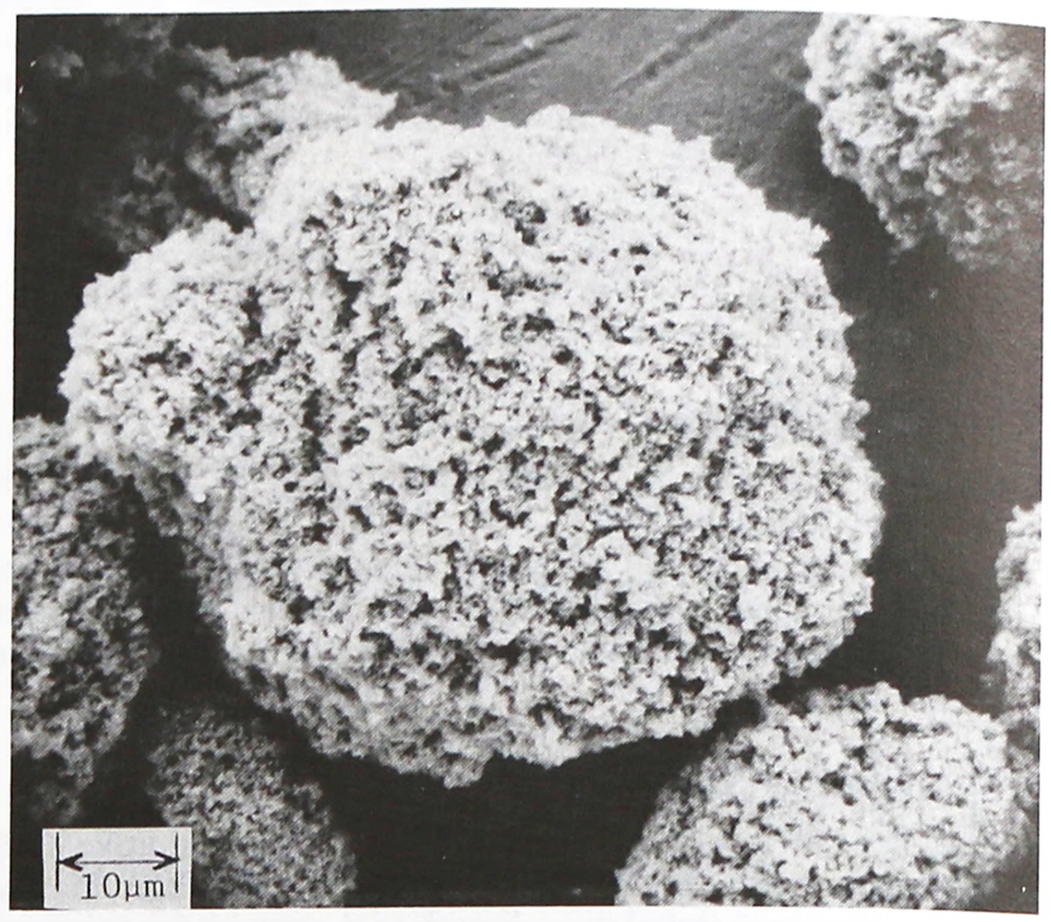
Coating agent; opacifier; pigment.

7 Applications in Pharmaceutical Formulation or Technology

Titanium dioxide is widely used in confectionery, cosmetics, and foods, in the plastics industry, and in topical and oral pharmaceutical formulations as a white pigment.

Owing to its high refractive index, titanium dioxide has light-scattering properties that may be exploited in its use as a white pigment and opacifier. The range of light that is scattered can be altered by varying the particle size of the titanium dioxide powder. For example, titanium dioxide with an average particle size of 230 nm scatters visible light, while titanium dioxide with an average particle size of 60 nm scatters ultraviolet light and reflects visible light.[1]

In pharmaceutical formulations, titanium dioxide is used as a white pigment in film-coating suspensions,[2,3] sugar-coated tablets, and gelatin capsules. Titanium dioxide may also be admixed with other pigments.



Titanium dioxide is also used in dermatological preparations and cosmetics, such as sunscreens.[1,4]

8 Description

Titanium dioxide occurs as a white, amorphous, odorless, and tasteless nonhygroscopic powder. Although the average particle size of titanium dioxide powder is less than 1 µm, commercial titanium dioxide generally occurs as aggregated particles of approximately 100 µm diameter.

Titanium dioxide may occur in several different crystalline forms: rutile; anatase; and brookite. Of these, rutile and anatase are the only forms of commercial importance. Rutile is the more thermodynamically stable crystalline form, but anatase is the form most commonly used in pharmaceutical applications.

SEM 1: Excipient: titanium dioxide; magnification: 1200×; voltage: 10 kV.

9 Pharmacopeial Specifications

See Table I. The PhEur includes a nonmandatory functionality related characteristics section in the monograph for titanium dioxide. This section applies when the material is being used as an opacifier in solid oral dosage forms and in preparations for cutaneous application. The appropriate test is for particle size distribution, but as this is a nonmandatory test no limits are given.

Table I: Pharmacopeial specifications for titanium dioxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—
Appearance of solution	—	+	—

Lead	≤60 ppm	—	—
Assay	≥98.5%	98.0–100.5%	99.0–100.5%

10 Typical Properties

Density (bulk) 0.4–0.62 g/cm^3 [5]

Density (tapped) 0.625–0.830 g/cm^3 [6]

Density (true)

3.8–4.1 g/cm^3 for anatase;

≈3.9 g/cm^3 for *Hombitan FF-Pharma*;

3.9–4.2 g/cm^3 for rutile.

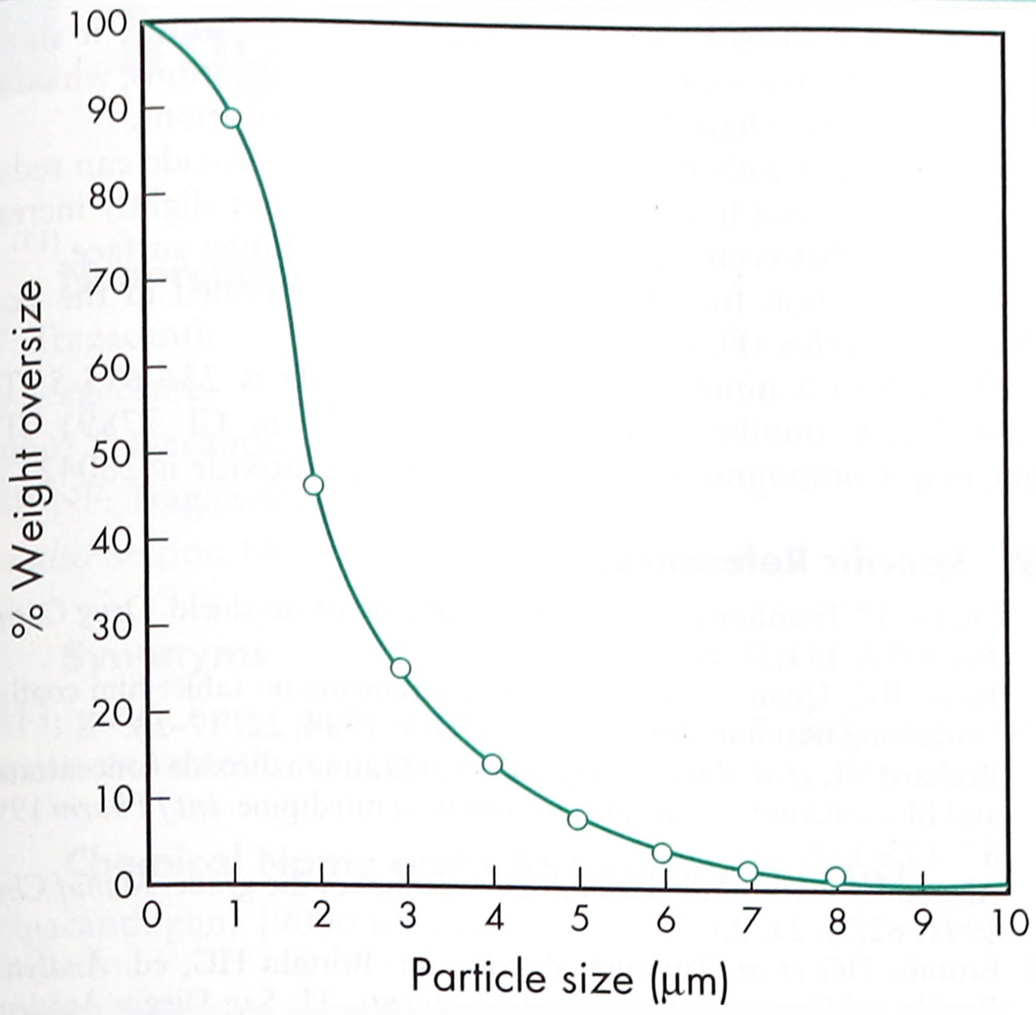

Figure 1: Particle-size distribution of titanium dioxide (fine powder).

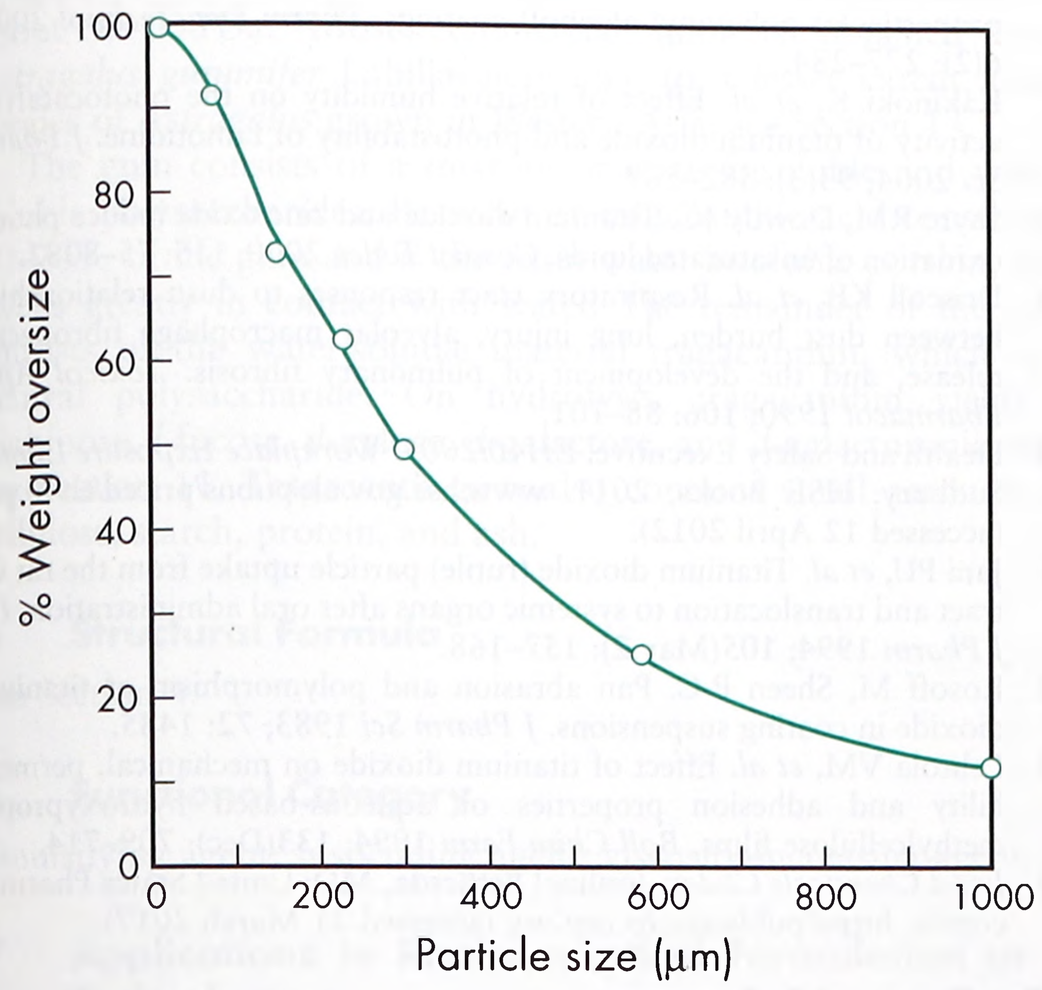

Figure 2: Particle-size distribution of titanium dioxide (agglomerated particles).

Dielectric constant

48 for anatase;

114 for rutile.

Hardness (Mohs)

5–6 for anatase;

6–7 for rutile.

See also Section 18.

Melting point 1855°C

Moisture content 0.44%

Particle size distribution Average particle size = 1.05 μm;[5]

≈0.3 μm for *Hombitan FF-Pharma*. *See also* Figures 1 and 2.

Refractive index

2.55 for anatase;

≈2.5 for *Hombitan FF-Pharma*;

2.76 for rutile.

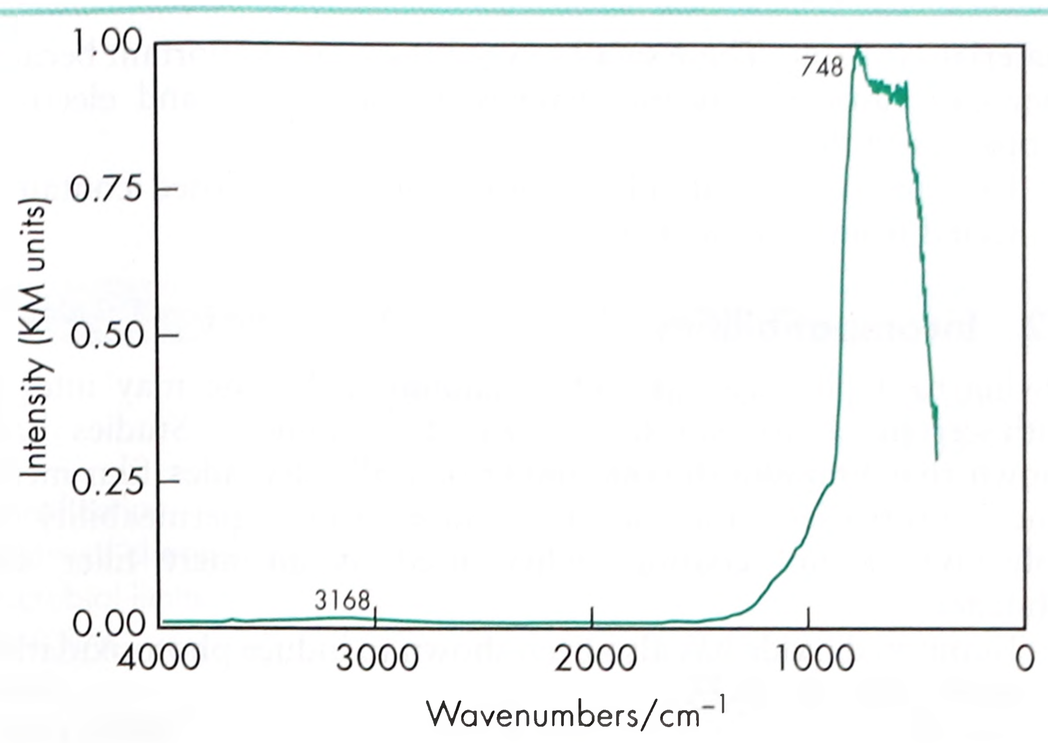

Figure 3: Infrared spectrum of titanium dioxide measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

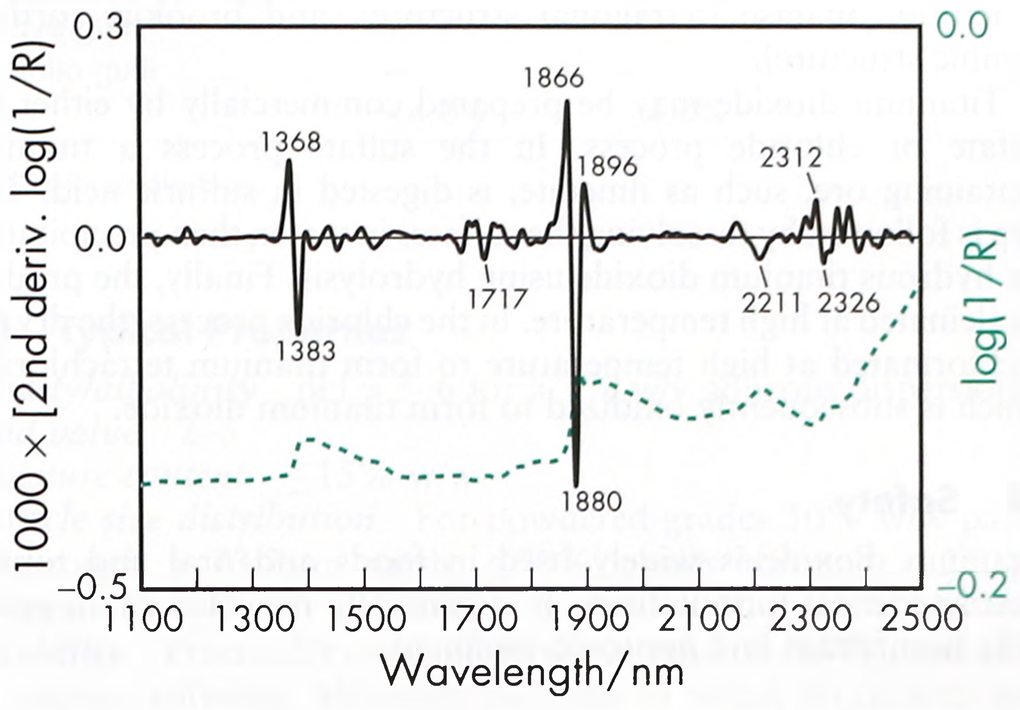

Figure 4: Near-infrared spectrum of titanium dioxide measured by reflectance. Titanium dioxide shows no significant absorption in the near-infrared region; however, it will generally show some peaks due to moisture (approx. 1450 nm and 1950 nm).

Solubility Practically insoluble in dilute sulfuric acid, hydrochloric acid, nitric acid, organic solvents, and water. Soluble in hydrofluoric acid and hot concentrated sulfuric acid. Solubility depends on previous heat treatment; prolonged heating produces a less-soluble material.

Specific heat

0.71 J/g (0.17 cal/g) for anatase;

0.71 J/g (0.17 cal/g) for rutile.

Specific surface area

9.90–10.77 m^2/g;

≈10.0 m^2/g for *Hombitan FF-Pharma*.

Spectroscopy

IR spectrum *see* Figure 3.

NIR spectrum *see* Figure 4.

Tinting strength (Reynolds)

1200–1300 for anatase;

1650–1900 for rutile.

11 Stability and Storage Conditions

Titanium dioxide is extremely stable at high temperatures. This is due to the strong bond between the tetravalent titanium ion and the bivalent oxygen ions. However, titanium dioxide can lose small, unweighable amounts of oxygen by interaction with radiant energy. This oxygen can easily recombine again as a part of a reversible photochemical reaction, particularly if there is no oxidizable

material available. These small oxygen losses are important because they can cause significant changes in the optical and electrical properties of the pigment.

Titanium dioxide should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Owing to a photocatalytic effect, titanium dioxide may interact with certain active substances, e.g. famotidine.[7] Studies have shown that titanium dioxide monatomically degrades film mechanical properties and increases water vapor permeability of polyvinyl alcohol coatings when used as an inert filler and whitener.[6]

Titanium dioxide has also been shown to induce photooxidation of unsaturated lipids.[8]

13 Method of Manufacture

Titanium dioxide occurs naturally as the minerals rutile (tetragonal structure), anatase (tetragonal structure), and brookite (orthorhombic structure).

Titanium dioxide may be prepared commercially by either the sulfate or chloride process. In the sulfate process a titanium containing ore, such as ilmenite, is digested in sulfuric acid. This step is followed by dissolving the sulfates in water, then precipitating the hydrous titanium dioxide using hydrolysis. Finally, the product is calcinated at high temperature. In the chloride process, the dry ore is chlorinated at high temperature to form titanium tetrachloride, which is subsequently oxidized to form titanium dioxide.

14 Safety

Titanium dioxide is widely used in foods and oral and topical pharmaceutical formulations. It is generally regarded as an essentially nonirritant and nontoxic excipient.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, gloves, and a dust mask are recommended. Titanium dioxide is regarded as a relatively innocuous nuisance dust,[9] that may be irritant to the respiratory tract. In the UK, the long-term (8-hour TWA) workplace exposure limit is 10 mg/m^3 for total inhalable dust and 4 mg/m^3 for respirable dust.[10]

Titanium dioxide particles in the 500 nm range have been reported to translocate to all major body organs after oral administration in the rat.[11]

16 Regulatory Status

Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (dental paste; intrauterine suppositories; ophthalmic preparations; oral capsules, suspensions, tablets; topical and transdermal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Coloring agents.

18 Comments

Titanium dioxide was originally selected for harmonization by the Pharmacopeial Discussion Group, but has subsequently been removed from the work program.

Titanium dioxide is a hard, abrasive material. Coating suspensions containing titanium dioxide have been reported to cause abrasion and wear of a steel-coated pan surface, which led to white tablets being contaminated with black specks.[12]

If titanium dioxide is used as a pigment in the EU, it should conform to the appropriate food standards specifications, which are more demanding than the pharmacopeial specifications.

When mixed with methylcellulose, titanium dioxide can reduce the elongation and tensile strength of the film but slightly increase the adhesion between pigmented film and the tablet surface.[13]

A specification for titanium dioxide is contained in the *Food Chemicals Codex* (FCC).[14]

The EINECS number for titanium dioxide is 236-675-5. The Color Index number for titanium dioxide is CI 77891. The PubChem Compound ID (CID) for titanium dioxide is 26042.

Tragacanth

1 Nonproprietary Names

BP: Tragacanth
JP: Tragacanth
PhEur: Tragacanth
USP–NF: Tragacanth
See also Section 18.

2 Synonyms

E413; goat's horn; gum benjamin; gum dragon; gum tragacanth; persian tragacanth; trag; tragant; tragacantha.

3 Chemical Name and CAS Registry Number

Tragacanth gum [9000-65-1]

4 Empirical Formula and Molecular Weight

Tragacanth is a natural biopolymer of high molecular weight of about 84 000 Da. Most commercial gum is obtained from *Astragalus gummifer* Labillardière and, to a lesser extent, other species of *Astragalus* grown in Western Asia; *see* Section 13.

The gum consists of a mixture of water-insoluble and water-soluble polysaccharides. Bassorin or tragacanthic acid constitutes 60–70% of the gum and is the main water-insoluble portion, that swells greatly in contact with water. The remainder of the gum consists of the water-soluble material tragacanthin, which is a neutral polysaccharide. On hydrolysis, tragacanthin yields *l*-arabinose, *l*-fucose, *d*-xylose, *d*-galactose, and *d*-galacturonic acid; *see* Section 11. Tragacanth gum also contains small amounts of cellulose, starch, protein, and ash.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; suspending agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Tragacanth gum is used as an emulsifying and suspending agent in a variety of pharmaceutical formulations. It is used in creams, gels, and emulsions at various concentrations according to the application of the formulation and the grade of gum used.It has been used as a diluent and, to a lesser extent, as a binder and a sustained-release polymer in tablet formulations.[1–3]

Tragacanth gum is also used similarly in cosmetics and food products.

8 Description

Tragacanth gum occurs as flattened, lamellated, frequently curved fragments, or as straight or spirally twisted linear pieces from 0.5–2.5 mm in thickness; it may also be obtained in a powdered form. White to yellowish in color, tragacanth is a translucent, odorless substance, with an insipid mucilaginous taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for tragacanth.

10 Typical Properties

Acidity/alkalinity pH = 5–6 for a 1% w/v aqueous dispersion.
Acid value 2–5
Moisture content ≤15% w/w
Particle size distribution For powdered grades 50% w/w passes through a 73.7 µm mesh; ≤90% passes through a 150 µm mesh.[2]
Solubility Practically insoluble in water, ethanol (95%), and other organic solvents. Although insoluble in water, tragacanth gum swells rapidly in 10 times its own weight of either hot or cold water to produce viscous colloidal sols or semigels.[2] *See also* Section 18.
Specific gravity 1.250–1.385
Spectroscopy

NIR spectrum *see* Figure 1

Viscosity (dynamic) Viscosity is the most important factor used to evaluate quality and functionality of tragacanth. In general, the ribbon form gives a higher viscosity than the flake form.[4] The viscosity of tragacanth dispersions varies according to the grade and source of the material. Typically, 1% w/v aqueous dispersions may range in viscosity from 100–4000 mPa s (100–4000 cP) at 25°C and 20 rpm. Maximum viscosity is

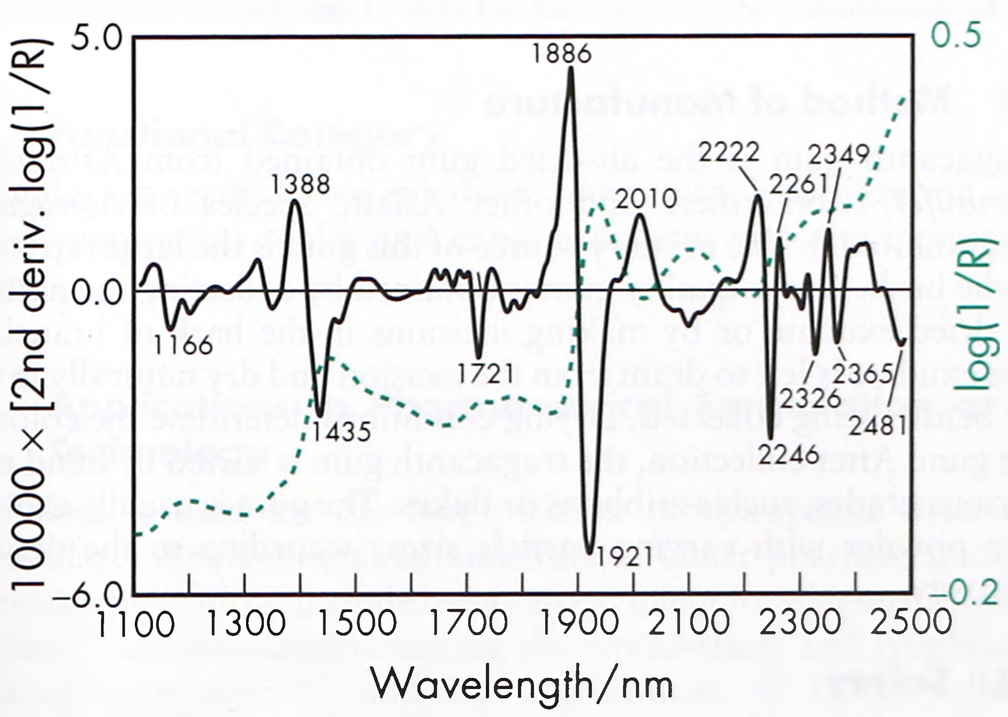

Figure 1: Near-infrared spectrum of tragacanth measured by reflectance.

obtained after 24 hours at room temperature or by heating at 50°C for 2 hours. Maximum initial viscosity occurs at pH 8, although the greatest stability of tragacanth dispersions occurs at about pH 5. Solutions show pseudoplastic behavior typical of most gums. *See also* Sections 11 and 12.

11 Stability and Storage Conditions

Both the flaked and powdered forms of tragacanth are stable. Tragacanth gels are liable to exhibit microbial contamination with enterobacterial species, and stock solutions should therefore contain suitable antimicrobial preservatives. In emulsions, glycerin or propylene glycol are used as preservatives; in gel formulations, tragacanth is usually preserved with either 0.1% w/v benzoic acid, sorbic acid, or sodium benzoate below pH 6. A combination of 0.17% w/v methylparaben and 0.03% w/v propylparaben is also an effective preservative for tragacanth gels;[5] *see also* Section 12. Gels may be sterilized by autoclaving. Sterilization by gamma irradiation causes a marked reduction in the viscosity of tragacanth dispersions.[6]

The use of heat on tragacanth results in a reversible viscosity thinning effect. However, prolonged heating can degrade the gum and reduce viscosity permanently. It may be pulverized by heating to 50°C.

A higher tendency of tragacanth gum to hydrolyze compared to other hydrocolloids, such as guar or xanthan gums, has been described and is attributed to its highly branched and complex structure.[7]

Tragacanth dispersions are most stable at pH 4–8, although stability is satisfactory at higher pH or as low as pH 2. It is one of the most acid-resistant gums. However, it is recommended that acids be added only after the gum has fully hydrated.

The bulk material should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

At pH 7, tragacanth has been reported to considerably reduce the efficacy of the antimicrobial preservatives benzalkonium chloride, chlorobutanol, and methylparaben, and to a lesser extent that of phenol and phenylmercuric acetate.[8] However, at pH <5 tragacanth was reported to have no adverse effects on the preservative efficacy of benzoic acid, chlorobutanol, or methylparaben.[5]

The addition of strong mineral and organic acids can reduce the viscosity of tragacanth dispersions. Viscosity may also be reduced by the addition of alkali or sodium chloride, particularly if the dispersion is heated. Tragacanth is compatible with relatively high salt concentrations and most other natural and synthetic suspending agents such as acacia, carboxymethylcellulose, starch, and sucrose. A yellow colored, stringy precipitate is formed with 10% w/v ferric chloride solution.

In emulsions, tragacanth is unstable under alkaline conditions.

13 Method of Manufacture

Tragacanth gum is the air-dried gum obtained from *Astragalus gummifer* Labillardière and other Asiatic species of *Astragalus* (Leguminosae). The primary source of this gum is the large tap roots of the bush. A low-quality gum is obtained by collecting the natural air-dried exudate or by making incisions in the bark of branches. The exudate is left to drain from the incision and dry naturally in the air before being collected. Drying conditions determine the color of the gum. After collection, the tragacanth gum is sorted by hand into various grades, such as ribbons or flakes. The gum is usually ground into powder with varying particle sizes, according to the desired viscosity.

14 Safety

Tragacanth has been used for many years in oral pharmaceutical formulations and food products, and is generally regarded as an essentially nontoxic material. It can be ingested in large amounts with little danger except for diarrhea and flatulence.[9] Tragacanth has been shown to be noncarcinogenic in mice.[10] However, hypersensitivity reactions, which are occasionally severe, have been reported following ingestion of products containing tragacanth.[11,12] Contact dermatitis has also been reported following the topical use of tragacanth formulations.[13] It is a skin and eye irritant.

The WHO has not specified an acceptable daily intake for tragacanth gum, as the daily intake necessary to achieve a desired effect, and its background levels in food, were not considered to be a hazard to health.[14]

LD_{50} (hamster, oral): 8.8 g/kg[15]

LD_{50} (mouse, oral): 10 g/kg

LD_{50} (rabbit, oral): 7.2 g/kg

LD_{50} (rat, oral): 16.4 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Tragacanth gum may be irritant to the skin and eyes. Eye protection, gloves, and a dust mask are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (buccal/sublingual tablets, oral powders, suspensions, syrups, and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Classified as 'acceptable daily intake (ADI) not specified' (the highest category of safety evaluation) by the Joint WHO/FAO Expert Committee on Food Additives.

17 Related Substances

See Section 18.

18 Comments

Tragacanth gum is a naturally occurring material whose physical properties vary greatly according to the grade and source of the material. Samples can contain relatively high levels of bacterial contamination.[16,17]

Powdered tragacanth gum tends to form lumps when added to water, and aqueous dispersions should therefore be agitated vigorously with a high-speed mixer. However, aqueous dispersions are more readily prepared by first prewetting the tragacanth with a small quantity of a wetting agent such as ethanol (95%), glycerin, or propylene glycol. If lumps form, they usually disperse on standing. Dispersion is generally complete after 1 hour. If other powders, such as sucrose, are to be incorporated into a tragacanth formulation the powders are best mixed together in the dry state.

Xanthan gum has been used in industrial applications as a substitute for tragacanth. In combination with gum arabic, an 'unusual' viscosity reduction has been observed with tragacanth.[2] In the food industry, presence of tragacanth should be listed on the label of a product due to possible allergic sensitization.[18]

Some pharmacopeias, such as JP XVII, contain a specification for powdered tragacanth.

Trehalose

1 Nonproprietary Names

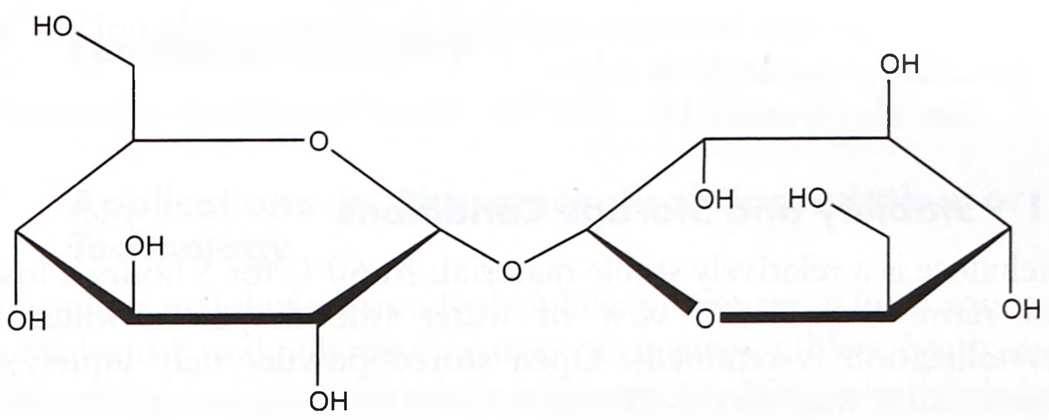
JP: Trehalose Hydrate
PhEur: Trehalose Dihydrate
USP–NF: Trehalose

2 Synonyms

α-D-Glucopyranosyl-α-D-glucopyranoside; (α-D-glucosido)-α-D-glucoside; mycose; natural trehalose; α,α-trehalose; *Treha*; trehalose hydrate; trehalose dihydrate.

3 Chemical Name and CAS Registry Number

(2*R*,3*R*,4*S*,5*R*,6*R*)-2-(Hydroxymethyl)-6-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy-oxane-3,4,5-triol anhydrous [99-20-7]



(2*R*,3*R*,4*S*,5*R*,6*R*)-2-(Hydroxymethyl)-6-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4,5-trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxy-oxane-3,4,5-triol dihydrate [6138-23-4]

See also Section 17.

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30 (anhydrous)
$C_{12}H_{22}O_{11}\cdot 2H_2O$ 378.33 (dihydrate)

5 Structural Formula

α,α-Trehalose dihydrate

6 Functional Category

Complexing agent; flavor enhancer; humectant; lyophilization aid; sweetening agent; tablet and capsule diluent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Trehalose is used for the lyoprotection of therapeutic proteins, particularly for parenteral administration. Other pharmaceutically relevant applications include use as an excipient for diagnostic assay tablets;[1] for stabilization during the freeze–thaw and lyophilization of liposomes;[2,3] and for stabilization of blood cells,[4] cosmetics,[5] and monoclonal antibodies.[6] Trehalose may also be used in formulations for topical application.[7]

8 Description

Trehalose occurs as virtually odorless, white or almost white crystals with a sweet taste (approximately 45% of the sweetness of sucrose).[8]

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for trehalose.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Color and clarity of solution	+	+	+
Specific rotation	+197 to +201°	+197 to +201°	+197 to +201°
Microbial limits	—	+	+
Bacterial endotoxins	—	+	+
pH	4.5–6.5	4.5–6.5	4.5–6.5

Related substances	—	+	+
Assay (anhydrous basis)	98.0–101.0%	97.0–102.0%	97.0–102.0%

10 Typical Properties

Acidity/alkalinity pH = 4.5–6.5 (30% w/v aqueous solution)
Melting point 97°C (for the dihydrate)[8]
Moisture content 9.5% (for the dihydrate)
Solubility Soluble in water; very slightly soluble in ethanol (95%); practically insoluble in ether.
See also Section 18.

11 Stability and Storage Conditions

Trehalose is a relatively stable material. At 60°C for 5 hours it loses not more than 1.5% w/w of water (the dihydrate water of crystallization is retained). Open stored powder may liquefy at high relative humidity (≥90%).

Trehalose should be stored in a cool, dry place in a well-sealed container.

12 Incompatibilities

Trehalose is incompatible with strong oxidizing agents, especially in the presence of heat.

13 Method of Manufacture

Trehalose is prepared from liquefied starch by a multistep enzymatic process.[8] The commercial product is the dihydrate.

14 Safety

Trehalose is used in cosmetics, foods, and parenteral and nonparenteral pharmaceutical formulations. It is generally regarded as a relatively nontoxic and nonirritant material when used as an excipient.

In the gut, trehalose is rapidly metabolized to glucose by the specific enzyme trehalase. A small minority of the population exhibits a primary (hereditary) or secondary (acquired) trehalase deficiency and thus may experience intestinal discomfort after ingestion of excessive amounts of trehalose owing to the osmotic activity of undigested trehalose in the gut. However, smaller amounts of trehalose are tolerated by such individuals without any symptoms.[8]

Trehalose is used as a sweetener and is reported to have substantially less cariogenic potential than sucrose.

LD_{50} (dog, IV): >1 g/kg
LD_{50} (dog, oral): >5 g/kg
LD_{50} (mouse, IV): >1 g/kg
LD_{50} (mouse, oral): >5 g/kg
LD_{50} (rat, IV): >1 g/kg
LD_{50} (rat, oral): >5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. In Canada it is classified as an NHP under schedule 1, item 2 (an isolate) of the Natural Health Products regulations. In the UK trehalose may be used in certain food applications.[9] Included in parenteral and nonparenteral investigational formulations.

17 Related Substances

Isotrehalose; neotrehalose.

Isotrehalose

CAS number [499-23-0]
Synonyms β,β-Trehalose.

Neotrehalose

CAS number [585-91-1]
Synonyms α,β-Trehalose.

18 Comments

α,α-Trehalose is the only naturally occurring isomer of trehalose and occurs as the dihydrate. However, α,β-trehalose (neotrehalose) and β,β-trehalose (isotrehalose) have been synthesized and are also available commercially. *See also* Section 17.

Trehalose is a nonreducing sugar and therefore does not react with amino acids or proteins as a part of Maillard browning. It is relatively stable under low-pH conditions compared to other disaccharides.

It should be noted that although trehalose dihydrate is quoted to have a melting point of 97°C, the true nature of this melting process has been the subject of debate in the literature,[10–12] including the transformation of the dihydrate into the anhydrous form. Anhydrous crystalline trehalose has been reported to melt at 203°C,[13] although higher values (215°C) have also been quoted in the literature.[14]

The glass transition temperature of trehalose is reported to be approximately 120°C (anhydrous amorphous phase).[15]

A specification for trehalose is contained in the *Food Chemicals Codex* (FCC).[16]

The EINECS number for trehalose is 202-739-6. The PubChem Compound ID (CID) for trehalose is 7427.

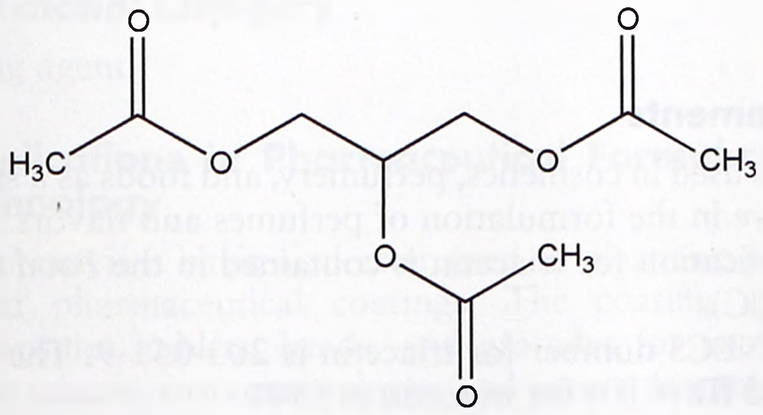
Triacetin

1 Nonproprietary Names

BP: Triacetin
PhEur: Triacetin
USP–NF: Triacetin

2 Synonyms

Captex 500; E1518; glycerol triacetate; glyceryl triacetate; *Kollisolv GTA*; *Speziol GTA*; triacetinum; triacetyl glycerine.



3 Chemical Name and CAS Registry Number

1,2,3-Propanetriol triacetate [102-76-1]

4 Empirical Formula and Molecular Weight

$C_9H_{14}O_6$ 218.21

5 Structural Formula

6 Functional Category

Humectant; plasticizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Triacetin is mainly used as a hydrophilic plasticizer in both aqueous and solvent-based polymeric coating of capsules, tablets, beads, and granules; typical concentrations used are 10–35% w/w.[1,2] It has been studied for use in microspheres in controlled-release drug delivery systems.[3]

8 Description

Triacetin occurs as a colorless, viscous liquid with a slightly fatty odor.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Autoignition temperature 432°C
Boiling point 258°C
Density 1.16 g/cm^3 at 25°C
Explosive limits
1.05% at 189°C lower limit;
7.73% at 215°C upper limit.
Flash point 153°C (open cup)

17.4 mPa s (17.4 cP) at 25°C;
1.8 mPa s (1.8 cP) at 100°C.

Table II: Solubility of triacetin.

Solvent	Solubility at 20°C
Carbon disulfide	Miscible
Chloroform	Miscible
Ethanol	Miscible
Ethanol (95%)	Miscible
Ether	Miscible
Toluene	Miscible
Water	1 in 14

11 Stability and Storage Conditions

Triacetin is stable and should be stored in a well-closed, nonmetallic container, in a cool, dry place.

12 Incompatibilities

Triacetin is incompatible with metals and may react with oxidizing agents. Triacetin may destroy rayon fabric.

13 Method of Manufacture

Triacetin is prepared by the esterification of glycerin with acetic anhydride.

14 Safety

Triacetin is used in oral pharmaceutical formulations and is generally regarded as a relatively nontoxic and nonirritant material at the levels employed as an excipient.[4]

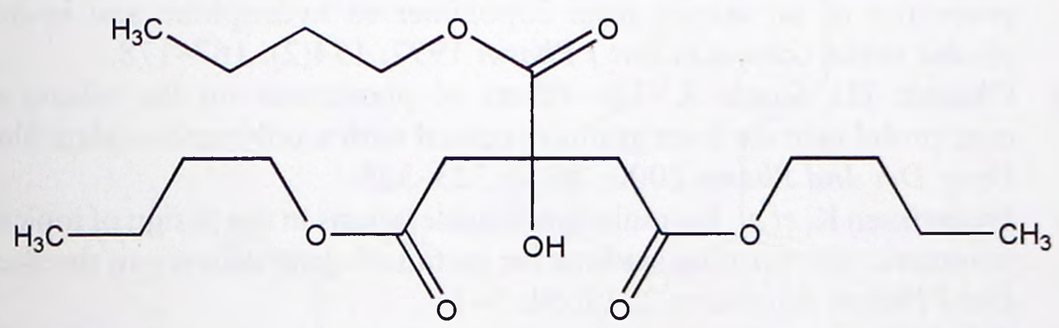
Tributyl Citrate

1 Nonproprietary Names

USP–NF: Tributyl Citrate

2 Synonyms

Butyl citrate; citric acid, tributyl ester; *Citroflex 4*; *Citrofol BI*; TBC; tri-*n*-butyl citrate; tributyl 2-hydroxy-1,2,3 -propanetricarboxylate.



3 Chemical Name and CAS Registry Number

1,2,3-Propanetricarboxylic acid, 2-hydroxy, tributyl ester [77-94-1]

4 Empirical Formula and Molecular Weight

$C_{18}H_{32}O_7$ 360.44

5 Structural Formula

6 Functional Category

Plasticizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Tributyl citrate is a citric acid ester used to plasticize polymers in formulated pharmaceutical coatings. The coating applications include capsules, tablets, beads, and granules for taste masking, immediate release, sustained-release, and enteric formulations.[1–6]

Plasticizing applications also extend to topical polymeric film-forming systems for sustained drug delivery to the skin as well as other soft tissue drug delivery applications. The addition of tributyl citrate increases drug release from the film, lowers the T_g, and improves flexibility. It is typically used at concentrations of 10–20% relative to the polymer dry weight.[7,8]

Tributyl citrate can also be used as a plasticizer for polymers used in sustained-release lipophilic calcium stearate pellets via hot-melt extrusion. Adding the liquid plasticizer (5–10% w/w) to the matrix carrier during the extrusion process decreases the viscosity and lowers the required process temperature and torque.[9]

8 Description

Tributyl citrate occurs as a clear, odorless, practically colorless, oily liquid.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for tributyl citrate.

Test	USP 40–NF 35 S1
Identification	+
Specific gravity	1.037–1.045
Refractive index	1.443–1.445
Acidity	+
Water	≤0.2%
Heavy metals	—
Assay (anhydrous basis)	≥99.0%

10 Typical Properties

Acid value 0.02
Boiling point 322°C (decomposes)
Flash point 185°C

Pour point −62°C
Refractive index n_D^{25} = 1.443–1.445
Solubility Miscible with acetone, ethanol, and vegetable oil; practically insoluble in water.
Specific gravity 1.037–1.045 for *Citroflex 4*.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.
Viscosity 32 mPa s (32 cP) at 25°C

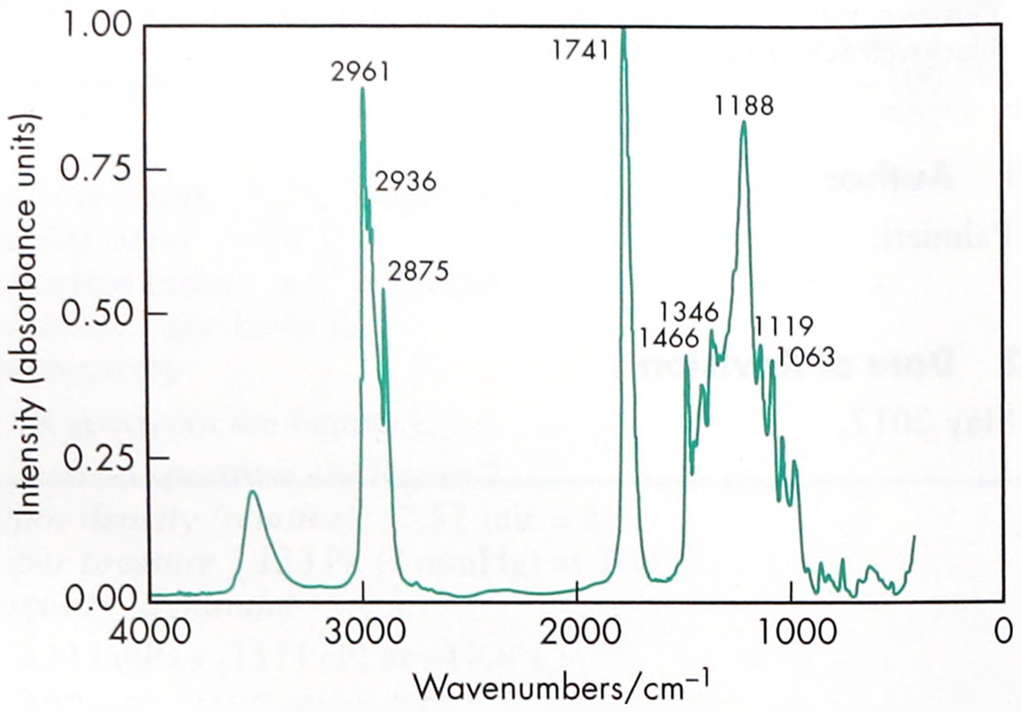


Figure 1: Infrared spectrum of tributyl citrate measured by transmission. Adapted with permission of Informa Healthcare.

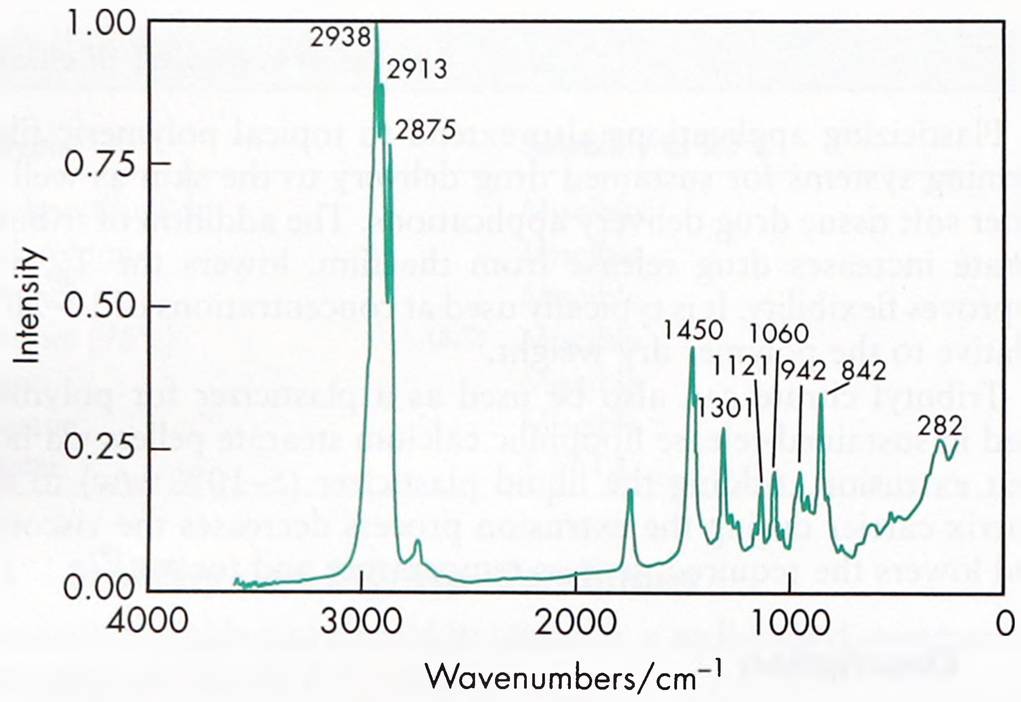

Figure 2: Raman spectrum of tributyl citrate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Tributyl citrate should be stored in well-closed containers in a cool, dry location at temperatures not exceeding 38°C. When stored in accordance with these conditions, tributyl citrate is a stable material.

12 Incompatibilities

Tributyl citrate is incompatible with strong alkalis and oxidizing materials.

13 Method of Manufacture

Tributyl citrate is prepared by the esterification of citric acid with butanol.

14 Safety

Tributyl citrate is used in oral pharmaceutical formulations. It is generally regarded as an essentially nontoxic and nonirritating material. However, ingestion of large quantities may be harmful.

LD_{50} (cat, oral): >50 mL/kg[10]
LD_{50} (mouse, IP): 2.9 g/kg
LD_{50} (rat, oral): >30 mL/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Tributyl citrate may be irritating to the eyes. It may also be irritating to the respiratory system at elevated temperatures.

Gloves and eye protection are recommended for normal handling, and a respirator is recommended for elevated temperatures.

16 Regulatory Status

Approved in the US for indirect food contact in food films. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Acetyltributyl citrate; acetyltriethyl citrate; triethyl citrate.

18 Comments

Tributyl citrate can be used to improve the properties of zein films for applications in food packaging. Among zein films tested with mass ratios of 10% to 50% tributyl citrate, those containing 10% are most flexible and toughest.[11]

Tributyl citrate is also used as a plasticizer and solvent for nitrocellulose lacquers, polishes, and inks, and it can be used as an anti-foam agent.[12]

The EINECS number for tributyl citrate is 201-071-2. The PubChem Compound ID (CID) for tributyl citrate is 6507.

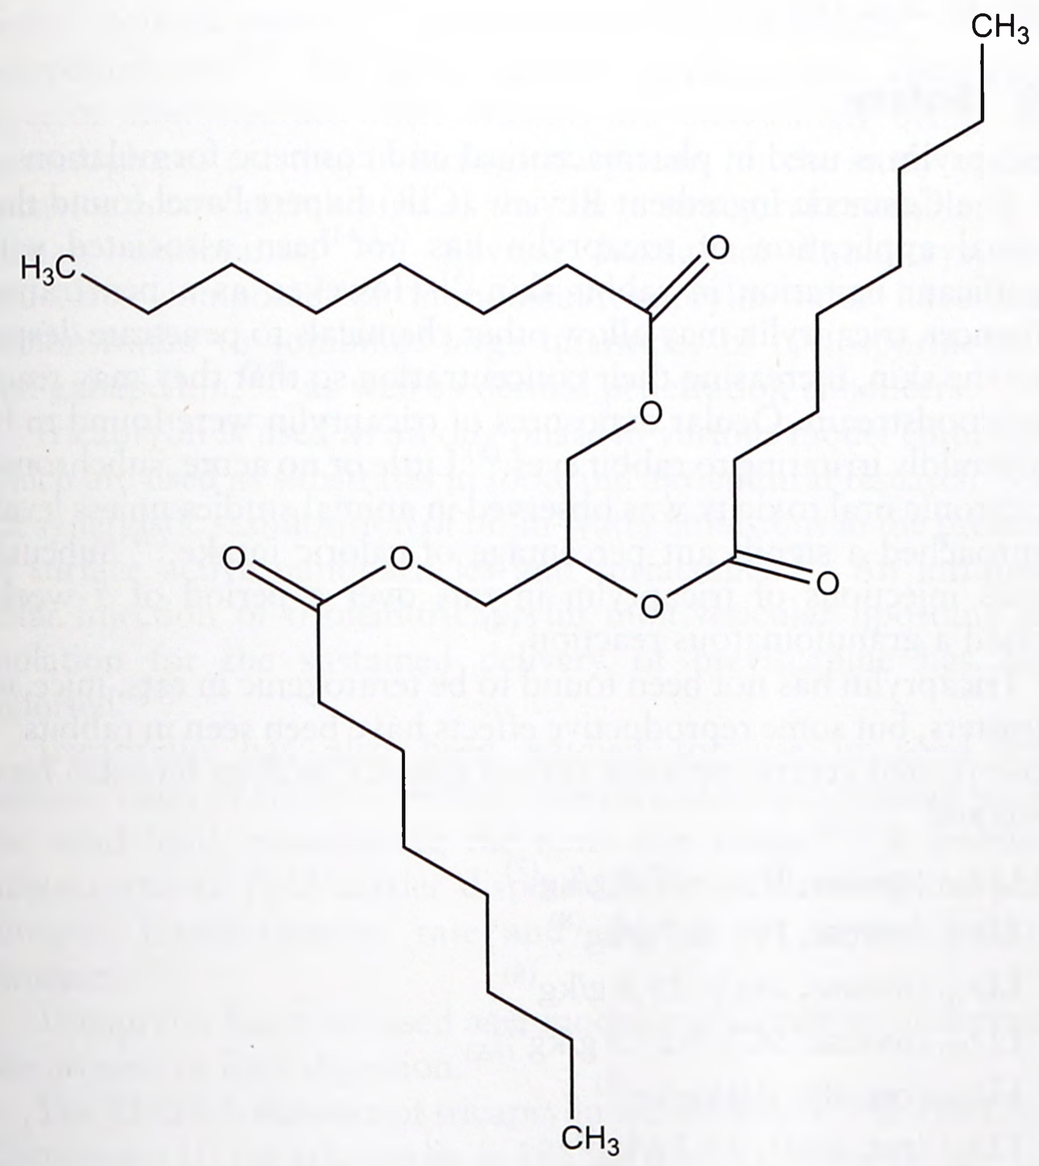
Tricaprylin

1 Nonproprietary Names

None adopted.

2 Synonyms

Caprylic acid, 1,2,3-propanetriyl ester; caprylic acid triglyceride; *Captex 8000*; glycerin tricaprylate; glycerol tricaprylate; glycerol trioctanoate; glyceryl tricaprylate; glyceryl trioctanoate; *Hest TC*; MCT; *Miglyol 808*; *n*-octanoic acid glycerol triester; octanoic acid, 1,2,3-propanetriyl ester; *Rofetan GTC*; tricaprilin; tricaprylglycerol; tricaprylylglycerin; trioctanoin; trioctonolglycerol; *Trivent OC-G*.



3 Chemical Name and CAS Registry Number

1,3-Di(octanoyloxy)propan-2-yl octanoate [538-23-8]

4 Empirical Formula and Molecular Weight

$C_{27}H_{50}O_6$ 470.70

5 Structural Formula

6 Functional Category

Dispersing agent; emollient; lubricant; nonionic surfactant; penetration enhancer; plasticizing agent; solubilizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Tricaprylin is used in pharmaceutical preparations as a neutral carrier, absorption promoter, and solubilizer for active drugs. It has been used as an oily phase to prepare water-in-oil-in-water multiple emulsions for incorporating water-soluble drugs such as cefadroxil, cephradine, 4-aminoantipyrine, and antipyrine,[1] and also for obtaining stable microcapsules[2] and oral microemulsions.[3]

Tricaprylin acts as a vehicle for topical creams and lotions and cosmetic preparations, and is used as a penetration-enhancing lipid base and emollient. Owing to its nongreasy characteristics and low viscosity, it has very good spreadability and leaves a 'silky feel' on the skin. In spite of being skin-permeable, tricaprylin does not obstruct natural skin respiration, and hence it is used in baby oils, massage oils, and face masks. It is an excellent dispersant, and acts as a solubilizer, wetting agent and binder in color cosmetics. Being readily miscible with natural oils and surfactants, tricaprylin is used as the fat component in two-phase foam baths. It is used in sunscreen creams and oils because of its compatibility with organic and inorganic filter agents. It is also used as a fixative for perfumes/fragrances.

8 Description

Tricaprylin occurs as a clear, colorless to pale-yellow liquid. It forms crystals from acetone/ethanol (95%). Tricaprylin is odorless.

See also Table I.

Table I: Description of commercially available grades of tricaprylin.

Grade	Description
Captex 8000	Clear to light-yellow liquid with bland taste and neutral odor
Hest TC	Light liquid
Miglyol 808	Clear, virtually colorless oily liquid with neutral odor and taste
Rofetan GTC	Liquid
Trivent OC-G	Clear straw-colored liquid with mild odor

9 Pharmacopeial Specifications

See Section 18.

10 Typical Properties

Acid value

≤0.1 for *Captex 8000*;

≤0.1 for *Miglyol 808*;

≤0.1 for *Rofetan GTC*;

≤0.5 for *Trivent OC-G*.

Ash 0.1% for *Rofetan GTC*

Boiling point 233°C at 133.3 Pa (1 mmHg)

Cloud point −5.0°C for *Rofetan GTC*

Color

≤150.0 (Hazen color index) for *Captex 8000*;

≤50.0 (Hazen color index) for *Miglyol 808*;

≤50.0 (Hazen color index) for *Rofetan GTC*.

Density

0.95 g/cm^3;

0.94–0.96 g/cm^3 for *Rofetan GTC* at 20°C.

Fatty acid distribution *see* Table II.

Flash point

209°C;

246°C (open cup) for *Captex 8000*;

>180°C for *Trivent OC-G*.

Freezing point ≤10.0 for *Trivent OC-G*.

Heavy metals 10 mg/kg for *Rofetan GTC*

HLB value 7.0 for *Hest TC*

Hydroxyl value ≤0.5 for *Rofetan GTC*.

Iodine number

≤0.3 for *Miglyol 808*;

≤0.3 for *Rofetan GTC*.

Melting point 9–10°C

Moisture content

≤0.1% w/w for *Captex 8000*;

≤0.1% w/w for *Miglyol 808*;

≤0.1% w/w for *Rofetan GTC*.

Partition coefficient $\log P_{ow}$ (octanol : water) = 9.20[4]

Peroxide value ≤0.1 for *Rofetan GTC*.

Refractive index

1.4484;

1.447 for *Rofetan GTC* at 20°C;

1.4430 for *Trivent OC-G* at 25°C.

Saponification value

335–360 for *Captex 8000*;

340–370 for *Miglyol 808*;

340–370 for *Rofetan GTC*;

360 for *Trivent OC-G*.

Solubility Miscible with most organic solvents including ethanol (95%). *Captex 8000* is insoluble in water. *Trivent OC-G* is insoluble in water and lower molecular weight diols and triols.

Specific gravity

0.94 for *Captex 8000* at 25°C;

0.95 for *Trivent OC-G* at 25°C.

Specific heat of vaporisation 0.0165 kJ/g

Spreading rate 254 mm^2 for *Hest TC*

Surface tension 0.030 N/m

Vapor pressure <133.3 Pa (<1 mmHg) for *Captex 8000* at 25°C

Viscosity (dynamic)

11.57 mPa s at 39.9°C;

23–29 mPa s (23–29 cP) for *Miglyol 808* at 20°C;

23–29 mPa s (23–29 cP) for *Rofetan GTC* at 20°C.

Viscosity (kinematic) 20.9 mm^2/s (20.9 cSt) for *Captex 8000* at 25°C

Table II: Typical fatty acid distribution of commercially available grades of tricaprylin.

Grade	Fatty acid distribution by gas–liquid chromatography (GLC)
Captex 8000	
Caproic acid (C_6)	≤1.0%
Caprylic acid (C_8)	≥90.0%
Capric acid (C_{10})	≤5.0%
Lauric acid (C_{12})	≤1.0%
Rofetan GTC	
Caproic acid (C_6)	≤0.5%
Caprylic acid (C_8)	≥95.0%
Capric acid (C_{10})	≤5.0%
Lauric acid (C_{12})	≤0.5%

11 Stability and Storage Conditions

Tricaprylin is classified as a stable compound. It has high stability against oxidation and is not heat sensitive. Even in hot climates cooling is not necessary. However, exposure to high temperatures near the flash point (246°C) should be avoided. Owing to its very low water content, it is not sensitive to hydrolytic and microbial splitting. Although polymerization of tricaprylin will not occur, it is reported to decompose into carbon monoxide and carbon dioxide.

Tricaprylin should be stored in well-closed containers, protected from light, in a dry place at ambient temperature. High-density polyethylene, polypropylene, metal (aluminum), and glass are suitable for packaging. Some plastics, especially those containing plasticizers, can become brittle or expand in the presence of tricaprylin. Polystyrene and polyvinyl chloride are not suitable for its storage. Tricaprylin has a high tendency to migrate, and therefore care should be taken when selecting seal-closure elastomer material.

12 Incompatibilities

Tricaprylin is incompatible with strong oxidizing agents.

13 Method of Manufacture

Tricaprylin is a triglyceride manufactured by esterification of caprylic acid and glycerin.

14 Safety

Tricaprylin is used in pharmaceutical and cosmetic formulations.

The Cosmetic Ingredient Review (CIR) Expert Panel found that dermal application of tricaprylin has not been associated with significant irritation in rabbit skin.[5] However, as a penetration enhancer, tricaprylin may allow other chemicals to penetrate deeper into the skin, increasing their concentration so that they may reach the bloodstream. Ocular exposures of tricaprylin were found to be only mildly irritating to rabbit eyes.[5] Little or no acute, subchronic, or chronic oral toxicity was observed in animal studies unless levels approached a significant percentage of caloric intake.[5] Subcutaneous injections of tricaprylin in rats over a period of 5 weeks caused a granulomatous reaction.[5]

Tricaprylin has not been found to be teratogenic in rats, mice, or hamsters, but some reproductive effects have been seen in rabbits.[5] Dose-related central nervous system toxicity in dogs has also been observed.[6]

LD_{50} (mouse, IP): >27.8 g/kg[7]

LD_{50} (mouse, IV): 3.7 g/kg[8]

LD_{50} (mouse, oral): 29.6 g/kg[8]

LD_{50} (mouse, SC): >27.8 g/kg[7]

LD_{50} (rat, IP): 0.05 g/kg[8]

LD_{50} (rat, oral): 33.3 g/kg[8]

T

LD_{50} (rat, SC): >27.8 g/kg[7]
LD_{Lo} (rat, IV): 4 g/kg[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Use of a mask and/or respirator is recommended. When heated to decomposition, tricaprylin emits acrid smoke and irritating fumes. Ventilation is recommended to control dust or fumes from the heated material. Chemical splash goggles are recommended for eye protection, and neoprene-type gloves are also recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (injections and oral tablets). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Glyceryl triisooctanoate; medium-chain triglycerides.

Glyceryl triisooctanoate

Empirical formula $C_{27}H_{50}O_6$
Molecular weight 470.68
CAS number [7360-38-5]
Synonyms Glyceryl tris-2-ethylhexanoate
Residue on ignition ≤0.5%
Specific gravity 0.945–0.950
Comments A clear, colorless to pale yellow, oily liquid; odorless. Miscible with ethanol, 2-propanol, and diethyl ether; practically insoluble in water. Listed in JPE 2004.[9]

18 Comments

Although it is not currently included in the pharmacopeias, a specification for tricaprylin is included in the *Japanese Pharmaceutical Excipients Directory* (JPED); *see* Table III. It is included in the Cosmetics Ingredient Review (CIR) Category 1 and Category 37 as safe for use in cosmetics.[10]

Tricaprylin has been investigated as the oily phase to fabricate 'hairy' colloidosomes,[11] colloidosome microcapsules,[2,12] and microemulsions[13] for drug delivery applications. Tricaprylin/glycerol monostearate/water systems are increasingly being used as mesophases existing in biological systems for the study of drug behavior across membranes as they have structural resemblance to human membranes.[14,15] Reverse hexagonal liquid-crystalline structures composed of monoolein/tricaprylin/water have been demonstrated to solubilize large quantities of cyclosporine A[16] and gabapentin,[17] as well as dermal penetration enhancers.

Tricaprylin is used as an oily phase in various model emulsions, which are used as substrates in food and agricultural research[18] or for synergistic stabilization of oil-in-water emulsions in the presence of surface active nanoparticles and surfactants.[19] An intramuscular injection of triolein/tricaprylin multivesicular liposome formulation for the sustained delivery of breviscapine has been reported.[20]

Tricaprylin has also been studied for use in solid lipid nanoparticles in which superfine nanostructures are formed within the solid lipid, maintaining the nano size range.[21] It stabilizes nanostructured lipid carrier dispersions by accelerating the polymorphic transformation rate and altering the crystal packing structure.[22]

Tricaprylin has been used as a model triglyceride to understand the process of lipid digestion.[23]

The EINECS number of tricaprylin is 208-686-5. The PubChem Compound ID for tricaprylin is 10850.

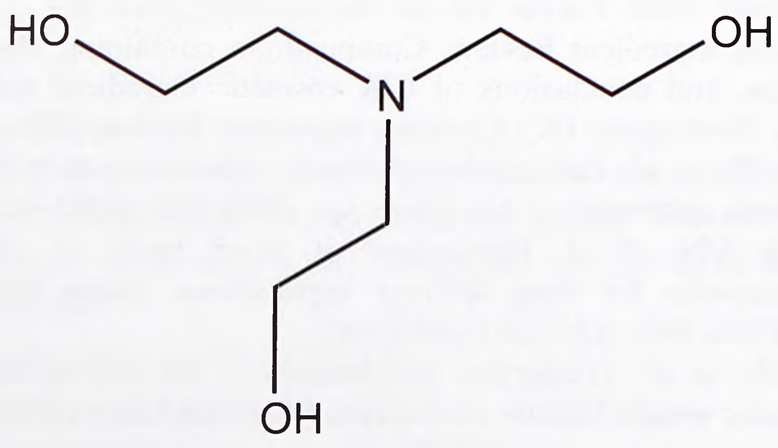
Triethanolamine

1 Nonproprietary Names

BP: Triethanolamine
PhEur: Trolamine
USP–NF: Trolamine

2 Synonyms

TEA; *Tealan*; triethylolamine; trihydroxytriethylamine; tris(hydroxyethyl)amine; trolaminum.



3 Chemical Names and CAS Registry Number

2,2′,2″-Nitrilotriethanol [102-71-6]

4 Empirical Formula and Molecular Weight

$C_6H_{15}NO_3$ 149.19

5 Structural Formula

6 Functional Category

Alkalizing agent; emulsifying agent.

7 Applications in Pharmaceutical Formulation or Technology

Triethanolamine is widely used in topical pharmaceutical formulations, primarily in the formation of emulsions.

When mixed in equimolar proportions with a fatty acid, such as stearic acid or oleic acid, triethanolamine forms an anionic soap with a pH of about 8, which may be used as an emulsifying agent to produce fine-grained, stable oil-in-water emulsions. Concentrations that are typically used for emulsification are 2–4% v/v of triethanolamine and 2–5 times that of fatty acids. In the case of mineral oils, 5% v/v of triethanolamine will be needed, with an appropriate increase in the amount of fatty acid used. Preparations that contain triethanolamine soaps tend to darken on storage. However, discoloration may be reduced by avoiding exposure to light and contact with metals and metal ions.

Triethanolamine is also used in salt formation for injectable solutions and in topical analgesic preparations. It is also used in sun screen preparations.[1]

8 Description

Triethanolamine is a clear, colorless to pale yellow-colored viscous liquid having a slight ammoniacal odor. It is a mixture of bases, mainly 2,2′,2″-nitrilotriethanol, although it also contains 2,2′-iminobisethanol (diethanolamine) and smaller amounts of 2-aminoethanol (monoethanolamine).

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for triethanolamine.

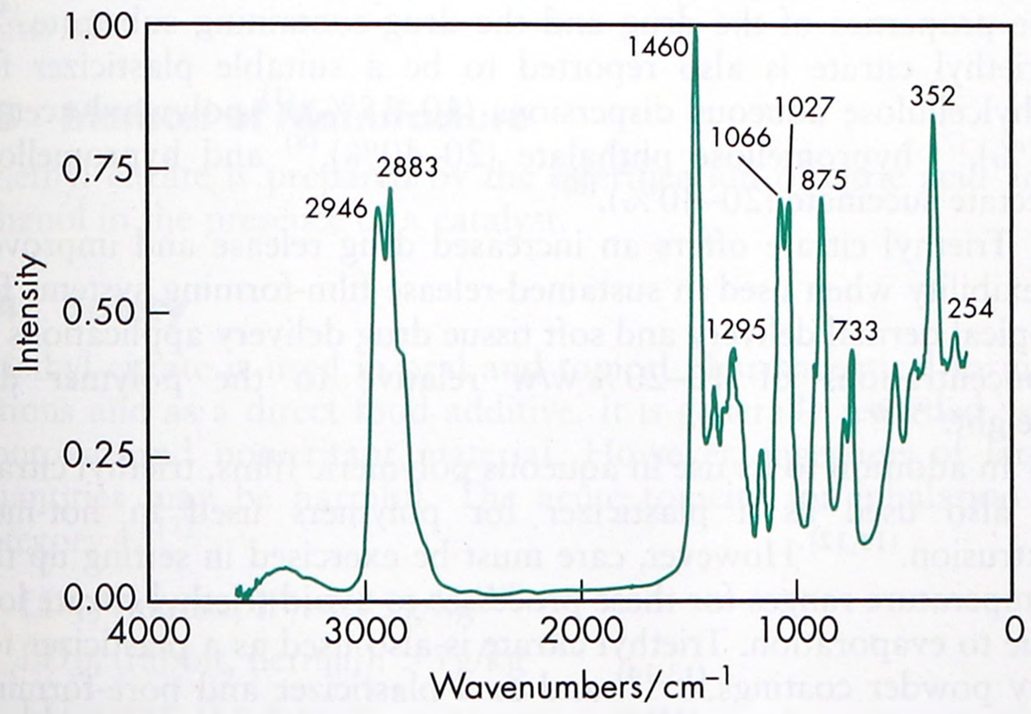

Figure 2: Raman spectrum of triethanolamine measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Triethanolamine may turn brown on exposure to air and light.

The 85% grade of triethanolamine tends to stratify below 15°C; homogeneity can be restored by warming and mixing before use.

Triethanolamine should be stored in an airtight container protected from light, in a cool, dry place.

See Monoethanolamine for further information.

12 Incompatibilities

Triethanolamine is a tertiary amine that contains hydroxy groups; it is capable of undergoing reactions typical of tertiary amines and alcohols. Triethanolamine will react with mineral acids to form crystalline salts and esters. With the higher fatty acids, triethanolamine forms salts that are soluble in water and have characteristics of soaps. Triethanolamine will also react with copper to form complex salts. Discoloration and precipitation can take place in the presence of heavy metal salts.

Triethanolamine can react with reagents such as thionyl chloride to replace the hydroxy groups with halogens. The products of these reactions are very toxic, resembling other nitrogen mustards.

13 Method of Manufacture

Triethanolamine is prepared commercially by the ammonolysis of ethylene oxide. The reaction yields a mixture of monoethanolamine, diethanolamine, and triethanolamine, which are separated to obtain the pure products.

14 Safety

Triethanolamine is used primarily as an emulsifying agent in a variety of topical pharmaceutical preparations. Although generally regarded as a nontoxic material,[2] triethanolamine may cause hypersensitivity or be irritant to the skin when present in formulated products. The lethal human oral dose of triethanolamine is estimated to be 5–15 g/kg body-weight.

Following concern about the possible production of nitrosamines in the stomach, the Swiss authorities have restricted the use of triethanolamine to preparations intended for external use.[3]

LD_{50} (guinea pig, oral): 5.3 g/kg[4]
LD_{50} (mouse, IP): 1.45 g/kg
LD_{50} (mouse, oral): 7.4 g/kg
LD_{50} (rat, oral): 8 g/kg

15 Handling Precautions

Triethanolamine may be irritant to the skin, eyes, and mucous membranes. Inhalation of vapor may be harmful. Protective clothing, gloves, eye protection, and a respirator are recommended. Ideally, triethanolamine should be handled in a fume cupboard. On heating, triethanolamine forms highly toxic nitrous fumes. Triethanolamine is combustible.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (rectal, topical, and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Diethanolamine; monoethanolamine.

18 Comments

Various grades of triethanolamine are available. The standard commercial grade contains 85% triethanolamine. The superior grade contains 98–99% triethanolamine.

One part by volume of triethanolamine with 5–7 parts of a mixture of CaO_2 and ZnO_2 is used as a filling material that enhances the restorative process in periodontal tissues.

Triethanolamine is used as an intermediate in the manufacture of surfactants, textile specialties, waxes, polishes, herbicides, petroleum demulsifiers, toilet goods, cement additives, and cutting oils. Triethanolamine is also claimed to be used for the production of lubricants for the rubber gloves and textile industries. Other general uses are as buffers, solvents, and polymer plasticizers, and as a humectant. Triethanolamine is recommended as the preferred stabilizer to be used in latex polymerization because of its weak mutagenic effect in the Ames tests.

The EINECS number for triethanolamine is 203-049-8.

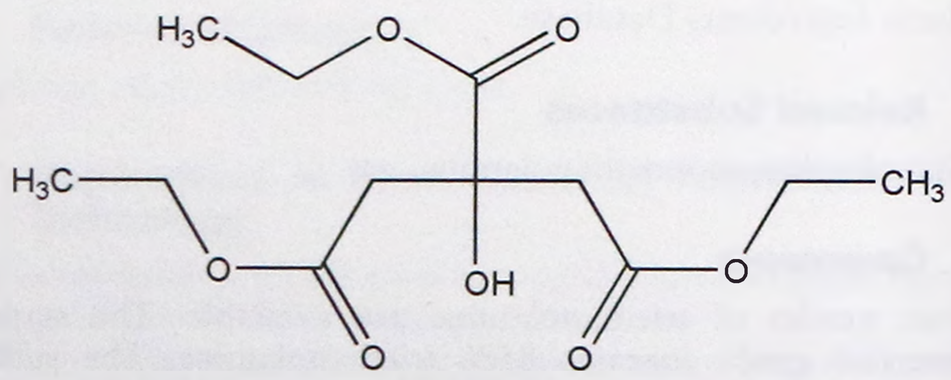
USP–NF: Triethyl Citrate

2 Synonyms

Citric acid ethyl ester; citric acid triethyl ester; *Citroflex 2*; *Citrofol AI*; citronensaeuretriethylester; *Crodamol TC*; E1505; Ethyl c; ethyl citrate; *Hydagen CAT*; 1,2,3-propanetricarboxylic acid, 2-hydroxy-, triethyl ester (9CI); TEC; triethyl 2-hydroxypropane-1,2,3-tricarboxylate; triethylis citras; *Uniflex TEC*; *Uniplex 80*.



3 Chemical Name and CAS Registry Number

2-Hydroxy-1,2,3-propanetricarboxylic acid triethyl ester [77-93-0]

4 Empirical Formula and Molecular Weight

$C_{12}H_{20}O_7$ 276.28

5 Structural Formula

6 Functional Category

Plasticizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Triethyl citrate is used to plasticize polymers in formulated pharmaceutical coatings, particularly aqueous polymeric dispersions used for extended-release and enteric formulations.[1–5]

For extended-release applications, drug release from polymeric films plasticized with triethyl citrate is generally faster compared to films plasticized with water-insoluble plasticizers due to the aqueous solubility of triethyl citrate.[1,4] Triethyl citrate is a suitable plasticizer for polymethacrylate polymeric film coatings where it is typically used at concentrations of 10–20% relative to the polymer dry weight, although higher concentrations may be needed depending on the physicochemical properties of the polymers and the properties of the drug and the drug-containing substrate.[4,6] Triethyl citrate is also reported to be a suitable plasticizer for ethylcellulose aqueous dispersions (10–35%),[1] polyvinyl acetate (5%),[7] hypromellose phthalate (20–40%),[8] and hypromellose acetate succinate (20–40%).[8]

Triethyl citrate offers an increased drug release and improved flexibility when used in sustained-release film-forming systems for topical dermal delivery and soft tissue drug delivery applications at concentrations of 10–20% w/w relative to the polymer dry weight.[9,10]

In addition to its use in aqueous polymeric films, triethyl citrate is also used as a plasticizer for polymers used in hot-melt extrusion.[11,12] However, care must be exercised in setting up the temperature ranges for these processes to avoid triethyl citrate loss due to evaporation. Triethyl citrate is also used as a plasticizer for dry powder coatings,[13,14] and as a plasticizer and pore-forming agent in microspheres.[15] For spray drying applications, it has been reported to improve the morphological properties of microspheres when used at concentrations of 10–15%.[16]

8 Description

Triethyl citrate occurs as a clear, viscous, odorless, bitter, and practically colorless, hygroscopic oily liquid.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for triethyl citrate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance	+	—
Specific gravity	—	1.135–1.139
Refractive index	1.440–1.446	1.439–1.441
Acidity	+	+
Related substances		
Individual	≤0.2%	—
Total	≤0.5%	—
Sulfated ash	≤0.1%	—
Heavy metals	—	≤10 ppm
Water	≤0.25%	≤0.25%
Assay (anhydrous basis)	98.5–101.0%	99.0–100.5%

10 Typical Properties

Acid value 0.02
Boiling point 127°C at 1 mmHg;
294°C at 760 mmHg
Density 1.135–1.139 g/cm^3 at 25°C
Flash point 150–155°C
Pour point 10°C
Saponification value 610
Solubility Soluble 1 in 125 of peanut oil, 1 in 15 of water. Miscible with ethanol (95%), ether, acetone, and propan-2-ol.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (dynamic) 35.2 mPa s (35.2 cP) at 25°C

11 Stability and Storage Conditions

Triethyl citrate should be stored in a closed container in a cool, dry location. When stored in accordance with these conditions, triethyl citrate is a stable product.

12 Incompatibilities

Triethyl citrate is incompatible with strong alkalis and oxidizing materials.

13 Method of Manufacture

Triethyl citrate is prepared by the esterification of citric acid and ethanol in the presence of a catalyst.

14 Safety

Triethyl citrate is used in oral and topical pharmaceutical formulations and as a direct food additive. It is generally regarded as a nontoxic and nonirritant material. However, ingestion of large quantities may be harmful. The acute toxicity for inhalation is category 4.[17]

LD_{50} (mouse, IP): 1.75 g/kg[18]
LD_{50} (rabbit, dermal): >5 g/kg[17]
LD_{50} (rat, IP): 4 g/kg[18]
LD_{50} (rat, oral): 5.9 g/kg[18]
LD_{50} (rat, SC): 6.6 g/kg[18]

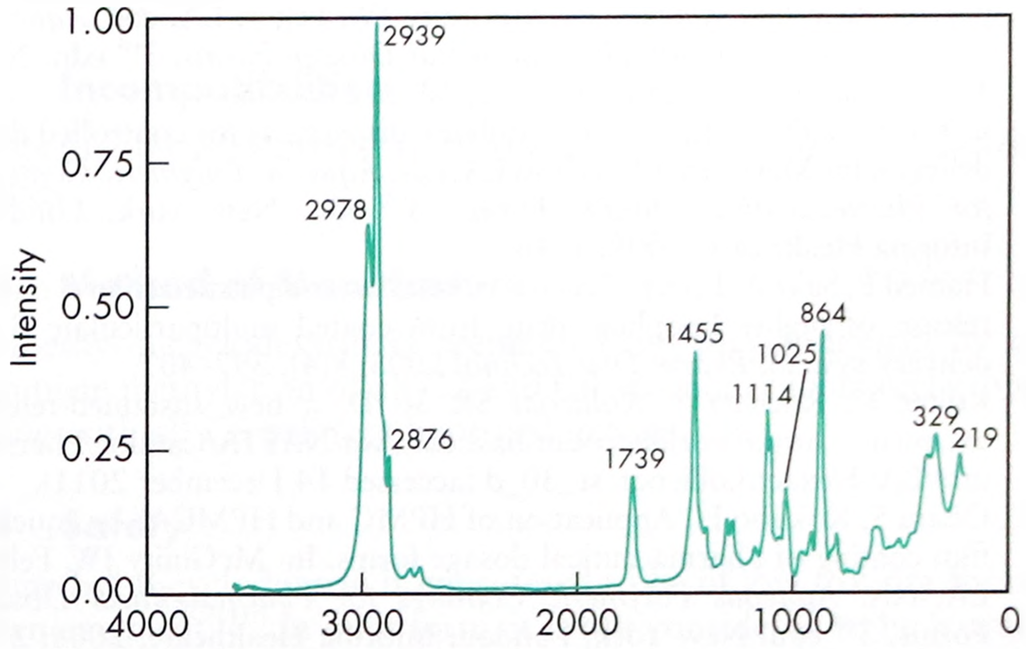

Figure 2: Raman spectrum of triethyl citrate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Triethyl citrate is irritating to the eyes and may irritate the skin at high concentrations. It is irritating to the respiratory system as a mist or at elevated temperatures. Use in a well ventilated area. Gloves, eye protection, and a respirator are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in the Canadian Natural Health Ingredients Database. Triethyl citrate is listed as a food additive in the EAFUS list compiled by the FDA.

17 Related Substances

Acetyltributyl citrate; acetyltriethyl citrate; tributyl citrate.

18 Comments

Triethyl citrate is used as an active agent in deodorants, where it inhibits enzymatic decomposition of sweat components. Therapeutically, it can also be found in facial peels and topical creams that are used for the treatment of moderate acne.[19]

Triethyl citrate is also used as a carrier for flavors and processing aids in foods. As a food additive (E1505), triethyl citrate is used to stabilize foams, especially as a whipping aid for egg white. It is also

used as a solvent and fixative in perfumes, and as a tackiness reducer for low volatile hair sprays.[20]

A specification for triethyl citrate is contained in the *Food Chemicals Codex* (FCC).[21]

The EINECS number for triethyl citrate is 201-070-7. The PubChem Compound ID (CID) for triethyl citrate is 6506.

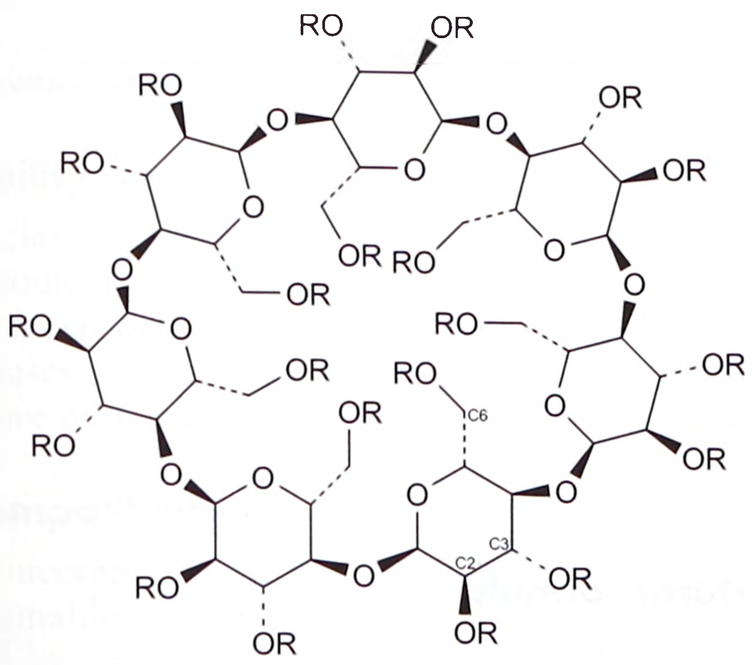
Trimethyl-β-cyclodextrin

1 Nonproprietary Names

None adopted.

2 Synonyms

β-Cyclodextrin permethyl ether; heptakis(2,3,6-tri-O-methyl)beta-cyclodextrin; permethyl-β-cyclodextrin; TM-β-CD; TOMBC; 2,3,6-tri-O-methyl-beta-cyclodextrin; TRIMEB.



3 Chemical Name and CAS Registry Number

Tri-O-methyl-beta-cyclodextrin [55216–11–0]

4 Empirical Formula and Molecular Weight

$C_{63}H_{112}O_{35}$ 1 429.54

5 Structural Formula

R = CH_3 for trimethyl β-cyclodextrin.

6 Functional Category

Complexing agent; modified-release agent; microencapsulating agent; solubilizing agent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Trimethyl-β-cyclodextrin is used to improve dissolution, solubility, bioavailability, and stability of poorly water-soluble drugs through the formation of inclusion complexes in oral,[1] nasal,[2] ophthalmic[3,4] and rectal[5] pharmaceutical formulations. It is used in applications similar to those for β-cyclodextrin (*see* Cyclodextrins), and is more water-soluble than the unsubstituted β-cyclodextrin.

8 Description

Trimethyl-β-cyclodextrin is a nonionic methylated β-cyclodextrin derivative. It occurs as a white crystalline powder.

9 Pharmacopeial Specifications

—

10 Typical Properties

Cavity diameter 4.0–7.0 Å
Conductivity <100 µS/cm (25°C, 1% solution in water)[6]
Melting point 157°C;[7] also 170–178°C[8]
Moisture content ≤1% w/w
Solubility Soluble 1 in 3.2 parts of water at 25°C; solubility decreases with increasing temperature. Soluble in organic solvents.[7]
Surface Tension 56 mN/m (56 dynes/cm) at 25°C

11 Stability and Storage Conditions

Trimethyl-β-cyclodextrin is stable in the solid state if protected from high humidity. It is reasonably stable in alkaline medium but is very susceptible to acid hydrolysis due to severe distortion in the cyclodextrin ring configuration.[7,9]

Store in a tightly sealed container, in a cool, dry and well-ventilated place.

12 Incompatibilities

Trimethyl-β-cyclodextrin is incompatible with strong oxidizing agents.

13 Method of Manufacture

Trimethyl-β-cyclodextrin is prepared from β-cyclodextrin by the complete methylation of all C2 and C3 secondary hydroxyl groups along with all C6 primary hydroxyl groups.

14 Safety

Trimethyl-β-cyclodextrin is considered to be of low toxicity for use as an excipient.[10] In pure form, it is not considered to be harmful by inhalation, ingestion, eye or skin contact, and no significant acute toxicological data have been reported.[11] However, direct contact with the material may cause irritation.

The International Agency for Research on Cancer (IARC) reports that no component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen.[8]

In the USA, the OSHA permissible exposure limit is 5 mg/m^3 respirable fraction for trimethyl-β-cyclodextrin.[11]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Avoid contact with skin and eyes, and avoid breathing vapors, mist or gas. Gloves and eye protection are recommended. Handle in a well-ventilated environment.

16 Regulatory Status

—

17 Related Substances

Cyclodextrins (α, β and γ-cyclodextrin); dimethyl-β-cyclodextrin; hydroxyethyl-β-cyclodextrin; hydroxypropyl betadex; betadex sulfobutyl ether sodium.

18 Comments

Trimethyl-β-cyclodextrin is used as a chiral additive in liquid chromatography for enantiomer resolution and chiral separation of basic drug substances by capillary electrophoresis.[12] It is also a cholesterol sequestering agent.[13]

The PubChem Compound ID (CID) for trimethyl-β-cyclodextrin is 162771.

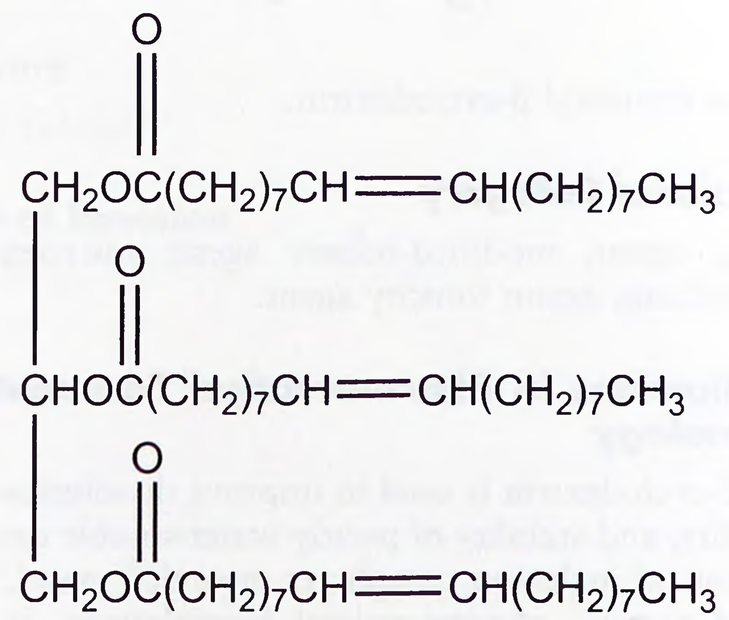
Triolein

1 Nonproprietary Names

None adopted.

2 Synonyms

Captex GTO; glycerol trielaidate; glyceryl trioleate; 9-octadecenoic acid-1,2,3-propanetriyl ester; olein; 1,2,3-propanetriyl tris((*E*)-9-octadecenoate); trielaidin; trielaidoylglycerol; 1,2,3-tri(*cis*-9-octadecenoyl)glycerol.



3 Chemical Name and CAS Registry Number

2,3-bis[[(*Z*)-octadec-9-enoyl]oxy]propyl (*Z*)-octadec-9-enoate [122-32-7]

4 Empirical Formula and Molecular Weight

$C_{57}H_{104}O_6$ 885.43

5 Structural Formula

6 Functional Category

Emollient; penetration enhancer; solubilizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Triolein is used as a solubilizer and solvent in injectable preparations. It has been used in marketed preparations of sustained-release multivesicular liposomal cytarabine and morphine sulfate. It has also been used in controlled-release binary lipid nanoparticles of itraconazole[1] and sustained-release breviscapine and thymopentin[2,3] liposomal formulations.

Triolen is used in personal care products as a skin-conditioning and viscosity-controlling agent.

8 Description

Triolein occurs as a clear, colorless to yellowish oily liquid, and is tasteless and odorless.

9 Pharmacopeial Specifications

—

10 Typical Properties

Boiling point 235–240°C
Density 0.915 g/cm^3
Flash point 330°C
Free fatty acids ≤0.1%
Iodine value 80–100
Melting point −5 to −4°C
Peroxide value ≤2
Refractive index
n_D^{20} = 1.4676;
n_D^{60} = 1.4561.
Solubility Soluble in chloroform, ether, carbon tetrachloride; slightly soluble in ethanol (95%); practically insoluble in water.
Specific gravity 0.9 at 25°C (water = 1)
Vapor density >1 (air = 1)
Vapor pressure <133.3 Pa (<1 mmHg) at 25°C
Viscosity (kinematic) 74 mm^2/s (74 cSt) at 25°C

11 Stability and Storage Conditions

Triolein is classified as a stable compound but is sensitive to air and light. It should be stored in airtight containers in a dry area at 2–8°C. Thermal decomposition of triolein may lead to release of irritating gases and vapors such as carbon oxides. Exposure to air and moisture over prolonged periods should be avoided.

12 Incompatibilities

Triolein is incompatible with strong oxidizing agents and spontaneously flammable products. Being a triglyceride ester, triolein can be hydrolyzed by strong acids, and particularly by strong bases. It is possible for primary amines to form an adduct across the olefinic double bonds (analogous to a Michael addition).

13 Method of Manufacture

Triolein is manufactured by the esterification of fractionated fatty acids, mainly oleic acid and glycerin.

14 Safety

Triolein is used in injectable preparations, in enteric coatings for oral preparations, and in personal care products. Chronic exposure may cause nausea and vomiting, and higher exposures may cause unconsciousness.

The Cosmetic Ingredient Review (CIR) Expert Panel found that dermal application of triolein was not associated with significant irritation, and no evidence of sensitization or photosensitization was observed.[4] Ocular exposures were found to be only mildly irritating to eyes. Triolein has not been found to be genotoxic in a number of *in vitro* and *in vitro* assay systems. Subcutaneous injections of triolein in rats showed no tumors at the injection site. The CIR Expert Panel also noted that metabolism data indicated that glyceryl triesters (including triolein) followed the same metabolic pathways as fats in food. They were split into monoglycerides, free fatty acids, and glycerol, all of which were absorbed into the intestinal mucosa and metabolized further. Therefore, oral exposure to these compounds was not found to be a concern.[4]

A triolein-based amphotericin emulsion showed better safety with a higher LD_{50} in rats as compared with the conventional amphotericin deoxycholate.[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Use of a mask and/or respirator is recommended in case aerosol/dust is formed. Ventilation is recommended to control dust or fumes from the material. For eye protection, safety glasses with side shields are recommended. For hand protection, PVC or other plastic material gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (liposomal suspension for epidural injections). Included in parenteral medicines (suspension for intrathecal injection) licensed in the UK.

Triolein is included in the CIR category as safe for use in cosmetics and personal care products. Its use as an indirect food additive has been approved by the FDA.

17 Related Substances

—

18 Comments

Addition of a relatively small amount of triolein can dramatically enhance the stability of tristearin nanostructured lipid carrier against aggregation. Studies have shown that triolein enhances the transfection efficiency of polycation nanostructured lipid carriers.[6,7] Transferrin-conjugated solid lipid nanoparticles containing triolein have been found to enhance the delivery of quinine dihydrochloride to the brain for the treatment of cerebral malaria.[8] A polymer-lipid hybrid nanoparticle containing triolein has been reported to have higher transfection efficiency with acceptable cytotoxicity.[9]

A nanoemulsion lipoprotein delivery system, comprising triolein in its oily phase, has been found to show lower cytotoxicity than conventional systems in *in vitro* gene transfection in human glioma cells.[10] Gadolinium-containing lipid nanoemulsions have also been prepared using triolein.[11] An intra-arterial delivery of triolein emulsion has been reported to increase the vascular permeability in skeletal muscles of rabbits, suggesting its application in drug delivery.[12] A paclitaxel prodrug has been incorporated into a lipid nanoparticle formulation comprising triolein in a mixture of lipids and has shown promising results in the treatment of folate receptor tumors.[13] A synthetic nano-low-density lipoprotein vehicle in lipid emulsion containing triolein has been found to have selective targeting for glioblastoma multiforme cells.[14,15] Folate receptor-targeted solid lipid nanoparticles of hematoporphyrin containing triolein have also shown specific receptor binding and potential as a targeted drug delivery system.[16] Partitioning of polychlorinated biphenyls into triolein closely mimicked that in human lipids rather than in octanol or liposomes. Thus, triolein was a better surrogate to study assessment of hydrophobic organic contaminant bioaccumulation in humans.[17]

The EINECS number for triolein is 204-534-7. The PubChem Compound ID (CID) for triolein is 5497163.

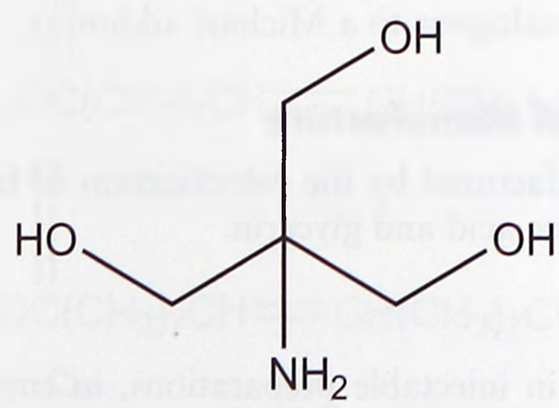
Tromethamine

1 Nonproprietary Names

BP: Trometamol
PhEur: Trometamol
USP–NF: Tromethamine

2 Synonyms

Aminotrimethylolmethane; *Pehanorm*; *Talatrol*; TRIS; trisamine; TRIS buffer; tris(hydroxymethyl)aminomethane; tris(hydroxymethyl)methanamine; tris(hydroxymethyl)methylamine; 1,1,1-tris(hydroxymethyl)methylamine; *Trizma*; trometamolum.



3 Chemical Name and CAS Registry Number

2-Amino-2-(hydroxymethyl)propane-1,3-diol [77-86-1]

4 Empirical Formula and Molecular Weight

$C_4H_{11}NO_3$ 121.14

5 Structural Formula

6 Functional Category

Alkalizing agent; buffering agent; emulsifying agent.

7 Applications in Pharmaceutical Formulation or Technology

Tromethamine is widely used as a buffering agent in parenteral, oral, topical, and ophthalmic preparations. It is used to prepare water-soluble salts of NSAIDs (e.g., ketorolac or ibuprofen), which can then be entrapped in polymeric vehicles for continuous release.[1–6]

Tromethamine is also used as an emulsifying agent for cosmetic creams and lotions, and mineral oil and paraffin wax emulsions.[7]

8 Description

Tromethamine occurs as a white or almost white crystalline powder or colorless crystals.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for tromethamine.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Melting range	168–174°C	168–172°C
pH	10.0–11.5	10.0–11.5
Loss on drying	≤0.5%	≤1.0%
Residue on ignition	≤0.1%	≤0.1%
Heavy metals	–	≤0.001%
Related substances	+	–
Chlorides	≤100 ppm	–
Iron	≤10 ppm	–
Bacterial endotoxins	<0.03 IU/mg	–
Assay (dried basis)	99.0–100.5%	99.0–101.0%

10 Typical Properties

Boiling point 219–220°C (10 mmHg)[7]
Density 1.353 g/cm^3 [8]
Dissociation constants

pK_a = 8.3 at 20°C;
pK_a = 7.82 at 37°C.[7]

Solubility *See* Table II.
Vapor pressure ≈2.2 × 10^{-5} mmHg at 25°C[9]

Table II: Solubility of tromethamine.

Solvent	Solubility of tromethamine at 20°C unless otherwise stated
Acetone	Soluble
Carbon tetrachloride	Practically insoluble
Chloroform	Practically insoluble
Cyclohexane	Very slightly soluble
Ethanol (96%)	Sparingly soluble
Ethyl acetate	Very slightly soluble
Ethylene glycol	Soluble
Methanol	Soluble
Olive oil	Very slightly soluble
Water	Freely soluble

11 Stability and Storage Conditions

Store in airtight containers in a cool, dry place. The bulk material is hygroscopic.

12 Incompatibilities

Tromethamine is incompatible with strong oxidizing agents, bases, copper, brass, and aluminum.

13 Method of Manufacture

Tromethamine may be prepared by reduction or catalytic hydrogenation of the corresponding nitro compound.

14 Safety

Tromethamine as the pure material is moderately toxic by ingestion and IV routes. It is an irritant to eyes, skin, and the respiratory tract.

LD_{50} (mouse, IP): 3.3 g/kg[10]
LD_{50} (mouse, IV): 3.5 g/kg[9]
LD_{50} (mouse, oral): 5.5 g/kg[10]
LD_{50} (rat, IV): 1.8 g/kg[11]
LD_{50} (rat, oral): 5.9 g/kg[11]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Tromethamine is combustible. When heated to decomposition, it produces nitrogen oxides, carbon monoxide, and carbon dioxide.[11] Suitable eye, skin, and respiratory protection is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (intravenous, intramuscular, subcutaneous, intrathecal, intra-arterial injections and infusions; ophthalmics (solutions and suspensions); oral preparations (tablets and capsules); topical (gels and solutions); inhalation, rectal, and urethral solutions). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Therapeutically, tromethamine is an organic amine proton acceptor used as an alkalizing agent in the treatment of metabolic acidosis, though it is mainly used during cardiac bypass surgery and during cardiac arrest.[12] THAM (Fisher Scientific) is a sterile, nonpyrogenic 0.3 molar solution of tromethamine, adjusted to a pH of approximately 8.6 with glacial acetic acid, administered by IV injection.

Tromethamine may be restricted in certain sports as it is considered to be a member of a prohibited group (diuretics).[12]

The EINECS number for tromethamine is 201-064-4. The PubChem Compound ID (CID) number for tromethamine is 6503.

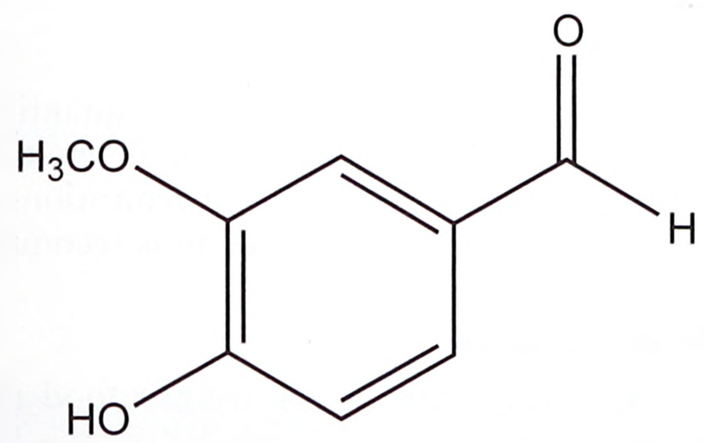
Vanillin

1 Nonproprietary Names

BP: Vanillin
PhEur: Vanillin
USP–NF: Vanillin

2 Synonyms

4-Hydroxy-*m*-anisaldehyde; *p*-hydroxy-*m*-methoxybenzaldehyde; 3-methoxy-4-hydroxybenzaldehyde; methylprotocatechuic aldehyde; protocatechualdehyde, methyl-; *Rhovanil*; vanillic aldehyde; *p*-vanillin; vanillinum.



3 Chemical Name and CAS Registry Number

4-Hydroxy-3-methoxybenzaldehyde [121-33-5]

4 Empirical Formula and Molecular Weight

$C_8H_8O_3$ 152.15

5 Structural Formula

6 Functional Category

Flavoring agent; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

As a pharmaceutical excipient, vanillin is used in tablets, solutions (0.01–0.02% w/v), syrups, and powders to mask the unpleasant taste and odor characteristics of certain formulations, such as caffeine tablets and polythiazide tablets. It is similarly used in film coatings to mask the taste and odor of vitamin tablets.

Vanillin has been investigated as a photostabilizer in furosemide 1% w/v injection, haloperidol 0.5% w/v injection, and thiothixene 0.2% w/v injection.[1] It has also been crosslinked with chitosan nanoparticles as a potential vehicle for the delivery of anticancer drugs.[2]

8 Description

Vanillin occurs as white or cream crystalline needles, or powder with characteristic vanilla odor and sweet taste.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity Aqueous solutions are acid to litmus.
Boiling point 284–285°C (with decomposition)

Methanol	Soluble
Oils	Soluble
Water	1 in 100
	1 in 16 at 80°C

11 Stability and Storage Conditions

Vanillin oxidizes slowly in moist air and is affected by light.

Solutions of vanillin in ethanol decompose rapidly in light to give a yellow-colored, slightly bitter tasting solution of 6,6′-dihydroxy-5,5′-dimethoxy-1,1′-biphenyl-3,3′-dicarbaldehyde. Alkaline solutions also decompose rapidly to give a brown-colored solution. However, solutions stable for several months may be produced by adding sodium metabisulfite 0.2% w/v as an antioxidant.[3]

The bulk material should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Vanillin is incompatible with acetone, forming a brightly colored compound.[4] It is also incompatible with strong oxidizers and reducers. A compound practically insoluble in ethanol is formed with glycerin. Vanillin can react violently with bromine, perchloric acid, potassium-*tert*-butoxide, and also with mixtures of *tert*-chlorobenzene and sodium hydroxide, or formic acid and thallium nitrate.

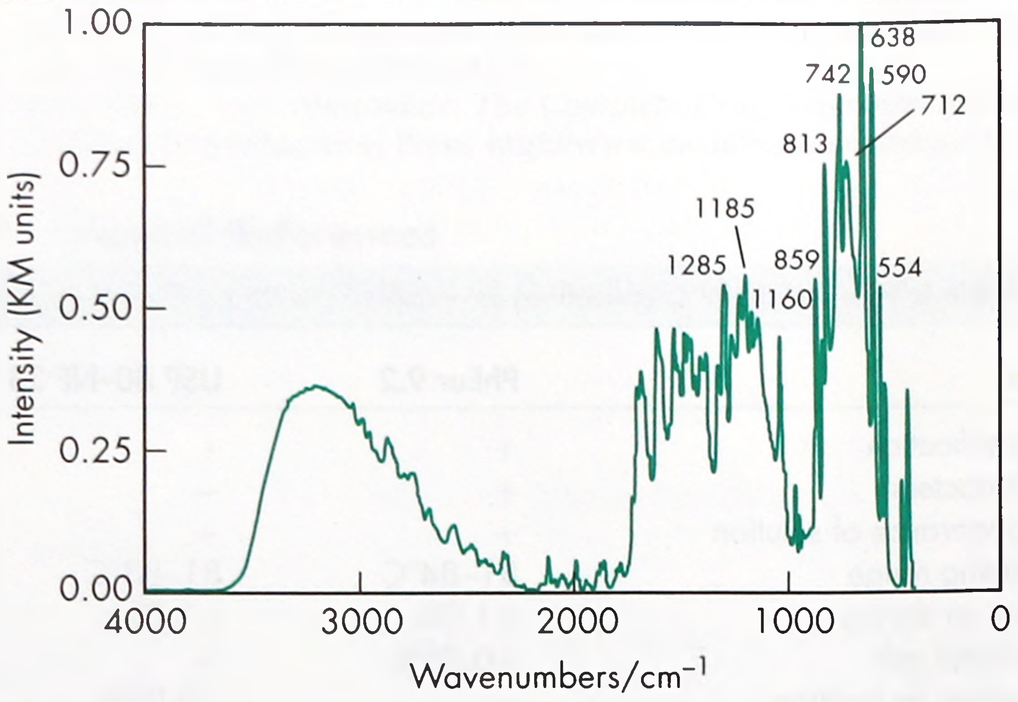

Figure 1: Infrared spectrum of vanillin measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

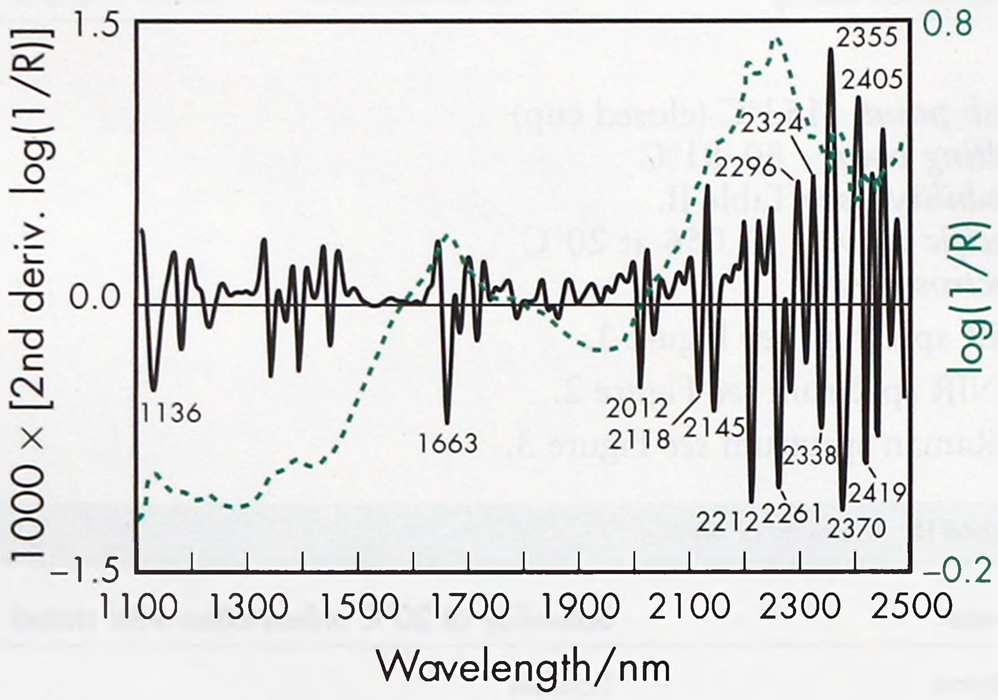

Figure 2: Near-infrared spectrum of vanillin measured by reflectance.

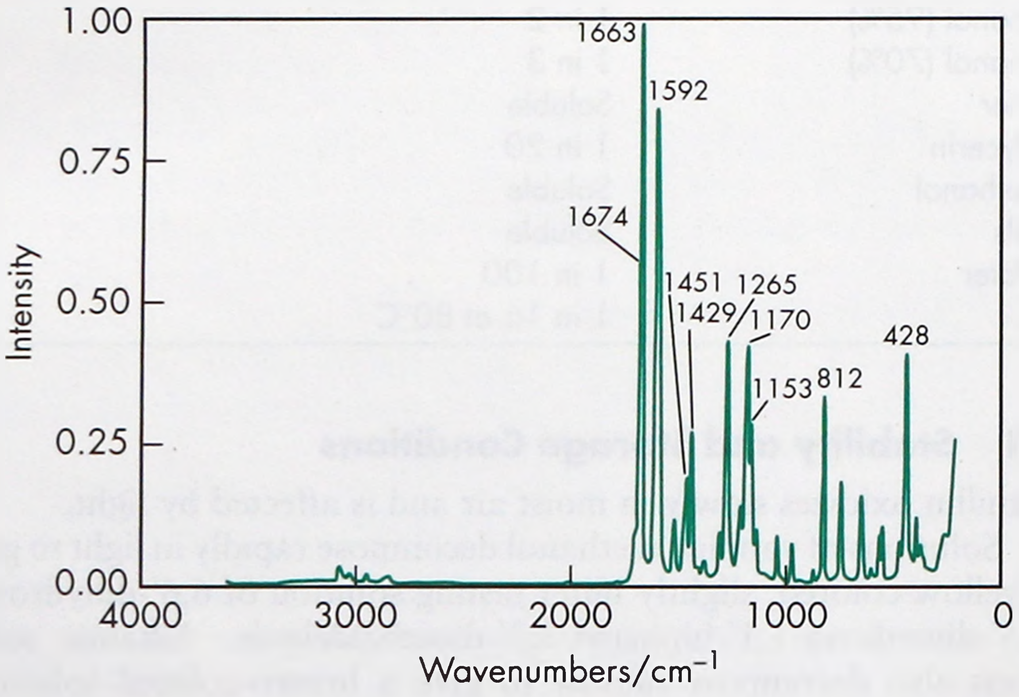

Figure 3: Raman spectrum of vanillin measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Vanillin occurs naturally in many essential oils and particularly in the pods of *Vanilla planifolia* and *Vanilla tahitensis*. Industrially, vanillin is prepared from lignin, which is obtained from the sulfite wastes produced during paper manufacture. Lignin is treated with alkali at elevated temperature and pressure, in the presence of a catalyst, to form a complex mixture of products from which vanillin is isolated. Vanillin is then purified by successive recrystallizations.

Vanillin may also be prepared synthetically by condensation, in weak alkali, of a slight excess of guaiacol with glyoxylic acid at room temperature. The resultant alkaline solution, containing 4-hydroxy-3-methoxymandelic acid is oxidized in air, in the presence of a catalyst, and vanillin is obtained by acidification and simultaneous decarboxylation. Vanillin is then purified by successive recrystallizations.

14 Safety

There have been few reports of adverse reactions to vanillin, although it has been speculated that cross-sensitization with other structurally similar molecules, such as benzoic acid, may occur.[5] Adverse reactions that have been reported include contact dermatitis[6] and bronchospasm caused by hypersensitivity.[7] In pure form, vanillin is moderately toxic by ingestion, IP, IV, and SC routes.[8]

The WHO has allocated an estimated acceptable daily intake for vanillin of up to 10 mg/kg body-weight.[9]

LD_{50} (guinea pig, IP): 1.19 g/kg[8]
LD_{50} (guinea pig, oral): 1.4 g/kg
LD_{50} (mouse, IP): 0.48 g/kg
LD_{50} (rat, IP): 1.16 g/kg
LD_{50} (rat, oral): 1.58 g/kg
LD_{50} (rat, SC): 1.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the quantity of material handled. When heated to decomposition vanillin emits acrid smoke and irritating fumes.[8] Heavy airborne concentrations of dust may present an explosion hazard. Eye protection is recommended.

16 Regulatory Status

Although not GRAS listed, vanillin is listed as a food additive in the EAFUS list compiled by the FDA. Included in the FDA Inactive Ingredients Database (oral solutions, suspensions, syrups, powders, capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ethyl vanillin.

18 Comments

Vanillin is widely used as a synthetic flavor in pharmaceuticals, foods, beverages, and confectionery products, to which it imparts a characteristic taste and odor of natural vanilla. It has been used as an intermediate in the synthesis of a number of pharmaceuticals, particularly methyldopa. In food applications, vanillin has been investigated as a preservative.[10,11] One part of synthetic vanillin is equivalent to 400 parts of vanilla pods.

Vanillin is also used in perfumes, mosquito repellents, and as an analytical reagent. Additionally, it has been investigated as a potential therapeutic agent in sickle cell anemia[12] and is claimed to have some antifungal properties.[13] Vanillin has also been demonstrated to protect human keratinocyte stem cells against ultraviolet B irradiation.[14]

A study into the effect of vanillin on cytochrome P450 enzymes, indicated no significant effect in human *in vitro* samples. However an *in vivo* animal study reported some induction or inhibition of cytochrome P450 enzymes.[15]

A specification for vanillin is included in the *Food Chemicals Codex*[16] and the *Japanese Pharmaceutical Excipients* (JPE).[17]

The EINECS number for vanillin is 204-465-2. The PubChem Compound ID (CID) for vanillin is 1183.

Vegetable Oil, Hydrogenated

1 Nonproprietary Names

BP: Hydrogenated Vegetable Oil
JP: Hydrogenated Oil
USP–NF: Hydrogenated Vegetable Oil
See also Sections 8, 9, and 17.

2 Synonyms

—

3 Chemical Name and CAS Registry Number

Hydrogenated vegetable oil [68334-28-1]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 defines two types of hydrogenated vegetable oil, type I and type II, which differ in their physical properties and applications; *see* Sections 9 and 17.

5 Structural Formula

$R^1COOCH_2—CH(OOCR^2)—CH_2OOCR^3$
where R^1, R^2, and R^3 are mainly C_{15} and C_{17}.

6 Functional Category

Modified-release agent; tablet and capsule binder; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Hydrogenated vegetable oil type I may be used as a lubricant in tablet and capsule formulations.[1,2] In this application it is used at concentrations of 1–6% w/w, usually in combination with talc, silica, or a silicate to prevent sticking to tablet punch faces. It may also be used as an auxiliary binder in tablet formulations.

Hydrogenated vegetable oil type I is additionally used as the matrix-forming material in lipid-based controlled-release formulations;[3–6] it may also be used as a coating aid in controlled-release formulations. It has also been investigated in hydrophobic melt agglomeration.[7]

Other uses of hydrogenated vegetable oil type I include use as a viscosity modifier in the preparation of oil-based liquid and semisolid formulations; in the preparation of suppositories, to reduce the sedimentation of suspended components and to improve the solidification process; and in the formulation of liquid and semisolid fills for hard gelatin capsules.[8]

Fully hydrogenated vegetable oil products may also be used as alternatives to hard waxes in cosmetics and topical pharmaceutical formulations.

See also Section 17.

8 Description

Hydrogenated vegetable oil is a mixture of triglycerides of fatty acids. The two types that are defined in the USP 40–NF 35 S1 are characterized by their physical properties; *see* Section 9.

Hydrogenated vegetable oil type I occurs in various forms, e.g. fine powder, flakes, or pellets. The color of the material depends on the manufacturing process and the form. In general, the material is white to yellowish-white with the powder grades appearing more white-colored than the coarser grades.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydrogenated vegetable oil.

Test	BP 2017[a]	JP XVII[b]	USP 40–NF 35 S1	
			Type I	Type II
Identification	+	–	–	–
Characters	+	+	–	–
Melting range	57–70°C	–	57–85°C	20–50°C

Acid value	≤4.0	≤2.0	≤4.0	≤4.0
Unsaponifiable matter	≤0.8%	–	≤0.8%	≤0.8%
Residue on ignition	–	≤0.1%	–	–

(a) Note that the BP 2017 also has separate monographs for Hydrogenated Arachis Oil, Hydrogenated Cottonseed Oil, and Hydrogenated Soya Oil.
(b) Note that Hydrogenated Oil JP may be of fish, animal or vegetable origin.

10 Typical Properties

Density (tapped) 0.57 g/cm^3 for *Lubritab*
Melting point 61–66°C for *Lubritab*
Particle size distribution 85% < 177 µm, 25% < 74 µm in size for *Lubritab*. Average particle size is 104 µm.
Solubility Soluble in chloroform, petroleum spirit, and hot propan-2-ol; practically insoluble in water.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

Hydrogenated vegetable oil type I is a stable material; typically it is assigned a 2-year shelf-life.

The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Incompatible with strong oxidizing agents.

13 Method of Manufacture

Hydrogenated vegetable oil type I is prepared from refined vegetable oils, which are hydrogenated using a catalyst.

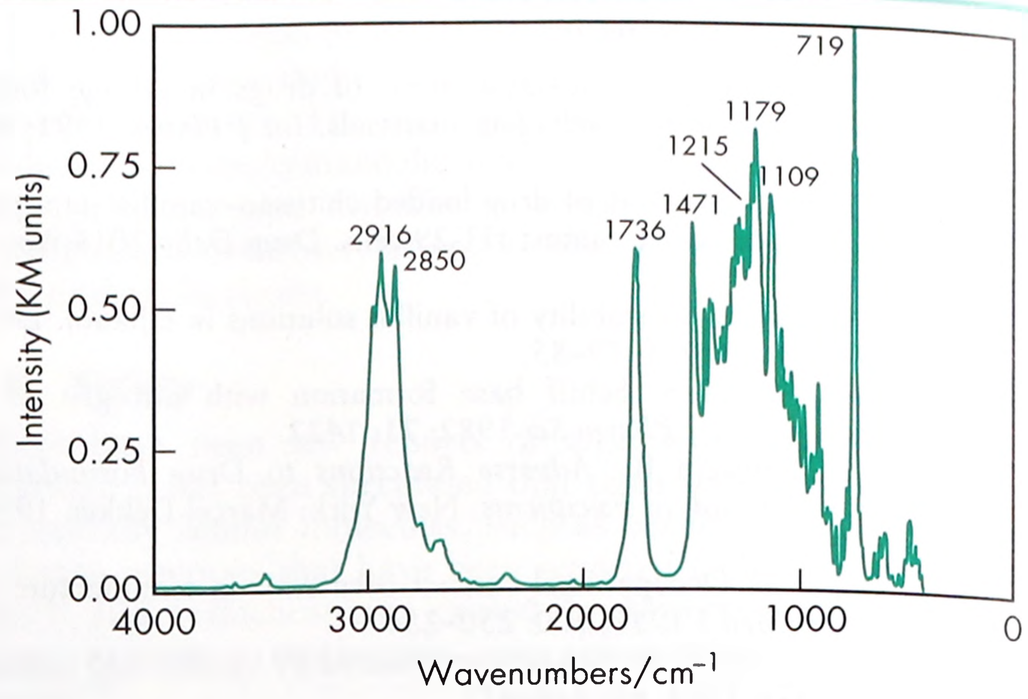

Figure 1: Infrared spectrum of hydrogenated vegetable oil type I measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

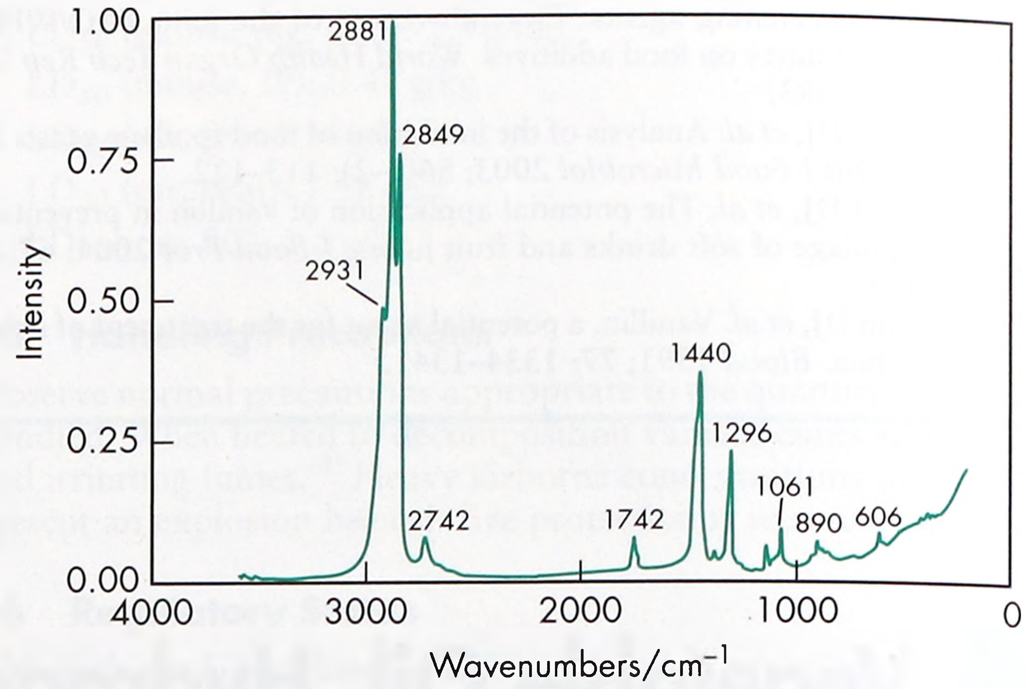

Figure 2: Raman spectrum of hydrogenated vegetable oil type I measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

14 Safety

Hydrogenated vegetable oil type I is used in food products and oral pharmaceutical formulations, and is generally regarded as a nontoxic and nonirritant excipient.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Gloves, eye protection, and a dust mask are recommended when handling fine powder grades.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets; rectal and vaginal suppositories and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Hydrogenated Vegetable Oil, Type I is GRAS listed.

17 Related Substances

Castor oil, hydrogenated; hydrogenated vegetable oil, type II; hydrogenated arachis oil; hydrogenated cottonseed oil; hydrogenated soya-bean oil; medium-chain triglycerides; palm oil, hydrogenated; suppository bases.

V

Hydrogenated vegetable oil, type II

Comments Hydrogenated vegetable oil type II includes partially hydrogenated vegetable oils from different sources that have a wide range of applications. In general, type II materials have lower melting ranges and higher iodine values than type I materials. Many type II materials are prepared to meet specific customer requirements for use in cosmetics. Type II materials may also be used in the manufacture of suppositories. *See also* Section 9.

The US FDA has determined that partially hydrogenated vegetable oils are no longer 'generally recognised as safe' for use in food because they are a major source of dietary *trans* fat.[9] This may impact their use in oral medicines in the US.

Hydrogenated arachis oil

CAS number [68425-36-5]

Comments Hydrogenated arachis oil (also known as hydrogenated peanut oil) is obtained from the shelled seeds of *Arachis hypogaea* (L) by refining, and hydrogenation. Each type of hydrogenated arachis oil is characterised by its nominal drop point. It consists mainly of the triglycerides of palmitic, stearic and oleic acids. The specification is given in Table II.

Hydrogenated cottonseed oil

CAS number [68334-00-9]

Synonyms *Akofine*; *Lubritab*; *Sterotex*.

Comments Hydrogenated cottonseed oil is obtained from the seeds of varieties of *Gossypium hirsutum* (L) or other *Gossypium* species by refining, and hydrogenation. It consists mainly of the triglycerides of palmitic and stearic acids. The specification is given in Table II.

Hydrogenated soya-bean oil

CAS number [8016-70-4]

Synonyms Hydrogenated soybean oil; *Lipovol HS-K*; *Sterotex HM*.

Comments Hydrogenated soya-bean oil is obtained from soy beans (seeds of *Glycine max* (L) Merr. (*G. hispida* (Moench) Maxim) by refining, bleaching, hydrogenation and deodorisation. It consists mainly of the triglycerides of palmitic and stearic acids. The specification is given in Table II.

18 Comments

Products from different manufacturers may vary owing to differences in the source of the vegetable oil used for hydrogenation. Certain materials are made from mixed hydrogenated oils, e.g. hydrogenated soya-bean oil and hydrogenated castor oil (*Sterotex K*).

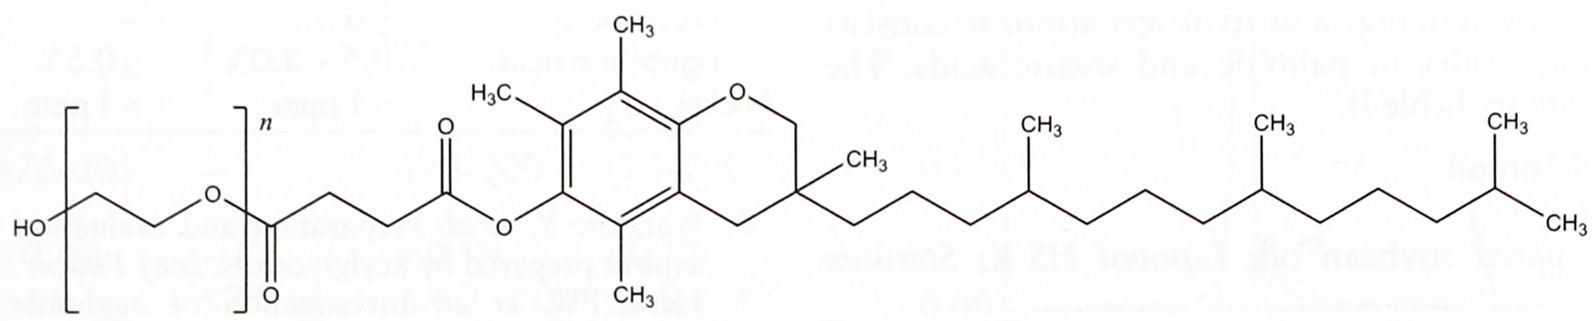
Vitamin E Polyethylene Glycol Succinate

1 Nonproprietary Names

USP–NF: Vitamin E Polyethylene Glycol Succinate

2 Synonyms

Speziol TPGS Pharma; tocofersolan; tocophersolan; tocopherol polyethylene glycol succinate; D-α-tocopheryl polyethylene glycol 1000 succinate; TPGS; vitamin E polyethylene glycol 1000 succinate; vitamin E TPGS; *VEGS*.



3 Chemical Name and CAS Registry Number

4-*O*-(2-Hydroxyethyl)-1-*O*-[2,5,7,8-tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydrochromen-6-yl]butanedioate [9002-96-4] and [30999-06-5]

4 Empirical Formula and Molecular Weight

$C_{33}O_5H_{54}(CH_2CH_2O)_{20-22}$ ≈1 513

5 Structural Formula

n = 20-22

6 Functional Category

Antioxidant; emulsifying agent; nonionic surfactant; ointment base; solubilizing agent; suspending agent; tablet and capsule binder.

7 Applications in Pharmaceutical Formulation or Technology

Vitamin E polyethylene glycol succinate is an esterified vitamin E (tocopherol) derivative primarily used as a solubilizer or emulsifying agent because of its surfactant properties.[1] Structurally, it is amphipathic and hydrophilic, unlike the tocopherols, and therefore it is a water-soluble derivative that can be used in pharmaceutical formulations such as capsules,[2] tablets,[3] hot-melt extrusion,[4] microemulsions,[5] topical products,[6] and parenterals.[7] One of the most important applications is its use as a vehicle for lipid-based drug delivery formulations, and other drug delivery systems.[8]

8 Description

Vitamin E polyethylene glycol succinate is a synthetic product. It is available as a white to light-brown, waxy solid and is practically tasteless. Chemically, it is a mixture composed principally of monoesterified polyethylene glycol 1000, the diesterified polyethylene glycol 1000, free polyethylene glycol 1000, and free tocopherol.[9]

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for vitamin E polyethylene glycol succinate.

Test	USP 40–NF 35 S1
Identification	+
Solubility in water	+
Acid value	+
Optical rotation, specific rotation	≥+24.0°
Assay (α-tocopherol)	≥25.0%

10 Typical Properties

Acid value ≤1.5[1]
Critical micelle concentration 0.02% w/w (at 37°C)[1]
HLB value ≈13.2[1]
Melting point 37–41°C[1]
Solubility Miscible in water in all parts.[1]
Specific gravity 1.06 (at 45°C)[1]

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

Vitamin E polyethylene glycol succinate is stable at ambient room temperature for up to 4 years. It reacts with alkalis and acids. Aqueous solutions of vitamin E polyethylene glycol succinate are stable over a pH range of 4.5–7.5 and can be further stabilized with propylene glycol.[1]

12 Incompatibilities

Vitamin E polyethylene glycol succinate is incompatible with strong acids and strong alkalis.

13 Method of Manufacture

Vitamin E polyethylene glycol succinate is prepared by esterification of the acid group of crystalline D-α-tocopheryl acid succinate by polyethylene glycol 1000.

14 Safety

Vitamin E polyethylene glycol succinate has been used at levels of 280 mg/capsule in the product *Agenerase* (amprenavir), which was dosed at 8 capsules (2240 mg vitamin E TPGS) per day;[2] however, this product has since been discontinued for commercial reasons. An additional assessment of the safety of vitamin E polyethylene glycol succinate has been published, which includes a report

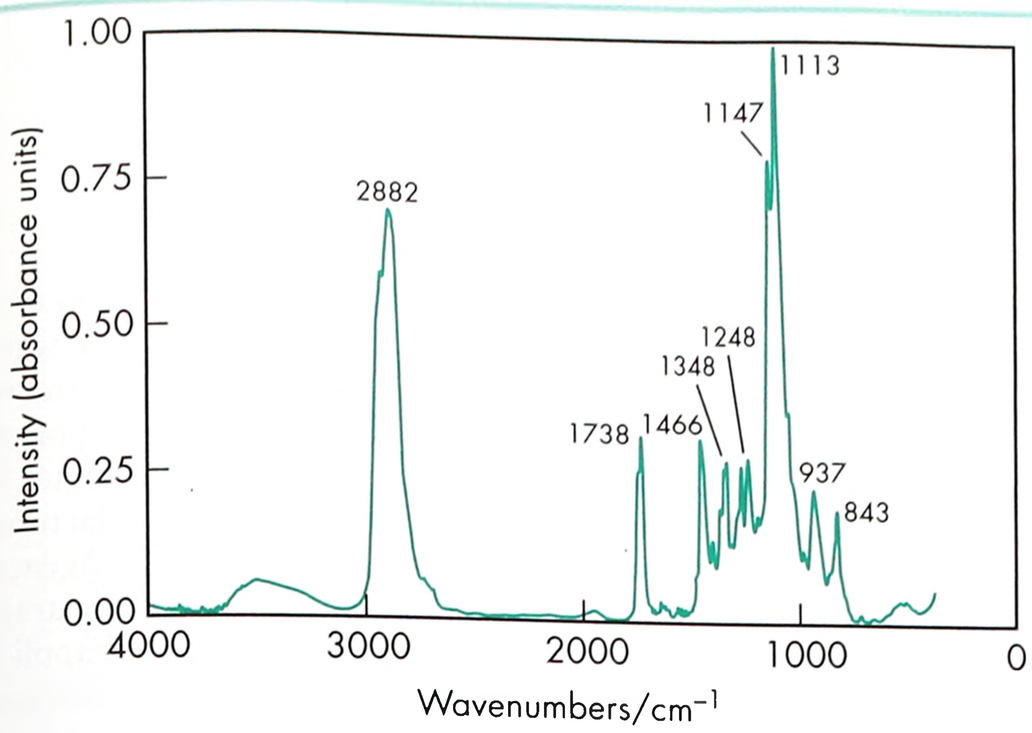


Figure 1: Infrared spectrum of vitamin E polyethylene glycol succinate measured by transmission. Adapted with permission of Informa Healthcare.

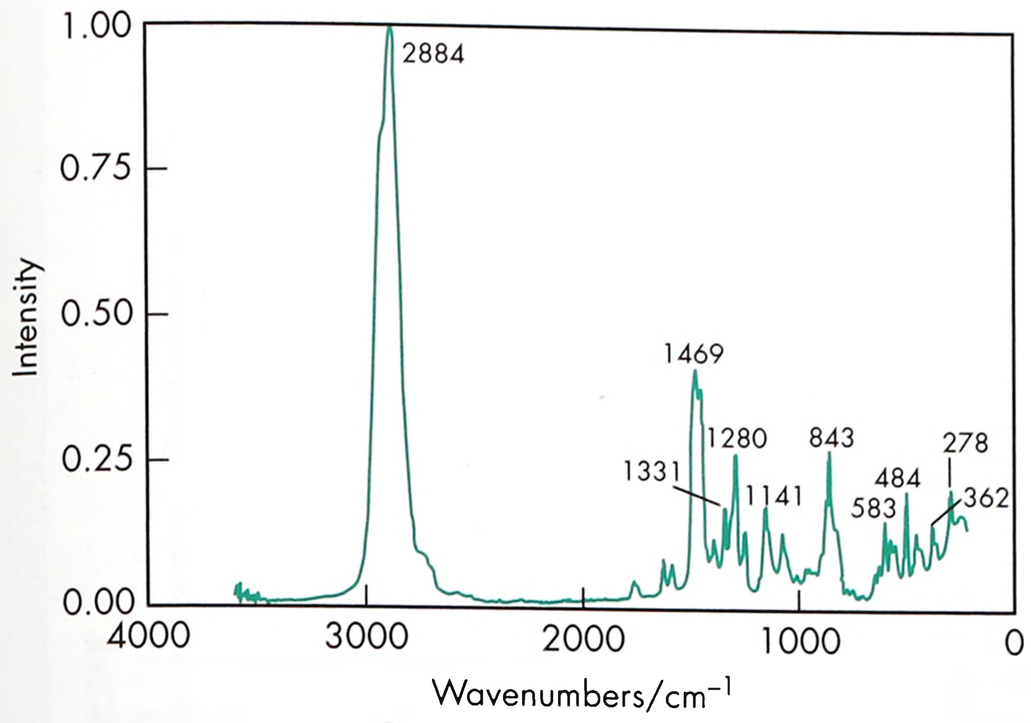

Figure 2: Raman spectrum of vitamin E polyethylene glycol succinate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

showing no-observed-adverse-effect-level (NOAEL) in rats of 1000 mg/kg/day.[9]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Gloves and eye protection are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (ophthalmic solution or drops; oral capsules, solution, tablet; topical solution or drops). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Alpha tocopherol.

18 Comments

Vitamin E polyethylene glycol succinate has been characterized with respect to its mechanism of action and studied as a P-glycoprotein inhibitor.[10–13] It can also be used as a source of vitamin E.[1]

The PubChem Compound ID (CID) for vitamin E polyethylene glycol succinate is 71406.

Solvent.

7 Applications in Pharmaceutical Formulation or Technology

Water is widely used as a raw material, ingredient and solvent in the processing, formulation and manufacture of pharmaceutical products, active pharmaceutical ingredients (API) and intermediates, and analytical reagents. Specific grades of water are used for particular applications in concentrations up to 100%; *see* Table I.

Table I: Typical applications of specific grades of water.

Type	Use
Bacteriostatic water for injection	Diluent for ophthalmic and multiple-dose injections.
Potable water	Public supply suitable for drinking, the purity of which is unlikely to be suitable for use in the manufacture of pharmaceuticals.
Purified water	Vehicle and solvent for the manufacture of drug products and pharmaceutical preparations; not suitable for use in the manufacture of parenteral products.
Sterile water for inhalation	Diluent for inhalation therapy products.
Sterile water for injection	Diluent for injections.
Sterile water for irrigation	Diluent for internal irrigation therapy products.
Water for injections in bulk	Water for the bulk preparation of medicines for parenteral administration.

8 Description

The term 'water' is used to describe potable water that is freshly drawn direct from the public supply and is suitable for drinking. Water used in the pharmaceutical industry and related disciplines is classified as either drinking (potable) water, purified water, sterile purified water, water for injection (WFI), sterile water for injection, bacteriostatic water for injection, sterile water for irrigation, or sterile water for inhalation. Validation is required for all systems producing the water indicated, with the exception of potable water.

The chemical composition of potable water is variable, and the nature and concentrations of the impurities in it depend upon the source from which it is drawn. Water classified as potable water for applications such as some initial rinsing and API manufacturing operations, must meet the US Environmental Protection Agency's National Primary Drinking Water Regulations, or comparable regulations of the EU or Japan. For most pharmaceutical applications, potable water is purified by distillation, ion exchange treatment, reverse osmosis (RO), or some other suitable process to produce 'purified water'. For certain applications, water with pharmacopeial specifications differing from those of purified water should be used, e.g. WFI; *see* Sections 9 and 18.

Water is a clear, colorless, odorless, and tasteless liquid.

9 Pharmacopeial Specifications

See Table II and III. *See also* Section 17.

10 Typical Properties

Boiling point 100°C
Critical pressure 22.1 MPa (218.3 atm)
Critical temperature 374.2°C
Dielectric constant $D^{25} = 78.54$
Dipole moment
1.76 in benzene at 25°C;
1.86 in dioxane at 25°C.
Ionization constant 1.008×10^{-14} at 25°C.
Latent heat of fusion 6 kJ/mol (1.436 kcal/mol)
Latent heat of vaporization 40.7 kJ/mol (9.717 kcal/mol)
Melting point 0°C
Refractive index $n_D^{20} = 1.3330$
Solubility Miscible with most polar solvents.
Specific gravity 0.9971 at 25°C.
Specific heat (liquid) 4.184 J/g/°C (1.00 cal/g/°C) at 14°C.
Surface tension 71.97 mN/m (71.97 dynes/cm) at 25°C.
Vapor pressure 3.17 kPa (23.76 mmHg) at 25°C.
Viscosity (dynamic) 0.89 mPa s (0.89 cP) at 25°C.

11 Stability and Storage Conditions

Water is chemically stable in all physical states (ice, liquid, and vapor). Water leaving the pharmaceutical purification system and entering the storage tank must meet specific requirements. The goal when designing and operating the storage and distribution system is to keep the water from exceeding allowable limits during storage. In particular, the storage and distribution system must ensure that water is protected against ionic and organic contamination, which would lead to an increase in conductivity and total organic carbon, respectively. The system must also be protected against physical entry of foreign particles and microorganisms so that microbial growth is prevented or minimized. Water for specific purposes should be stored in appropriate containers; *see* Table IV.

12 Incompatibilities

In pharmaceutical formulations, water can react with drugs and other excipients that are susceptible to hydrolysis (decomposition in the presence of water or moisture) at ambient and elevated temperatures.

Water can react violently with alkali metals and rapidly with alkaline metals and their oxides, such as calcium oxide and magnesium oxide. Water also reacts with anhydrous salts to form

Table II: Pharmacopeial specifications of water for purified and sterile purified water.

Table IV: Storage requirements for different grades of water.

Type	Storage requirements[a]
Bacteriostatic water for injection	Preserve in single-dose and multiple-dose containers, preferably of Type I or Type II glass, not larger than 30 mL in size.
Potable water	Preserve in tightly sealed containers.
Purified water	Preserve in tightly sealed containers. If it is stored in bulk, the conditions of storage should be designed to limit the growth of microorganisms and avoid any other contamination.
Sterile water for inhalation	Preserve in single-dose containers, preferably of Type I or Type II glass.
Sterile water for injection	Preserve in single-dose containers, preferably of Type I or Type II glass, not more than 1000 mL in size.
Water for injection	Preserve in tightly sealed containers.
Water for injections in bulk	Collect and store in conditions designed to prevent growth of microorganisms and avoid any other contamination.

(a) To prevent evaporation and to maintain quality.

hydrates of various compositions, and with certain organic materials and calcium carbide.

13 Method of Manufacture

Unlike other excipients, water is not purchased from outside suppliers but is manufactured in-house by pharmaceutical companies. As naturally occurring water has a variety of contaminants, many treatment processes have been developed to remove these. A typical pharmaceutical water purification system contains several unit operations designed to remove various components. The selection of the most appropriate system and its overall design are crucial factors in ensuring that water of the correct quality is produced.[1,2]

To produce potable or drinking water, insoluble matter is first removed from a water supply by coagulation, settling (clarification), and filtering processes. Pathogenic microorganisms present are then destroyed by aeration, chlorination, or some other means. Water may also be rendered free of viable pathogenic microorganisms by active boiling for 15–20 minutes. Activated carbon filters are employed to remove chlorine and many dissolved organic materials found in water, although they may become a breeding ground for microorganisms. The palatability of the water is improved by aeration and charcoal filtration.

Purified water suitable for use in pharmaceutical formulations is usually prepared by purifying potable water by one of several processes, such as distillation, deionization, or RO.[1,3–8]

The quality attributes of WFI are stricter than those for purified water. Consequently, the preparation methods typically vary in the last stage to ensure good control of WFI quality. Methods for the production of WFI are the subject of current debate. The PhEur 9.2 indicates that only distillation would give assurance of consistent supply of the appropriate quality, but permits distillation, ion exchange, RO or any other suitable method that complies with regulations on water intended for human consumption laid down by the competent authority. The USP 40–NF 35 S1 and the JP XVII permit the use of RO in addition to distillation and ultrafiltration. In the past 10–15 years, RO has become the most common way to produce pharmaceutical purified water, either as a final treatment step or as a pretreatment step for the distillation stills.

Distillation Distillation is a process that involves the evaporation of water followed by the condensation of the resulting steam. While expensive, it allows removal of almost all organic and inorganic impurities and achieves very high quality water. It is also considered the safest method to avoid microbial and endotoxin contamination. To improve energy efficiency, distillation is usually conducted in multiple-effects stills designed to recover most of the energy spent on evaporating the water. A typical design consists of an evaporator, vapor separator, and compressor. The distilland (raw feed water) is heated in the evaporator to boiling and the vapor produced is separated from entrained distilland in the separator. The vapor then enters a compressor where the temperature of the vapors is raised to 107°C. Superheated vapors are then condensed on the outer surface of the tubes of the evaporator containing cool distilland circulating within.

Vapor compression stills of various sizes are commercially available and can be used to produce water of high purity when properly constructed. A high-quality distillate, such as WFI, can be obtained if the water is first deionized. The best stills are constructed from types 304 or 316 stainless steel and coated with pure tin, or are made from chemical-resistant glass.

Deionization An ionic exchange process is based on the ability of certain synthetic resins to selectively adsorb either cations or anions, and to release (exchange) other ions based on their relative activity. Cationic and anionic ion exchange resins are used to purify potable water by removing any dissolved ions. Dissolved gases are also removed, while chlorine, in the concentrations generally found in potable water, is destroyed by the resin itself. Some organics and colloidal particles are removed by adsorption and filtration. Resin beds may, however, foster microbial life and produce pyrogenic effluent unless adequate precautions are taken to prevent contamination. Another disadvantage is the type of chemicals required for resin regeneration. A continuous deionization system, which represents a combination of ion exchange and membrane separation technologies, uses an electrical current to continuously regenerate the ion exchange resin simultaneously with the water treatment process, eliminating the need to handle powerful chemicals. Ion exchange units are normally used today to treat raw feed water prior to distillation or RO processing.

Reverse osmosis Water is forced through a semipermeable membrane in the opposite direction to normal osmotic diffusion. Typically, membranes range between 1–10 Å and reject not only organic compounds, bacteria and viruses, but also 90–99% of all ions. It is common to use double-pass RO systems with two filtration stages connected in series. Such systems meet requirements for USP–NF purified water and WFI. However, EU regulations do not allow RO to be used as a final treatment step for the production of WFI.

Membrane filtration Membrane filters are surface-type filters, which stop particles larger than the pore size at the upstream surface of the polymeric membrane. Microfiltration uses membranes with pores in the 0.1–1.0 µm range, which can filter out particles of dust, activated carbon, ion exchange resin fines, and most microorganisms. Ultrafiltration uses membranes that reject not only solid particles but also dissolved matter with a high molecular weight. The 'molecular weight cut-off' point of such membranes varies in the range 10 000–100 000 Da, and bacteria, endotoxins, colloidal contaminants, and large organic molecules can be removed.

14 Safety

Water is the base for many biological life forms, and its safety in pharmaceutical formulations is unquestioned provided it meets standards of quality for potability[9] and microbial content; *see* Sections 9 and 18. Plain water is considered slightly more toxic upon injection into laboratory animals than physiological salt solutions such as normal saline or Ringer's solution.

Ingestion of excessive quantities of water can lead to water intoxication, with disturbances of the electrolyte balance.

WFI should be free from pyrogens.

LD_{50} (mouse, IP): 25 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in nonparenteral and parenteral medicines licensed in the UK and US.

17 Related Substances

Bacteriostatic water for injection; carbon dioxide-free water; de-aerated water; hard water; soft water; sterile water for inhalation; sterile water for injection; sterile water for irrigation; water for injection (WFI).

Bacteriostatic water for injection

Comments The USP 40–NF 35 S1 describes bacteriostatic water for injection as sterile water for injection that contains one or more suitable antimicrobial agents.

Carbon dioxide-free water

Comments Purified water that has been boiled vigorously for 5 minutes and allowed to cool while protecting it from absorption of atmospheric carbon dioxide.

De-aerated water

Comments Purified water that has been boiled vigorously for 5 minutes and cooled to reduce the air (oxygen) content.

Hard water

Comments Water containing the equivalent of not less than 120 mg/L and not more than 180 mg/L of calcium carbonate.

Soft water

Comments Water containing the equivalent of not more than 60 mg/L of calcium carbonate.

Sterile water for inhalation

Comments The USP 40–NF 35 S1 describes sterile water for inhalation as WFI sterilized and suitably packaged. It contains no antimicrobial agents or other added substances, except where used in humidifiers or other similar devices, and where liable to contamination over a period of time.

Sterile water for injection

Comments The USP 40–NF 35 S1 describes sterile water for injection as WFI sterilized and suitably packaged. It contains no antimicrobial agents or other substances.

Sterile water for injection is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Sterile water for irrigation

Comments The USP 40–NF 35 S1 describes sterile water for irrigation as WFI sterilized and suitably packaged. It contains no antimicrobial agents or other substances.

Water for injection (WFI)

Comments The USP 40–NF 35 S1 describes WFI as water purified by distillation or RO. It contains no added substances. The PhEur 9.2 title is 'water for injections' and comprises two parts: 'water for injections in bulk' and 'sterilized water for injection'. The PhEur 9.2 states that water for injections is produced by distillation.

18 Comments

In most pharmacopeias, the term 'water' now refers to purified or distilled water.

Without further purification, 'water' may be unsuitable for certain pharmaceutical applications; for example, the presence of calcium in water affects the viscosity and gel strength of algins and pectin dispersions, while the use of potable water affects the clarity and quality of cough mixtures, and the stability of antibiotic liquid preparations.

Water commonly contains salts of aluminum, calcium, iron, magnesium, potassium, sodium, and zinc. Toxic substances such as arsenic, barium, cadmium, chromium, cyanide, lead, mercury, and selenium may constitute a danger to health if present in excessive amounts. Ingestion of water containing high amounts of calcium and nitrate is also contraindicated. National standards generally specify the maximum limits for these inorganic substances in potable water. Limits have also been placed on microorganisms, detergents, phenolics, chlorinated phenolics, and other organic substances. The WHO[11] and national bodies have issued guidelines for water quality, although many countries have their own standards for water quality embodied in specific legislation.[12] *See* Table V.

Control of microbiological contamination is critical for waters used in preparation of pharmaceuticals, as proliferation of microorganisms can potentially occur during all stages of manufacture, storage, or distribution. Suitable control is achieved by ensuring that the water system is well designed and well maintained. Purified water that is produced, stored, and circulated at ambient temperatures is susceptible to the establishment of biofilms; therefore, frequent monitoring, high usage, correct flow rate, and appropriate sanitization are all factors that require consideration to ensure that water is satisfactory.[13]

Table V: Limits for inorganic substances in potable water (mg/L).

Contaminant	UK (mg/L)	WHO (mg/L)
Aluminum	0.2	0.2
Ammonium	0.5	—
Antimony	0.01	—
Arsenic	0.05	0.05
Barium	1.0	No limit
Beryllium	—	No limit
Boron	2.0	—
Cadmium	0.005	0.005
Calcium	250	—
Chloride	400	250
Chromium	0.05	0.05
Copper	3.0	1.0
Cyanide	0.05	0.1
Fluoride	1.5	1.5
Iron	0.2	0.3
Lead	0.05	0.05
Magnesium	50	—
Manganese	0.05	0.1
Mercury	0.001	0.001
Nickel	0.05	No limit
Nitrate (as N)	—	10
Nitrate (as NO_3)	50	—
Nitrite (as NO_2)	0.1	—
Phosphorus	2.2	—
Potassium	12	—
Selenium	0.01	0.01
Silver	0.01	No limit
Sodium	150	200
Sulfate	250	400
Zinc	5.0	5.0

Monitoring of the whole system is essential in order to demonstrate that correct microbiological quality is achieved. For WFI, the recommended methodology is membrane filtration (0.45 μm) as a large sample size (100–300 mL) is required. For

purified water, membrane filtration or plate count methods are typically used depending on the quality requirements of the system. It is important to set appropriate target, alert, and action limits to serve as an indication of action required to bring the quality of water back under control. It is recognized that limits are not intended as pass/fail criteria for water or product batches; however, an investigation regarding the implications should be conducted.[14]

Validation is conducted to provide a high level of assurance that the water production and distribution system will consistently produce water conforming to a defined quality specification. The validation process serves to qualify the design (DQ), installation (IQ), operation (OQ), and performance (PQ) of the system. The extent of monitoring data required should be defined, with consideration given to whether validation to FDA guidelines is required.[14] It is also important to have an ongoing control program with respect to maintenance, and periodic reviews of the performance of the water system.

The PubChem Compound ID (CID) for water is 962.

Wax, Anionic Emulsifying

1 Nonproprietary Names

BP: Emulsifying Wax

PhEur: Cetostearyl Alcohol (Type A), Emulsifying
Cetostearyl Alcohol (Type B), Emulsifying

2 Synonyms

Collone HV; *Crodex A*; *Cyclonette Wax*; *Kerawax*; *Lanette SX*; *Lanette W*.

3 Chemical Name and CAS Registry Number

Anionic emulsifying wax [8014-38-8]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 specifies that cetostearyl alcohol (type A), emulsifying contains a minimum of 80% cetostearyl alcohol and 7% sodium cetostearyl sulfate. Cetostearyl alcohol (type B), emulsifying contains a minimum of 80% cetostearyl alcohol and 7% sodium lauryl sulfate. A suitable buffer can be added to both.

The BP 2017 describes anionic emulsifying wax as containing cetostearyl alcohol, and either sodium lauryl sulfate or a sodium salt of a similar sulfated higher primary aliphatic alcohol. *See also* Section 18.

The BP 2017 specifies that the formula of anionic emulsifying wax is:

Cetostearyl alcohol	90 g
Sodium lauryl sulfate	10 g
Purified water	4 mL

5 Structural Formula

See Section 4.

6 Functional Categories

Emulsifying agent; solubilizing agent; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Anionic emulsifying wax is used in cosmetics and topical pharmaceutical formulations primarily as an emulsifying agent. The wax is

added to fatty or paraffin bases to facilitate the production of oil-in-water emulsions that are nongreasy. In concentrations of about 2%, emulsions are pourable; stiffer emulsions, e.g. aqueous cream BP, may contain up to 10% of anionic emulsifying wax.

Creams should be adequately preserved and can usually be sterilized by autoclaving. A better-quality emulsion is produced by incorporating some alkali into the aqueous phase, although care should be taken not to use an excess.

Anionic emulsifying wax (3–30%) may also be mixed with soft and liquid paraffins to prepare anhydrous ointment bases such as emulsifying ointment BP. A preparation of 80% anionic emulsifying wax in white soft paraffin has been used as a soap substitute in the treatment of eczema.

In addition, anionic emulsifying wax (10%) has been added to theobroma oil (cocoa butter) to produce a suppository base with a melting point of 34°C.

8 Description

Anionic emulsifying wax occurs as an almost white or pale yellow colored, waxy solid or flakes, which when warmed become plastic before melting. It has a faint characteristic odor and a bland taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for anionic emulsifying wax.

Test	PhEur 9.2
Identification	+
Characters	+
Acid value	≤2.0
Iodine value	≤3.0
Saponification value	≤2.0
Water	≤3.0%

10 Typical Properties

Density 0.97 g/cm^3
Flash point >205°C
Melting range 49–54°C
Solubility Soluble in chloroform, ether, and, on warming, in fixed oils and mineral oil. The PhEur 9.2 specifies that cetostearyl alcohol, emulsifying (type A and type B) are soluble in hot water giving an opalescent solution, practically insoluble in cold water, and slightly soluble in ethanol (96%). The BP 2017 specifies that emulsifying wax is practically insoluble in water (forms an emulsion); partly soluble in ethanol (96%).
Spectroscopy

NIR spectrum *see* Figure 1.

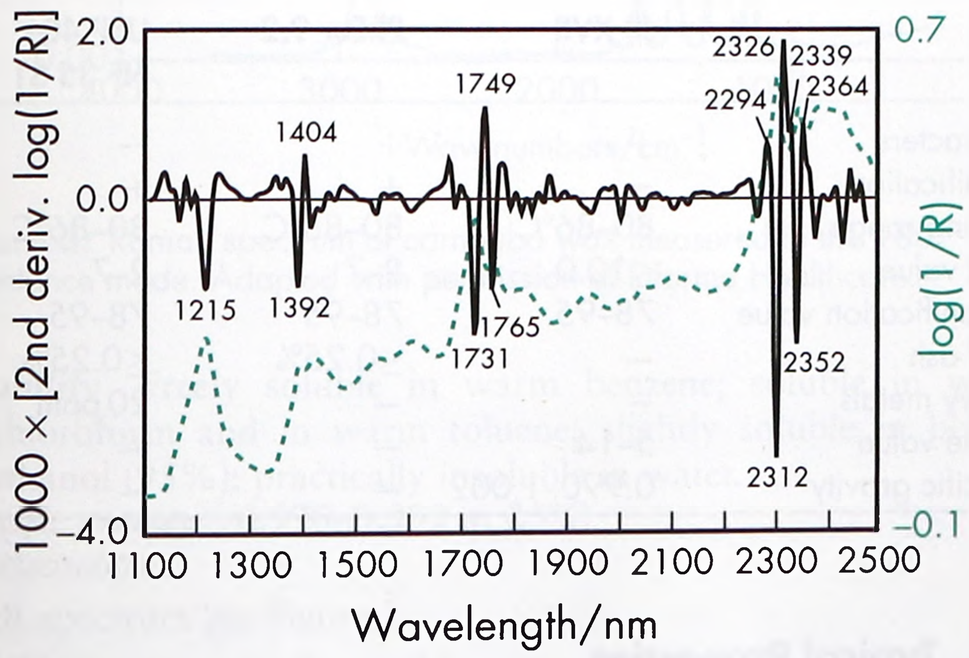

Figure 1: Near-infrared spectrum of anionic emulsifying wax measured by reflectance.

11 Stability and Storage Conditions

Solid anionic emulsifying wax is chemically stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Incompatibilities of anionic emulsifying wax are essentially those of sodium alkyl sulfates and include cationic compounds (quaternary ammonium compounds, acriflavine, ephedrine hydrochloride, antihistamines, and other nitrogenous compounds), salts of polyvalent metals (aluminum, zinc, tin, and lead), and thioglycolates. Anionic emulsifying wax is compatible with most acids above pH 2.5. It is also compatible with alkalis and hard water.

Iron vessels should not be used when heating anionic emulsifying wax; stainless steel containers are satisfactory.

13 Method of Manufacture

Anionic emulsifying wax is prepared by melting cetostearyl alcohol and heating to about 95°C. Sodium lauryl sulfate, or some other suitable anionic surfactant, and purified water are then added. The mixture is heated to 115°C and, while this temperature is maintained, the mixture is stirred vigorously until any frothing ceases. The wax is then rapidly cooled.

14 Safety

Anionic emulsifying wax is used primarily in topical pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material. However, sodium lauryl sulfate, a constituent of anionic emulsifying wax, is known to be irritant to the skin at high concentrations; sodium cetyl sulfate is claimed to be less irritating.

Emulsifying ointment BP, which contains anionic emulsifying wax, has been found to have major sunscreen activity in clinically normal skin and should therefore not be used before phototherapy procedures.[1]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (rectal emulsions and aerosol foams; topical aerosols, emulsions, creams, lotions, and ointments). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cetostearyl alcohol; sodium lauryl sulfate; wax, nonionic emulsifying.

A number of emulsifying waxes are commercially available that contain different sodium alkyl sulfates and may not meet official compendial specifications. *See also* Section 18.

18 Comments

The nomenclature for emulsifying wax is confusing since there are three groups of emulsifying waxes, with different titles in Europe, the UK and US; *see* Table II.

The waxes have similar physical properties but vary in the type of surfactant used, which, in turn, affects the range of compatibilities. Emulsifying wax BP and emulsifying wax USP–NF contain anionic and nonionic surfactants, respectively, and are therefore not interchangeable in formulations.

Table II: Nomenclature for emulsifying wax.

	Europe	UK	US
Nonionic	—	Cetomacrogol emulsifying wax	Emulsifying wax
Anionic	Cetostearyl alcohol (type A), emulsifying Cetostearyl alcohol (type B), emulsifying	Emulsifying wax	—
Cationic	—	Cetrimide emulsifying wax	—

Wax, Carnauba

1 Nonproprietary Names

BP: Carnauba Wax

JP: Carnauba Wax

PhEur: Carnauba Wax

USP–NF: Carnauba Wax

2 Synonyms

Brazil wax; caranda wax; cera carnauba; *EZ COAT CWM*; E903.

3 Chemical Name and CAS Registry Number

Carnauba wax [8015-86-9]

4 Empirical Formula and Molecular Weight

Carnauba wax consists primarily of a complex mixture of esters of acids and hydroxy acids, mainly aliphatic esters, ω-hydroxy esters, *p*-methoxycinnamic aliphatic esters, and *p*-hydroxycinnamic aliphatic diesters composed of several chain lengths, in which C_{26} and C_{32} alcohols are the most prevalent.[1]

Also present are acids, oxypolyhydric alcohols, hydrocarbons, resinous matter, and water.

5 Structural Formula

See Section 4.

6 Functional Category

Coating agent.

7 Applications in Pharmaceutical Formulation or Technology

Carnauba wax is widely used in cosmetics, certain foods, and pharmaceutical formulations. Cosmetically, carnauba wax is commonly used in lip balms.[2]

Carnauba wax is the hardest and highest-melting of the waxes commonly used in pharmaceutical formulations and is used primarily as a 10% w/v aqueous emulsion to polish sugar-coated tablets. Aqueous emulsions may be prepared by mixing carnauba wax with an ethanolamine compound and oleic acid. The carnauba wax coating produces tablets of good luster without rubbing. Carnauba wax may also be used in powder form to polish sugar-coated tablets.

Carnauba wax (10–50% w/w) is also used alone or with other excipients such as hypromellose, hydroxypropyl cellulose, alginate/pectin-gelatin, polymethacrylates, and stearyl alcohol to produce sustained-release solid-dosage formulations.[3–10]

8 Description

Carnauba wax occurs as a light brown- to pale yellow-colored powder, flakes, or irregular lumps of a hard, brittle wax. It has a characteristic bland odor and practically no taste. It is free from rancidity. Various types and grades are available commercially.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for carnauba wax.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

Specific gravity 0.990–0.999 at 25°C

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Unsaponified matter 50–55%

11 Stability and Storage Conditions

Carnauba wax is stable and should be stored in a well-closed container, in a cool, dry place. Protect from light.

12 Incompatibilities

—

13 Method of Manufacture

Carnauba wax is obtained from the leaf buds and leaves of the Brazilian carnauba palm, *Copernicia cerifera*. The leaves are dried and shredded, and the wax is then removed by the addition of hot water.

14 Safety

Carnauba wax is widely used in oral pharmaceutical formulations, cosmetics, and certain food products. It is generally regarded as an essentially nontoxic and nonirritant material.[11–13] However, there have been reports of allergic contact dermatitis from carnauba wax in mascara.[14]

The WHO has established an acceptable daily intake of up to 7 mg/kg body-weight for carnauba wax.[15]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition it emits acrid smoke and irritating fumes.[16]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

In cosmetics, carnauba wax is mainly used to increase the stiffness of formulations, e.g. lipsticks and mascaras. It has been experimentally investigated for use in producing microparticles in a novel hot air coating (HAC) process developed as an alternative to conventional spray-congealing techniques.[17] In addition, carnauba wax has been used to produce gel beads for intragastric floating drug delivery[18] and has been investigated for use in nanoparticulate sunscreen formulations.[19]

The EINECS number for carnauba wax is 232-399-4.

Wax, Cetyl Esters

1 Nonproprietary Names

USP–NF: Cetyl Esters Wax

2 Synonyms

Cera cetyla; *Crodamol SS*; *Cutina CP*; *Liponate SPS*; *Protachem MST*; *Ritaceti*; *Ritachol SS*; spermaceti wax replacement; *Starfol Wax CG*; *Synaceti 116*; synthetic spermaceti.

3 Chemical Name and CAS Registry Number

Cetyl esters wax [977067-67-6]

4 Empirical Formula and Molecular Weight

$C_nH_{2n}O_2$ ≈470–490 (where n = 26–38).

The USP 40–NF 35 S1 describes cetyl esters wax as a mixture consisting primarily of esters of saturated fatty alcohols (C_{14}–C_{18}) and saturated fatty acids (C_{14}–C_{18}).

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Cetyl esters wax is a stiffening agent and emollient used in creams and ointments as a replacement for naturally occurring spermaceti.

Cetyl esters wax is hydrophobic and has been proposed as a suitable component of an ophthalmic gelatin-based, controlled-release delivery matrix.[1]

The physical properties of cetyl esters wax vary greatly from manufacturer to manufacturer owing to differences between the mixtures of fatty acids and fatty alcohol esters that are used. Differences between products appear most obviously in the melting point, which can range from 43–47°C (USP 40–NF 35 S1 range) to 51–55°C, depending on the mixture. Materials with a high melting point tend to contain predominantly cetyl and stearyl palmitates. *See* Table I.

Table I: Uses of cetyl esters wax.

Use	Concentration (%)
Cold cream	12.5
Rose water ointment	12.5
Spermaceti ointment	20.0
Topical creams and ointments	1–15

8 Description

Cetyl esters wax occurs as white to off-white, somewhat translucent flakes (typically in the range of 5 μm to several millimeters in the largest dimension), having a crystalline structure and a pearly luster when caked. It has a faint, aromatic odor and a bland, mild taste.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for cetyl esters wax.

Test	USP 40–NF 35 S1
Melting range	43–47°C
Acid value	≤5
Iodine value	≤1
Saponification value	109–120
Paraffin and free acids	+

10 Typical Properties

Dielectric constant 6–18
Flash point >240°C
Peroxide value ≤0.5
Refractive index n_D^{60} = 1.440
Solubility High melting materials tend to be less soluble. *See* Table III.

Table III: Solubility of cetyl esters wax.

Solvent	Solubility at 20°C unless otherwise stated
Acetone	1 in 500
Chloroform	1 in 2.5
Dichloromethane	1 in 3
Ethanol	1 in 170
Ethanol (95%)	Practically insoluble 1 in 2.5 at 78°C
Ether	Soluble
Ethyl acetate	1 in 80
Fixed and volatile oils	Soluble
Hexane	1 in 8
Mineral oil	1 in 70
Water	Practically insoluble

Specific gravity 0.820–0.840 at 50°C
Viscosity (dynamic) 6.7–7.4 mPa s (6.7–7.4 cP) at 100°C

11 Stability and Storage Conditions

Store in a well-closed container in a cool, dry place. Avoid exposure to excessive heat (above 40°C).

12 Incompatibilities

Cetyl esters wax is incompatible with strong acids or bases.

13 Method of Manufacture

Cetyl esters wax is prepared by the direct esterification of the appropriate mixtures of fatty alcohols and fatty acids.

14 Safety

Cetyl esters wax is an innocuous material generally regarded as essentially nontoxic and nonirritant.

LD_{50} (rat, oral): >16 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Spermaceti wax.

Spermaceti wax

CAS number [8002-23-1]
Appearance Spermaceti is a waxy substance obtained from the head of the sperm whale. It consists of a mixture of the cetyl esters of fatty acids (C_{12}–C_{18}) with cetyl laurate, cetyl myristate, cetyl palmitate, and cetyl stearate comprising at least 85% of the total esters. It occurs as white, translucent, slightly unctuous masses with a faint odor and mild, bland taste.
Iodine value 3.0–4.4
Melting point 44–52°C
Refractive index n_D^{80} = 1.4330
Saponification value 120–136
Solubility Soluble in chloroform, boiling ethanol (95%), ether, and fixed or volatile oils; practically insoluble in ethanol (95%) and water.
Specific gravity 0.938–0.944
Uses Spermaceti has been used in creams, ointments, and suppositories,[2] although it has largely been superseded in pharmaceutical and cosmetics formulation by the synthetic material, cetyl esters wax.
Comments The EINECS number for spermaceti wax is 232-302-5.

Wax, Microcrystalline

1 Nonproprietary Names

USP–NF: Microcrystalline Wax

2 Synonyms

Amorphous wax; E907; petroleum ceresin; petroleum wax (microcrystalline).

3 Chemical Name and CAS Registry Number

Microcrystalline wax [63231-60-7]

4 Empirical Formula and Molecular Weight

Microcrystalline wax is composed of a mixture of straight-chain and randomly branched saturated alkanes obtained from petroleum. The carbon chain lengths range from C_{41} to C_{57}; cyclic hydrocarbons are also present.

5 Structural Formula

See Section 4.

6 Functional Category

Coating agent; modified-release agent; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Microcrystalline wax is used mainly as a stiffening agent in topical creams and ointments.

The wax is used to modify the crystal structure of other waxes (particularly paraffin wax) present in a mixture so that changes in crystal structure, usually exhibited over a period of time, do not occur. Microcrystalline wax also minimizes the sweating or bleeding of oils from blends of oils and waxes. Microcrystalline wax generally has a higher melting point than paraffin wax, and higher viscosity when molten, thereby increasing the consistency of creams and ointments when incorporated into such formulations.

Microcrystalline wax is also used in oral controlled-release matrix pellet formulations for various active compounds[1–3] and as a tablet- and capsule-coating agent. In controlled-release systems, microcrystalline wax coatings can also be used to affect the release of drug from ion-exchange resin beads.[4]

Microcrystalline wax is also used in confectionery, cosmetics, and food products.

8 Description

Microcrystalline wax occurs as odorless and tasteless waxy lumps or flakes containing small irregularly shaped crystals. It may vary in color from white to yellow, amber, brown, or black depending on the grade of material; pharmaceutical grades are usually white or yellow.

The USP 40–NF 35 S1 describes microcrystalline wax as a mixture of straight-chain, branched-chain, and cyclic hydrocarbons, obtained by solvent fractionation of the still-bottom fraction of petroleum by suitable means of dewaxing or de-oiling.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for microcrystalline wax.

Test	USP 40–NF 35 S1
Color	+
Melting range	54–102°C
Consistency	3–100
Acidity	+
Alkalinity	+
Residue on ignition	≤0.1%
Organic acids	+
Fixed oils, fats, and rosin	+

10 Typical Properties

Acid value 1.0
Density 0.928–0.941 g/cm^3
Freezing point 60.0–75.0°C
Refractive index n_D^{100} = 1.435–1.445
Saponification value 0.05–0.10
Solubility Soluble in benzene, chloroform, and ether; slightly soluble in ethanol; practically insoluble in water. When melted, microcrystalline wax is miscible with volatile oils and most warm fixed oils.
Spectroscopy

NIR spectrum *see* Figure 1.

Viscosity (dynamic) 10.0–30.0 mPa s (10.0–30.0 cP) at 100°C.

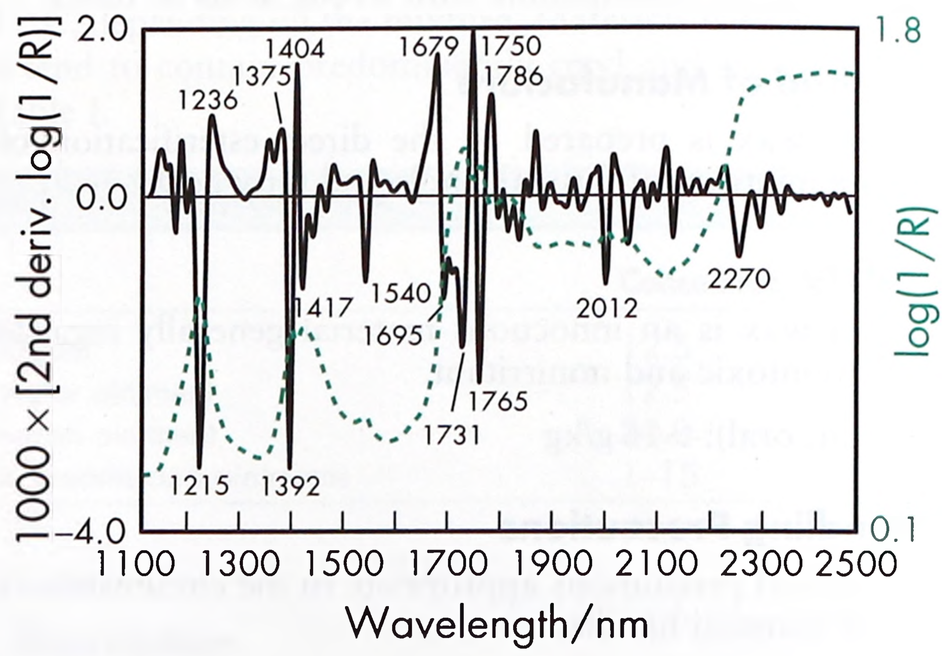

Figure 1: Near-infrared spectrum of microcrystalline wax measured by reflectance.

11 Stability and Storage Conditions

Microcrystalline wax is stable in the presence of acids, alkalis, light, and air. The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Microcrystalline wax is obtained by solvent fractionation of the still-bottom fraction of petroleum by suitable dewaxing or de-oiling.

14 Safety

Microcrystalline wax is mainly used in topical pharmaceutical formulations but is also used in some oral products. It is generally regarded as a nontoxic and nonirritating material.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

16 Regulatory Status

Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Paraffin; wax, white; wax, yellow.

18 Comments

Rheological studies of a model ointment containing microcrystalline wax, white petroleum, and mineral oil showed that while the latter two substances control the rheology of the ointment, microcrystalline wax incorporates itself into the existing white petroleum structure and builds up the structure of the ointment.[5]

Waxes have been combined in melt-extruded drug delivery systems.

A specification for refined microcrystalline wax (petroleum wax) is contained in the *Food Chemicals Codex* (FCC).[6]

Wax, Nonionic Emulsifying

1 Nonproprietary Names

BP: Cetomacrogol Emulsifying Wax

USP–NF: Emulsifying Wax

2 Synonyms

Collone NI; *Crodex N*; *Emulgade 1000NI*; *Kerawax*; *Lipowax P*; *Masurf Emulsifying Wax*; *Permulgin D*; *Polawax*; *Ritachol 2000*; *T-Wax*.

3 Chemical Name and CAS Registry Number

Nonionic emulsifying wax [97069-99-0]

See also Section 4

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 designates nonionic emulsifying wax as emulsifying wax that is prepared from cetostearyl alcohol and contains a polyoxyethylene derivative of a fatty acid ester of sorbitan. However, the BP 2017 describes nonionic emulsifying wax as cetomacrogol emulsifying wax prepared from cetostearyl alcohol and macrogol cetostearyl ether (22). The UK and US materials are therefore constitutionally different. *See also* Section 18.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; solubilizing agent; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Nonionic emulsifying wax is used as an emulsifying agent in the production of oil-in-water emulsions that are unaffected by moderate concentrations of electrolytes and are stable over a wide pH range. The concentration of wax used alters the consistency of a product owing to its 'self-bodying action'; at concentrations up to about 5% a product is pourable.

Concentrations of about 15% of nonionic emulsifying wax are commonly used in creams, but concentrations as high as 25% may be employed, e.g. in chlorhexidine cream BP. Nonionic emulsifying wax is particularly recommended for use with salts of polyvalent metals and medicaments based on nitrogenous compounds. Creams are susceptible to microbial spoilage and should be adequately preserved.

Nonionic emulsifying wax is also used in nonaqueous ointment bases, such as cetomacrogol emulsifying ointment BP, and in barrier creams. It has also been investigated for its effects on the physical

properties of cetyltrimethyl ammonium bromide (CTAB)-based solid lipid nanoparticles.[1]

8 Description

Nonionic emulsifying wax occurs as a white or off-white waxy solid or flakes, which melt when heated to give a clear, almost colorless liquid. Nonionic emulsifying wax has a faint odor, which is characteristic of cetostearyl alcohol.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for nonionic emulsifying wax.

Test	BP 2017	USP 40–NF 35 S1
Identification	+	–
Characters	+	–
Melting range	–	50–54°C
Solidifying point	45–53°C	–
pH (3% dispersion)	–	5.5–7.0
Alkalinity	+	–
Acid value	≤0.5	–
Hydroxyl value	175–192	178–192
Iodine value	–	≤3.5
Refractive index (at 60°C)	1.435–1.439	–
Saponification value	≤2.0	≤14
Sulfated ash	≤0.1%	–

10 Typical Properties

Density 0.94 g/cm^3

Flash point >150°C for *Masurf Emulsifying Wax NF*

Solubility The BP 2017 specifies that cetomagrocol emulsifying wax is practically insoluble in water, forming an emulsion, and is moderately soluble in ethanol (96%), and partly soluble in ether.

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Nonionic emulsifying wax is stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Nonionic emulsifying wax is incompatible with tannin, phenol and phenolic materials, resorcinol, and benzocaine. It may reduce the antibacterial efficacy of quaternary ammonium compounds.

W

13 Method of Manufacture

The BP 2017 specifies that cetomacrogol emulsifying wax (nonionic emulsifying wax) may be prepared by melting and mixing together 800 g of cetostearyl alcohol and 200 g of macrogol cetostearyl ether (22). The mixture is then stirred until cold.

The USP 40–NF 35 S1 formula for nonionic emulsifying wax is a mixture of unstated proportions of cetostearyl alcohol and a polyoxyethylene derivative of a fatty acid ester of sorbitan.

14 Safety

Nonionic emulsifying wax is used in cosmetics and topical pharmaceutical formulations, and is generally regarded as a nontoxic and nonirritant material.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

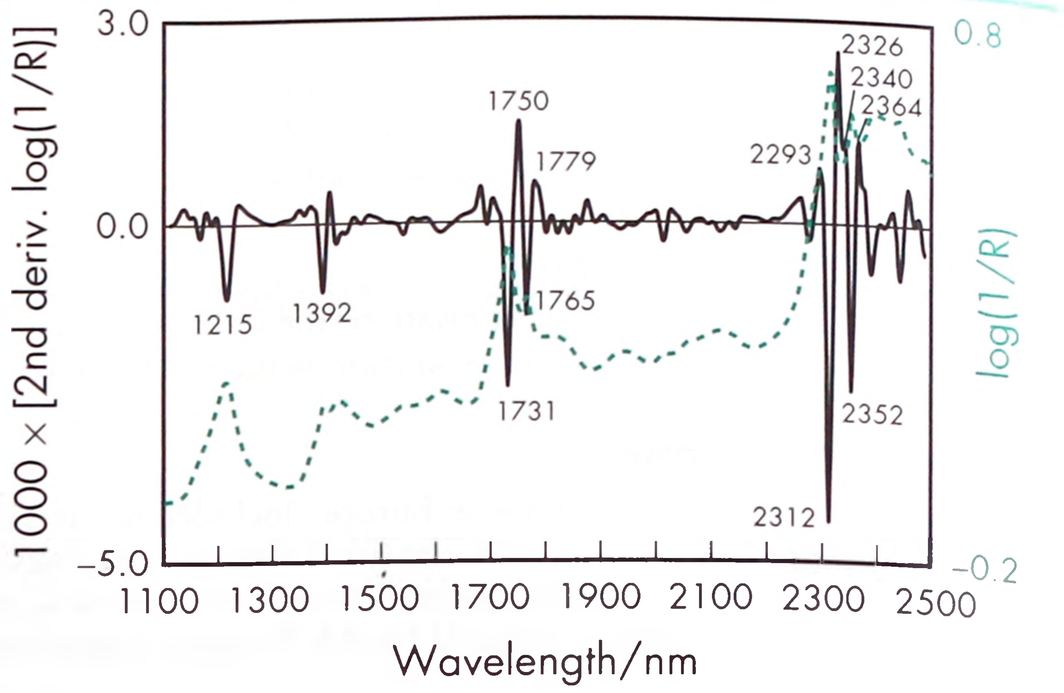

Figure 1: Near-infrared spectrum of nonionic emulsifying wax measured by reflectance.

16 Regulatory Status

Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cationic emulsifying wax; cetostearyl alcohol; polyoxyethylene alkyl ethers; wax, anionic emulsifying.

It should be noted that there are many similar nonionic emulsifying waxes composed of different nonionic surfactants and fatty alcohols.

Cationic emulsifying wax

Synonyms cetrimide emulsifying wax; *Crodex C.*

Method of manufacture Cetrimide emulsifying wax is prepared similarly to nonionic emulsifying wax and contains 90 g of cetostearyl alcohol and 10 g of cetrimide.

Comments Cationic emulsifying wax is claimed to be of particular value in cosmetic and pharmaceutical formulations when cationic characteristics are important. Thus it can be used in medicated creams, germicidal creams, ointments and lotions, hair conditioners, baby creams, and skin care products in which cationic compounds are included. Cationic emulsifying wax is compatible with cationic and nonionic materials, but is incompatible with anionic surfactants and drugs. Additional antimicrobial preservatives should be included in creams. Cetrimide may cause irritation to the eye; *see* Cetrimide.

18 Comments

The nomenclature for emulsifying wax is confusing since there are three groups of emulsifying waxes with different titles in Europe, the UK, and US; *see* Table II.

Table II: Nomenclature for emulsifying wax.

	Europe	UK	US
Nonionic	–	Cetomacrogol emulsifying wax	Emulsifying wax
Anionic	Cetostearyl alcohol (type A), emulsifying Cetostearyl alcohol (type B), emulsifying	Emulsifying wax	–
Cationic	–	Cetrimide emulsifying wax	–

The waxes have similar physical properties but vary in the type of surfactant used, which, in turn, affects the range of compatibilities.

Emulsifying wax BP and emulsifying wax USP–NF contain anionic and nonionic surfactants, respectively, and are therefore not interchangeable in formulations.

Wax, White

1 Nonproprietary Names

BP: White Beeswax

JP: White Beeswax

PhEur: Beeswax, White

USP–NF: White Wax

2 Synonyms

Bleached wax; cera alba; E901.

3 Chemical Name and CAS Registry Number

White beeswax [8012-89-3]

4 Empirical Formula and Molecular Weight

White wax is the chemically bleached form of natural beeswax; *see* Section 13.

Beeswax consists of 70–75% of a mixture of various esters of straight-chain monohydric alcohols with even-numbered carbon chains from C_{24} to C_{36} esterified with straight-chain acids. These straight-chain acids also have even numbers of carbon atoms up to C_{36} together with some C_{18} hydroxy acids. The chief ester is myricyl palmitate. Also present are free acids (about 14%) and carbohydrates (about 12%) as well as approximately 1% free wax alcohols and stearic esters of fatty acids.

5 Structural Formula

See Section 4.

6 Functional Category

Coating agent; emulsion stabilizing agent; modified-release agent; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

White wax is a chemically bleached form of yellow wax and is used in similar applications: for example, to increase the consistency of creams and ointments, and to stabilize water-in-oil emulsions. White wax is used to polish sugar-coated tablets and to adjust the melting point of suppositories.

White wax is also used as a film coating in sustained-release tablets.[1] White beeswax microspheres may be used in oral dosage forms to retard the absorption of an active ingredient from the stomach, allowing the majority of absorption to occur in the intestinal tract. Wax has been incorporated in dosage forms intended to float in the stomach fluids to prolong drug release, with mixed results.[2] Wax coatings can also be used to affect the release of drug from ion-exchange resin beads.[3–5]

See also Wax, Yellow and Microcrystalline Wax.

8 Description

White wax consists of tasteless, white or slightly yellow-colored sheets or fine granules with some translucence. Its odor is similar to that of yellow wax but is less intense.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for white wax.

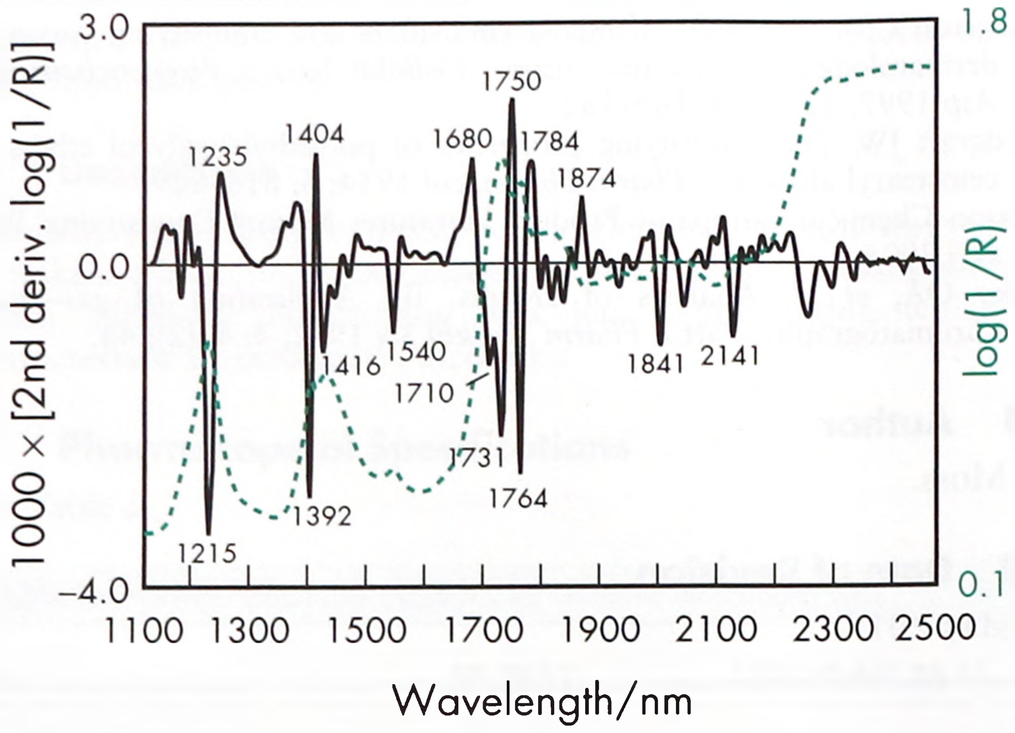

Figure 1: Near-infrared spectrum of white wax measured by reflectance.

10 Typical Properties

Arsenic ≤3 ppm
Density 0.95–0.96 g/cm^3
Flash point 245–258°C
Heavy metals ≤0.004%
Iodine number 8–11
Lead ≤10 ppm
Melting point 61–65°C
Peroxide value ≤8
Solubility Soluble in chloroform, ether, fixed oils, volatile oils, and warm carbon disulfide; sparingly soluble in ethanol (95%); practically insoluble in water.
Spectroscopy

NIR spectrum *see* Figure 1.

Unsaponified matter 52–55%

11 Stability and Storage Conditions

When the wax is heated above 150°C, esterification occurs with a consequent lowering of acid value and elevation of melting point. White wax is stable when stored in a well-closed container, protected from light.

12 Incompatibilities

White wax is incompatible with oxidizing agents.

13 Method of Manufacture

Yellow wax (beeswax) is obtained from the honeycomb of the bee (*Apis mellifera* Linné (Fam. Apidae)); *see* Wax, Yellow. Subsequent treatment with oxidizing agents bleaches the wax to yield white wax.

14 Safety

White wax is used in both topical and oral formulations, and is generally regarded as an essentially nontoxic and nonirritant material. However, although rare, hypersensitivity reactions to beeswax (attributed to contaminants in the wax) have been reported.[6,7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules and tablets; rectal, topical, and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Paraffin; wax, microcrystalline; wax, yellow.

18 Comments

Waxes have been combined in melt-extruded drug delivery systems.

A specification for white beeswax is contained in the *Food Chemicals Codex* (FCC).[8]

W

Wax, Yellow

1 Nonproprietary Names

BP: Yellow Beeswax
JP: Yellow Beeswax
PhEur: Beeswax, Yellow
USP–NF: Yellow Wax

2 Synonyms

Apifil; cera flava; E901; refined wax.

3 Chemical Name and CAS Registry Number

Yellow beeswax [8012-89-3]

4 Empirical Formula and Molecular Weight

Yellow wax is naturally obtained beeswax; *see* Section 13.

Beeswax consists of 70–75% of a mixture of various esters of straight-chain monohydric alcohols with even-numbered carbon chains from C_{24} to C_{36} esterified with straight-chain acids. These straight-chain acids also have even numbers of carbon atoms up to C_{36} together with some C_{18} hydroxy acids. The chief ester is myricyl palmitate. Also present are free acids (about 14%) and carbohydrates (about 12%) as well as approximately 1% free wax alcohols and stearic esters of fatty acids.

5 Structural Formula

See Section 4.

6 Functional Category

Coating agent; emulsion stabilizing agent; modified-release agent; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Yellow wax is used in food, cosmetics, and confectionery products. Its main use is in topical pharmaceutical formulations, where it is used at a concentration of 5–20%, as a stiffening agent in ointments and creams. Yellow wax is also employed in emulsions because it enables water to be incorporated into water-in-oil emulsions.

In some oral formulations yellow wax is used as a polishing agent for sugar-coated tablets. It is also used in sustained-release formulations. Yellow wax coatings can be used to affect the release rate of drug from ion-exchange resin beads,[1] and yellow wax has also been used in multiparticulate controlled-release dosage forms of chlorphenamine maleate.[2]

Yellow wax forms a soap with borax.

8 Description

Yellow or light brown pieces or plates with a fine-grained matt, noncrystalline fracture and a faint characteristic odor. The wax becomes soft and pliable when warmed.

The PhEur 9.2 describes yellow wax as the wax obtained by melting the walls of the honeycomb made by the honeybee, *Apis mellifera*, with hot water and removing foreign matter.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for yellow wax.

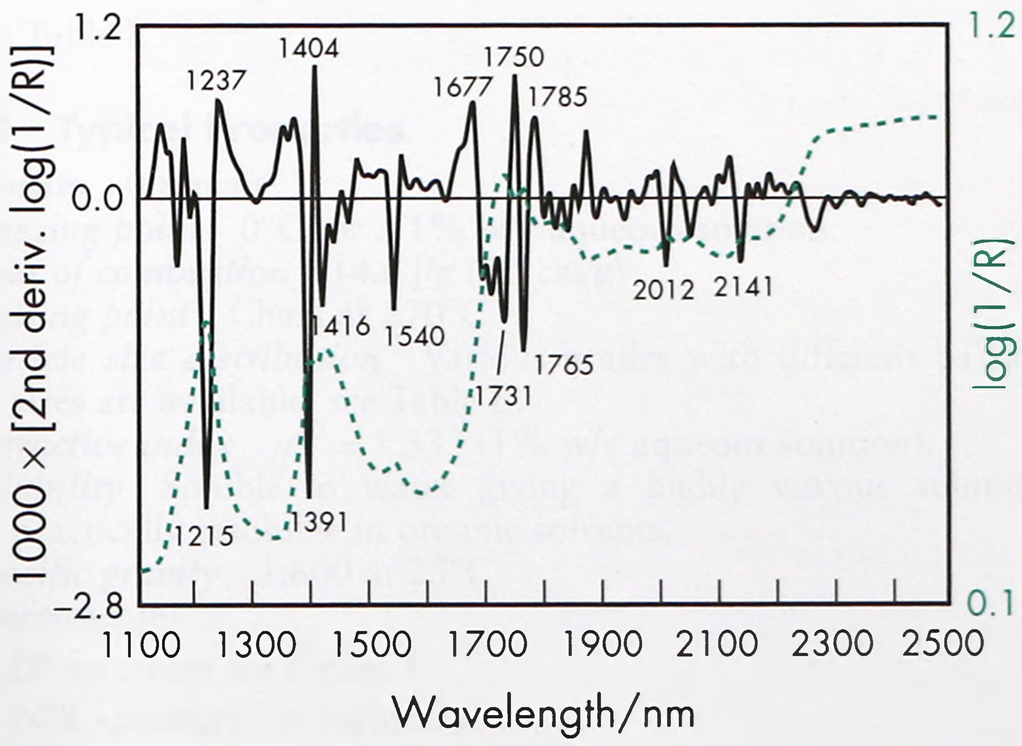

Figure 1: Near-infrared spectrum of yellow wax measured by reflectance.

11 Stability and Storage Conditions

When the wax is heated above 150°C esterification occurs with a consequent lowering of acid value and elevation of melting point. Yellow wax is stable when stored in a well-closed container, protected from light.

12 Incompatibilities

Yellow wax is incompatible with oxidizing agents.

13 Method of Manufacture

Yellow wax is a natural secretion of bees (*Apis mellifera* Linné (Fam. Apidae)) and is obtained commercially from honeycombs. Honey is abstracted from combs either by draining or centrifugation, and water is added to the remaining wax to remove soluble impurities. Hot water is then added to form a floating melt, which is strained to remove foreign matter. The wax is then poured into flat dishes or molds to cool and harden.

14 Safety

Yellow wax is generally regarded as an essentially nontoxic and nonirritant material, and is used in both topical and oral formulations. However, hypersensitivity reactions attributed to contaminants in the wax, although rare, have been reported.[3,4]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM injections; oral capsules and tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Paraffin; wax, microcrystalline; wax, white.

18 Comments

Studies have shown that yellow wax, when added to suppository formulations, increased the melting point of the preparation significantly and decreased the rate of release of the active substance.[5] *See also* White Wax.

Waxes have been combined in melt-extruded drug delivery systems.

A specification for yellow beeswax is contained in the *Food Chemicals Codex* (FCC).[6]

Xanthan Gum

1 Nonproprietary Names

BP: Xanthan Gum

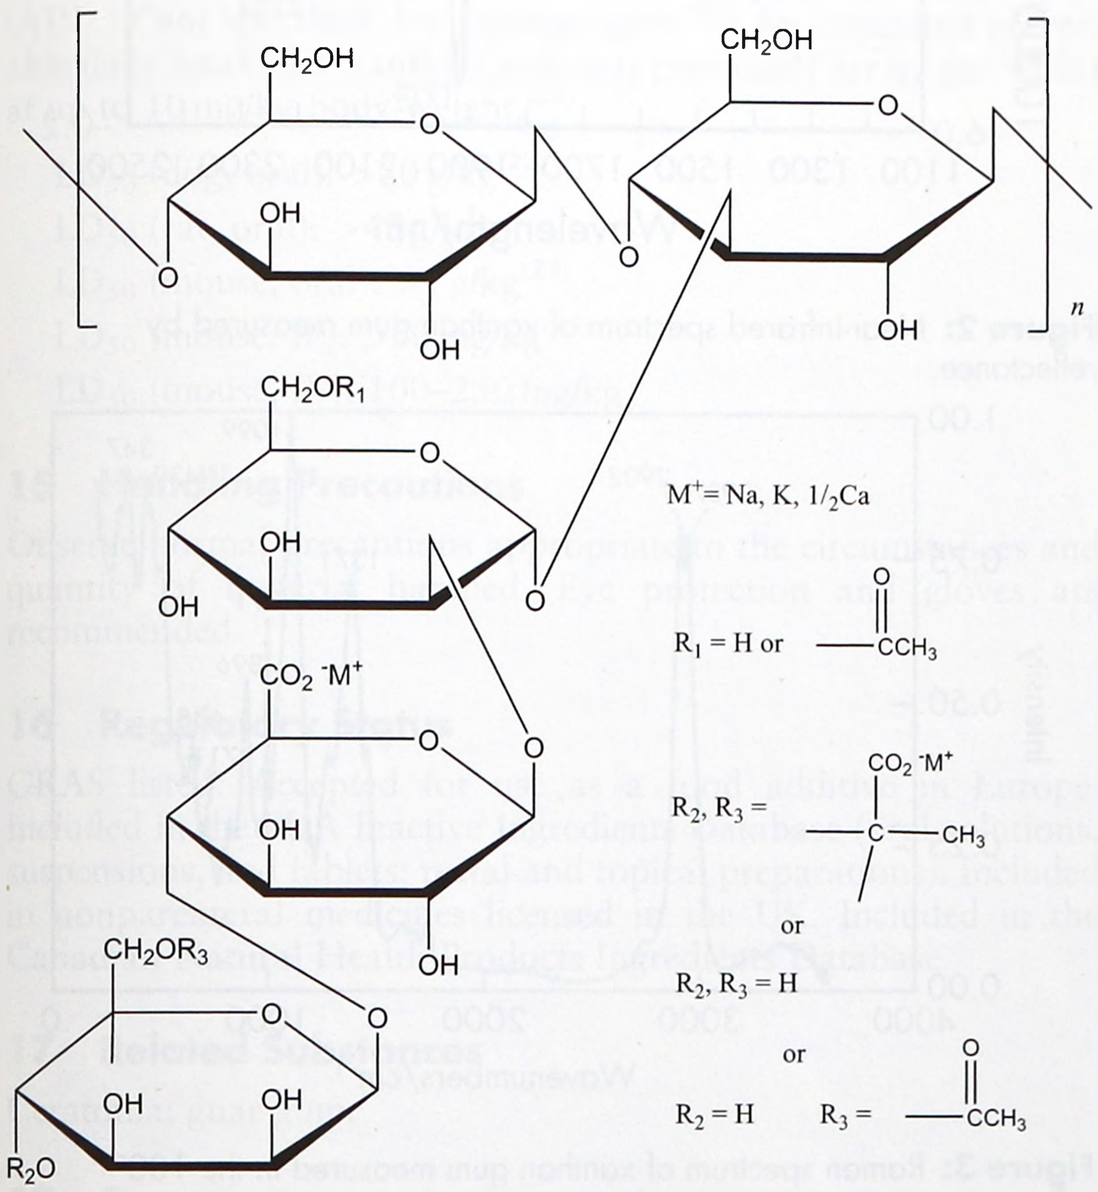
PhEur: Xanthan Gum

USP–NF: Xanthan Gum

2 Synonyms

Corn sugar gum; E415; *Grindsted*; *Keldent*; *Keltrol*; polysaccharide B-1459; *Rhodicare S*; *Rhodigel*; *Rhodopol*; *Satiaxane U*; *Vanzan NF*; xanthani gummi; *Xantural*.

3 Chemical Name and CAS Registry Number



Xanthan gum [11138-66-2]

4 Empirical Formula and Molecular Weight

$(C_{35}H_{49}O_{29})_n$ approximately 1 000 000

The USP 40–NF 35 S1 describes xanthan gum as a high molecular weight polysaccharide gum. It contains D-glucose and D-mannose as the dominant hexose units, along with D-glucuronic acid, and is prepared as the sodium, potassium, or calcium salt.

5 Structural Formula

Each xanthan gum repeat unit contains five sugar residues: two glucose, two mannose, and one glucuronic acid. The polymer backbone consists of linear (1→4) linked β-D-glucose units, and is therefore identical in structure to cellulose. Trisaccharide side chains on alternating anhydroglucose units distinguish xanthan from cellulose. Each side chain comprises a glucuronic acid residue between two mannose units. Approximately 50% of terminal mannose residues are pyruvated and nonterminal residues usually carry an acetyl group at C-6. The glucuronic acid and pyruvic acid groups on the side chains give xanthan gum its anionic charge. The interaction of these anionic side chains with the polymer backbone and with each other determines the beneficial properties of xanthan gum solutions. The resulting stiff polymer chain may exist in solution as a single, double, or triple helix that interacts with other xanthan gum molecules to form complex, loosely bound networks.[1,2]

6 Functional Category

Bioadhesive material; emulsifying agent; gelling agent; modified-release agent; suspending agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Xanthan gum is widely used in oral and topical pharmaceutical formulations, cosmetics, and foods as a suspending agent, thickening agent and emulsifying agent.

Xanthan gum has been used as a suspending agent for conventional, dry and sustained-release suspensions.[3–5] Although primarily used as a suspending agent, xanthan gum has also been used to prepare sustained-release matrix tablets,[6–9] with chitosan,[10–12] guar gum,[6,9] galactomannan,[13] tragacanth,[14] and ceratonia (locust bean gum).[15]

A synergistic interaction occurs between xanthan gum and galactomannans such as guar gum, locust bean gum, and cassia gum, resulting in enhanced viscosity or gelation, which is valuable in applications where very high viscosity or gel formation is needed. Optimum synergistic effects are obtained with xanthan gum : guar gum ratios between 1 : 1 and 1 : 9. Similarly, mixtures of xanthan gum and magnesium aluminum silicate in ratios between 1 : 2 and 1 : 9 produce optimum synergistic rheological properties.[16]

Xanthan gum is also used as a hydrocolloid in the food industry, and in cosmetics it has been used as a thickening agent in shampoo.[17] Polyphosphate with xanthum gum in soft drinks is suggested to be effective at reducing erosion of enamel.[18,19]

See also Section 18.

8 Description

Xanthan gum occurs as a cream- or white-colored, odorless, free-flowing, fine powder.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Density 0.8 g/cm^3

Freezing point 0°C for a 1% w/v aqueous solution.

Heat of combustion 14.6 J/g (3.5 cal/g)

Melting point Chars at 270°C.

Particle size distribution Various grades with different particle sizes are available; *see* Table II.

Refractive index n_D^{20} = 1.333 (1% w/v aqueous solution).

Solubility Soluble in water giving a highly viscous solution; practically insoluble in organic solvents.

Specific gravity 1.600 at 25°C

Xantural 11K	1100

11 Stability and Storage Conditions

Xanthan gum is a stable material. Aqueous solutions are stable over a wide pH range (pH 2–12), with slightly lower viscosity at extreme temperatures, although they demonstrate maximum stability at pH 4–10 and temperatures of 10–60°C. Xanthan gum solutions of less than 1% w/v concentration may be adversely affected by higher than ambient temperatures: for example, viscosity is reduced. Xanthan gum provides the same thickening, stabilizing, and suspending properties during long-term storage at elevated temperatures as it does at ambient conditions. In addition, it ensures excellent freeze–thaw stability. Solutions are also stable in the presence of enzymes, salts, acids, and bases.

Xanthan gum gels show pseudoplastic behavior, with the shear thinning being directly proportional to the shear rate. Viscosity returns to normal immediately on release of shear stress.

The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Xanthan gum is an anionic material and is not usually compatible with cationic surfactants, polymers, or preservatives, as precipitation occurs. Anionic and amphoteric surfactants at concentrations above 15% w/v cause precipitation of xanthan gum from a solution.

Under highly alkaline conditions, polyvalent metal ions such as calcium cause gelation or precipitation; this may be inhibited by the addition of a glucoheptonate sequestrant. The presence of low levels of borates (<300 ppm) can also cause gelation. This may be avoided by increasing the boron ion concentration or by lowering the pH of a formulation to less than pH 5. The addition of ethylene glycol, sorbitol, or mannitol may also prevent this gelation.

Xanthan gum is compatible with most synthetic and natural viscosity-increasing agents, many strong mineral acids, and up to 30% inorganic salts. If it is to be combined with cellulose derivatives, then xanthan gum free of cellulase should be used to prevent depolymerization of the cellulose derivative. Xanthan gum solutions are stable in the presence of up to 50% water-miscible organic solvents such as acetone, methanol, ethanol, or propan-2-ol. However, above this concentration precipitation or gelation occurs.

The viscosity of xanthan gum solutions is considerably increased, or gelation occurs, in the presence of some materials such as ceratonia, guar gum, and magnesium aluminum silicate.[16]

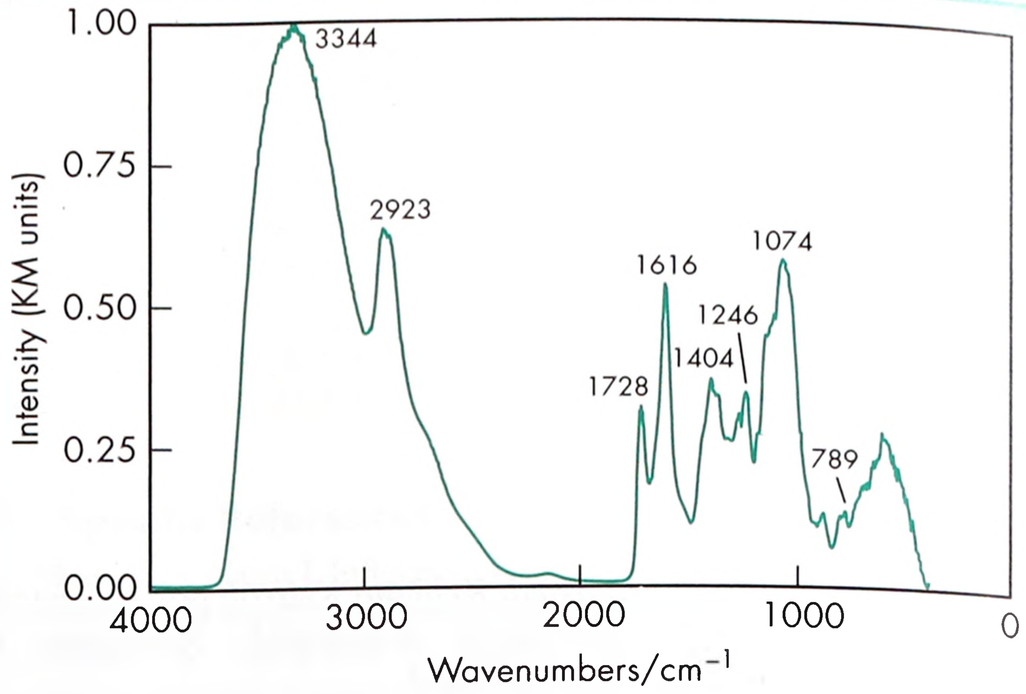

Figure 1: Infrared spectrum of xanthan gum measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

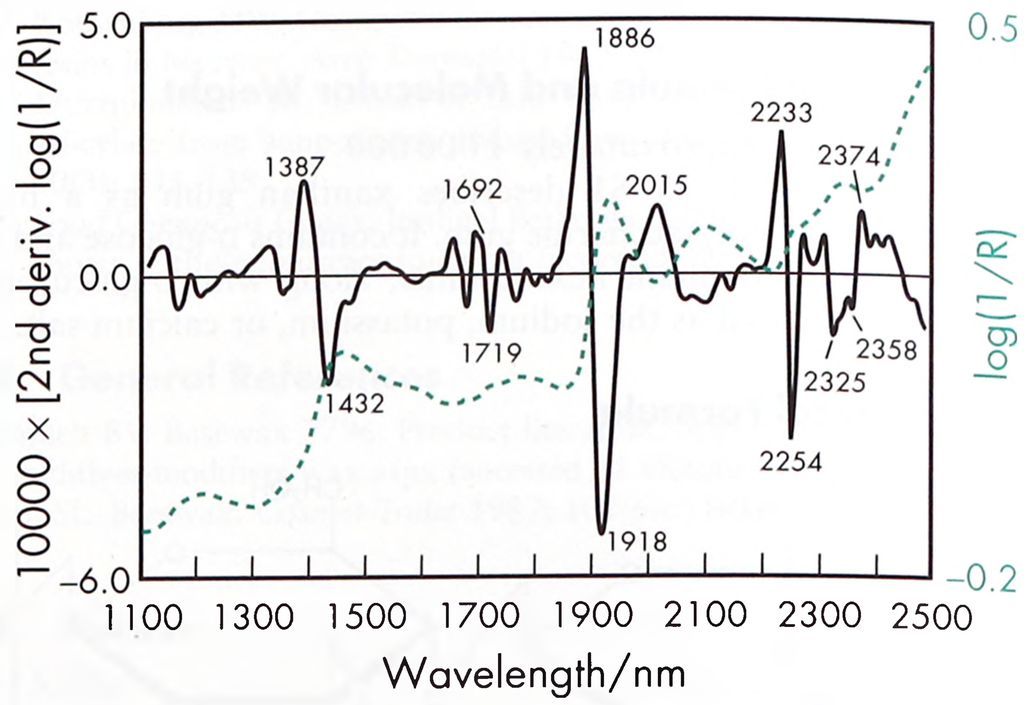

Figure 2: Near-infrared spectrum of xanthan gum measured by reflectance.

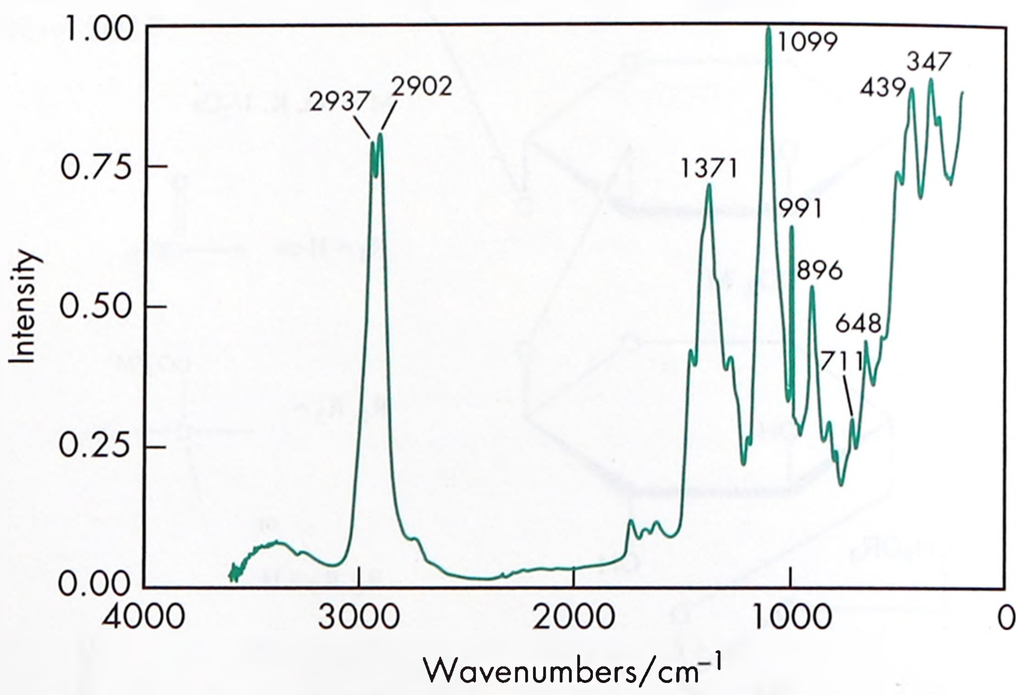

Figure 3: Raman spectrum of xanthan gum measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

This effect is most pronounced in deionized water and is reduced by the presence of salt. This interaction may be desirable in some instances and can be exploited to reduce the amount of xanthan gum used in a formulation; *see* Section 7.

Xanthan gum is incompatible with oxidizing agents such as persulfates, peroxides, and hypochlorites as they cause depolymerization, which is accelerated by heat and catalyzed by certain transition metals such as ferrous ions.

Xanthan gum interacts with some active ingredients such as amitriptyline, tamoxifen, and verapamil.[20]

13 Method of Manufacture

Xanthan gum is a high molecular weight exocellular polysaccharide derived from the bacterium *Xanthomonas campestris* using a natural, aerobic fermentation process. The process is conducted in a sterile environment where pH, oxygen content, and temperature are rigorously controlled. After fermentation is complete, the broth is sterilized and the gum is recovered by precipitation with isopropyl alcohol. It is then dried, milled, and packaged under aseptic conditions.

14 Safety

Xanthan gum is widely used in oral and topical pharmaceutical formulations, cosmetics, and food products, and is generally regarded as nontoxic and nonirritant at the levels employed as a pharmaceutical excipient.

Safety studies have indicated no adverse effects from ingestion of high doses of xanthan gum. The Joint FAO/WHO Expert Committee on Food Additives has established an acceptable daily intake (ADI) of'not specified' for xanthan gum.[21] An estimated acceptable daily intake for xanthan gum was previously set by the WHO at up to 10 mg/kg body-weight.[22]

LD_{50} (dog, oral): >20 g/kg[22]
LD_{50} (rat, oral): >45 g/kg
LD_{50} (mouse, oral): >1 g/kg[23]
LD_{50} (mouse, IP): >50 mg/kg[23]
LD_{50} (mouse, IV): 100–250 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral solutions, suspensions, and tablets; rectal and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ceratonia; guar gum.

18 Comments

Xanthan gum is available in several different grades that have varying particle sizes. Fine-mesh grades of xanthan gum are used in applications where high solubility is desirable since they dissolve rapidly in water. However, fine-mesh grades disperse more slowly than coarse grades and are best used dry blended with the other ingredients of a formulation. In general, it is preferable to dissolve xanthan gum in water first and then add the other ingredients of a formulation.

Xanthan gum in combination with other polymers have been investigated for colonic[24] and floating[25,26] drug delivery systems. It has also been converted to sodium carboxymethyl xanthan gum and crosslinked with aluminum ions to prepare microparticles as a carrier for protein delivery.[27] Xanthan gum in combination with gellan gum was found to protect *Lactobacillus plantarum* and *L. rhamnosus* against simulated bile, improving their viability and can be utilised for probiotic encapsulation.[28]

Xanthan gum increases gel strength and bioadhesion through interaction with mucin, with prolonged retention of the dosage form and increased drug bioavailability. A thermoreversible *in-situ* gel formulated in combination with mucoadhesive polymers such as xanthan gum has been studied for sustained ocular drug delivery.[29–33]

Xanthan gum has been found to increase the bioadhesive strength in vaginal formulations.[34,35] Xanthan gum alone or in combination with other polymers have been investigated as a mucoadhesive controlled-release excipient for buccal drug delivery.[36,37] Xanthan gum-based gels have been studied in the treatment of periodontal diseases.[38] Modified xanthan films, in combination with sodium alginate, have also been studied as a matrix system for transdermal delivery.[39,40]

Xanthan gum has been investigated as a gelling agent[41] for topical formulations incorporating solid lipid nanoparticles[42] or microemulsions.[43] A combined polymer system consisting of xanthan gum and carboxymethylcellulose with a polyvinyl pyrrolidone-backboned polymer has also been investigated for relieving the symptoms of xerostomia.[44] Xanthan gum may also be used in spray-drying and freeze-drying processes for better results.[45,46]

Xanthan gum has been successfully used alone or in combination with agar for microbial culture media.[47]

Novel pH-sensitive hydrogel beads have been prepared using a copolymer of poly(acrylamide-*g*-xanthan) for targeting ketoprofen to the intestine. These beads were able to retard drug release in the stomach, thus diminishing gastric side effects such as ulceration, hemorrhage and erosion of gastric mucosa.[48] Bioadhesive nasal inserts prepared from xanthan gum alone or in combination have a high potential as a new nasal dosage form for extended drug delivery.[49,50] Xanthum gum along with chitosan have used to coat liposomes to yield microparticles for drug delivery to lungs.[51] Xanthan gum wafers have potential as drug delivery systems for suppurating wounds.[52,53]

The USP 40–NF 35 S1 also includes a monograph for xanthan gum solution. A specification for xanthan gum is contained in the *Food Chemicals Codex* (FCC).[54]

The EINECS number for xanthan gum is 234-394-2. The PubChem Compound ID (CID) for xanthan gum is 7107.

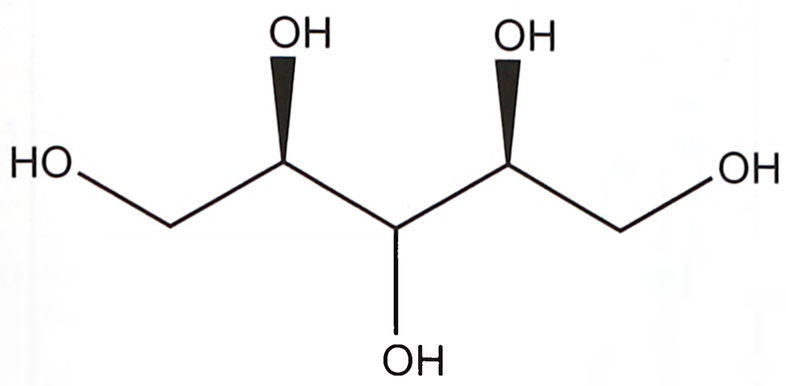
Xylitol

1 Nonproprietary Names

BP: Xylitol
JP: Xylitol
PhEur: Xylitol
USP–NF: Xylitol

2 Synonyms

E967; *Klinit*; *meso*-xylitol; xilitol; *Xylifin*; *Xylisorb*; xylit; *Xylitab*; xylite; *Xylitolo*; xylitolum.



3 Chemical Name and CAS Registry Number

xylo-Pentane-1,2,3,4,5-pentol [87-99-0]

4 Empirical Formula and Molecular Weight

$C_5H_{12}O_5$ 152.15

5 Structural Formula

6 Functional Category

Coating agent; emollient; flavor enhancer; humectant; sweetening agent; tablet and capsule diluent; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Xylitol is used as a noncariogenic sweetening agent in a variety of pharmaceutical dosage forms, including tablets, syrups, and coatings. It is also widely used as an alternative to sucrose in foods and as a base for medicated confectionery.

Xylitol is finding increasing application in chewing gum,[1,2] mouthrinses,[3] and toothpastes[4] as an agent that decreases dental plaque and tooth decay (dental caries). Unlike sucrose, xylitol is not fermented into cariogenic acid end products[5] and it has been shown to reduce dental caries by inhibiting the growth of the cariogenic bacterium, *Streptococcus mutans*.[6,7] As xylitol has an equal sweetness intensity to sucrose, combined with a distinct cooling effect upon dissolution of the crystal, it is highly effective in enhancing the flavor of tablets and syrups and masking the unpleasant or bitter flavors associated with some pharmaceutical actives and excipients.

In topical cosmetic and toiletry applications, xylitol is used primarily for its humectant and emollient properties, although it has also been reported to enhance product stability through a combination of potentiation of preservatives and its own bacteriostatic and bactericidal properties.

Granulates of xylitol are used as diluents in tablet formulations, where they can provide chewable tablets with a desirable sweet taste and cooling sensation, without the 'chalky' texture experienced with some other tablet diluents. Xylitol solutions are employed in tablet-coating applications at concentrations in excess of 65% w/w. Xylitol coatings are stable and provide a sweet-tasting and durable hard coating.

In liquid preparations, xylitol is used as a sweetening agent and vehicle for sugar-free formulations. In syrups, it has a reduced tendency to 'cap-lock' by effectively preventing crystallization around the closures of bottles. Xylitol also has a lower water activity and a higher osmotic pressure than sucrose, therefore enhancing product stability and freshness. In addition, xylitol has also been demonstrated to exert certain specific bacteriostatic and bactericidal effects, particularly against common spoilage organisms.[8,9]

8 Description

Xylitol occurs as a white, granular solid comprising crystalline, equidimensional particles having a mean diameter of about 0.4–0.6 mm. It is odorless, with a sweet taste that imparts a cooling sensation. Xylitol is also commercially available in powdered form, and several granular, directly compressible forms.[10] *See also* Section 17.

9 Pharmacopeial Specifications

■ *Xylitab 200* granulated with 2.0% carboxymethylcellulose
▲ *Xylitab 300* wet granulated.

Figure 3: Particle size distribution of granulated xylitol (*Xylitab*, Danisco A/S).

X

Density (bulk)

0.8–0.85 g/cm^3 for crystalline xylitol;

0.5–0.7 g/cm^3 for directly compressible granulated grades.

Flowability Flow characteristics vary depending upon the particle size of xylitol used. Fine-milled grades tend to be relatively poorly flowing, while granulated grades have good flow properties.

Heat of solution −157.1 kJ/kg (−36.7 cal/g)

Melting point 92.0–96.0°C

Moisture content Xylitol is a moderately hygroscopic powder under normal conditions; *see also* Figure 2. At 20°C and 52% relative humidity, the equilibrium moisture content of xylitol is 0.1% w/w. After drying in a vacuum, over P_2O_5 at 80°C for 4 hours, xylitol loses less than 0.5% w/w water.

Osmolarity A 4.56% w/v aqueous solution is iso-osmotic with serum.

Particle size distribution The particle size distribution of xylitol depends upon the grade selected. Normal crystalline material typically has a mean particle size of 0.4–0.6 mm. Milled grades are commercially available that offer mean particle sizes as low as 50 μm. For particle size distributions of granulated xylitol, *see* Figure 3.

Solubility *see* Table II.

Specific rotation Not optically active.

Spectroscopy

NIR spectrum *see* Figure 4.

Viscosity (dynamic) *see* Figure 5.

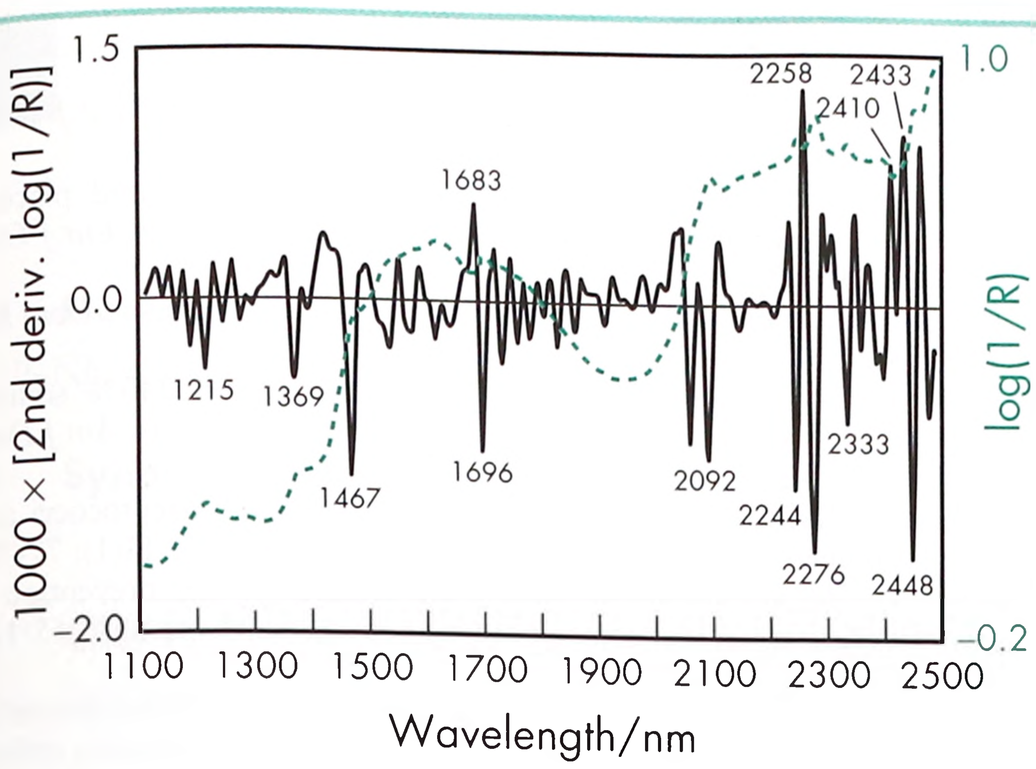

Figure 4: Near-infrared spectrum of xylitol measured by reflectance.

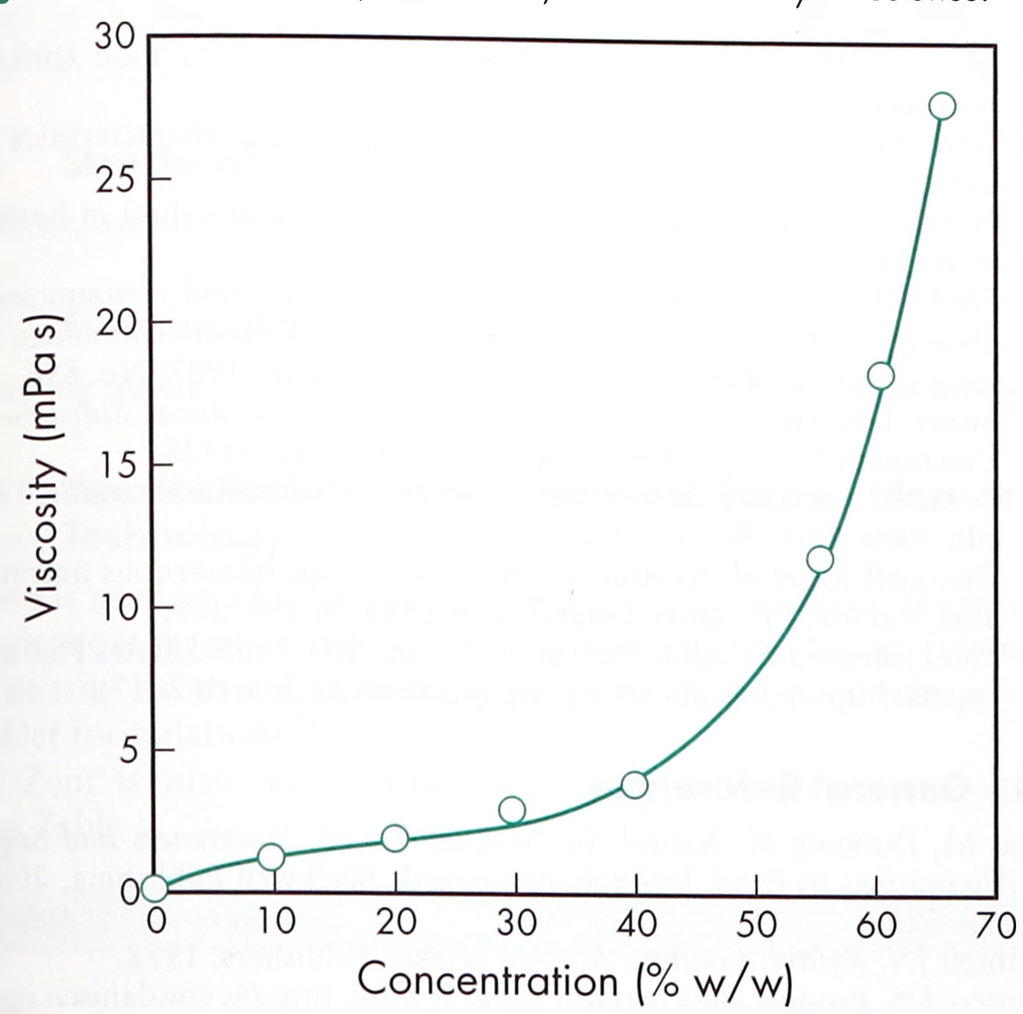

Figure 5: Viscosity of aqueous xylitol solutions at 20°C.

Table II: Solubility of xylitol.

Solvent	Solubility at 20°C
Ethanol	1 in 80
Glycerin	Very slightly soluble
Methanol	1 in 16.7
Peanut oil	Very slightly soluble
Propan-2-ol	1 in 500
Propylene glycol	1 in 15
Pyridine	Soluble
Water	1 in 1.6

11 Stability and Storage Conditions

Xylitol is stable to heat but is marginally hygroscopic. Caramelization can occur only if it is heated for several minutes near its boiling point. Crystalline material is stable for at least 3 years if stored at less than 65% relative humidity and 25°C. Milled and specialized granulated grades of xylitol have a tendency to cake and should therefore be used within 9 to 12 months. Aqueous xylitol solutions have been reported to be stable, even on prolonged heating and storage. Since xylitol is not utilized by most microorganisms, products made with xylitol are usually safe from fermentation and microbial spoilage.[8,9]

Xylitol should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Xylitol is incompatible with oxidizing agents.

13 Method of Manufacture

Xylitol occurs naturally in many fruits and berries, although extraction from such sources is not considered to be commercially viable. Industrially, xylitol is most commonly derived from various types of hemicellulose obtained from such sources as wood, corn cobs, cane pulp, seed hulls, and shells. These materials typically contain 20–35% xylan, which is readily converted to xylose (wood sugar) by hydrolysis. This xylose is subsequently converted to xylitol via hydrogenation (reduction). Following the hydrogenation step, there are a number of separation and purification steps that ultimately yield high-purity xylitol crystals. The nature of this process, and the stringent purification procedures employed, result in a finished product with a very low impurity content. Potential impurities that may appear in small quantities are mannitol, sorbitol, galactitol, or arabitol.

Less commonly employed methods of xylitol manufacture include the conversion of glucose (dextrose) to xylose followed by hydrogenation to xylitol, and the microbiological conversion of xylose to xylitol.

14 Safety

Xylitol is used in oral pharmaceutical formulations, confectionery, and food products, and is generally regarded as an essentially nontoxic, nonallergenic, and nonirritant material.

Xylitol has an extremely low relative glycemic response and is metabolized independently of insulin. Following ingestion of xylitol, the blood glucose and serum insulin responses are significantly lower than following ingestion of glucose or sucrose. These factors make xylitol a suitable sweetener for use in diabetic or carbohydrate-controlled diets.[11]

Up to 100 g of xylitol in divided oral doses may be tolerated daily, although, as with other polyols, large doses may have a laxative effect. The laxative threshold depends on a number of factors, including individual sensitivity, mode of ingestion, daily diet, and previous adaptation to xylitol. Single doses of 20–30 g and daily doses of 0.5–1.0 g/kg body-weight are usually well tolerated by most individuals. Approximately 25–50% of the ingested xylitol is absorbed, with the remaining 50–75% passing to the lower gut, where it undergoes indirect metabolism via fermentative degradation by the intestinal flora.

An acceptable daily intake for xylitol of 'not specified' has been set by the WHO since the levels used in foods do not represent a hazard to health.[12]

LD_{50} (mouse, IP): 22.1 g/kg[13,14]
LD_{50} (mouse, IV): 12 g/kg
LD_{50} (mouse, oral): 12.5 g/kg
LD_{50} (rat, oral): 16.5 g/kg
LD_{50} (rat, IV): 10.8 g/kg
LD_{50} (rabbit, oral): 16.5 g/kg
LD_{50} (rabbit, IV): 4 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Xylitol may cause transient gastrointestinal discomfort if ingested in large quantities; and may also be

X

irritant to the eyes. Eye protection and gloves are recommended. Conventional dust-control practices should be employed. Xylitol is flammable, but does not ignite readily.

16 Regulatory Status

GRAS listed. Approved for use as a food additive in over 70 countries worldwide, including Europe, the USA and Japan. Included in the FDA Inactive Ingredients Database (oral solution, chewing gum). Included in nonparenteral medicines licensed in the UK and USA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Various directly compressible forms of xylitol that contain other excipients are commercially available, e.g. *Xylitab 100*, which contains 3.5% polydextrose, and *Xylitab 200*, which contains 2.0% carboxymethylcellulose. A directly compressible form of pure xylitol called *Xylitab 300* is also available, which is produced via wet granulation.

Pyrogen-free grades of xylitol suitable for parenteral use are also commercially available.

18 Comments

The sweetening power of xylitol is approximately equal to that of sucrose, although it has been shown to be pH-, concentration-, and temperature-dependent; xylitol is approximately 2.5 times as sweet as mannitol.

Xylitol is highly chemically stable, meaning that it will not interact with pharmaceutical actives or excipients, and can be utilized over a wide pH range (pH 1–11).

Xylitol has a negative heat of solution that is far larger than that of other alternative sweetening agents; *see* Table III. Because of this, xylitol produces an intense cooling effect as the crystalline material dissolves. Xylitol's combination of sweetness and cooling can create product appeal while helping to mask the undesirable taste of many pharmaceutical actives or excipients.

Therapeutically, xylitol is used as an energy source for intravenous infusion therapy following trauma.[15]

A specification for xylitol is contained in the *Food Chemicals Codex* (FCC).[16]

The EINECS number for xylitol is 201-788-0. The PubChem Compound ID (CID) for xylitol is 6912.

Table III: Comparison of the heat of solution of selected sweetening agents.

Sweetening agent	Heat of solution (kJ/kg)
Lactitol (anhydrous)	−35.0
Maltitol	−69.2
Mannitol	−120.9
Sorbitol	−106.3
Sucrose	−23.0
Xylitol	−157.1

Zein

1 Nonproprietary Names

USP–NF: Zein

2 Synonyms

—

3 Chemical Name and CAS Registry Number

Zein [9010-66-6]

4 Empirical Formula and Molecular Weight

Zein is a prolamin with a molecular weight of approximately 38 000.

5 Structural Formula

See Section 8.

6 Functional Category

Coating agent; modified-release agent; tablet and capsule binder.

7 Applications in Pharmaceutical Formulation or Technology

Zein is used as a tablet binder in wet-granulation processes or as a tablet-coating agent mainly as a replacement for shellac. It is used primarily as an enteric-coating agent or in extended-release oral tablet formulations.[1]

Zein is also used in food applications as a coating agent. *See* Table I.

Table I: Uses of zein.

Use	Concentration (%)
Tablet-coating agent	15
Tablet sealer	20
Wet granulation binder	30

8 Description

Zein is a prolamin obtained from corn (*Zea mays* Linné (Fam. Gramineae)). It occurs as a granular, straw- to pale yellow-colored amorphous powder or fine flakes and has a characteristic odor and bland taste.

Zein is a protein derivative that does not contain lysine or tryptophan. For the approximate amino acid content of zein, *see* Table II.

Table II: Approximate amino acid content of zein.

Alanine	8.3%	Leucine	19.3%
Arginine	1.8%	Methionine	2.0%
Asparagine	4.5%	Phenylalanine	6.8%
Cystine	0.8%	Proline	9.0%
Glutamic acid	1.5%	Serine	5.7%
Glutamine	21.4%	Threonine	2.7%
Glycine	0.7%	Tyrosine	5.1%
Histidine	1.1%	Valine	3.1%
Isoleucine	6.2%		

9 Pharmacopeial Specifications

See Table III.

Table III: Pharmacopeial specifications for zein.

Test	USP 40–NF 35 S1
Identification	+
Microbial limits	$\leq 10^3$ cfu/g
Loss on drying	≤8.0%
Residue on ignition	≤2.0%
Heavy metals	≤20 µg/g
Protein content (dried basis)	81.9–100.0%

10 Typical Properties

Density 1.23 g/cm^3

Melting point When completely dry, zein may be heated to 200°C without visible signs of decomposition.

Particle size distribution 100% less than 840 µm in size.

Solubility Practically insoluble in acetone, ethanol, and water; soluble in aqueous alcohol solutions, aqueous acetone solutions (60–80% v/v), and glycols. Also soluble in aqueous alkaline solutions of pH 11.5 and above.

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Zein should be stored in an airtight container, in a cool, dry place. It has not been reported to polymerize.[2,3]

12 Incompatibilities

Zein is incompatible with oxidizing agents.

13 Method of Manufacture

Zein is extracted from corn gluten meal with dilute propan-2-ol.

14 Safety

Zein is used in oral pharmaceutical formulations and food products, and is generally regarded as an essentially nontoxic and

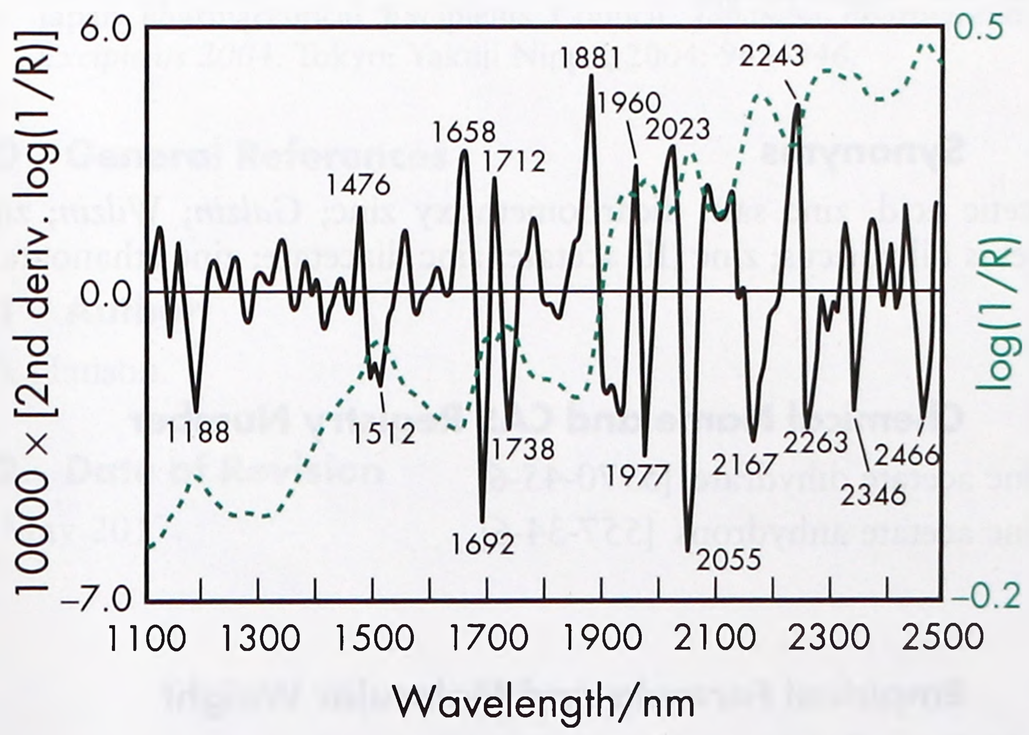

Figure 1: Near-infrared spectrum of zein measured by reflectance.

nonirritant material at the levels employed as an excipient. However, it may be harmful if ingested in large quantities. *See also* Section 18.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Zein may be irritant to the eyes and may evolve toxic fumes on combustion. Eye-protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Zein may be safely consumed by persons sensitive to gluten.

A study has investigated the adjuvanticity and immunogenicity of zein microspheres being researched as drug and vaccine carriers.[4,5] Zein has been investigated in the preparation of microspheres for delivery of insulin and heparin, and in other delivery systems.[6–8]

A specification for zein is contained in the *Food Chemicals Codex* (FCC)[9] and the *Japanese Pharmaceutical Excipients* (JPE).[10]

The EINECS number for zein is 232-722-9.

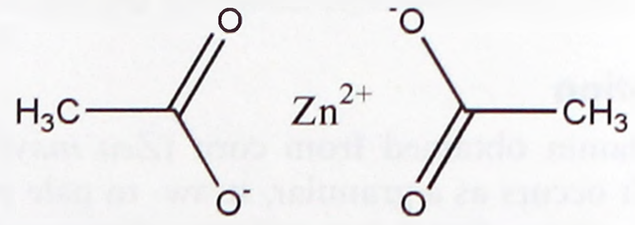
Zinc Acetate

1 Nonproprietary Names

BP: Zinc Acetate
PhEur: Zinc Acetate Dihydrate
USP–NF: Zinc Acetate

2 Synonyms

Acetic acid, zinc salt; dicarbomethoxy zinc; *Galzin*; *Wilzin*; zinc acetas dihydricus; zinc (II) acetate; zinc diacetate; zinc ethanoate.



3 Chemical Name and CAS Registry Number

Zinc acetate dihydrate [5970-45-6]
Zinc acetate anhydrous [557-34-6]

4 Empirical Formula and Molecular Weight

$C_4H_6O_4Zn{\cdot}2H_2O$ 219.50 (for dihydrate)
$C_4H_6O_4Zn$ 183.48 (for anhydrous)

5 Structural Formula

6 Functional Category

Emollient; emulsion stabilizing agent; gelling agent; opacifier.

7 Applications in Pharmaceutical Formulation or Technology

Zinc acetate has been used as an excipient in a variety of pharmaceutical formulations including topical gels, lotions and solutions, and subcutaneous injections. *See also* Section 18.

8 Description

Zinc acetate occurs as white crystalline, lustrous plates with a faint acetic odor and an astringent taste.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for zinc acetate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
pH (5% w/v)	5.8–7.0	6.0–8.0
Reducing substances	+	–
Insoluble matter	–	+
Arsenic	≤2 ppm	≤3 ppm
Lead	≤10 ppm	≤0.002%
Chlorides	≤50 ppm	≤0.005%
Sulfates	≤100 ppm	≤0.010%
Aluminum	≤5 ppm	–
Cadmium	≤2 ppm	–
Copper	≤50 ppm	–
Iron	≤50 ppm	–
Alkalis and alkaline earths	–	≤0.2%
Assay	99.0–101.0%	98.0–102.0%

10 Typical Properties

Acidity/alkalinity pH = 6.0–8.0 (5% w/v aqueous solution of the dihydrate)
Boiling point Decomposes.
Melting point 237°C
Solubility For the dihydrate, *see* Table II.
Specific gravity 1.735

Table II: Solubility of zinc acetate dihydrate.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	1 in 30 1 in 1 of boiling ethanol (95%)
Water	1 in 2.3 1 in 1.6 at 100°C

11 Stability and Storage Conditions

Zinc acetate loses water of hydration above 100°C. Zinc acetate should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Zinc acetate is incompatible with oxidizing agents, zinc salts, alkalis and their carbonates, oxalates, phosphates, and sulfides.[1]

13 Method of Manufacture

Zinc acetate is synthesized by reacting zinc oxide with glacial acetic acid, with subsequent crystallization, separation by centrifugation, and drying and milling of the crystals. No organic solvents are used during the synthesis.

14 Safety

Zinc acetate is used in topical pharmaceutical formulations and subcutaneous injections, where it is generally regarded as relatively nontoxic and nonirritant when used as an excipient. However, zinc acetate is poisonous by intravenous and intraperitoneal routes; it is also moderately toxic following oral consumption.[1]

Zinc acetate:
LD_{50} (rat, oral): 2.510 g/kg[1]
LD_{50} (mouse, IP): 0.057 g/kg

Zinc acetate dihydrate:
LD_{50} (rat, oral): 2.17 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. When heated to decomposition, zinc acetate emits toxic fumes of zinc oxide.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (SC injections; topical lotions and solutions). Included in medicines licensed in the UK.

17 Related Substances

—

18 Comments

Zinc acetate has been investigated for use in an oral controlled-release formulation for water-soluble drugs in combination with sodium alginate and xanthan gum.[2]

Therapeutically, zinc acetate is used as an astringent, and it has also been used in oral capsules for the treatment of Wilson's disease.[3] Zinc acetate has also demonstrated effectiveness as a spermicide in vaginal contraceptives.[4]

A specification for zinc acetate is included in the *Japanese Pharmaceutical Excipients* (JPE).[5]

The EINECS number for zinc acetate is 209-170-2.

Zinc Oxide

1 Nonproprietary Names

BP: Zinc Oxide
JP: Zinc Oxide
PhEur: Zinc Oxide
USP–NF: Zinc Oxide

2 Synonyms

AZO; Chinese white; *Descote*; pigment white 4; zincite; zinci oxidum; zinc monoxide; zinc white.

3 Chemical Name and CAS Registry Number

Zinc oxide [1314-13-2]

4 Empirical Formula and Molecular Weight

ZnO 81.41

5 Structural Formula

See Section 4.

6 Functional Category

Antimicrobial preservative; coating agent; opacifier.

7 Applications in Pharmaceutical Formulation or Technology

Zinc oxide is widely used in creams, ointments, and lotions in pharmaceutical and cosmetic applications;[1,2] *see* Table I. It is most commonly used in baby products,[2,3] and in calamine lotion where it is blended with a small amount of iron oxide[4,5] and may be slightly pink depending on the amount of iron oxide present. *See also* Section 17.

Table I: Typical uses of zinc oxide.

Use	Concentration (%)
Baby cream	2–35[2]
Baby powder	10[3]
Cosmetic make-ups and creams	5–30[1]
Semisolid creams	5–13[4]

Zinc oxide completely absorbs UV light < 366 nm[6] and therefore is widely used as a sunscreen agent to block UVA and UVB.[7] Zinc oxide nanoparticles between 200 and 400 nm reflect and scatter light but 40–100 nm particles absorb and scatter UV and absorb visible wavelengths, making the screen transparent.[8] It is used as an active 'physical' ingredient[9] since it physically blocks the UV from reaching the skin.

In addition, the ability of zinc oxide to scatter light makes it a useful opacifier for white creams. It can be used as a mild antibacterial or antifungicidal agent.[1,6] Zinc oxide is also used in small quantities in subcutaneous injections and suppositories.

8 Description

Zinc oxide occurs as a soft, white or yellowish-white odorless powder. It appears as loose aggregates consisting of amorphous submicron primary particles.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for zinc oxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	–
Alkalinity	+	+	+
Carbonate and color of solution	+	+	+
Arsenic	≤ 4 ppm	≤ 5 ppm	≤ 6 ppm
Cadmium	–	≤ 10 ppm	–
Lead	+	≤ 50 ppm	+
Loss on ignition	≤ 1.0%	≤ 1.0%	≤ 1.0%
Iron	≤ 10 ppm	≤ 200 ppm	+[(a)]
Sulfate	≤ 0.096%	–	–
Assay	≥ 99.0%	99.0–100.5%	99.0–100.5%

(a) and other heavy metals.

10 Typical Properties

Alkalinity/acidity pH 7.37 for pharmaceutical grades made by the 'French' process.
Density (bulk) 0.32–0.64 g/cm^3; *see also* Table III.

Table III: Physical properties of selected commercial grades of zinc oxide.

Grade	Specific surface area (m^2/g)	Particle size (μm)	Bulk density (g/cm^3)
AZO 66USP[11]	4.0–6.0	–	0.32–0.64
AZO 77USP[12]	6.0–9.0	–	0.32–0.64
Gold Seal[13]	3.5–6.7	–	–
USP-1[14]	9.0	0.12	0.48
USP-2[14]	3.2	0.33	0.64
USP-3[14]	5.0	0.21	0.56

Density (true) 5.67 g/cm^3[3,5]
Melting point > 1800°C[10]
Particle size distribution >99.9% passing through a #325 mesh; *see also* Table III.
Refractive index 2.015 for a 0.5 μm particle.[6]
Solubility Practically insoluble in water (0.42 mg/100 g water at 18°C);[6] soluble in dilute acids such as acetic acid, ammonia and alkali hydroxide solutions.[5]
Specific surface area 3.2–9.0 m^2/g depending on the grade;[11–14] *see* Table III.

11 Stability and Storage Conditions

Zinc oxide is stable and should be stored in a well-closed container.

12 Incompatibilities

Zinc oxide undergoes a violent reaction with magnesium or linseed oil.[10]

13 Method of Manufacture

Zinc oxide is manufactured by vaporizing high purity zinc metal at approx. 2000°C and mixing the vapor with air at controlled flow

rates to produce zinc oxide. Pharmaceutical grades are made by this process, known as the 'French process'.[6] Varying the flow rates and time before cooling allows different crystal sizes and shapes to be formed.

14 Safety

Zinc oxide is generally considered a nontoxic material.[6] It is moderately toxic to humans by ingestion in its pure form.[10]

Zinc oxide is considered a nuisance powder[15] and can cause skin and eye irritation.[10] Inhalation of fresh fumes during zinc oxide manufacture may cause a temporary flu-like illness ('zinc chills')[6,10,16] but this does not apply to inhalation of zinc oxide powder.

The safety of zinc oxide nanoparticles is less well understood, particularly the possibility of dermal adsorption, and is an area of ongoing investigation.[9] There is some experimental evidence that zinc oxide may act as a mutagen or teratogen.[10]

LC_{50} (mouse, inhalation): 2.5 g/m^3[10]
LD_{50} (mouse, oral): 7.95 g/kg
LD_{50} (rat, IP): 0.24 g/kg
LD_{Lo}(human, oral): 0.5 g/kg
TC_{Lo} (human, inhalation): 0.6 g/m^3

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Pharmaceutical applications require standard inhalation protection appropriate to the level of potential exposure. In the US, the OSHA limit is 10 mg/m^3 for total dust, 5 mg/m^3 respirable fraction for zinc oxide.[10]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (IM injections; SC injections and suspensions; suppositories). Approved by the FDA as a food additive and for externally applied drugs and cosmetics, including formulations applied to the eye area.[1] Included in the Canadian Natural Health Products Ingredients Database. Included in nonparenteral medicines licensed in the UK (creams, ointments, and suppositories).

17 Related Substances

Calamine.

Calamine

CAS number [8011-96-9]
Description Occurs as an odorless, preblended powder of white zinc oxide tinted with a small proportion of red iron oxide.
Pharmacopeial specifications *see* Table IV.
Solubility Soluble in dilute acetic acid or mineral acid, ammonia, ammonium carbonate, and fixed alkali hydroxide solution; insoluble in water.
Specific gravity 5.6–5.7
Storage Preserve in well-closed containers.
Comments Primarily used in traditional creams, ointment or lotions to treat a variety of skin conditions. Calamine is also available as a pre-blended powder,[4] and is used as a dusting powder.

18 Comments

Zinc oxide is approved by the FDA as a white pigment for external use in cosmetics, including the eye area. It is included in cosmetic face powders, rouges, eye make-up,[1] foundations, lipsticks, soaps and detergents, creams, deodorants, noncoloring shampoos and other products.[17]

Table IV: Pharmacopeial specifications for calamine.

Test	BP 2017[a]	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Microbial limits	–	+
Loss on ignition	–	≤ 2.0%
Acid insoluble substances	–	≤ 2.0%
Alkaline substances	–	+
Arsenic	–	8 ppm
Calcium	+	+
Calcium or magnesium	–	+
Soluble barium salts	+	–
Lead	≤ 150 ppm	+
Chloride	+	–
Sulfate	+	–
Ethanol–soluble dyes	+	–
Matter insoluble in hydrochloric acid (dried residue)	≤ 10 mg	–
Water–soluble dyes	+	–
Residue on ignition	68.0–74.0%	–
Assay (ZnO)	–	98.0–100.5%

(a) Calamine BP contains basic zinc carbonate rather than zinc oxide.

Zinc oxide is also used as a food additive in dietary supplements and vitamins tablets,[6,18] and therapeutically as an antiseptic and mild astringent.[5]

A specification for zinc oxide is contained in the *Food Chemicals Codex* (FCC).[19]

The EINECS number for zinc oxide is 215-222-5. The PubChem Compound ID (CID) for zinc oxide is 24852301.

Zinc Stearate

1 Nonproprietary Names

BP: Zinc Stearate
PhEur: Zinc Stearate
USP–NF: Zinc Stearate

2 Synonyms

Cecavon; *Demarone*; dibasic zinc stearate; *HyQual*; *Kemilub*; *Metallac*; stearic acid zinc salt; *Synpro*; zinc distearate; zinc octadecanoate; zinc soap; zinci stearas.

3 Chemical Name and CAS Registry Number

Octadecanoic acid zinc salt [557-05-1]

4 Empirical Formula and Molecular Weight

$C_{36}H_{70}O_4Zn$ 632.33 (for pure material)

The USP 40–NF 35 S1 describes zinc stearate as a compound of zinc with a mixture of solid organic acids obtained from fats, and consists chiefly of variable proportions of zinc stearate and zinc palmitate. It contains the equivalent of 12.5–14.0% of zinc oxide (ZnO).

The PhEur 9.2 states that zinc stearate [$(C_{17}H_{35}COO)_2Zn$] may contain varying proportions of zinc palmitate [$(C_{15}H_{31}COO)_2Zn$] and zinc oleate [$(C_{17}H_{33}COO)_2Zn$]. It contains not less than 10.0% and not more than 12.0% of zinc.

5 Structural Formula

See Section 4.

6 Functional Category

Tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Zinc stearate is primarily used in pharmaceutical formulations as a lubricant in tablet and capsule manufacture at concentrations up to 1.5% w/w. It has also been used as a thickening and opacifying agent in cosmetic and pharmaceutical creams, and as a dusting powder. *See* Table I.

Table I: Uses of zinc stearate.

Use	Concentration (%)
Tablet lubricant	0.5–1.5
Water-repellent ointments	2.5

8 Description

Zinc stearate occurs as a fine, white, bulky, hydrophobic powder, free from grittiness and with a faint characteristic odor.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Autoignition temperature 421°C
Density 1.09 g/cm^3
Flash point 277°C
Melting point 120–122°C; 130°C also reported.[1,2]
Particle size distribution 100% through a 44.5-μm sieve (#325 mesh).
Solubility Insoluble in ethanol (95%), ether, and water; practically insoluble in oxygenated solvents; soluble in acids, benzene, and other aromatic solvents.
Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

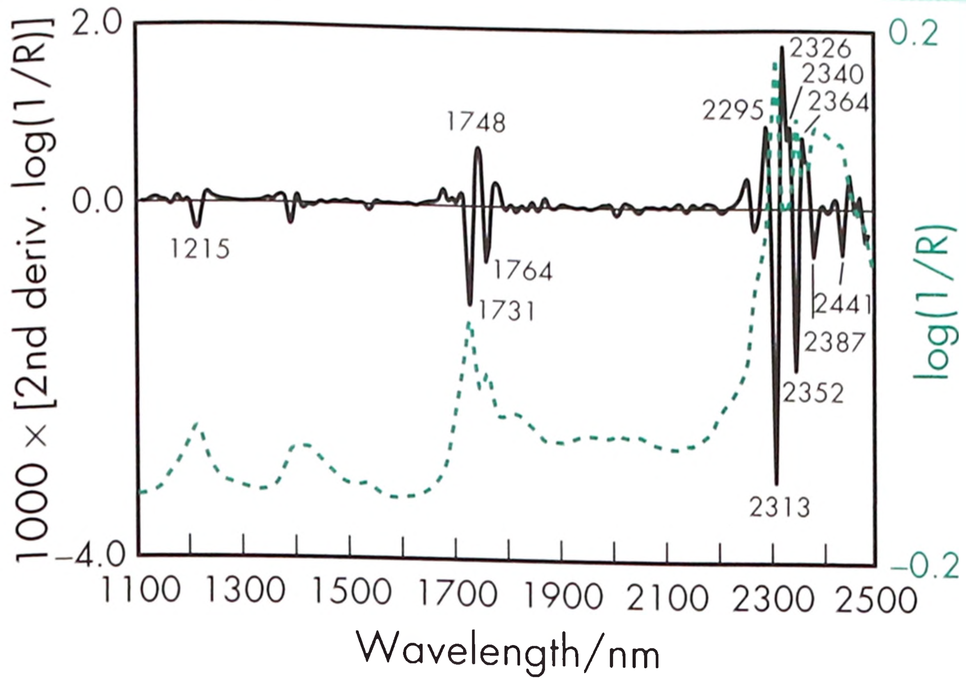
Zinc stearate is stable and should be stored in a well-closed container in a cool, dry place.

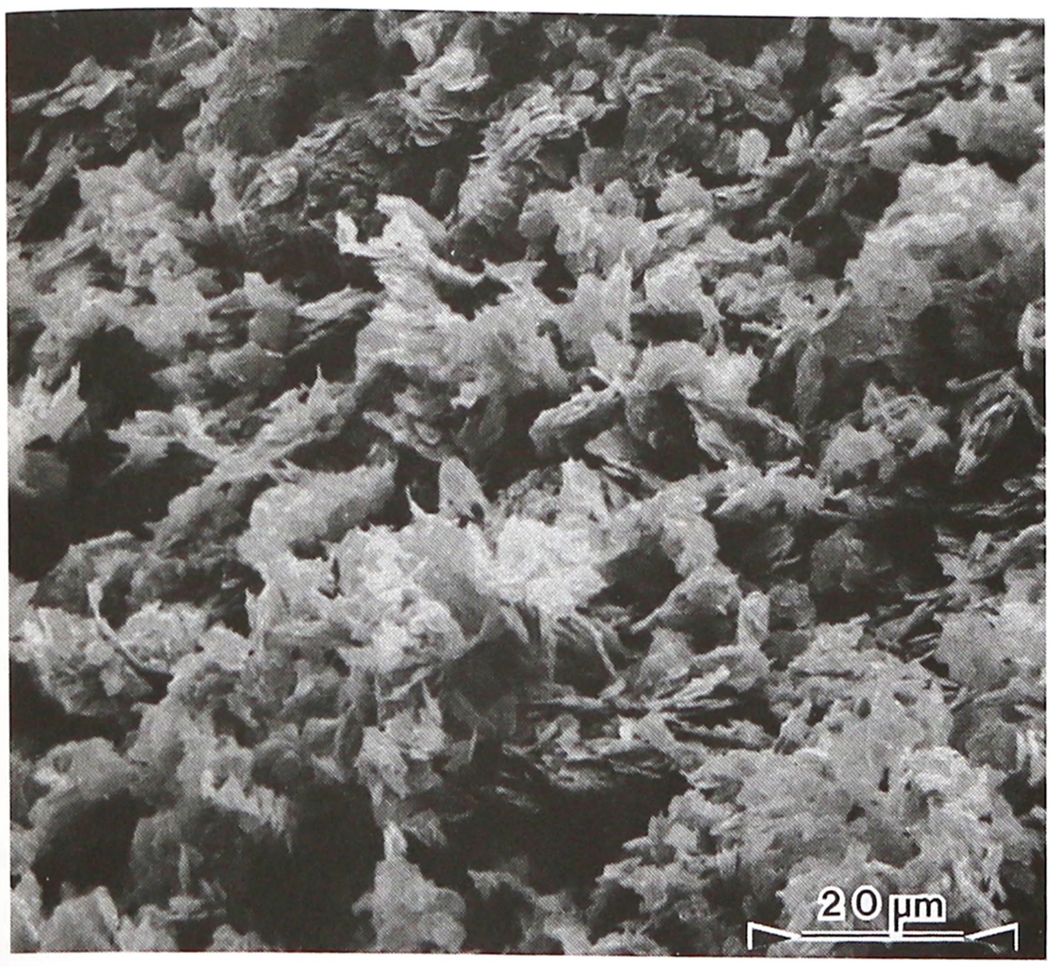
12 Incompatibilities

Zinc stearate is decomposed by dilute acids. It is incompatible with strong oxidizing agents.

Table II: Pharmacopeial specifications for zinc stearate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Acidity or alkalinity	+	–
Alkalis and alkaline earths	–	≤1.0%
Appearance of solution	+	–
Acid value of the fatty acids	195–210	–
Appearance of solution of fatty acids	+	–
Arsenic	–	≤1.5 ppm
Cadmium	≤5 ppm	–
Lead	≤25 ppm	≤10 ppm
Chlorides	≤250 ppm	–
Sulfates	≤0.6%	–
Assay (as Zn)	10.0–12.0%	–
Assay (as ZnO)	–	12.5–14.0%





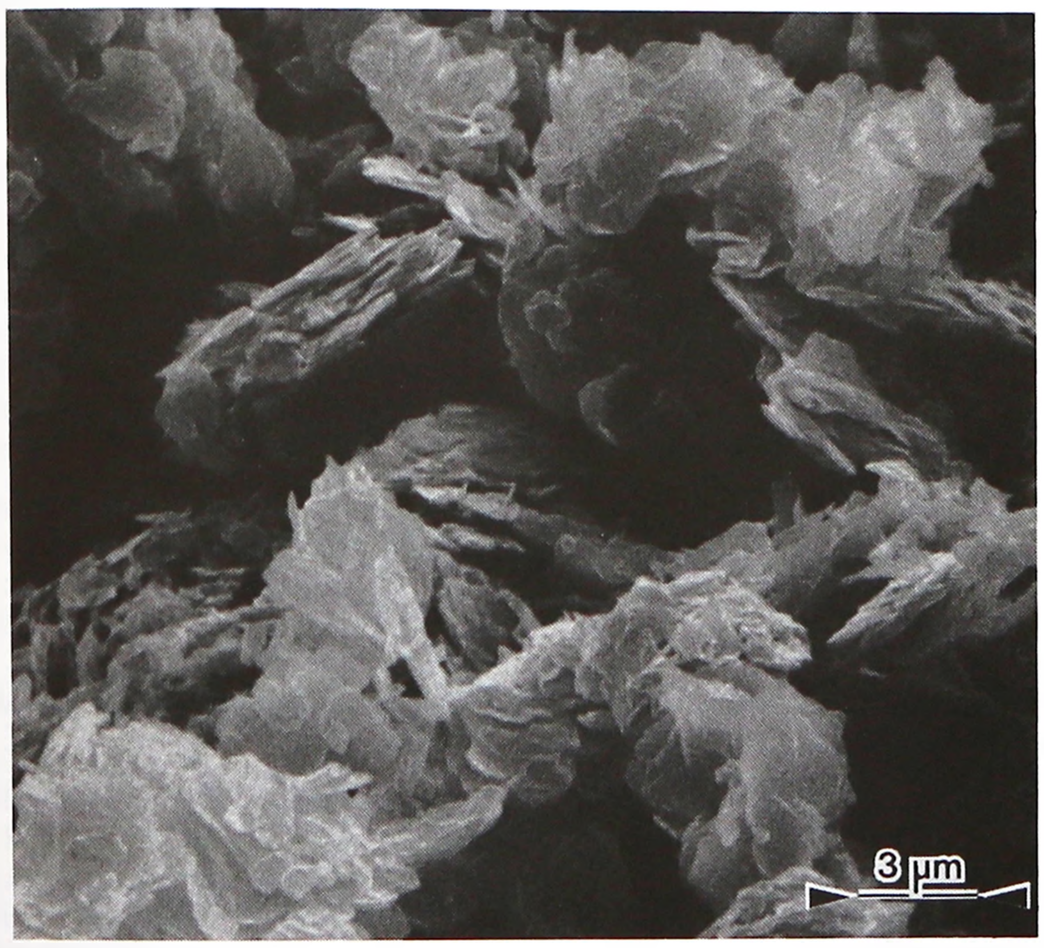


Figure 1: Near-infrared spectrum of zinc stearate measured by reflectance.

SEM 1: Excipient: zinc stearate; magnification: 600×.

SEM 2: Excipient: zinc stearate; magnification: 2400×.

13 Method of Manufacture

An aqueous solution of zinc sulfate is added to sodium stearate solution to precipitate zinc stearate. The zinc stearate is then washed with water and dried. Zinc stearate may also be prepared from stearic acid and zinc chloride.

14 Safety

Zinc stearate is used in oral and topical pharmaceutical formulations, and is generally regarded as a nontoxic and nonirritant excipient. However, following inhalation, it has been associated with fatal pneumonitis, particularly in infants.[3] As a result, zinc stearate has now been removed from baby dusting powders.

LD_{50} (rat, IP): 0.25 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Zinc stearate may be harmful on inhalation and should be used in a well-ventilated environment; a respirator is recommended. In the UK, the long-term (8-hour TWA) workplace exposure limit for zinc stearate is 10 mg/m^3 for total inhalable dust and 4 mg/m^3 for respirable dust. The short-term (15-minutes) workplace exposure limit for total inhalable dust is 20 mg/m^3.[4] In the US, the OSHA limit is 15 mg/m^3 for total dust, 5 mg/m^3 respirable fraction for zinc stearate.[5]

When heated to decomposition, zinc stearate emits acrid smoke and fumes of zinc oxide.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium stearate; magnesium stearate; stearic acid.

18 Comments

Zinc stearate is neutral to moistened litmus paper.

The EINECS number for zinc stearate is 209-151-9. *See* Magnesium Stearate for further information and references.

Appendix II: List of Monographs by Functional Category

Acidifying agent *see* Acidulant
Acidulant
- Acetic Acid, Glacial, 32
- Adipic Acid, 40
- Ammonium Chloride, 71
- Ascorbic Acid, 80
- Citric Acid Monohydrate, 250
- Fumaric Acid, 387
- Gluconolactone, 398
- Hydrochloric Acid, 441
- Lactic Acid, 502
- Maleic Acid, 567
- Malic Acid, 569
- Phosphoric Acid, 682
- Propionic Acid, 788
- Sulfuric Acid, 956
- Tartaric Acid, 969

Adsorbent
- Albumin, 45
- Aluminum Hydroxide Adjuvant, 61
- Aluminum Oxide, 65
- Aluminum Phosphate Adjuvant, 67
- Attapulgite, 91
- Bentonite, 93
- Calcium Polycarbophil, 155
- Calcium Silicate, 156
- Carboxymethylcellulose Calcium, 172
- Carboxymethylcellulose Sodium, 174
- Cellulose, Microcrystalline, 194
- Cellulose, Powdered, 201
- Colloidal Silicon Dioxide, 255
- Hectorite, 429
- Kaolin, 499
- Magnesium Aluminum Silicate, 548
- Magnesium Carbonate, 551
- Polycarbophil, 693
- Saponite, 825

Adsorbing agent *see* Adsorbent
Aerosol propellant
- Carbon Dioxide, 170
- Chlorodifluoroethane (HCFC), 238
- Chlorofluorocarbons (CFC), 240
- Difluoroethane (HFC), 324
- Dimethyl Ether, 327
- Heptafluoropropane (HFC), 431
- Hydrocarbons (HC), 439
- Nitrogen, 630
- Nitrous Oxide, 631
- Norflurane (HFC), 633

Air displacement
- Carbon Dioxide, 170
- Nitrogen, 630

Alcohol denaturant
- Denatonium Benzoate, 296
- Sucrose Octaacetate, 942

Alkalizing agent
- Ammonia Solution, 68
- Calcium Hydroxide, 143
- Diethanolamine, 316
- Monoethanolamine, 616
- Potassium Bicarbonate, 765
- Potassium Citrate, 769
- Potassium Hydroxide, 771
- Sodium Bicarbonate, 846
- Sodium Borate, 850
- Sodium Carbonate, 852
- Sodium Citrate Dihydrate, 858
- Sodium Hydroxide, 866
- Triethanolamine, 994
- Tromethamine, 1002

Anionic surfactant
- Docusate Sodium, 340
- Lauric Acid, 535
- Phospholipids, 678
- Sodium Lauryl Sulfate, 869

Antiadherent
- Leucine, 541

Antiadhesive agent *see* Antiadherent
Anticaking agent
- Calcium Phosphate, Tribasic, 152
- Calcium Silicate, 156
- Colloidal Silicon Dioxide, 255
- Hydrophobic Colloidal Silica, 444
- Magnesium Oxide, 555
- Magnesium Silicate, 557
- Maltodextrin, 576
- Talc, 965

Antifoaming agent
- Dimethicone, 325
- Lauric Acid, 535
- Simethicone, 833

Antimicrobial preservative
- Acetone Sodium Bisulfite, 35
- Benzalkonium Chloride, 96
- Benzethonium Chloride, 99
- Benzoic Acid, 101
- Benzyl Alcohol, 105
- Benzyl Benzoate, 108
- Betadex Sulfobutyl Ether Sodium, 112
- Boric Acid, 117
- Bronopol, 120
- Butylated Hydroxyanisole, 124
- Butylene Glycol, 128
- Butylparaben, 130
- Calcium Acetate, 134
- Calcium Chloride, 142
- Calcium Lactate, 145
- Cetrimide, 213
- Cetrimonium Bromide, 216
- Cetylpyridinium Chloride, 223
- Chlorhexidine, 229
- Chlorobutanol, 233
- Chlorocresol, 235
- Chloroxylenol, 243
- Cresol, 279
- Edetic Acid, 350
- Ethanol, 356
- Ethylparaben, 379
- Glycerin, 401
- Hexetidine, 435
- Hydrogen Peroxide, 442
- Imidurea, 481
- Isopropyl Alcohol, 491
- Methylparaben, 604
- Monothioglycerol, 620
- Pentetic Acid, 658
- Phenol, 664
- Phenoxyethanol, 667
- Phenylethyl Alcohol, 669
- Phenylmercuric Acetate, 671
- Phenylmercuric Borate, 673
- Phenylmercuric Nitrate, 675
- Potassium Benzoate, 763
- Potassium Metabisulfite, 772
- Potassium Nitrate, 776
- Potassium Sorbate, 779
- Propionic Acid, 788
- Propyl Gallate, 790
- Propylene Glycol, 795
- Propylparaben, 803
- Propylparaben Sodium, 807
- Sodium Acetate, 835
- Sodium Benzoate, 843
- Sodium Borate, 850
- Sodium Lactate, 868
- Sodium Metabisulfite, 873
- Sodium Propionate, 884
- Sodium Sulfite, 895
- Sorbic Acid, 899
- Tetrasodium Edetate, 971
- Thimerosal, 974
- Zinc Oxide, 1040

Antioxidant
- Acetone Sodium Bisulfite, 35
- Alpha Tocopherol, 58
- Ascorbic Acid, 80
- Ascorbyl Palmitate, 84
- Butylated Hydroxyanisole, 124
- Butylated Hydroxytoluene, 126
- Citric Acid Monohydrate, 250
- D-Mannose, 589
- Dodecyl Gallate, 343
- Erythorbic Acid, 352
- Fumaric Acid, 387
- Histidine, 437
- Malic Acid, 569
- Monothioglycerol, 620
- Octyl Gallate, 636
- Potassium Metabisulfite, 772
- Propionic Acid, 788
- Propyl Gallate, 790
- Sodium Ascorbate, 841
- Sodium Formaldehyde Sulfoxylate, 863
- Sodium Metabisulfite, 873
- Sodium Sulfite, 895
- Sodium Thiosulfate, 897
- Sulfur Dioxide, 954
- Thymol, 977
- Vitamin E Polyethylene Glycol Succinate, 1010

Bioadhesive material
- Carbomer, 165
- Chitosan, 225
- Glyceryl Monooleate, 411
- Guar Gum, 425
- Polycarbophil, 693
- Polyethylene Oxide, 707
- Poly(methyl vinyl ether/maleic anhydride), 718
- Xanthan Gum, 1029

Biocompatible material
- Aliphatic Polyesters, 51

Biodegradable material
- Aliphatic Polyesters, 51
- Glyceryl Palmitostearate, 417

Maltodextrin, 576
Phospholipids, 678
Polydextrose, 699

Appendix IV: List of Excipient 'E' Numbers

E Number	*Excipient*	
E100	Curcumin	263
E101	Riboflavin	263
E102	Tartrazine	263
E104	Quinoline Yellow	263
E110	Sunset Yellow FCF	263
E120	Carmine	263
E122	Carmoisine	263
E123	Amaranth	263
E124	Ponceau 4R	263
E127	Erythrosine	263
E129	Allura Red AC	263
E131	Patent Blue V	263
E132	Indigo Carmine	263
E133	Brilliant Blue FCF	263
E140	Chlorophylls	263
E141	Copper Complexes of Chlorophylls and Chlorophyllins	263
E142	Green S	263
E150	Caramel	263
E151	Brilliant Black PN	263
E153	Vegetable Carbon	263
E155	Brown HT	263
E160	Alpha-, Beta-, Gamma-Carotene	110, 263
E160	Annatto	263
E160	Beta-apo-8′ Carotenal	263
E160	Capsorubin	263
E160	Lycopene	263
E161	Canthaxanthin	263
E162	Beetroot Red	263
E163	Cyanidin	263
E163	Delphidin	263
E163	Malvidin	263
E163	Pelargonidin	263
E163	Peonidin	263
E163	Petunidin	263
E170	Calcium Carbonate	138, 263
E171	Titanium Dioxide	263, 980
E172	Iron Oxides and Hydroxides	263, 485
E173	Aluminum	263
E200	Sorbic Acid	899
E201	Sorbic Acid	901
E202	Potassium Sorbate	779
E203	Sorbic Acid	901
E210	Benzoic Acid	101
E211	Sodium Benzoate	843
E212	Potassium Benzoate	763
E214	Ethylparaben	379
E215	Ethylparaben	382
E216	Propylparaben	803
E217	Propylparaben Sodium	806
E218	Methylparaben	604
E219	Methylparaben	607
E220	Sulfur Dioxide	954
E221	Sodium Sulfite	895
E222	Sodium Metabisulfite	874
E223	Sodium Metabisulfite	873
E224	Potassium Metabisulfite	772
E228	Potassium Metabisulfite	774
E252	Potassium Nitrate	776
E260	Acetic Acid, Glacial	32
E262	Sodium Acetate	835
E263	Calcium Acetate	134
E270	Lactic Acid	502
E280	Propionic Acid	788
E281	Sodium Propionate	884
E282	Sodium Propionate	886
E283	Sodium Propionate	886
E284	Boric Acid	117

E Number	*Excipient*	
E285	Sodium Borate	850
E290	Carbon Dioxide	170
E296	Malic Acid	569
E297	Fumaric Acid	387
E300	Ascorbic Acid	80
E301	Sodium Ascorbate	840
E302	Sodium Ascorbate	842
E304	Ascorbyl Palmitate	84
E307	Alpha Tocopherol	58
E308	Alpha Tocopherol	60
E309	Alpha Tocopherol	60
E310	Propyl Gallate	790
E311	Octyl Gallate	636
E312	Dodecyl Gallate	342
E315	Erythorbic Acid	352
E316	Erythorbic Acid	353
E320	Butylated Hydroxyanisole	124
E321	Butylated Hydroxytoluene	126
E322	Lecithin	538
E325	Sodium Lactate	868
E327	Calcium Lactate	144
E330	Citric Acid Monohydrate	250, 252
E331	Sodium Citrate Dihydrate	858
E332	Potassium Citrate	769
E334	Tartaric Acid	968
E338	Phosphoric Acid	682
E339	Sodium Phosphate, Dibasic	876, 878
E339	Sodium Phosphate, Monobasic	879
E340	Potassium Phosphate, Dibasic	777
E340	Sodium Phosphate, Monobasic	881
E341	Calcium Phosphate, Dibasic Anhydrous	146
E341	Calcium Phosphate, Dibasic Dihydrate	149
E341	Calcium Phosphate, Tribasic	152
E355	Adipic Acid	40
E385	Edetate Calcium Disodium	345
E400	Alginic Acid	47
E401	Sodium Alginate	837

E407	Carrageenan	178
E410	Ceratonia	206
E412	Guar Gum	425
E413	Tragacanth	983
E414	Acacia	27
E415	Xanthan Gum	1029
E418	Gellan Gum	396
E420	Sorbitol	906
E421	Mannitol	583
E422	Glycerin	401
E431	Polyoxyl 40 Stearate	742
E432	Polysorbate 20	736
E433	Polysorbate 80	736
E434	Polysorbate 40	736
E435	Polysorbate 60	736
E436	Polysorbate 65	736
E440	Pectin	656
E441	Gelatin	391
E452	Potassium Metaphosphate	774
E459	β-Cyclodextrin	288
E460	Cellulose, Microcrystalline	194
E460	Cellulose, Powdered	201
E461	Methylcellulose	600
E462	Ethylcellulose	370
E463	Hydroxypropyl Cellulose	457

E Number	*Excipient*	
E464	Hypromellose	468
E466	Carboxymethylcellulose Sodium	174
E471	Glyceryl Behenate	405
E473	Sucrose Palmitate	944
E473	Sucrose Stearate	946
E477	Propylene Glycol Dilaurate	800
E477	Propylene Glycol Monolaurate	801
E491	Sorbitan Monostearate	902
E492	Sorbitan Tristearate	902
E493	Sorbitan Monolaurate	902
E494	Sorbitan Monooleate	902
E495	Sorbitan Monopalmitate	902
E500	Sodium Bicarbonate	846
E500	Sodium Carbonate	852
E501	Potassium Bicarbonate	765
E504	Magnesium Carbonate	551, 554
E507	Hydrochloric Acid	441
E508	Potassium Chloride	766
E510	Ammonium Chloride	71
E513	Sulfuric Acid	956
E516	Calcium Sulfate	160, 162
E517	Ammonium Sulfate	77
E518	Magnesium Sulfate	563
E524	Sodium Hydroxide	866
E525	Potassium Hydroxide	771
E526	Calcium Hydroxide	143
E530	Magnesium Oxide	555
E553a	Magnesium Silicate	557
E553a	Magnesium Trisilicate	565
E553b	Talc	965
E558	Bentonite	93
E559	Kaolin	499
E570	Stearic Acid	930
E575	Gluconolactone	398
E621	Monosodium Glutamate	618
E640	Glycine	419
E642	Lysine Hydrochloride	546
E900	Dimethicone	325
E901	Wax, White	1025
E901	Wax, Yellow	1027
E903	Wax, Carnauba	1018
E904	Shellac	829
E907	Wax, Microcrystalline	1022
E913	Lanolin	530
E941	Nitrogen	630
E942	Nitrous Oxide	631
E943a	*n*-Butane	439
E943b	2-Methylpropane	439
E944	Dimethylmethane	439
E950	Acesulfame Potassium	29
E951	Aspartame	88
E952	Sodium Cyclamate	860, 862
E953	Isomalt	487
E954	Saccharin	817, 819
E954	Saccharin Sodium	820, 822
E957	Thaumatin	972
E959	Neohesperidin Dihydrochalcone	625
E961	Neotame	627
E965	Maltitol	571
E965	Maltitol Solution	574
E966	Lactitol	504
E967	Xylitol	1033
E968	Erythritol	354
E1200	Polydextrose	696
E1201	Povidone	781
E1202	Crospovidone	285
E1401–1452	Starch, Modified	921
E1440	Hydroxypropyl Starch	466
E1505	Triethyl Citrate	996
E1518	Triacetin	987
E1520	Propylene Glycol	795

Appendix V: List of Excipient 'EINECS' Numbers

EINECS	*Excipient*	
200-018-0	Lactic Acid	504
200-061-5	Sorbitol	909
200-066-2	Ascorbic Acid	83
200-075-1	Glucose, Liquid	401
200-143-0	Bronopol	121
200-210-4	Thimerosal	976
200-238-7	Chlorhexidine	232
200-272-2	Glycine	421
200-289-5	Glycerin	404
200-302-4	Chlorhexidine Acetate	232
200-311-3	Cetrimonium Bromide	217
200-312-9	Palmitic Acid	648
200-313-4	Stearic Acid	933
200-317-6	Chlorobutanol	234
200-333-3	Fructose	385
200-334-9	Sucrose	941
200-338-0	Propylene Glycol	797
200-353-2	Cholesterol	247
200-412-2	*d*-Alpha Tocopherol	61
200-416-4	Galactose	391
200-431-6	Chlorocresol	237
200-432-1	DL-Methionine	599
200-449-4	Edetic Acid	352
200-456-2	Phenylethyl Alcohol	670
200-470-9	Linoleic Acid	544
200-522-0	Leucine	542
200-529-9	Edetate Calcium Disodium	346
200-532-5	Phenylmercuric Acetate	672
200-540-9	Calcium Acetate	135
200-559-2	Lactose, Anhydrous	509
200-559-2	Lactose Monohydrate	518
200-562-9	Methionine	599
200-573-9	Tetrasodium Edetate	972
200-578-6	Ethanol	359
200-580-7	Acetic Acid, Glacial	33
200-618-2	Benzoic Acid	104
200-652-8	Pentetic Acid	659
200-661-7	Isopropyl Alcohol	493
200-662-2	Acetone	35
200-664-3	Dimethyl Sulfoxide	333
200-675-3	Sodium Citrate Dihydrate	860
200-711-8	Mannitol	586
200-716-5	Maltose	582
200-735-9	Asparagine	87
200-745-3	Histidine	438
200-772-0	Sodium Lactate	869
200-811-1	Arginine	80
201-064-4	Tromethamine	1003
201-066-5	Acetyltriethyl Citrate	40
201-067-0	Acetyltributyl Citrate	38
201-069-1	Citric Acid Monohydrate	253
201-070-7	Triethyl Citrate	998
201-071-2	Tributyl Citrate	990
201-176-3	Propionic Acid	790
201-321-0	Saccharin	819
201-550-6	Diethyl Phthalate	319
201-557-4	Dibutyl Phthalate	314
201-766-0	Tartaric Acid	970
201-772-3	Tagatose	965
201-788-0	Xylitol	1036
201-793-8	Chloroxylenol	244
201-928-0	Erythorbic Acid	353
201-939-0	Menthol	597
201-944-8	Thymol	979
202-016-5	Gluconolactone	399
202-307-7	Propylparaben	806
202-318-7	Butylparaben	132

EINECS	*Excipient*	
202-495-0	Monothioglycerol	621
202-598-0	Ethyl Lactate	363
202-601-5	Malic Acid	571
202-713-4	Niacinamide	629
202-739-6	Trehalose	986
202-785-7	Methylparaben	608
202-859-9	Benzyl Alcohol	107
203-049-8	Triethanolamine	996
203-051-9	Triacetin	988
203-068-1	Phenylmercuric Borate	674
203-416-2	Dipropylene Glycol	339
203-529-7	Butylene Glycol	129
203-572-1	Propylene Carbonate	794
203-577-9	Cresol	281
203-599-9	Dipropylene Glycol	339
203-632-7	Phenol	666
203-672-5	Dibutyl Sebacate	315
203-742-5	Maleic Acid	568
203-743-0	Fumaric Acid	389
203-751-4	Isopropyl Myristate	496
203-764-5	Diethyl Sebacate	320
203-768-7	Sorbic Acid	901
203-777-6	Heptafluoropropane (HFC)	434
203-821-4	Dipropylene Glycol	339
203-825-6	Squalane	914
203-868-0	Diethanolamine	317
203-889-5	Ethyl Oleate	367
203-919-7	Diethylene Glycol Monoethyl Ether	323
203-928-6	Cetrimonium Chloride	217
203-934-9	Isopropyl Stearate	494
203-993-0	Methyl Linoleate	543
204-000-3	Myristyl Alcohol	624
204-007-1	Oleic Acid	640
204-017-6	Stearyl Alcohol	935
204-065-8	Dimethyl Ether	328
204-214-7	Dioctyl Phthalate	314
204-271-8	Maltol	580
204-399-4	Ethylparaben	382
204-402-9	Benzyl Benzoate	109
204-464-7	Ethyl Vanillin	369
204-465-2	Vanillin	1006
204-479-9	Benzethonium Chloride	101
204-498-2	Propyl Gallate	792
204-534-7	Triolein	1001
204-589-7	Phenoxyethanol	668
204-593-9	Cetylpyridinium Chloride	224
204-648-7	Pyrrolidone	813
204-665-5	Butyl Stearate	123
204-673-3	Adipic Acid	42
204-696-9	Carbon Dioxide	171
204-772-1	Sucrose Octaacetate	944
204-823-8	Sodium Acetate	836
204-826-4	Dimethylacetamide	335
204-881-4	Butylated Hydroxytoluene	128
205-011-6	Dimethyl Phthalate	330
205-126-1	Sodium Ascorbate	842
205-290-4	Sodium Propionate	886
205-305-4	Ascorbyl Palmitate	85
205-316-4	*n*-Butyl Lactate	363
205-324-8	Cetrimonium Tosylate	217
205-358-3	Edetate Disodium	349
205-391-3	Pentasodium Pentetate	659
205-483-3	Monoethanolamine	617
205-500-4	Ethyl Acetate	361
205-513-5	Hexetidine	436
205-538-1	Monosodium Glutamate	619
205-542-3	Propylene Glycol Monolaurate	802

EINECS	*Excipient*	
205-571-1	Isopropyl Palmitate	498
205-582-1	Lauric Acid	537
205-597-3	Oleyl Alcohol	643
205-633-8	Sodium Bicarbonate	849
205-702-2	Proline	788
205-737-3	Erythritol	355
205-739-4	Sodium Formaldehyde Sulfoxylate	864
205-758-8	Trisodium Edetate	352
205-788-1	Sodium Lauryl Sulfate	872
206-059-0	Potassium Bicarbonate	766
206-101-8	Aluminum Distearate	64
206-328-2	DL-Leucine	542
206-376-4	Capric Acid	536
206-483-6	D-Methionine	599
206-513-8	D-Histidine Monohydrochloride (Monohydrate)	438
206-988-1	Sodium Palmitate	648
207-439-9	Calcium Carbonate	140
207-838-8	Sodium Carbonate	854
208-534-8	Sodium Benzoate	845
208-578-8	Aleuritic Acid	831
208-686-5	Tricaprylin	993
208-736-6	Cetyl Palmitate	222
208-761-2	Acetone Sodium Bisulfite	36
208-868-4	Ethyl Linoleate	543
208-875-2	Myristic Acid	622
208-915-9	Magnesium Carbonate	554
209-150-3	Magnesium Stearate	561
209-151-9	Zinc Stearate	1043
209-170-2	Zinc Acetate	1039
209-406-4	Docusate Sodium	342
209-481-3	Potassium Benzoate	764
209-566-5	Lactitol	506
209-566-6	Lactitol	506
209-567-0	Maltitol	573
210-189-3	DL-Proline	788
210-513-3	Asparagine	87
211-082-4	Sodium Laurate	536
211-279-5	Aluminum Tristearate	64
211-519-9	Lysine Hydrochloride	547
212-083-2	Leucine Hydrochloride	542
212-406-7	Calcium Lactate	146
212-487-9	Sodium Myristate	622
212-490-5	Sodium Stearate	892
212-755-5	Potassium Citrate	770
213-754-2	Histidine Hydrochloride Monohydrate	438
213-853-0	Octyl Gallate	637

246-770-3	Dipropylene Glycol	339
247-038-6	Glyceryl Monooleate	412
247-568-8	Sorbitan Palmitate	906
247-569-3	Sorbitan Trioleate	906
247-706-7	Sucrose Palmitate	946
247-891-4	Sorbitan Tristearate	906
248-315-4	Propylene Glycol Monolaurate	802
248-317-5	Sucrose Stearate	948
248-731-6	Sucrose Stearate	948
249-448-0	Sorbitan Dioleate	905
250-097-0	Glyceryl Behenate	407
250-705-4	Glyceryl Monostearate	416
252-488-1	Propylparaben Sodium	807
253-149-0	Cetyl Alcohol	220
254-372-6	Imidurea	482
257-098-5	Iron Oxide Yellow	486
257-529-7	Sorbitan Sesquistearate	906
258-822-2	Thaumatin	973
258-887-7	Ammonium Glycyrrhizate	74
259-141-3	Sorbitan Triisostearate	906
259-952-2	Sucralose	937
260-080-8	Benzalkonium Chloride	98
260-664-4	Lysine Acetate	545
261-673-6	Isodecyl Oleate	296
264-151-6	Benzalkonium Chloride	98
265-154-5	Paraffin	653
266-041-3	Hydrogenated Rosin	261
269-023-3	Isopropyl Isostearate	494
269-410-7	Sorbitan Diisostearate	905
269-647-6	Aqueous Shellac Solution	831
269-919-4	Benzalkonium Chloride	98
270-312-1	Oleoyl Polyoxylglycerides	751
270-325-2	Benzalkonium Chloride	98
271-056-3	Palm Oil, Hydrogenated	651
271-536-2	Sodium Borate	851
271-893-4	Hydrophobic Colloidal Silica	445
274-272-6	Albumin	47
275-117-5	Gellan Gum	397
275-126-4	Stearalkonium Hectorite	430
275-128-5	Quaternium 18-Hectorite	430
277-952-2	Caprylocaproyl Polyoxylglycerides	751
278-928-2	Diazolidinyl Urea	482
279-360-8	Safflower Glycerides	825
284-634-5	Ceratonia Extract	207
287-089-1	Benzalkonium Chloride	98
302-243-0	Attapulgite	92
303-650-6	Glyceryl Dibehenate	407
305-633-9	Stearalkonium Hectorite	430
310-127-6	Kaolin	501
500-163-2	Polymerized Rosin	261
610-547-2	Polacrilex Resin	685

5

Appendix VI: List of Excipient 'CAS' Numbers

Note: The CAS number listed in this index corresponds to the title of the excipient monograph; for details of the specific material the CAS number refers to, see the full monograph.

CAS Registry Number	*Excipient Monograph*	
50-21-5	Lactic Acid	502
50-70-4	Sorbitol	906
50-81-7	Ascorbic Acid	80
50-99-7	Dextrose Anhydrous	310
52-51-7	Bronopol	120
54-64-8	Thimerosal	974
55-56-1	Chlorhexidine	228
55-68-5	Phenylmercuric Nitrate	675
56-40-6	Glycine	419
56-81-5	Glycerin	401
56-87-1	Lysine	547
56-95-1	Chlorhexidine	228
57-09-0	Cetrimonium Bromide	216
57-10-3	Palmitic Acid	647
57-11-4	Purified Stearic Acid	932
57-11-4	Stearic Acid	930
57-15-8	Chlorobutanol	233
57-48-7	Fructose	383
57-50-1	Sucrose	938
57-55-6	Propylene Glycol	795
57-88-5	Cholesterol	245
58-95-7	*d*-Alpha Tocopherol Acetate	60
59-02-9	*d*-Alpha Tocopherol	59
59-23-4	Galactose	390
59-50-7	Chlorocresol	235
59-51-8	DL-Methionine	599
60-00-4	Edetic Acid	350
60-12-8	Phenylethyl Alcohol	669
60-33-3	Linoleic Acid	543
61-90-5	Leucine	541
62-33-9	Edetate Calcium Disodium	345
62-38-4	Phenylmercuric Acetate	671
62-54-4	Calcium Acetate	134
63-42-3	Lactose, Anhydrous	506
63-42-3	Lactose, Inhalation	510
63-68-3	Methionine	598
63-89-8	Phospholipids	678
64-02-8	Tetrasodium Edetate	971
64-17-5	Ethanol	356
64-19-7	Acetic Acid, Glacial	32
65-85-0	Benzoic Acid	101
67-43-6	Pentetic Acid	658
67-63-0	Isopropyl Alcohol	491
67-64-1	Acetone	34
67-68-5	Dimethyl Sulfoxide	331
68-04-2	Anhydrous Sodium Citrate	860
68-94-0	Coloring Agents	262
69-65-8	Mannitol	583
69-79-4	Maltose	581
70-47-3	Asparagine	86
71-00-1	Histidine	437
71-23-8	Propan-1-ol	492
72-17-3	Sodium Lactate	868
73-40-5	Coloring Agents	262
74-79-3	Arginine	79
75-37-6	Difluoroethane (HFC)	323
75-68-3	Chlorodifluoroethane (HCFC)	238
77-86-1	Tromethamine	1002
77-89-4	Acetyltriethyl Citrate	39
77-90-7	Acetyltributyl Citrate	37
77-92-9	Anhydrous Citric Acid	252
77-93-0	Triethyl Citrate	996
77-94-1	Tributyl Citrate	989
79-09-4	Propionic Acid	788
79-14-1	Glycolic Acid	54
79-33-44	Lactic Acid	502
80-62-6	Methyl Methacrylate	717
81-07-2	Saccharin	817
81-48-1	Coloring Agents	262
83-88-5	Coloring Agents	262
84-66-2	Diethyl Phthalate	318
84-74-2	Dibutyl Phthalate	312
85-86-9	Coloring Agents	262
87-66-1	Coloring Agents	262
87-69-4	Tartaric Acid	968
87-81-0	Tagatose	964
87-99-0	Xylitol	1033
88-04-0	Chloroxylenol	243
89-65-6	Erythorbic Acid	352
89-78-1	Menthol	595
89-83-8	Thymol	977
90-80-2	Gluconolactone	398
94-13-3	Propylparaben	803
94-18-8	Methylparaben	604
94-26-8	Butylparaben	130
95-48-7	*o*-Cresol	281
96-27-5	Monothioglycerol	620
97-64-3	Ethyl Lactate	362
97-67-6	L-Malic Acid	570
98-92-0	Niacinamide	628
99-20-7	Trehalose	985
99-76-3	Methylparaben	604
100-51-6	Benzyl Alcohol	105
100-88-9	Cyclamic Acid	862
102-71-6	Triethanolamine	994
102-76-1	Triacetin	987
102-98-7	Phenylmercuric Borate	673
106-44-5	*p*-Cresol	281
106-62-7	Dipropylene Glycol	338
107-88-0	Butylene Glycol	128
108-32-7	Propylene Carbonate	793
108-39-4	*m*-Cresol	280
108-61-2	Dipropylene Glycol	338
108-95-2	Phenol	664
109-43-3	Dibutyl Sebacate	314
110-16-7	Maleic Acid	567
110-17-8	Fumaric Acid	387
110-27-0	Isopropyl Myristate	495
110-40-7	Diethyl Sebacate	320
110-44-1	Sorbic Acid	899
110-54-3	Heptafluoropropane (HFC)	433
110-98-5	Dipropylene Glycol	338
111-01-3	Squalane	913
111-42-2	Diethanolamine	316
111-60-4	Ethylene Glycol Monostearate	377
111-62-6	Ethyl Oleate	366
111-90-0	Diethylene Glycol Monoethyl Ether	321
112-02-7	Cetrimonium Chloride	217
112-10-7	Isopropyl Stearate	494
112-63-0	Methyl Linoleate	543
112-69-9	Methyl Oleate	367
112-72-1	Myristyl Alcohol	623
112-80-1	Oleic Acid	639
112-92-5	Stearyl Alcohol	934
115-10-6	Dimethyl Ether	327
117-81-7	Dioctyl Phthalate	314

CAS Registry Number	*Excipient Monograph*	
117-84-0	Dioctyl Phthalate	314
118-71-8	Maltol	579
119-13-1	Delta Tocopherol	60
120-47-8	Ethylparaben	379
120-51-4	Benzyl Benzoate	108
121-32-4	Ethyl Vanillin	368
121-33-5	Vanillin	1005
121-54-0	Benzethonium Chloride	99
121-79-9	Propyl Gallate	790
122-32-7	Triolein	1000
122-99-6	Phenoxyethanol	667
123-03-5	Cetylpyridinium Chloride	223
123-95-5	Butyl Stearate	122
124-04-9	Adipic Acid	40
124-38-9	Carbon Dioxide	170
126-14-7	Sucrose Octaacetate	942
127-09-3	Sodium Acetate	835
127-19-5	Dimethylacetamide	334
128-37-0	Butylated Hydroxytoluene	126
128-44-9	Saccharin Sodium	820
128-49-4	Docusate Calcium	342
128-80-3	Coloring Agents	262
130-20-1	Coloring Agents	262
131-11-3	Dimethyl Phthalate	329
133-80-2	*dl*-Alpha Tocopherol Acetate	60
134-01-0	Coloring Agents	262
134-03-2	Sodium Ascorbate	840
134-04-3	Coloring Agents	262
137-40-6	Sodium Propionate	884
137-66-6	Ascorbyl Palmitate	84
138-22-7	*n*-Butyl Lactate	363
138-32-9	Cetrimonium Tosylate	217
139-05-9	Sodium Cyclamate	860
139-06-0	Calcium Cyclamate	862
139-33-3	Edetate Disodium	347
140-01-2	Pentasodium Pentetate	659
140-72-7	Cetylpyridinium Bromide	224
141-43-5	Monoethanolamine	616
141-78-6	Ethyl Acetate	359
141-94-6	Hexetidine	435
142-18-7	Glyceryl Laurate	409
142-47-2	Monosodium Glutamate	618
142-55-2	Propylene Glycol Monolaurate	801
142-82-5	*n*-Heptane	434
142-91-6	Isopropyl Palmitate	497
143-07-7	Lauric Acid	535
143-28-2	Oleyl Alcohol	642
144-55-8	Sodium Bicarbonate	846
147-85-3	Proline	787
148-03-8	Beta Tocopherol	60
149-32-6	Erythritol	354
149-44-0	Sodium Formaldehyde Sulfoxylate	863
150-38-9	Trisodium Edetate	351
151-21-3	Sodium Lauryl Sulfate	869
298-14-6	Potassium Bicarbonate	765
300-92-5	Aluminum Distearate	64
327-62-8	Potassium Propionate	886
328-39-2	DL-Leucine	542
334-48-5	Capric Acid	536
348-67-4	D-Methionine	599
351-50-8	D-Histidine	438
408-35-5	Sodium Palmitate	648
431-89-0	Heptafluoropropane (HFC)	431
458-37-7	Coloring Agents	262
470-38-2	Coloring Agents	262
471-34-1	Calcium Carbonate	138
471-34-1	Coloring Agents	262
479-61-8	Coloring Agents	262
497-19-8	Sodium Carbonate	852
499-23-0	Isotrehalose	986
502-65-8	Coloring Agents	262
512-69-6	Raffinose	814
514-78-3	Coloring Agents	262
518-47-8	Coloring Agents	262
519-62-0	Coloring Agents	262
520-26-3	Hesperidin	626
528-53-0	Coloring Agents	262
528-58-5	Coloring Agents	262
532-32-1	Sodium Benzoate	843
533-87-9	Aleuritic Acid	831
534-73-6	Isomalt	487
538-23-8	Tricaprylin	991
540-10-3	Cetyl Palmitate	221
540-92-1	Acetone Sodium Bisulfite	35
544-35-4	Ethyl Linoleate	543
544-63-8	Myristic Acid	621
546-93-0	Magnesium Carbonate	551
546-93-0	Magnesium Carbonate Anhydrous	554
547-64-8	Methyl Lactate	363
555-44-2	Palmitin	647
557-04-0	Magnesium Stearate	559
557-05-1	Zinc Stearate	1042
557-28-8	Zinc Propionate	886
557-34-6	Zinc Acetate	1038
577-11-7	Docusate Sodium	340
582-25-2	Potassium Benzoate	763
585-86-4	Lactitol	504
585-88-6	Maltitol	571
585-91-1	Neotrehalose	986
596-03-2	Coloring Agents	262
598-82-3	Lactic Acid	502
609-36-9	DL-Proline	788
616-45-5	Pyrrolidone	812
617-48-1	Malic Acid	569
629-25-4	Sodium Laurate	536
633-56-5	Coloring Agents	262
636-61-3	D-Malic Acid	570
637-12-7	Aluminum Tristearate	64
643-84-5	Coloring Agents	262
645-35-2	Histidine Hydrochloride Monohydrate	438
657-27-2	Lysine Hydrochloride	546
760-84-9	Leucine Hydrochloride	542
811-97-2	Norflurane (HFC)	633
814-80-2	Calcium Lactate	144
816-94-4	Phospholipids	678
822-12-8	Sodium Myristate	622
822-16-2	Sodium Stearate	891
831-61-8	Ethyl Gallate	792
846-70-8	Coloring Agents	262

Eighth edition

Handbook of Pharmaceutical Excipients

The *Handbook of Pharmaceutical Excipients* is an internationally acclaimed reference work recognized as one of the most authoritative and comprehensive sources of information on excipients used in pharmaceutical formulation.

- Jointly published by the American Pharmacists Association and the Pharmaceutical Press, publications division of the Royal Pharmaceutical Society.
- Written by over 170 pharmaceutical scientists from around the world, expert in the manufacture, analysis, or use of excipients.
- Now contains 407 fully referenced excipient monographs, many including IR and NIR spectra:
  - 149 new Raman spectra included this edition.
  - 28 monographs new to this edition including Arginine, Asparagine, Calcium Polycarbophil, Cholestyramine Resin, Dimethyl-β-cyclodextrin, Edetate Calcium Disodium, Niacinamide and Polacrilex Resin.
  - 380 existing monographs reviewed.
  - New Formulation Considerations and Related Information section covering Functional Categories of Pharmaceutical Excipients, Pharmaceutical Excipients in Pediatric Formulations, the Selection of Excipients for Oral Solid Dosage Forms, and Reactive Components in Pharmaceutical Excipients.
- Information on the uses, chemical and physical properties of excipients systematically collated from a variety of international sources including: pharmacopeias; patents; primary and secondary literature; websites and manufacturers' data.
- Extensive data provided on the applications, licensing and safety of excipients.
- Comprehensively cross-referenced and indexed, with many additional excipients described as related substances.
- An international suppliers directory and detailed information on trade names and specific grades or types of excipients commercially available.

The *Handbook of Pharmaceutical Excipients* is an essential resource for formulators in the pharmaceutical industry, as well as those interested in the formulation or production of confectionery, cosmetics, and food products.

From reviews of previous editions:

'There is no better or succinct source of information on excipients available…
A valuable reference work.' *Industrial Pharmacy,* 2012

'What makes the *Handbook* such a valuable resource is the fact that chapters are written by those most knowledgeable about the materials in question, and these individuals provide information that is selected through the viewpoint of their expert opinions… a required acquisition by those working with excipients, or by scientists who seek to use the functional properties of these materials to achieve the desired type of drug delivery for a given drug substance.'

Pharmaceutical Development and Technology, 2013
