A specification for glyceryl monostearate is contained in the *Food Chemicals Codex* (FCC).[39]

A specification for glyceryl monostearate, self-emulsifying type is included in the *Japanese Pharmaceutical Excipients* (JPE).[40]

The EINECS number for glyceryl monostearate is 250-705-4. The PubChem Compound ID (CID) for glyceryl monostearate includes 24699 and 15560611.

G

Glyceryl Palmitostearate

1 Nonproprietary Names

None adopted.

2 Synonyms

DUBCARE G50; glycerol palmitostearate; 2-[(1-oxohexadecyl)-oxy]-1,3-propanediyl dioctadecanoate and 1,2,3-propane triol.

3 Chemical Name and CAS Registry Number

Octadecanoic acid, 2,3-dihydroxypropyl ester mixed with 3-hydroxy-2-[(1-oxohexadecyl)-oxy] propyl octadecanoate [8067-32-1]

4 Empirical Formula and Molecular Weight

Glyceryl palmitostearate is a mixture of mono-, di-, and triglycerides of C_{16} and C_{18} fatty acids.

5 Structural Formula

See Sections 3 and 4.

6 Functional Category

Biodegradable material; coating agent; gelling agent; modified-release agent; tablet and capsule diluent; tablet and capsule lubricant; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Glyceryl palmitostearate is used in oral solid-dosage pharmaceutical formulations as a lubricant.[1,2] Disintegration times increase[3] and tablet strength decreases[4] with an increase in mixing time.

It is used as a lipophilic matrix for sustained-release tablet and capsule formulations.[5–7] Tablet formulations may be prepared by either granulation or a hot-melt technique,[8,9] the former producing tablets that have a faster release profile. Release rate decreases with increased glyceryl palmitostearate content.[5]

Glyceryl palmitostearate is used to form microspheres, which may be used in capsules or compressed to form tablets,[10,11] pellets,[12] coated beads,[13] and biodegradable gels.[14] It is also used for taste-masking.[15]

Glyceryl palmitostearate has been investigated in the preparation of aqueous colloidal dispersions for the entrapment of lipophilic drugs.[16–26] Solid lipid microparticles (SLM) have been prepared for ocular delivery, solid lipid nanoparticles (SLN) investigated for enhancing oral bioavailability, for topical delivery and for epidural administration, and nanostructured lipid carriers (NLC) for delivering drugs orally, topically and by inhalation.[16–26]

See Table I.

Table I: Uses of glyceryl palmitostearate.[15]

Use	Concentration (%)
Matrix for sustained release	10.0–20.0
Taste masking	2.0–6.0
Tablet lubricant	1.0–4.0

8 Description

Glyceryl palmitostearate occurs as a fine white powder or waxy solid with a faint odor.

9 Pharmacopeial Specifications

—

10 Typical Properties

Acid value <6.0
Boiling point 200°C
Color <3 (Gardner scale)

Free glycerin content <1.0%
Heavy metals <10 ppm
HLB value 2
Hydroxyl value 60–115
Iodine value <3
Melting point 52–56°C
1-Monoglycerides content 8.0–17.0%
Peroxide value <3.0
Saponification value 175–195
Solubility Freely soluble in chloroform and dichloromethane; practically insoluble in ethanol (95%), mineral oil, and water.
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Sulfated ash <0.1%
Unsaponifiable matter <1.0%
Water content <1.0%

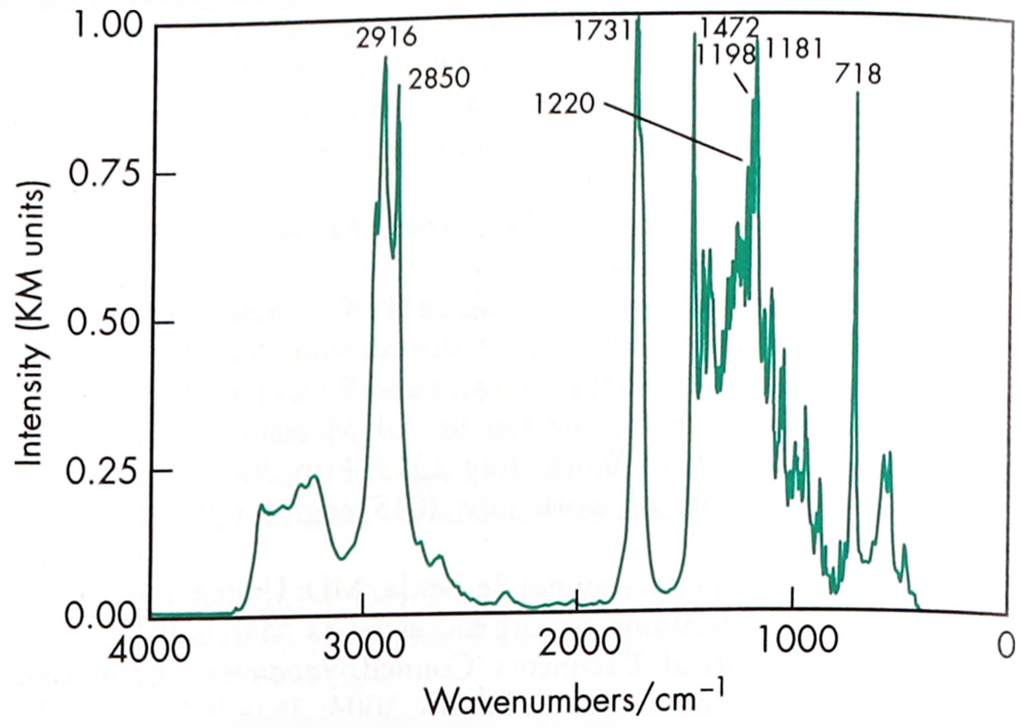

Figure 1: Infrared spectrum of glyceryl palmitostearate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

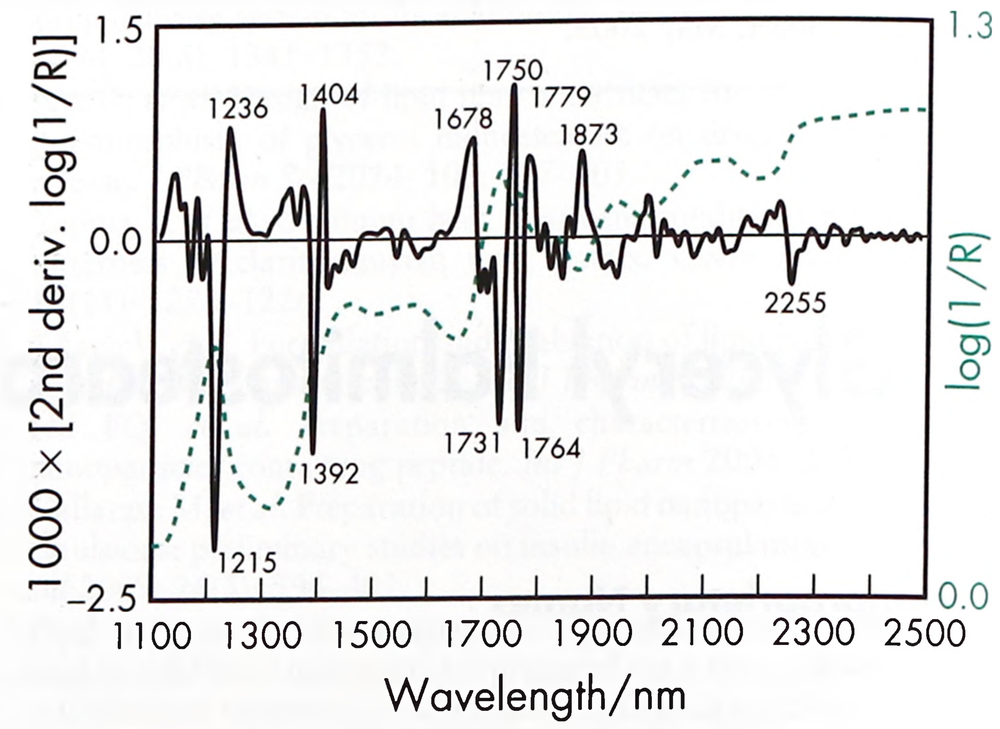

Figure 2: Near-infrared spectrum of glyceryl palmitostearate measured by reflectance.

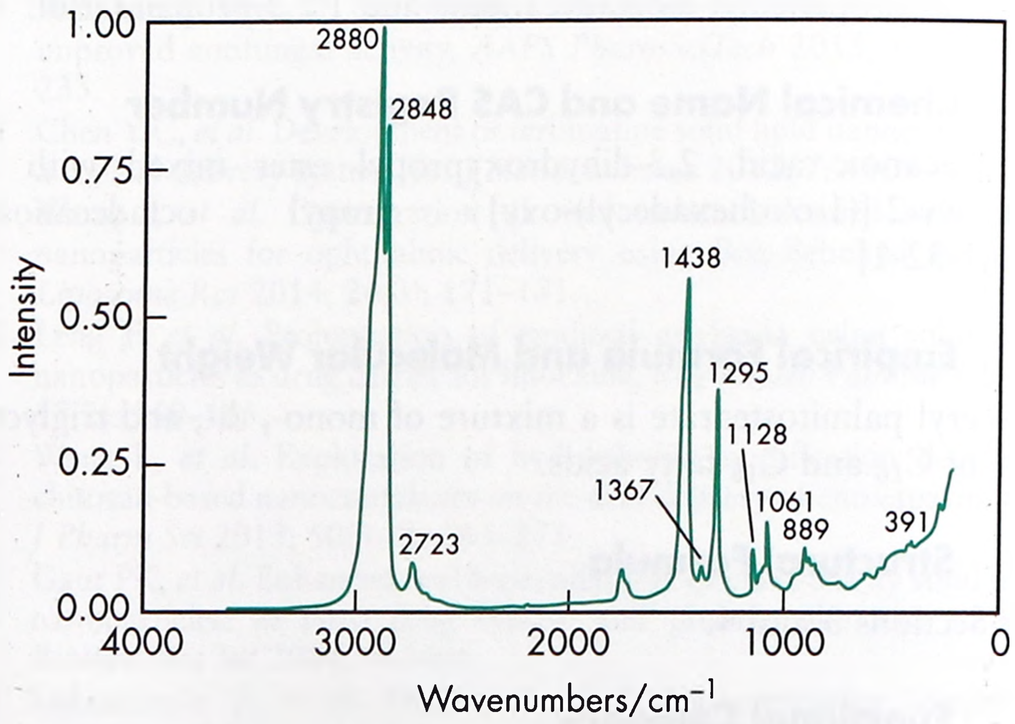

Figure 3: Raman spectrum of glyceryl palmitostearate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Glyceryl palmitostearate should not be stored at temperatures above 35°C. For storage for periods over 1 month, glyceryl palmitostearate should be stored at a temperature of 5–15°C in an airtight container, protected from light and moisture.

12 Incompatibilities

—

13 Method of Manufacture

Glyceryl palmitostearate is manufactured, without a catalyst, by the direct esterification of palmitic and stearic acids with glycerol.

14 Safety

Glyceryl palmitostearate is used in oral pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material.

LD_{50} (rat, oral): >6 g/kg[15]

15 Handling Precautions

Observe normal handling precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral suspension, oral tablet, intradermal injection). Included in nonparenteral preparations licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Glyceryl behenate; glyceryl laurate; glyceryl monooleate; glyceryl monostearate.

18 Comments

A specification for glyceryl palmitostearate is contained in the Food Chemicals Codex (FCC).[27] The EINECS number for glyceryl palmitostearate is 232-514-8. The PubChem Compound ID (CID) for glyceryl palmitostearate is 114690.

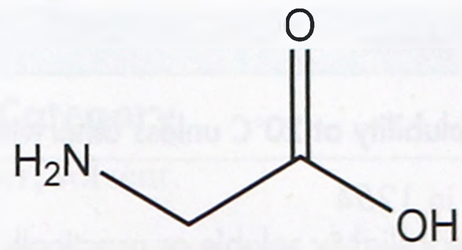
Glycine

1 Nonproprietary Names

BP: Glycine
JP: Glycine
PhEur: Glycine
USP–NF: Glycine

2 Synonyms

2-Aminoacetic acid; aminoacetic acid; E640; G; Gly; glycinium; glycinum; glycoamin; glycocoll; glycoll; glycolixir; Hampshire glycine; padil; sucre de gélatine.



3 Chemical Name and CAS Registry Number

Aminoethanoic acid [56-40-6]

4 Empirical Formula and Molecular Weight

$C_2H_5NO_2$ 75.07

5 Structural Formula

6 Functional Category

Buffering agent; lyophilization aid; tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology

Glycine is routinely used as a cofreeze-dried excipient in protein formulations owing to its ability to form a strong, porous, and elegant cake structure in the final lyophilized product.[1–3] It is one of the most frequently utilized excipients in freeze-dried injectable formulations[4] owing to its advantageous freeze-drying properties, and has been used to stabilize sugar-free intravenous immunoglobulin preparations (IVIGs) for improved patient tolerability.[5] *See also* Section 14

Glycine has been investigated as a disintegration accelerant in fast-disintegrating formulations owing to its rapid dissolution in aqueous systems,[6,7] and it has also been investigated for use in spray-dried formulations.[8]

8 Description

Glycine occurs as a white, odorless, crystalline powder, and has a sweet taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for glycine.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	–
Loss on drying	≤0.3%	≤0.5%	≤0.2%
Residue on ignition	≤0.1%	–	≤0.1%
pH	5.6–6.6	5.9–6.4	–
Appearance of solution	+	+	–
Chlorides	≤0.021%	≤75 ppm	≤0.007%
Sulfates	≤0.028%	–	≤0.0065%
Ammonium	≤0.02%	≤0.02%	–
Hydrolyzable substances	–	–	+
Ninhydrin-positive substances	–	+	–
Sulfated ash	–	≤0.1%	–
Heavy metals	≤20 ppm	–	≤20 ppm
Arsenic	≤2 ppm	–	–
Related substances	+	+	–
Assay (dried basis)	≥98.5%	98.5–101.0%	98.5–101.5%

10 Typical Properties

Acidity/alkalinity pH = 4 (0.2 M solution in water)
Density 1.1607 g/cm^3
Melting point 232–236°C
Solubility *see* Table II.

Table II: Solubility of glycine.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	1 in 1254
Ether	Very slightly soluble or practically insoluble
Pyridine	1 in 164
Water	1 in 4 at 25°C 1 in 2.6 at 50°C 1 in 1.9 at 75°C 1 in 1.5 at 100°C

11 Stability and Storage Conditions

Glycine starts to decompose at 233°C. Store in well-closed containers. Glycine irrigation solutions (95–105% glycine) should be stored in single dose containers, preferably type I or type II glass.

12 Incompatibilities

Glycine may undergo Maillard reactions with amino acids to produce yellowing or browning. Reducing sugars will also interact with secondary amines to form an imine, but without any accompanying yellow-brown discoloration.

13 Method of Manufacture

Chemical synthesis is the most suitable method of preparation of glycine. Amination of chloroacetic acid and the hydrolysis of aminoacetonitrile are the favored methods of production.[8]

14 Safety

Glycine is used as a sweetener, buffering agent, and dietary supplement. The pure form of glycine is moderately toxic by the IV route and mildly toxic by ingestion.

Systemic absorption of glycine irrigation solutions can lead to disturbances of fluid and electrolyte balance and cardiovascular and pulmonary disorders.[9] It has also been reported that glycine-stabilized IVIGs may have the potential to cause secondary renal impairment.[10]

LD_{50} (mouse, IP): 4.45 g/kg[11]
LD_{50} (mouse, IV): 2.37 g/kg
LD_{50} (mouse, oral): 4.92 g/kg
LD_{50} (mouse, SC): 5.06 g/kg
LD_{50} (rat, IV): 2.6 g/kg
LD_{50} (rat, oral): 7.93 g/kg
LD_{50} (rat, SC): 5.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, glycine emits toxic fumes of nitrogen oxides.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM, IV, SC injections; oral; rectal). Included in parenteral (powders for injection; solutions for injection; vaccines; kits for implant) and nonparenteral (orodispersible tablets/oral lyophilizate; powders for inhalation; powders for oral solution; tablets) formulations licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Accepted for use as a food additive in Europe.

17 Related Substances

Glycine hydrochloride; sodium glycinate.

Glycine hydrochloride

Empirical formula $C_2H_5NO_2 \cdot HCl$
Molecular weight 111.5
CAS number [6000-43-7]
Melting point 182°C
Comments The EINECS number for glycine hydrochloride is 227-841-8.

Sodium glycinate

Empirical formula $C_2H_4NO_2 \cdot Na$
Molecular weight 97.1
CAS number [6000-44-8]
Melting point 197–201°C
Comments The EINECS number for sodium glycinate is 227-842-3.

18 Comments

Anhydrous glycine exists in three polymorphic forms α, β, and γ,[12] which can have implications for product stability in lyophilized systems. The β form is generally produced during freeze-drying. However, the presence of moisture at room temperature can induce a polymorphic conversion to a mixture of the α and γ forms.[10]

Glycine at low levels (≤50 mol/L) has been shown to notably minimize the expected pH reduction in freeze-dried sodium phosphate buffer,[13] which can be detrimental to protein stability during the lyophilization process.

Glycine Irrigation 1.5% USP is a sterile nonpyrogenic, nonhemolytic, nonelectrolytic solution in single-dose containers for use as a urological irrigation solution.

Glycine is a non-essential aliphatic amino acid and is used as a dietary supplement. Therapeutically, glycine may be used along with antacids in the treatment of gastric hyperacidity, and it may also be included in aspirin preparations to aid the reduction of gastric irritation.[14] It is also used as a buffering agent and conditioner in cosmetics.

A specification for glycine is contained in the *Food Chemicals Codex* (FCC).[15]

The EINECS number for glycine is 200-272-2. The PubChem Compound ID (CID) for glycine is 750.

Glycofurol

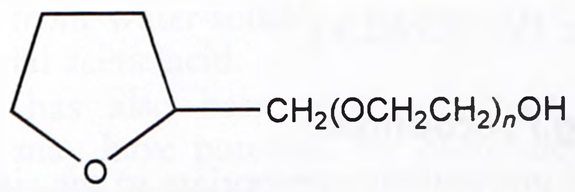
1 Nonproprietary Names

None adopted.

2 Synonyms

Glicofurol; glycofural; *Glycofurol 75*; tetraglycol; α-(tetrahydrofuranyl)-ω-hydroxy-poly(oxyethylene); tetrahydrofurfuryl alcohol polyethylene glycol ether; THFP.

Note: tetraglycol is also used as a synonym for tetrahydrofurfuryl alcohol.



3 Chemical Name and CAS Registry Number

α-[(Tetrahydro-2-furanyl)methyl]-ω-hydroxy-poly(oxy-1,2-ethanediyl) [31692-85-0]

4 Empirical Formula and Molecular Weight

$C_9H_{18}O_4$ (average) 190.24 (average)

5 Structural Formula

Glycofurol 75: n = 1–2

6 Functional Category

Penetration enhancer; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Glycofurol is used as a solvent in parenteral products for intravenous or intramuscular injection in concentrations up to 50% v/v.[1–5] It has also been investigated, mainly in animal studies, for use as a

penetration enhancer and solvent in topical[6,7] and intranasal formulations.[8–12] Glycofurol has also been used at 20% v/v concentration in a rectal formulation,[13] and it has been studied as a nontoxic solvent in self-microemulsifying drug delivery systems for improved intravenous[14] and oral[15,16] administration. It has also been investigated for use in microencapsulation in controlled drug release systems.[17–19]

8 Description

Glycofurol is a clear, colorless, almost odorless liquid, with a bitter taste; it produces a warm sensation on the tongue.

9 Pharmacopeial Specifications

—

10 Typical Properties

Boiling point 80–100°C for *Glycofurol 75*
Density 1.070–1.090 g/cm^3 at 20°C
Flash point >113°C (closed cup)
Hydroxyl value 300–400
Moisture content 0.2–5% at ambient temperature and 30% relative humidity.
Refractive index n_D^{40} = 1.4545
Solubility *see* Table I.
Viscosity (dynamic) 8–18 mPa s (8–18 cP) at 20°C for *Glycofurol 75*.

11 Stability and Storage Conditions

Stable if stored under nitrogen in a well-closed container protected from light, in a cool, dry place.

12 Incompatibilities

Glycofurol is incompatible with oxidizing agents.

13 Method of Manufacture

Glycofurol is prepared by the reaction of tetrahydrofurfuryl alcohol with ethylene oxide (followed by a special purification process in the case of *Glycofurol 75*).

14 Safety

Glycofurol is mainly used as a solvent in parenteral pharmaceutical formulations and is generally regarded as a relatively nontoxic and nonirritant material at the levels used as a pharmaceutical excipient. Glycofurol can be irritant when used undiluted; its tolerability is approximately the same as propylene glycol.[1,2]

Glycofurol may have an effect on liver function and may have a low potential for interaction with hepatoxins or those materials undergoing extensive hepatic metabolism.[4]

LD_{50} (mouse, IV): 3.5 mL/kg[1,2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in parenteral medicines licensed in Europe.

17 Related Substances

—

18 Comments

Grades other than *Glycofurol 75* may contain significant amounts of tetrahydrofurfuryl alcohol and other impurities. *Glycofurol 75* meets an analytical specification, which includes a requirement that the fraction in which n = 1 or 2 amounts to a minimum of 95%; *see* Section 5.

The EINECS number for glycofurol is 227-407-8. The PubChem Compound ID (CID) for glycofurol is 110717.

Table I: Solubility of glycofurol.

Solvent	Solubility at 20°C
Arachis oil	Immiscible
Castor oil	Miscible[a]
Ethanol (95%)	Miscible in all proportions
Glycerin	Miscible in all proportions
Isopropyl ether	Immiscible

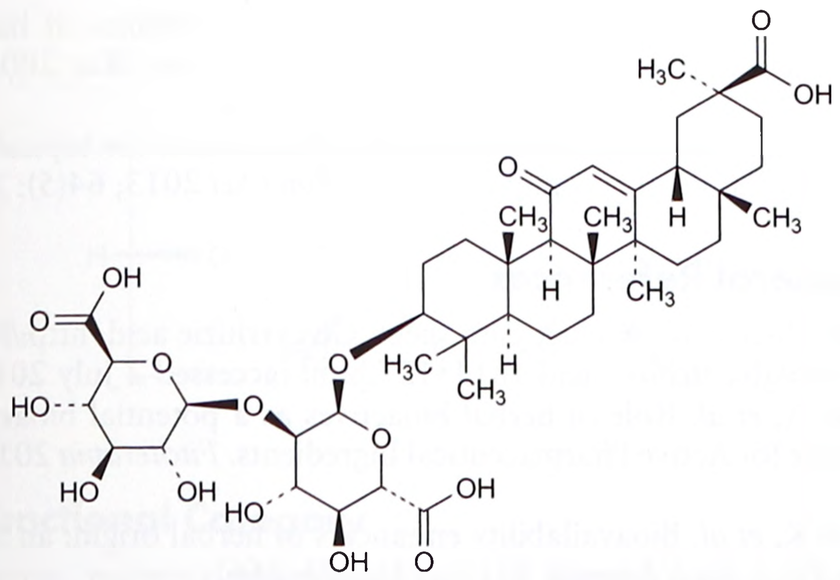
Glycyrrhizin

1 Nonproprietary Names

None adopted.

2 Synonyms

GA; glycyrrhizic acid; glycyrrhizinic acid; glycyrrhetinic acid glycoside.



3 Chemical Name and CAS Registry Number

(3β,20β)-20-Carboxy-11-oxo-30-norolean-12-en-3-yl 2-O-β-D-glucopyranuronosyl-α-D-glucopyranosiduronic acid [1405-86-3]

4 Empirical Formula and Molecular Weight

$C_{42}H_{62}O_{16}$ 822.93

5 Structural Formula

6 Functional Category

Flavoring agent; sweetening agent; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Glycyrrhizin is a naturally occurring triterpenoid saponin used as a sweetener and taste-masking agent in oral pharmaceutical formulations, and is approximately 50 times sweeter than sucrose.

Glycyrrhizin can form stable gels that have been investigated for topical drug application,[1,2] and due to the surfactant properties of saponins, it has also been investigated as a penetration enhancer.[1–4]

Glycyrrhizin conjugated low molecular weight chitosan nanoparticles have been investigated for the hepatocyte-targeted delivery of lamivudine.[5] Glycyrrhizin–nifedipine complexes have been investigated to increase the aqueous solubility of nifedipine.[6]

8 Description

Glycyrrhizin occurs as a white, crystalline hygroscopic powder, or crystals, with an intensely sweet taste.

9 Pharmacopeial Specifications

—

10 Typical Properties

Antimicrobial activity Glycyrrhizin possesses antibacterial[7] and antiviral[8] properties. It has shown activity against *Enterococcus faecalis*[9] and the hepatitis C virus.[10]

Dissociation Constant

$pK_{a1} = 3.98$

$pK_{a2} = 4.62$

$pK_{a3} = 5.17$

Melting point 200°C, with decomposition at 220°C

Optical rotation $[\alpha]_D^{17}$ +46.2° (1.5% w/v solution in alcohol)

Partition coefficient Log *P* (oil : water) = 2.8

Solubility Freely soluble in hot water and alcohol; soluble in dimethyl sulfoxide; practically insoluble in ether.

11 Stability and Storage Conditions

Glycyrrhizin is stable under normal conditions. It should be stored in a tightly closed container in a cool, well-ventilated area.

12 Incompatibilities

Glycyrrhizin is incompatible with strong oxidizing agents.

13 Method of Manufacture

Glycyrrhizin is a naturally occurring triterpenoid saponin found in the roots and rhizomes of the licorice plant *Glycyrrhiza glabra*,[11] and is isolated from water-soluble extracts.[12] Crystals are produced from glacial acetic acid.

Glycyrrhizin has also been produced from *G. inflata* cell cultures, which may have potential for future development for a large-scale production protocol.[13]

14 Safety

Glycyrrhizin is widely used in foods, cosmetics and oral pharmaceutical preparations, and is generally regarded as safe for use as an excipient.

Acute exposure may cause irritation to eyes, skin, respiratory or digestive tracts. Prolonged or repeated exposure may be harmful, and it may be mutagenic. In high doses, glycyrrhizin has been reported to induce side-effects such as hypertension and hypokalemic myopathy.[14–17] An acceptable daily intake of 0.015–0.229 mg/kg/day has been proposed,[18] and an upper limit of 100 mg/day has been recommended.[11]

The Cosmetic Ingredient Review Expert Panel has assessed glycyrrhizin and concluded that the material is safe as used in cosmetics and personal care products.[12]

LD_{50} (mouse, oral): 4.32 g/kg[19]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Avoid inhalation or contact with eyes, skin, and clothing. Avoid prolonged or repeated exposure. Suitable protective clothing, gloves, eye protection, and a respirator are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA inactive ingredient database (oral syrups). Included in the Canadian natural ingredients database.

17 Related Substances

Ammonium glycyrrhizate; potassium glycyrrhizate

Potassium glycyrrhizate

Empirical formula and Molecular weight

$C_{42}H_{61}KO_{16}$ 861.02

$C_{42}H_{60}K_2O_{16}$ 899.11

CAS number

Potassium glycyrrhizate [68039-19-0]

Monopotassium glycyrrhizate [42294-03-1]

Dipotassium glycyrrhizate [68797-35-3]

Synonyms Glycyrrhizinic acid, potassium salt; potassium glycyrrhizinate; *Rizinsan K2 A2*.

Comments Used as a flavoring and emulsifying agent in pharmaceutical, cosmetics and personal care products. It has been investigated for use as an emulsifying agent in a liposomal formulation for the topical delivery of benzocaine.[20] Therapeutically, it has also been used in a topical formulation as an anti-inflammatory agent.[21]

18 Comments

Glycyrrhizin is a constituent of liquorice and is widely used as a sweetener in food products and chewing tobacco.[14] It is also used cosmetic products.[12]

Therapeutically, glycyrrhizin has been investigated for its anti-inflammatory activity, antitumor activity, anti-allergic activities, and antiviral activities.[8,10] It is also of clinical interest for the treatment of chronic hepatitis C.[10,14]

The PubChem Compound ID (CID) for glycyrrhizin includes 3495, 14982, 128229, 16213698, 45358013, 45358130, 45356931, and 78577433. The EINECS number for glycyrrhizin is 215-785-7.

Guar Gum

1 Nonproprietary Names

BP: Guar Galactomannan

PhEur: Guar Galactomannan

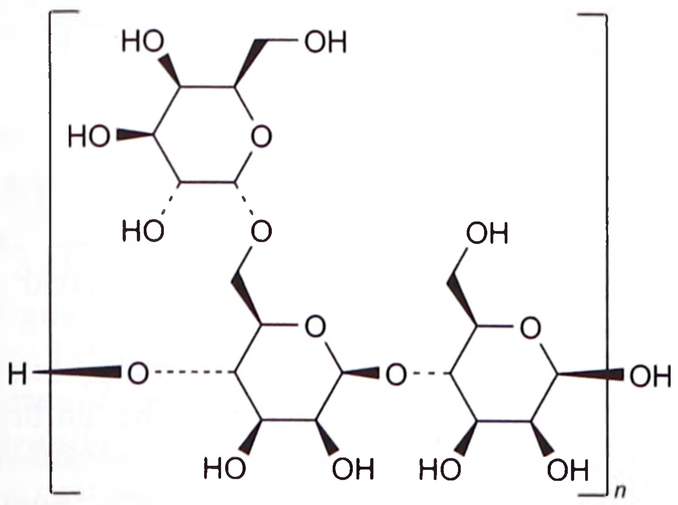
USP–NF: Guar Gum

2 Synonyms

Cyamopsis tetranoloba gum; E412; *Galactosol*; guar; guaran; guar flour; guar galactomannanum; gum guar; jaguar gum; *Meyprogat*; *Meyprodor*; *Meyprofin*.

3 Chemical Name and CAS Registry Number

Galactomannan polysaccharide [9000-30-0]



4 Empirical Formula and Molecular Weight

$(C_6H_{12}O_6)_n$ ≈220 000

See Section 5.

5 Structural Formula

Guar gum consists of linear chains of (1→4)-β-D-mannopyranosyl units with α-D-galactopyranosyl units attached by (1→6) linkages. The ratio of D-galactose to D-mannose is between 1 : 1.4 and 1 : 2. This water soluble galactomannan polysaccharide chain is also known as guaran, and accounts for 85% of the ground solid. *See also* Section 8.

6 Functional Category

Bioadhesive material; modified-release agent; suspending agent; tablet and capsule binder; tablet and capsule disintegrant; transdermal delivery component; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Guar gum is a galactomannan, commonly used in cosmetics, food products, and pharmaceutical formulations. In pharmaceuticals, guar gum is used in solid-dosage forms as a binder and disintegrant,[1–3] *see* Table I; in oral and topical products as a suspending, thickening, and stabilizing agent; and also as a controlled-release carrier. Guar gum is also used in transdermal patches.

Guar gum has been investigated in the oral delivery of proteins, colonic drug delivery, and in the preparation of sustained-release matrix tablets in the place of cellulose derivatives such as methylcellulose. Experimentally, guar gum has been utilised for matrix, multi-layer and compression coated tablets, hydrogels, and microspheres.[4–8] Guar-gum-based three-layer matrix tablets have been used experimentally in oral controlled-release formulations.[9]

Table I: Uses of guar gum.

Use	Concentration (%)
Emulsion stabilizer	1
Tablet binder	Up to 10
Thickener for lotions and creams	Up to 2.5

8 Description

The USP 40–NF 35 S1 describes guar gum as a gum obtained from the ground endosperms of *Cyamopsis tetragonolobus* (Linné) Taub. (Fam. Leguminosae). It consists chiefly of a high-molecular-weight hydrocolloidal polysaccharide, composed of galactan and mannan units combined through glycoside linkages, which may be described chemically as a galactomannan. The PhEur 9.2 similarly describes guar galactomannan as being obtained from the seeds of *Cyamopsis tetragonolobus* (L.) Taub. by grinding the endosperms and subsequent partial hydrolysis.

The main components are polysaccharides composed of D-galactose and D-mannose in molecular ratios of 1 : 1.4 to 1 : 2. The molecule consists of a linear chain of β-(1→4)-glycosidically linked manno-pyranoses and single α-(1→6)-glycosidically linked galacto-pyranoses. *See also* Section 18.

Guar gum occurs as an odorless or nearly odorless, white to yellowish-white powder with a bland taste.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for guar gum.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
pH (1% w/w solution)	5.5–7.5	–
Apparent viscosity	+	–

Starch	–	+
Galactomannans	–	≥66.0%
Tragacanth, sterculia gum, agar, alginates, and carrageenan	+	–

10 Typical Properties

Acidity/alkalinity pH = 5.0–7.0 (1% w/v aqueous dispersion)

Density 1.492 g/cm^3

Melting point 226–227°C

Solubility Practically insoluble in organic solvents. In cold or hot water, guar gum disperses and swells almost immediately to form a highly viscous, thixotropic sol. The optimum rate of hydration occurs at pH 7.5–9.0. Finely milled powders swell more rapidly and are more difficult to disperse. Two to four hours in water at room temperature are required to develop maximum viscosity.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

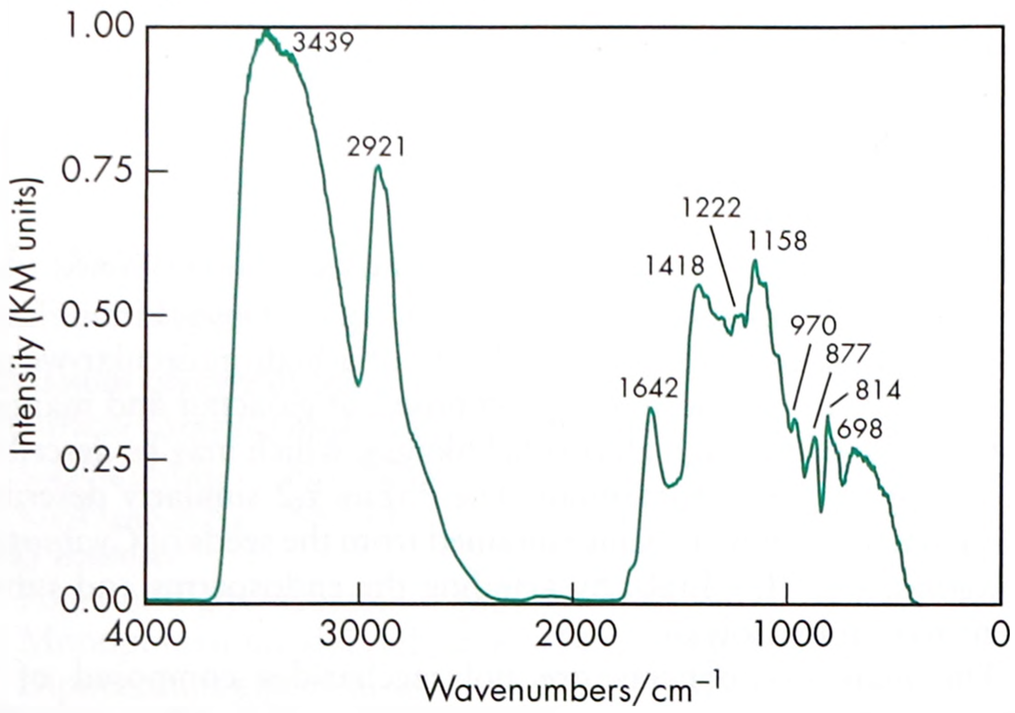

Figure 1: Infrared spectrum of guar gum measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

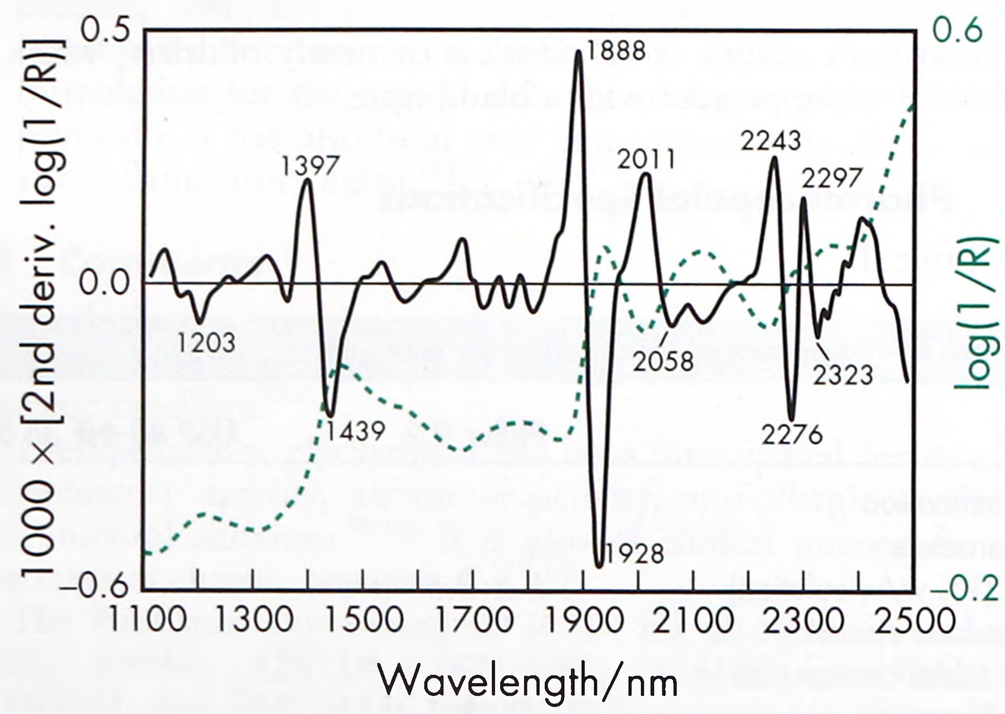

Figure 2: Near-infrared spectrum of guar gum measured by reflectance.

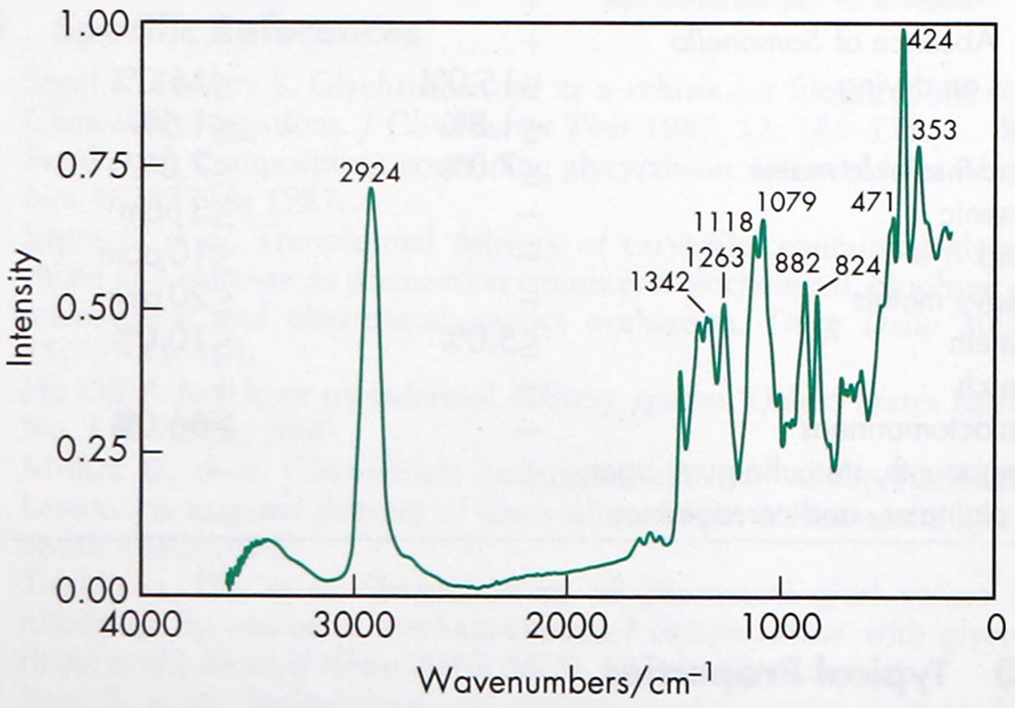

Figure 3: Raman spectrum of guar gum measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Viscosity (dynamic) 4.86 Pa s (4860 cP) for a 1% w/v dispersion. Viscosity is dependent upon temperature, time, concentration, pH, rate of agitation, and particle size of the guar gum powder. Synergistic rheological effects may occur with other suspending agents such as xanthan gum; *see* Xanthan Gum.

11 Stability and Storage Conditions

Aqueous guar gum dispersions have a buffering action and are stable at pH 4.0–10.5. However, prolonged heating reduces the viscosity of dispersions.

The bacteriological stability of guar gum dispersions may be improved by the addition of a mixture of 0.15% methylparaben and 0.02% propylparaben as a preservative. In food applications, benzoic acid, citric acid, sodium benzoate, or sorbic acid may be used.

Guar gum powder should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Guar gum is compatible with most other plant hydrocolloids such as tragacanth. It is incompatible with acetone, ethanol (95%), tannins, strong acids, and alkalis. Borate ions, if present in the dispersing water, will prevent the hydration of guar gum. However, the addition of borate ions to hydrated guar gum produces cohesive structural gels and further hydration is then prevented. The gel formed can be liquefied by reducing the pH to below 7, or by heating.

Reduction in the absorption of ethinyl estradiol, penicillin V, metaformin and some formulations of glyburide has been observed, in addition to the slow absorption of acetaminophen, bumetanide and digoxin with guar gum consumption.[10] The absorption of penicillin V from some formulations may be reduced by a quarter.[11]

13 Method of Manufacture

Guar gum is obtained from the ground endosperm of the guar plant, *Cyamopsis tetragonolobus* (Linné) Taub. (Fam. Leguminosae), which is grown in India, Pakistan, and the semiarid southwestern region of the US.

The seed hull can be removed by grinding, after soaking in sulfuric acid or water, or by charring. The embryo (germ) is removed by differential grinding, since each component possesses a different hardness. The separated endosperm, containing 80% galactomannan is then ground to different particle sizes depending upon final application.

14 Safety

Guar gum is widely used in foods, and oral and topical pharmaceutical formulations. Excessive consumption may cause gastrointestinal disturbance such as flatulence, diarrhea, or nausea.[10] There have also been reports of allergic reactions.[12] In food applications, an acceptable daily intake of guar gum has not been specified by the WHO.[13] Therapeutically, daily oral doses of up to 30 g of guar gum have been administered to patients with diabetes mellitus. Caution is advised to avoid a severe glucose deficiency.[10,14,15]

LD_{50} (hamster, oral): 6.0 g/kg[16]

LD_{50} (mouse, oral): 8.1 g/kg

LD_{50} (rabbit, oral): 7.0 g/kg

LD_{50} (rat, oral): 6.77 g/kg

Although it is generally regarded as a nontoxic and nonirritant material, the safety of guar gum when used as an appetite suppressant has been questioned. When consumed, the gum swells in the stomach to promote a feeling of fullness. However, it is claimed that premature swelling of guar gum tablets may occur and

cause obstruction of, or damage to, the esophagus. Consequently, appetite suppressants containing guar gum in tablet form have been banned in the UK.[17,18] However, appetite suppressants containing microgranules of guar gum are claimed to be safe.[19] The use of guar gum for pharmaceutical purposes is unaffected by the ban.

In 2007, the Rapid Alert System for Food and Feed (RASFF) received notification of serious contamination of guar gum supplied from India. Batches were found to contain more than 1000 times the normal background levels of dioxins and pentachlorophenol (PCP). A 2008 European Commission decision imposed rules on the import of guar gum into the EU from India, requiring imports to be accompanied by an analytical report. This was replaced by a review in 2010 adding additional measures.[12,20]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Guar gum may be irritating to the eyes and occupational development of asthma and rhinitis has been reported.[10] Eye protection, gloves, and a dust mask or respirator are recommended.

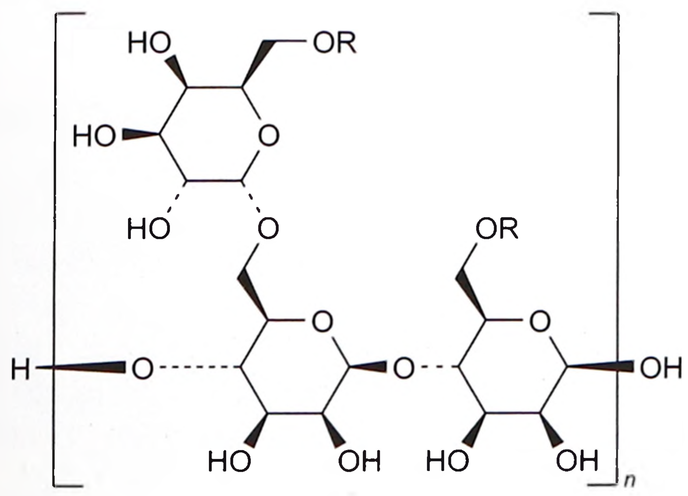
16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral suspensions, syrups, and tablets; topical preparations; vaginal tablets). Also included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Acacia; guar hydroxypropyltrimonium chloride; guaraprolose; tragacanth; xanthan gum.

Guaraprolose



Chemical name (1→6)-α-D-Galactopyrano-(1→4)-β-D-mannopyranan 2-hydroxypropyl ether

Synonyms 2-Hydroxypropyl guar gum; guar gum hydroxypropyl ether; HP-guar; hydroxypropyl guar; hydroxypropyl guar gum.

CAS number [39421-75-5]

Empirical formula $[C_{18}H_{30}O_{15}(C_3H_6O)_x]_n$

Structural formula

R = H, CH_2-CHOH-CH_3

Description White to yellowish-white powder

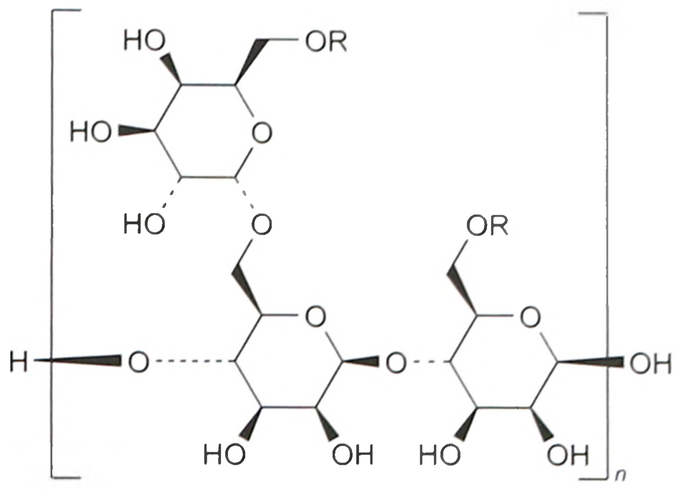
pH 6–8 (1% solution)

Solubility 10% maximum in water (% by weight)

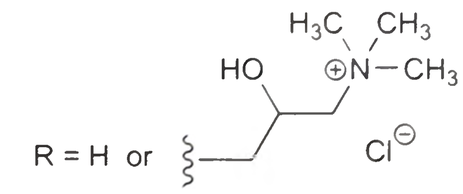
Specific gravity (H_2O = 1) Approximately 1 g/cc

Comments Guaraprolose is a gelling agent derived from guar gum. It is used in eye drops mimicking the mucin layer of the tear film.[21] It is also used in skin and hair care products and has many industrial applications. Hydroxypropyl guar gum can be prepared by alkaline etherification of guar gum with propylene oxide.[12]

Guar Hydroxypropyltrimonium Chloride



Chemical name Guar gum, 2-hydroxy-3(trimethylammonio)propyl ether chloride



Synonyms 2-Hydroxy-3-(trimethylammonio)propyl ether chloride guar gum; guar hydroxypropyl trimonium chloride; guar, 2-hydroxy-3-trimethylammoniopropyl ether, chloride; Jaguar C.

CAS number [65497-29-2]

Empirical formula $C_6H_{16}NO_2.xCl$

Structural formula

Description White to yellow fine powder

pH 6.0 to 7.5 (1% solution); 9.0 to 10.5 (1% aqueous, 25°C)

Solubility Very slightly soluble in water; practically insoluble in ethyl ether, chloroform, petrol ether, ethyl alcohol, and paraffin oil.

Comments Guar hydroxypropyltrimonium chloride is produced by the substitution of guar at the C6 position by 3-chloro-2 hydroxypropyl trimethyl ammonium chloride. The resulting structure is not fully substituted. Guar hydroxypropyltrimonium chloride has been also used in foot powders and sprays.[12]

18 Comments

Synthetic derivatives of guar gum, such as guar acetate, guar phthalate, guar acetate phthalate, oxidized guar gum, and sodium carboxymethyl guar, have also been investigated for their pharmaceutical applications. In particular, sodium carboxymethyl guar gives a transparent gel and, when poured over a pool of mercury, produces a flexible, clear, transparent film. Sodium carboxymethyl guar has been used as a polymer matrix in transdermal patches.[22]

Guar gum has been investigated as a matrix gel-forming sustained-release excipient in solid oral dosage forms.[23] It has also been evaluated in buccoadhesive tablets for sustained release along with other gums including xanthan gum and karaya gum, in combination with chitosan.[24] Studies have shown that films composed of guar gum and chitosan appear to be tougher and more bioadhesive.[25] Studies have also shown ethycellulose/guar gum coatings provide long-term stable ethanol-resistant drug release kinetics.[26,27]

A specification for guar gum is contained in the *Food Chemicals Codex* (FCC).[28]

The EINECS number for guar gum is 232-536-8.

3 Chemical Name and CAS Registry Number

Hectorite [12173-47-6]

4 Empirical Formula and Molecular Weight

$\approx Na_{0.3}(Mg,Li)_3Si_4O_{10}(F,OH)_2$ ≈383

Hectorite is a mineral with an approximate empirical formula owing to the variability in cation substitution; *see* Table I.

Table I: Approximate composition of hectorite based on chemical analysis.[1]

Component	Wt % range
SiO_2	53.6–55.9
Al_2O_3	0.1–1.1
MgO	24.9–25.4
Fe_2O_3	0–0.05
FeO	0–0.7
CaO	0–0.5
Li_2O	0.4–1.2
Na_2O	0.9–3.0
K_2O	0.05–0.4
TiO_2	0–0.4
F	3.2–6.0
H_2O+ (structural water OH)	5.6–8.3
H_2O- (hydration water)	7.2–9.9

5 Structural Formula

Hectorite is a natural mineral clay, obtained from altered volcanic ash with a high silica content. It is composed of two tetrahedral layers formed by phyllosilicate sheets and one octahedral layer. The apical oxygens of the two tetrahedral sheets project into the octahedral sheet. It is structurally similar to talc but differs by substitution, mainly in the octahedral layer. Common impurities include aluminum, calcium, chlorine, iron, potassium, and titanium.

See Section 4.

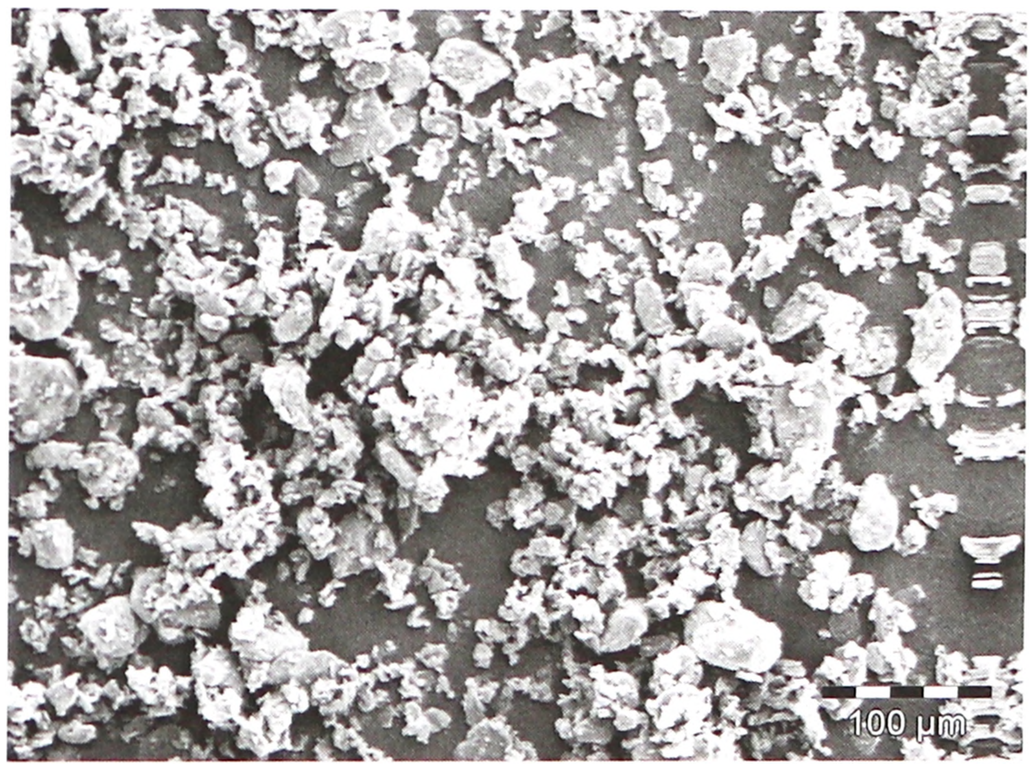
6 Functional Category

Adsorbent; emulsifying agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

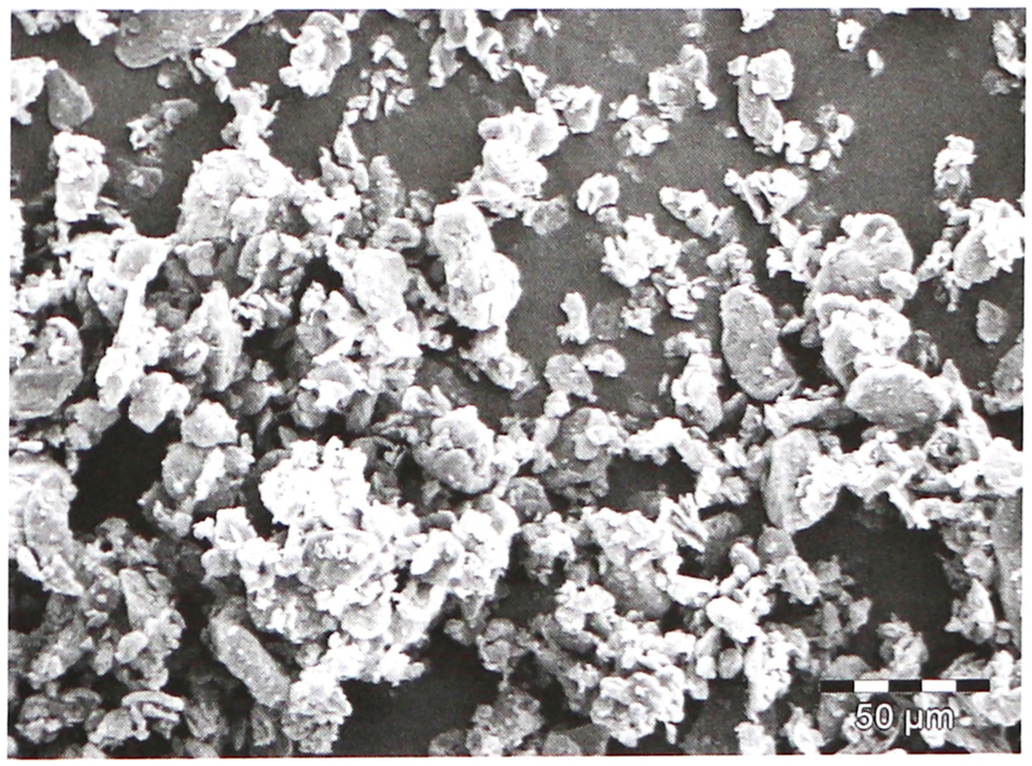
Hectorite is used widely in pharmaceutical preparations as an absorbent, emulsifier, stabilizer, suspending agent, thickener, and viscosity-controlling agent.[2]

Hectorite is a component of other naturally occurring clays and hence may be suitable for use in similar pharmaceutical formulation applications as an adsorbent, oil-in-water emulsifying agent, suspending agent, or viscosity-increasing agent.[3] It is also available as a synthetic material. Hectorite is used to modify the thixotropic behavior of pharmaceutical dispersions[4] and for stabilizing oil-in-water emulsion bases.[5,6] Due to its nature as an intercalating material it has been investigated for drug delivery applications.[7]



8 Description

Hectorite is a naturally occurring 2:1 phyllosilicate clay of the smectite (montmorillonite) group and is a principal component of bentonite clay. Hectorite occurs as an odorless, white to cream-colored, waxy, dull powder composed of aggregates of colloidal-sized lath-shaped crystals.



9 Pharmacopeial Specifications

See Section 18.

SEM 1: Excipient: hectorite (*Hectabrite DP*); manufacturer: American Colloid Co.; lot no.: 58905 NFT 288; magnification: 500×.

SEM 2: Excipient: hectorite (*Hectabrite DP*); manufacturer: American Colloid Co.; lot no.: 58905 NFT 288; magnification: 1000×.

10 Typical Properties

Cation exchange capacity 43.9 meq/100 g[8]
Crystal data Space group C2/*m*, a = 5.2, b = 9.16, c = 16.0, β ≈ 99°.[9]
Density (true) ≈2.3 g/cm^3 (measured)[9]
Hardness (Mohs) 1–2[9]
Moisture content Hectorite loses ≈10% of water up to 150°C; ≈2% above 150°C.[10]
Refractive index n_α= 1.49; n_β= 1.50; n_γ= 1.52 (biaxial –).[9]
Specific surface area 63.2 m^2/g. Hectorite swells on the addition of water.[8]

11 Stability and Storage Conditions

Hectorite is a stable material and should be stored in a cool, dry place.

12 Incompatibilities

Contact between hectorite and hydrofluoric acid may generate heat.

13 Method of Manufacture

Naturally occurring hectorite is mined from weathered bentonite deposits. It is further processed to remove grit and impurities so that it is suitable for pharmaceutical and cosmetic applications.

14 Safety

Hectorite is a natural clay mineral that is not considered acutely toxic; therefore no toxicity values have been established. However, hectorite may contain small amounts of crystalline silica in the form of quartz.

Dust can be irritating to the respiratory tract and eyes,[11] and contact with this material may cause drying of the skin. Chronic exposure to crystalline silica may have adverse effects on the respiratory system. EU labeling states that the material is not classified as dangerous.

LD_{50} (rat, oral): >5.0 g/kg[12]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material being handled. Avoid generating and breathing dust, and use eye protection. For dusty conditions, eye protection, gloves, and a dust mask are recommended. The occupational exposure limits for hectorite are 5 mg/m^3 (respirable) PEL-TWA, 3 mg/m^3 (respirable) TLV-TWA, and 10 mg/m^3 (inhalable dust) TLV-TWA.

16 Regulatory Status

The components of hectorite are individually reported in the EPA TSCA Inventory. Included in the FDA Inactive Ingredients Database (transdermal; film and controlled release).

17 Related Substances

Attapulgite; bentonite; kaolin; magnesium aluminum silicate; quaternium 18-hectorite; saponite; stearalkonium hectorite; talc.

Quaternium 18-hectorite

CAS numbers [71011-27-3]; [12001-31-9].
Synonyms *Bentone 38*.
Comments Quaternium 18-hectorite is used in cosmetics as a viscosity-controlling agent. It does not contain crystalline silica. The EINECS numbers for quaternium 18-hectorite are 234-406-6, and 275-128-5.

Stearalkonium hectorite

CAS numbers [94891-33-5]; [71011-26-2].
Synonyms *Bentone 27*.
Comments Steralkonium hectorite is used in cosmetics as a viscosity-controlling agent. Reported in the EPA TSCA Inventory. The EINECS numbers for stearalkonium hectorite are 305-633-9, and 275-126-4.

18 Comments

Hectorite is listed as a component of magnesium aluminum silicate in the USP 40–NF 35 S1 and as a component of bentonite in the *Food Chemicals Codex* (FCC).[13]

The infrared spectra for hectorite have been reported.[14,15] The correlation between XRPD pattern and water loss on heating has been examined.[16] The influence of electrolyte concentration on the yield value of hectorite gels has also been investigated.[17]

Polyethylene glycols 400, 1500, and 4000 have been shown to increase the consistency of hectorite dispersions.[18] Synthetic hectorite has been conjugated with block copolymers of polyethylene glycol to form hybrid nanocrystal drug carriers.[19] Host-guest interaction between hectorite and grisiofulvin has been investigated.[20,21] The role of hectorite in the induction of oxidative stress as determined by lipid peroxidation in biological matrices has been examined.[22]

When combined with an appropriate cation, hectorite exhibits properties suitable for use as a contrast agent.[23]

Hectorite is listed on the Australian inventory of chemical substances (AICS), Canada domestic substances list (DSL), and Chinese inventory of existing chemical substances (IECSC). The EINECS number for hectorite is 235-340-0.

4 Empirical Formula and Molecular Weight

C_3HF_7 170.0

5 Structural Formula

6 Functional Category

Aerosol propellant.

7 Applications in Pharmaceutical Formulation or Technology

Heptafluoropropane (P-227) is classified as a hydrofluorocarbon (HFC) aerosol propellant since the molecule consists only of carbon, fluorine, and hydrogen atoms. It does not contain any chlorine and consequently does not affect the ozone layer, nor does it have an effect upon global warming. It is therefore considered as an alternative propellant to CFCs for metered-dose inhalers (MDIs).

While some of its physical and chemical properties are known, little has been published in regard to its use as a replacement for CFCs in MDIs.[1–3]

The vapor pressure of heptafluoropropane (P-227) is somewhat lower than that of tetrafluoroethane and dichlorodifluoromethane but considerably higher than the vapor pressure used to formulate most MDIs.

When heptafluoropropane (P-227) is used for pharmaceutical aerosols and MDIs, the pharmaceutical grade must be specified. Industrial grades may not be suitable due to their impurity profile.

Similarly to tetrafluoroethane, heptafluoropropane is not a good solvent for medicinal agents or for the commonly used surfactants and dispersing agents used in the formulation of MDIs.

Heptafluoropropane is used in MDIs as a propellant.

8 Description

Heptafluoropropane is a liquefied gas and exists as a liquid at room temperature when contained under its own vapor pressure, or as a gas when exposed to room temperature and atmospheric pressure. The liquid is practically odorless and colorless. The gas in high concentration has a faint etherlike odor. Heptafluoropropane is noncorrosive, nonirritating, and nonflammable.

9 Pharmacopeial Specifications

—

10 Typical Properties

Boiling point −16.5°C
Density 1.386 g/cm^3 for liquid at 25°C
Flammability Nonflammable.
Freezing point −131°C
Solubility Soluble 1 in 1725 parts of water at 20°C.
Specific gravity 1.41 at 25°C
Vapor pressure 459.81 kPa (66.69 psia) at 25°C

11 Stability and Storage Conditions

Heptafluoropropane is a nonreactive and stable material. The liquefied gas is stable when used as a propellant and should be stored in a metal cylinder in a cool, dry place.

12 Incompatibilities

Heptafluoropropane is incompatible with alkali metals, alkaline earth metals, and powdered aluminium or zinc.[4]

13 Method of Manufacture

—

14 Safety

Heptafluoropropane is used as a fire extinguisher and is applicable as a non-CFC propellant in various MDIs and some topical pharmaceutical preparations. Heptafluoropropane is regarded as nontoxic and nonirritating when used as directed. No acute or chronic hazard is present when it is used normally. Inhaling high concentrations of heptafluoropropane vapors can be harmful and is similar to inhaling vapors of other propellants. Deliberate inhalation of vapors of heptafluoropropane can be dangerous and may cause death. The same labeling required of CFC aerosols would be required for those containing heptafluoropropane as a propellant (except for the EPA requirement). *See* Chlorofluorocarbons (CFC), Section 14.

15 Handling Precautions

Heptafluoropropane is usually encountered as a liquefied gas and appropriate precautions for handling such materials should be taken. Eye protection, gloves, and protective clothing are recommended. Heptafluoropropane should be handled in a well-ventilated environment. The vapors are heavier than air and do not support life; therefore, when cleaning large tanks that have contained this propellant, adequate provisions for oxygen supply in the tanks must be made in order to protect workers cleaning the tanks. Although nonflammable, when heated to decomposition heptafluoropropane will emit hydrogen fluoride and carbon monoxide.

16 Regulatory Status

Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Difluoroethane; tetrafluoroethane.

18 Comments

The main disadvantage of using heptafluoropropane is its lack of miscibility with water and its poor solubility characteristics when used with medicinal agents and the commonly used MDI surfactants.

The use of heptafluoropropane as a propellant for MDIs has been the subject of many patents throughout the world. These patents cover the formulation of MDIs, the use of specific surfactants and cosolvents, etc., and the formulator is referred to the patent literature prior to formulating an MDI with any HFC as the propellant. The formulation of MDIs with tetrafluoroethane and heptafluoropropane propellant is complicated since they serve as a replacement for dichlorodifluoromethane or dichlorotetrafluoroethane in MDIs. The use of an HFC as the propellant also requires a change in manufacturing procedure, which necessitates a redesign of the filling and packaging machinery for an MDI.

The PubChem Compound ID (CID) for heptafluoropropane is 62442.

n-Hexane

1 Nonproprietary Names

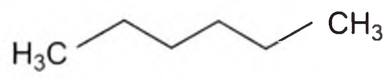
None adopted.

2 Synonyms

n-Caproylhydride; dipropyl; *Gettysolve-B*; *n*-hexane; hexan; hexyl hydride; ; normal hexane; *Skellysolve B*.

3 Chemical Name and CAS Registry Number

n-Hexane [110-54-3]



4 Empirical Formula and Molecular Weight

C_6H_{14} 86.18

n-Hexane is a straight-chain saturated aliphatic hydrocarbon compound (or alkane).

The purified material contains 95–99.5% *n*-hexane with small amounts of other hexane isomers as impurities.[1,2]

5 Structural Formula

6 Functional Category

Solvent.

7 Applications in Pharmaceutical Formulation or Technology

n-Hexane is used as a solvent in pharmaceutical preparations for the manufacture of active pharmaceutical ingredients (e.g. the extraction of artemisinin from plant material) and oral tablets.[3–6]

n-Hexane has been investigated for use in transdermal preparations,[7] and in nanoparticles or microspheres for controlled drug delivery.[8–10]

8 Description

n-Hexane occurs as a colorless, flammable, volatile liquid with a faint petroleum-like odor.

9 Pharmacopeial Specifications

—

10 Typical Properties

Acidity/alkalinity pH 7
Autoignition temperature 225°C; also reported as 234°C[11]
Boiling point 68–69°C (760 mm Hg)
Density 0.66 g/mL (at 20°C)
Evaporation rate 15.8
Flash point -18°C to -22°C (closed cup); also reported as -26°C (closed cup)[11]
Heat of combustion 4163.2 kJ/mol[12]
Heat of vaporization 31.56 kJ/mol at 25°C[13]
Henry's Law constant 1.69 atm-m^3 mol[14]
Melting point –95°C
Partition coefficient Log *P* (octanol : water) 3.29
Refractive index n_D^{20} = 1.373–1.377 at 20°C[15]
Solubility Insoluble in water; miscible with acetone, alcohol, chloroform, and ether.
Surface tension 18.41 mN/m (18.41 dyne/cm) at 20°C
Vapor density 2.97 (air = 1)
Vapor pressure 20 kPa (2.9 psia) at 25°C[14,16]
Viscosity 0.337 mPa s (0.337 cps) at 15°C; 0.3 mPa s (0.3 cps) at 25°C[17]

11 Stability and Storage Conditions

Stable under normal temperatures and pressures. Store in airtight containers in a cool, well-ventilated area. Keep away from sources of heat or ignition.

12 Incompatibilities

n-Hexane is incompatible with strong oxidizing agents. It will attack some forms of plastics, rubber, and coatings.[18]

13 Method of Manufacture

n-Hexane is a chief constituent of petroleum ether and commercial hexane. It is a naturally occurring minor constituent of crude oil and natural gas, and represents a variable proportion of different petroleum distillates, e.g. *n*-hexane comprises about 11.6% of unleaded gasoline and about 2% of JP-4 aviation fuel.[14,16]

n-Hexane is mainly obtained from petroleum mixtures through controlled fractional distillation, by molecular sieve separation, or by other refinery-based processes.[19,20]

14 Safety

n-Hexane is used in the manufacture of oral pharmaceutical formulations, and as an extraction solvent in food production. The most probable route of human exposure to *n*-hexane is by inhalation since it is a constituent of gasoline, but individuals are most likely to be exposed to *n*-hexane in the workplace.[14,16]

Acute exposure to *n*-hexane may cause dizziness, drowsiness, slight nausea, headache, and in severe cases unconsciousness.[2,18] Ingestion may cause nausea, vomiting, and occasionally diarrhea.[21] *n*-Hexane may also cause skin[22] and eye irritation.

Chronic occupational exposure and abuse of *n*-hexane have been associated with the development of peripheral neuropathies,[23–25] with numbness in the extremities, muscular weakness, blurred vision, headache, and fatigue observed.[16,26] The minimum levels of *n*-hexane that are neurotoxic in humans have not been established. It has been suggested that methyl ethyl ketone potentiates the peripheral neuropathy induced by *n*-hexane.[27] In the US, the OSHA exposure limit (8-hour TWA) for *n*-hexane is 500 ppm (1800 mg/m^3).[18] In the UK, the long-term (8-hour TWA) workplace exposure limit for *n*-hexane is 20 ppm (72 mg/m^3).[28]

Due to its long term toxicity, *n*-hexane is often replaced by *n*-heptane, which will not form the toxic metabolite hexane-2,5-dione.[29–31]

LD_{50} (rat, oral): 28.71 g/kg;[32] 45 mL/kg[33]
LD_{50} (rabbit, skin): 3 g/kg[33]
LD_{50} (mouse, oral): 5 g/kg[33]
LC_{50} (rat, inhalation): 48 000 ppm[33]
LC_{50} (mouse, inhalation): 48 000 ppm[33]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

n-Hexane is a highly flammable liquid and vapor. When heated to decomposition, it emits acrid smoke and fumes, producing carbon monoxide and carbon dioxide.

Avoid ingestion, inhalation, and contact with skin or eyes. Wear suitable protective equipment and clothing.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets).

The FAO/WHO have not allocated an acceptable daily intake for *n*-hexane, but recommend that the solvent should be used only in accordance with good manufacturing practice, to ensure minimal residues in food.[2] When used as a processing solvent for API manufacture *n*-hexane is considered a Class 2 solvent and has a permissible daily exposure limit of 2.9 mg/day and a concentration limit of 290 ppm.[34,35]

In the USA, cottonseed products and hop extract, modified for human consumption, must contain not more than 60 mg *n*-hexane/kg and 25 mg *n*-hexane/kg, respectively. The latter limit also applies to specified food coloring agents containing *n*-hexane.[2]

H

17 Related Substances

n-Heptane.

n-Heptane

Synonyms Dipropyl methane; *Gettysolve C*; heptyl hydride; *Skellysolve C*
Chemical name *n*-Heptane
CAS number [142-82-5]
Empirical formula C_7H_{16}
Molecular weight 100.2
Boiling point 98.38°C
Density 0.6795 g/cm^3 at 25°C
Melting point -90.55°C
Vapor density 3.45 (air = 1)
Solubility Soluble in water (3.40 mg/L at 25°C); soluble in carbon tetrachloride; very soluble in ethanol; miscible with ethyl ether, acetone, benzene, chloroform, and petroleum ether.
Comments *n*-Heptane may be used as an alternative to *n*-hexane as it does not form the toxic metabolite hexane-2,5-dione.[29–31] In the UK, the long-term (8-hour TWA) workplace exposure limit for *n*-heptane is 500 ppm (2085 mg/m^3).[28]

18 Comments

n-Hexane also has many uses as a solvent in the chemical and food industries, either in pure form or as a component of the mixture commercial hexane. In a highly purified form, *n*-hexane is used in chemical laboratories as an extractant for a wide range of hydrocarbons and nonpolar organic compounds. Mixtures containing *n*-hexane, such as hexane-acetone or hexane-isopropanol, are used in processes for the extraction of edible fats and oils in the food industry.[14,16,36]

Commercial hexane contains a mixture of hexane isomers (*n*-hexane, 2-methyl pentane, 3-methyl pentane, 2,3-dimethyl butane), cyclohexane, methyl cyclopentane, pentane and heptane isomers, acetone, methyl ethyl ketone, dichloromethane, and trichloroethylene. Phthalate esters, adipate esters, and organophosphorous compounds have been identified as minor components. The *n*-hexane content of commercial hexane varies from 20% to 85%.[1,2] Commercial grades of hexane are used as solvents for glues (rubber cement, adhesives), varnishes, and inks. *n*-Hexane is used as a cleaning agent (degreaser) in textile and furniture manufacturing, and in the printing industry, and it has also been used as the liquid in low temperature thermometers.[14,16]

Studies have shown that *n*-hexane used in herbal remedies may have inhibitory activity against multidrug resistant strains of pathogenic bacteria.[36]

Although not included in any pharmacopeias, a specification for hexanes is included in the *Food Chemicals Codex* (FCC),[37] *see* Table I.

The EINECS number for *n*-hexane is 203-777-6. The PubChem Compound ID (CID) for *n*-hexane is 8058.

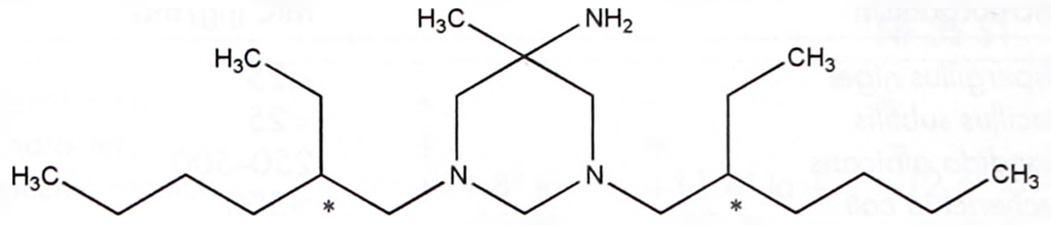
Hexetidine

1 Nonproprietary Names

BP: Hexetidine
PhEur: Hexetidine

2 Synonyms

5-Amino-1,3-bis(2-ethylhexyl)hexahydro-5-methylpyrimidine; 5-amino-1,3-di(β-ethylhexyl)hexahydro-5-methylpyrimidine; 1,3-bis(2-ethylhexyl)-5-methylhexahydropyrimidin-5-ylamine; 1,3-bis(β-ethylhexyl)-5-methyl-5-aminohexahydropyrimidine; *Glypesin*; hexetidinum; *Hexigel*; *Hexocil*; *Hexoral*; *Hextril*; *Oraldene*; *Sterisil*; *Steri/Sol*.



3 Chemical Name and CAS Registry Number

1,3-bis(2-Ethylhexyl)-5-methylhexahydro-5-pyrimidinamine [141-94-6]

4 Empirical Formula and Molecular Weight

$C_{21}H_{45}N_3$ 339.61

5 Structural Formula

Mixture of stereoisomers

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Hexetidine is used as an antimicrobial preservative in cosmetics and nonparenteral pharmaceutical formulations.

8 Description

Hexetidine is a colorless or faint yellow-colored oily liquid with a characteristic amine odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hexetidine.

H

10 Typical Properties

Antimicrobial activity Hexetidine is a nonantibiotic antimicrobial agent that possesses broad-spectrum antimicrobial activity against Gram-positive and Gram-negative bacteria and fungi such as *Candida albicans*.[1–4] Several studies have identified the antiplaque activity of hexetidine.[3–8] Hexetidine has been shown to be effective against isolates of *Staphylococcus aureus* and *Pseudomonas aeruginosa* in planktonic form and against biofilms of the same microorganisms on PVC.[1] Hexetidine has also been reported to reduce the adherence of *Candida albicans* to human buccal epithelial cells *in vitro*.[9] Hexetidine has been shown to be a promising candidate antimalarial agent, with IC_{50} values being comparable with those of quinine chlorohydrate and chloroquine sulfate.[10] *See also* Table II.

Boiling point 172–176°C

Dissociation constant $pK_a = 8.3$

Density 0.864–0.870 at 20°C

Refractive index $n_D^{20} = 1.463–1.467$

Solubility Soluble in acetone, benzene, chloroform, dichloromethane, ethanol (95%), *n*-hexane, methanol, mineral acids, petroleum ether, and propylene glycol; very slightly soluble in water.

Table II: Minimum inhibitory concentrations (MICs) for hexetidine.

Microorganism	MIC (μg/mL)
Aspergillus niger	<25
Bacillus subtilis	<25
Candida albicans	250–500
Escherichia coli	>500
Pseudomonas aeruginosa	>500
Staphylococcus aureus	>25
Staphylococcus epidermitis	>6

11 Stability and Storage Conditions

Hexetidine is stable and should be stored in a well-closed container in a cool, dry place. Brass and copper equipment should not be used for the handling or storage of hexetidine.

12 Incompatibilities

Hexetidine is incompatible with strong oxidizing agents. Salts are formed with mineral and organic acids; strong acids cause opening of the hexahydropyrimidine ring, releasing formaldehyde.

13 Method of Manufacture

Hexetidine is prepared by hydrogenation under pressure of 1,3-bis(2-ethylhexyl)-5-methyl-4-nitrohexahydropyriminine at 100°C using Raney nickel as a catalyst.

14 Safety

Hexetidine is mainly used in mouthwashes as a bactericidal and fungicidal antiseptic. It is also used as an antimicrobial preservative and is generally regarded as a relatively nontoxic and nonirritant material at concentrations up to 0.1% w/v. Allergic contact dermatitis and altered olfactory and taste perception have occasionally been reported. Hexetidine is toxic when administered intravenously.

Solutions of hexetidine in oil at concentrations of 5–10% w/v cause strong primary irritations without sensitization in humans. Long-term toxicological studies of up to 0.1% w/w of hexetidine in food for 1 year do not show any toxic effect. Fetotoxicity, embryotoxicity, and teratogenicity studies in rats of doses up to 50 mg/kg/day exhibit no sign of toxicity.

LD_{100} (cat, IV): 5–20 mg/kg
LD_{50} (dog, oral): 1.60 g/kg
LD_{50} (mouse, IP): 0.142 g/kg
LD_{50} (mouse, oral): 1.52 g/kg
LD_{50} (rat, oral): 0.61–1.43 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Hexetidine may be harmful upon inhalation or on contact with the skin or eyes. Eye protection and gloves are recommended. When significant quantities are being handled, the use of a respirator with an appropriate gas filter is recommended.

16 Regulatory Status

Included in nonparenteral formulations licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Hexetidine has been quantitatively determined in both commercial formulations and saliva using a reversed-phase HPLC method,[11] with determination being possible at concentrations below the published minimum inhibitory concentrations for a selection of microorganisms.

Therapeutically, hexetidine is mainly used as a 0.1% w/v solution in mouthwash formulations for the prevention and treatment of minor local infections, gingivitis, and mouth ulcers.

The EINECS number for hexetidine is 205-513-5.

H

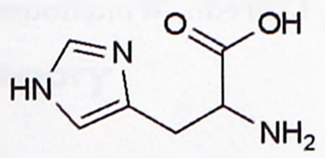
Histidine

1 Nonproprietary Names

BP: Histidine
JP: L-Histidine;-Histidine",4 >
PhEur: Histidine
USP–NF: Histidine

2 Synonyms

AjiPure; 2-amino-3(4-imidasyl)propionic acid; (*S*)-α-amino-1*H*-imidazole-4-propanoic acid; L-alpha-amino-4-imidazolepropionic acid; α-amino-4(or 5)-imidazolepropionic acid; L-alpha-amino-5-imidazolepropionic acid; glyoxaline-5-alanine; H; His; histidinum.



3 Chemical Name and CAS Registry Number

(*S*)-2-Amino-3-(imidazol-4-yl)propanoic acid [71-00-1]

4 Empirical Formula and Molecular Weight

$C_6H_9N_3O_2$ 155.15

5 Structural Formula

6 Functional Category

Antioxidant; buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Histidine is used as a buffering agent for antibody formulations and as an antioxidant that scavenges hydroxyl radicals in solution.[1]

8 Description

Histidine occurs as a white or almost white, crystalline powder or colourless crystals.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for histidine.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	–
Specific rotation	+11.8° to +12.8°	+11.4° to + 12.4°	+12.6° to +14.0°
Residue on ignition	≤0.1%	–	≤0.4%
Sulfated ash	–	≤0.1%	–
pH	7.0–8.5	–	7.0–8.5
Appearance of solution	+	+	+
Ninhydrin-positive substances	–	≤0.5%[a]	–
Chlorides	≤0.021%	≤200 ppm	≤0.05%
Sulfates	≤0.028%	≤300 ppm	≤0.03%
Ammonium	≤0.02%	+	–
Iron	≤10 ppm	≤10 ppm	≤30 ppm
Heavy metals	≤10 ppm	–	≤15 ppm
Loss on drying	≤0.3%	≤0.5%	≤0.2%
Related substances	+	–	–
Assay (dried basis)	99.0%–101.0%	98.5%–101.0%	98.5%–101.5%

(a) ≤0.2% for each impurity.

10 Typical Properties

Bulk density 430 kg/m^3
Dissociation constant

pK_{a1} = 1.82;
pK_{a2} = 6.00;
pK_{a3} = 9.17.

Melting point 282°C. Decomposes at 287°C, softens at 277°C.
Solubility Freely soluble in formic acid, soluble in water, very slightly soluble in alcohol, insoluble in ether.
Specific gravity 1.44

11 Stability and Storage Conditions

Store in well-closed containers protected from light.

12 Incompatibilities

Histidine is incompatible with oxidizing agents.

13 Method of Manufacture

Histidine is a naturally occurring amino acid.

14 Safety

Reduced growth rate and increased serum urea nitrogen were reported in rats receiving 400 mg/kg/day of histidine. The maximum safe dose reported in this study was approximately 200 mg/kg.[2] Human mutagenic effects have been reported.[3]

LD_{50} (rat, oral): >5110 mg/kg[4]
LD_{50} (mouse, oral): 15000 mg/kg[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Keep away from heat and sources of ignition. Evaporate residue from empty containers under a fume hood as they may otherwise pose a fire risk. Wear suitable protective clothing to avoid inhalation of dust and contact with eyes. When heated to decomposition histidine emits toxic nitrogen oxides.[3]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (intravenous and subcutaneous injections and oral suspensions) and the Canadian Natural Health Products Ingredients Database. Also included in parenteral products licensed in the UK.

17 Related Substances

D-Histidine; DL-histidine; histidine hydrochloride monohydrate; D-histidine monohydrochloride (monohydrate).

D-Histidine

CAS number [351-50-8]
Comments The PubChem Compound ID (CID) for D-histidine is 71083.

DL-Histidine

CAS number [4998-57-6]
Solubility Soluble in water
Comments The EINECS number for DL-histidine is 225-660-9. The PubChem Compound ID (CID) for DL-histidine is 773.

Histidine Hydrochloride Monohydrate

Empirical formula $C_6H_9N_3O_2.HCl.H_2O$
Molecular Weight 209.63
CAS number [645-35-2] (anhydrous histidine hydrochloride); [5934-29-2] (histidine hydrochloride monohydrate)
Synonyms Histidine hydrochloride hydrate; L-histidine hydrochloride monohydrate; L-histidine hydrochloride hydrate; (*S*)-2-amino-3-(1*H*-imidazol-4-yl)propanoic acid monohydrochloride monohydrate.
Description Histidine hydrochloride monohydrate occurs as white or almost white, crystalline powder or colourless crystals.
Typical Properties
Melting point 140°C, decomposes at 251-252°C for anhydrous histidine hydrochloride; 80°C for the monohydrate.
Solubility Soluble in water, slightly soluble in alcohol and in ether.
Storage Store in well-closed containers protected from light.
Comments Histidine hydrochloride is used as a dietary supplement.[6] Histidine hydrochloride monohydrate is listed in the JP XVII and PhEur 9.2. The EINECS number for histidine hydrochloride is 213-754-2.

D-Histidine Monohydrochloride (Monohydrate)

CAS number [6341-24-8]
Comments The names D-Histidine monohydrochloride and D-histidine hydrochloride monohydrate are used interchangeably in the literature; however, they do have different EINECS numbers. The EINECS number for D-histidine monohydrochloride is 228-733-3. The EINECS number for D-histidine hydrochloride monohydrate is 206-513-8. The PubChem Compound ID (CID) for both is 15556510.

18 Comments

As histidine is a basic amino acid essential for infant growth and which may be essential for some other groups, such as patients with uraemia, it is also used as a dietary supplement.[6] Histidine is a precursor to histamine, and is also a component of carnisine.

A specification for histidine is included in the Food Chemicals Codex (FCC).[7]

The EINECS number for histidine is 200-745-3. The PubChem Compound ID (CID) for histidine is 6274.

(b) 2-Methylpropane [75-28-5]
(c) Propane [74-98-6]

4 Empirical Formula and Molecular Weight

(a) C_4H_{10} 58.12
(b) C_4H_{10} 58.12
(c) C_3H_8 44.10

5 Structural Formula

6 Functional Category

Aerosol propellant.

7 Applications in Pharmaceutical Formulation or Technology

Propane, butane, and isobutane are hydrocarbons (HC). They are used as aerosol propellants: alone, in combination with each other, and in combination with a hydrofluoroalkane propellant. They are used primarily in topical pharmaceutical aerosols (particularly aqueous foam and some spray products).

Depending upon the application, the concentration of hydrocarbon propellant range is 5–95% w/w. Foam aerosols generally use about 4–5% w/w of a hydrocarbon propellant consisting of isobutane (84.1%) and propane (15.9%), or isobutane alone. Spray-type aerosols utilize propellant concentrations of 50% w/w and higher.[1]

Hydrocarbon propellants are also used in cosmetics and food products as aerosol propellants.

Only highly purified hydrocarbon grades can be used for pharmaceutical formulations since they may contain traces of unsaturated compounds that not only contribute a slight odor to a product but may also react with other ingredients resulting in decreased stability.

8 Description

Hydrocarbon propellants are liquefied gases and exist as liquids at room temperature when contained under their own vapor pressure, or as gases when exposed to room temperature and atmospheric pressure. They are essentially clear, colorless, odorless liquids but may have a slight etherlike odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydrocarbons from the USP 40–NF 35 S1.

Test	Butane	Isobutane	Propane
Identification	+	+	+
Water	≤0.001%	≤0.001%	≤0.001%
High-boiling residues	≤5 µg/mL	≤5 µg/mL	≤5 µg/mL
Acidity of residue	+	+	+
Sulfur compounds	+	–	+
Assay	≥97.0%	≥95.0%	≥98.0%

10 Typical Properties

See Table II for selected typical properties.

11 Stability and Storage Conditions

Butane and the other hydrocarbons used as aerosol propellants are stable compounds and are chemically nonreactive when used as propellants. They are, however, highly flammable and explosive when mixed with certain concentrations of air; *see* Section 10.[2] They should be stored in a well-ventilated area, in a tightly sealed cylinder. Exposure to excessive heat should be avoided.

12 Incompatibilities

Other than their lack of miscibility with water, butane and the other hydrocarbon propellants do not have any practical incompatibilities with the ingredients commonly used in pharmaceutical aerosol formulations. Hydrocarbon propellants are generally miscible with nonpolar materials and some semipolar compounds such as ethanol.

Table II: Selected typical properties for hydrocarbon propellants.

	Butane	Isobutane	Propane
Autoignition temperature	405°C	420°C	468°C
Boiling point	−0.5°C	−11.7°C	−42.1°C
Density: liquid at 20°C	0.58 g/cm^3	0.56 g/cm^3	0.50 g/cm^3
Explosive limits			
Lower limit	1.9% v/v	1.8% v/v	2.2% v/v
Upper limit	8.5% v/v	8.4% v/v	9.5% v/v
Flash point	−62°C	−83°C	−104.5°C
Freezing point	−138.3°C	−159.7°C	−187.7°C
Kauri-butanol value	19.5	17.5	15.2
Vapor density			
Absolute	2.595 g/m^3	2.595 g/m^3	1.969 g/m^3
Relative	2.046 (air = 1)	2.01 (air = 1)	1.53 (air = 1)
Vapor pressure at 21°C	113.8 kPa (16.5 psig)	209.6 kPa (30.4 psig)	758.4 kPa (110.0 psig)
Vapor pressure at 54.5°C	—	661.9 kPa (96.0 psig)	1765.1 kPa (256 psig)

H

13 Method of Manufacture

Butane and isobutane are obtained by the fractional distillation, under pressure, of crude petroleum and natural gas. They may be purified by passing through a molecular sieve to remove any unsaturated compounds that are present.

Propane is prepared by the same method. It may also be prepared by a variety of synthetic methods.

14 Safety

The hydrocarbons are generally regarded as nontoxic materials when used as aerosol propellants. However, deliberate inhalation of aerosol products containing hydrocarbon propellants can be fatal as they will deplete oxygen in the lungs when inhaled.

15 Handling Precautions

Butane and the other hydrocarbon propellants are liquefied gases and should be handled with appropriate caution. Direct contact of liquefied gas with the skin is hazardous and may result in serious cold burn injuries. Protective clothing, rubber gloves, and eye protection are recommended.

Butane, isobutane, and propane are asphyxiants and should be handled in a well-ventilated environment; it is recommended that environmental oxygen levels are monitored and not permitted to fall below a concentration of 18% v/v. These vapors do not support life; therefore when cleaning large tanks, adequate provisions for oxygen supply must be provided for personnel cleaning the tanks. Butane is highly flammable and explosive and must only be handled in an explosion-proof room that is equipped with adequate safety warning devices and explosion-proof equipment.

To fight fires, the flow of gas should be stopped and dry powder extinguishers should be used.

16 Regulatory Status

GRAS listed. Butane, isobutane, and propane are accepted for use as food additives in Europe. Included in the FDA Inactive Ingredients Database (aerosol formulations for topical application). Included in nonparental medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dimethyl ether.

18 Comments

Although hydrocarbon aerosol propellants are relatively inexpensive, nontoxic, and environmentally friendly (since they are not damaging to the ozone layer and are not greenhouse gases), their use is limited by their flammability. While hydrocarbon propellants are primarily used in topical aerosol formulations, it is possible that butane may also be useful in metered-dose inhalers as a replacement for chlorofluorocarbons.

Various blends of hydrocarbon propellants that have a range of physical properties suitable for different applications are commercially available, e.g. A-46 (*Aeropres*) is a commonly used mixture for aerosol foams and consists of about 85% isobutane and 15% propane. The number following the letter denotes the approximate vapor pressure of the blend or mixture.

Specifications for butane, isobutane, and propane are contained in the *Food Chemicals Codex* (FCC).[3]

The PubChem Compound IDs (CIDs) for butane, isobutane, and propane are 7843, 6360, and 6334 respectively.

Hydrochloric Acid

1 Nonproprietary Names

BP: Hydrochloric Acid
JP: Hydrochloric Acid
PhEur: Hydrochloric Acid, Concentrated
USP–NF: Hydrochloric Acid

2 Synonyms

Acidum hydrochloridum concentratum; chlorohydric acid; concentrated hydrochloric acid; E507.

3 Chemical Name and CAS Registry Number

Hydrochloric acid [7647-01-0]

4 Empirical Formula and Molecular Weight

HCl 36.46

5 Structural Formula

H—Cl

6 Functional Category

Acidulant.

7 Applications in Pharmaceutical Formulation or Technology

Hydrochloric acid is widely used as an acidulant, in a variety of pharmaceutical and food preparations (*see* Section 16). It may also be used to prepare dilute hydrochloric acid; *see* Section 17.

8 Description

Hydrochloric acid occurs as a clear, colorless, fuming aqueous solution of hydrogen chloride, with a pungent odor.

The JP XVII specifies that hydrochloric acid contains 35.0–38.0% w/w of HCl; the PhEur 9.2 specifies that hydrochloric acid contains 35.0–39.0% w/w of HCl; and the USP 40–NF 35 S1 specifies that hydrochloric acid contains 36.5–38.0% w/w of HCl.

See also Section 9.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 0.1 (10% v/v aqueous solution)
Boiling point 110°C (constant boiling mixture of 20.24% w/w HCl)
Density ≈1.18 g/cm^3 at 20°C
Freezing point ≈−24°C
Refractive index n_D^{20} = 1.342 (10% v/v aqueous solution)
Solubility Miscible with water; soluble in diethyl ether, ethanol (95%), and methanol.

11 Stability and Storage Conditions

Hydrochloric acid should be stored in a well-closed, glass or other inert container at a temperature below 30°C. Storage in close proximity to concentrated alkalis, metals, and cyanides should be avoided.

Table I: Pharmacopeial specifications for hydrochloric acid.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	—
Appearance of solution	—	+	—
Residue on ignition	≤1.0 mg	—	≤0.008%
Residue on evaporation	—	≤0.01%	—
Bromide or iodide	+	—	+
Free bromine	+	—	+
Free chlorine	+	≤4 ppm	+
Sulfate	+	≤20 ppm	+
Sulfite	+	—	+
Arsenic	≤1 ppm	—	—
Heavy metals	≤5 ppm	—	≤5 ppm
Mercury	≤0.04 ppm	—	—
Assay (of HCl)	35.0–38.0%	35.0–39.0%	36.5–38.0%

12 Incompatibilities

Hydrochloric acid reacts violently with alkalis, with the evolution of a large amount of heat. Hydrochloric acid also reacts with many metals, liberating hydrogen.

13 Method of Manufacture

Hydrochloric acid is an aqueous solution of hydrogen chloride gas produced by a number of methods including: the reaction of sodium chloride and sulfuric acid; the constituent elements; as a by-product from the electrolysis of sodium hydroxide; and as a by-product during the chlorination of hydrocarbons.

14 Safety

When used diluted, at low concentration, hydrochloric acid is not usually associated with any adverse effects. However, the concentrated solution is corrosive and can cause severe damage on contact with the eyes and skin, or if ingested.

LD_{50} (mouse, IP): 1.4 g/kg[1]
LD_{50} (rabbit, oral): 0.9 g/kg

15 Handling Precautions

Caution should be exercised when handling hydrochloric acid, and suitable protection against inhalation and spillage should be taken. Eye protection, gloves, face mask, apron, and respirator are recommended, depending on the circumstances and quantity of hydrochloric acid handled. Spillages should be diluted with copious amounts of water and run to waste. Splashes on the skin and eyes should be treated by immediate and prolonged washing with large amounts of water and medical attention should be sought. Fumes can cause irritation to the eyes, nose, and respiratory system; prolonged exposure to fumes may damage the lungs. In the UK, the recommended short-term workplace exposure limit for hydrogen chloride gas and aerosol mists is 8 mg/m^3 (5 ppm). The long-term exposure limit (8-hour TWA) is 2 mg/m^3 (1 ppm).[2]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (dental solu-

tions; epidural injections; IM, IV, and SC injections; inhalations; ophthalmic preparations; oral solutions; nasal, otic, rectal, and topical preparations). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dilute hydrochloric acid.

Dilute hydrochloric acid

Synonyms Acidum hydrochloridum dilutum; diluted hydrochloric acid.

Density ≈1.05 g/cm^3 at 20°C

Comments The JP XVII and PhEur 9.2 specify that dilute hydrochloric acid contains 9.5–10.5% w/w of HCl and is prepared by mixing 274 g of hydrochloric acid with 726 g of water. The USP 40–NF 35 S1 specifies 9.5–10.5% w/v of HCl, prepared by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

18 Comments

In pharmaceutical formulations, dilute hydrochloric acid is usually used as an acidulant in preference to hydrochloric acid. It is used intravenously in the management of metabolic alkalosis, and orally for the treatment of achlorhydria. Hydrochloric acid is also used therapeutically as an escharotic.[3]

The PhEur 9.2 also contains a specification for hydrochloric acid, dilute; *see* Section 17. A specification for hydrochloric acid is contained in the *Food Chemicals Codex* (FCC).[4]

The EINECS number for hydrochloric acid is 231-595-7. The PubChem Compound ID (CID) for hydrochloric acid is 313.

3 Chemical Name and CAS Registry Number

Hydrogen peroxide [7722-84-1]

4 Empirical Formula and Molecular Weight

H_2O_2 34.01

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Hydrogen peroxide is an oxidizing agent and has uses as an antiseptic. It has been included in liquid antacid preparations,[1,2] and film-coated tablets, as well as over the counter antifungal preparations and acne treatments.[3–5] Hydrogen peroxide is also used as a disinfectant in contact lens solutions[6] and has been used as a foaming agent in dental products and mouthwashes. An *in-vitro* study showed the potential of hydrogen peroxide as a permeability enhancer in transvaginal drug delivery.[7] Hydrogen peroxide solutions are typically available at concentrations of 3%, 6%, 27% or 30%.

8 Description

Hydrogen peroxide occurs as a clear, colourless liquid.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Density 1.463
Melting point -0.43°C
Boiling point 152°C
Solubility Miscible with water, soluble in ether and ethanol, insoluble in petroleum ether.

(a) The USP 40–NF 35 S1 refers to hydrogen peroxide 3% as 'hydrogen peroxide topical solution' and hydrogen peroxide 30% as 'hydrogen peroxide concentrate'.

11 Stability and Storage Conditions

Hydrogen peroxide should be stored protected from light, in partially filled containers with a small vent. It should be stored in a cool place and if the solution doesn't contain stabilizer, below 15°C. Aqueous solutions will gradually decompose over time or if allowed to become alkaline, and should not be stored for long periods. Hydrogen peroxide solutions are usually stabilized by the addition of acetanilide or similar organic materials.

12 Incompatibilities

Hydrogen peroxide is a strong oxidising agent and undergoes exothermic decomposition (more vigorously at higher concentrations) in contact with oxidizable substances including organic matter, certain metals, metallic salts, alkalis, iodides, permanganates.

13 Method of Manufacture

Hydrogen, atmospheric oxygen and an anthraquinone derivative (typically 2-ethylanthraquinone) react together to form hydrogen peroxide which is then purified. This is known as the anthraquinone oxidation process and the anthraquinone derivative acts as a reaction carrier.[8]

Alternative methods of manufacture are being researched to improve sustainability and reduce production costs.[8]

14 Safety

Hydrogen peroxide, even in small concentrations, is not safe for ingestion and will cause bleaching or corrosion if it comes into contact with skin. Note that it is advised that tooth-whitening with hydrogen peroxide be carried out by a healthcare professional (*see* Section 18).

The Joint FAO/WHO Expert committee on food additives (JECFA) has not allocated an ADI for hydrogen peroxide, however it does not consider any small residues on food at the time of consumption a safety concern.[9]

Hydrogen peroxide (8–20%)

LD_{50} (rat, oral): 1.52 g/kg[10]

Hydrogen peroxide (90%)

LD_{50} (rat, SC): 4.06 g/kg[10]

LD_{50} (rabbit, IV): 15 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Although Hydrogen Peroxide undergoes exothermic decomposition in the presence of certain materials (see Incompatibilities), it is safe and stable under recommended conditions. It is corrosive to skin. Gloves and eye protection are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral delayed-action tablets; topical solutions and sponges). Included in nonparenteral products licensed in the UK. Included as a food additive in the 'EAFUS' list compiled by the FDA. Included in the Canadian Natural Health Product Ingredients Database.

17 Related Substances

—

H

18 Comments

Hydrogen peroxide is present as a reactive component at low levels in many excipients. It is used in tooth-whitening and hair-bleaching products in the cosmetics industry. It is also used as a disinfectant.

A specification for hydrogen peroxide is included in the Food Chemicals Codex.[11]

The EINECS number for hydrogen peroxide is 231-765-0.

Hydrophobic Colloidal Silica

1 Nonproprietary Names

BP: Hydrophobic Colloidal Anhydrous Silica
PhEur: Silica, Hydrophobic Colloidal
USP–NF: Hydrophobic Colloidal Silica

2 Synonyms

Aerosil R972; *HDK*; silica dimethyl silylate; silica hydrophobica colloidalis; silicic acid, silylated; silicon dioxide, silanated.

3 Chemical Name and CAS Registry Number

Silane, dichloro-dimethyl-, reaction products with silica [68611-44-9]

4 Empirical Formula and Molecular Weight

SiO_2 (partly alkylated for hydrophobation) 60.08

5 Structural Formula

See Section 4.

6 Functional Category

Anticaking agent; emulsion stabilizing agent; glidant; suspending agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydrophobic colloidal silica has nano-sized primary particles and a large specific surface area,[1] which provide desirable flow characteristics in dry powders used in tableting[2–4] and capsule filling.[3] The hydrophobic grades absorb less moisture[5] and may offer an advantage in moisture-sensitive formulations. Generally, the uses of hydrophobic colloidal silica and the concentrations used are similar to those of the standard hydrophilic colloidal silicon dioxide.

Hydrophobic colloidal silica is also used to thixotropically control viscosity, to thicken and stabilize emulsions, or as a suspending agent in gels and semisolid preparations. Hydrophobic colloidal silica has a less pronounced effect on solution viscosity but can thicken and stabilize the oil phase of a water–oil emulsion.[3,5] With other ingredients of similar refractive index, transparent gels may be formed.[5] The highly hydrophobic particles can be used to form a powder shell that encapsulates water droplets forming 'dry water'[6,7] (also known as 'dry emulsion' or 'liquid marbles'),[6]

which can be used to topically deliver water-soluble active agents that are released by rubbing the 'dry' powder onto the skin.

8 Description

Hydrophobic colloidal silica occurs as a light, fine, white or almost white amorphous powder, not wettable by water.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydrophobic colloidal silica.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Chloride	≤250 ppm	≤0.025%
Water-dispersible fraction	≤3.0%	≤3.0%
Lead	–	≤0.0025%
Loss on ignition	≤6.0%	≤6.0%
Assay (on ignited sample)	99.0–101.0%	99.0–101.0%

10 Typical Properties

Density (bulk) 0.094 g/cm^3[3(4)]
Density (tapped) see Table II.
Moisture content Less than 0.5% w/w at room temperature between 0 and 100% relative humidity.[5]
Particle size distribution Primary particle size is 16 nm for *Aerosil* R972. Forms loose agglomerates of 10–200 μm.[5]
Acidity/alkalinity pH = 6.5–8.0 for *HDK* H2000;[8] pH = 3.8–4.8 for *HDK* H13L[9] (4% dispersion in 1:1 mixture of water–methanol).
Refractive index 1.46[5]
Solubility Solubility is 1 in 6.7 parts of water (pH 7, 25°C).[5] Practically insoluble in organic solvents[5] and acids, except hydrofluoric acid; soluble in hot solutions of alkali hydroxide.[10]
Specific gravity 2.0–2.2[5]
Specific surface area see Table II.

Table II: Physical properties of commercial grades of hydrophobic colloidal silica

Grade	Sepcific surface area[a] (m^2/g)	Density (tapped) (g/cm^3)
Aerosil R972	110 ± 20	0.05
HDK H13L	125 ± 15	0.07
HDK H2000	200 ± 30	0.2

(a) BET method

11 Stability and Storage Conditions

Hydrophobic colloidal silica should be stored in a well-closed container. It will not absorb moisture but may still absorb volatile substances owing to its high surface area.

12 Incompatibilities

Use of hydrophobic colloidal silica has been shown to reduce the strength of starch-based tablets.[4]

13 Method of Manufacture

Hydrophobic colloidal silica is prepared by the flame hydrolysis of chlorosilanes, such as silicon tetrachloride, at 1800°C using a hydrogen–oxygen flame. It is rapidly cooled to create an amorphous product[11] and immediately treated with dichlorodimethyl silane in a fluid bed reactor.[5] The resulting surface is covered with dimethylsilyl groups.[1] See also Section 18.

14 Safety

The safety profile of hydrophobic colloidal silica is the same as for the hydrophilic silica types, as the modified silica surface does not significantly alter the toxicological properties.[12]

LD_{50} (rat, IV): 0.015 g/kg[13]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye protection and gloves are recommended. Considered to be a nuisance dust.[11] Inhalation of amorphous hydrophobic colloidal silica dust may cause irritation to the respiratory tract but it is not associated with fibrosis of the lungs (silicosis), which can occur upon exposure to crystalline silica.[11,13]

Precautions should be taken to avoid inhalation of colloidal silicon dioxide. In the absence of suitable containment facilities, a dust mask should be worn when handling small quantities of material. For larger quantities, a dust respirator is recommended.[14] Colloidal silica may build up static charge due to friction during pneumatic conveying and some engineering risk controls may be required.[14,15]

16 Regulatory Status

Approved for use in pharmaceuticals in Europe. Approved by FDA and Europe for food contact articles. Included in nonparenteral medicines (oral tablets; rectal suppositories) licensed in the UK.

17 Related Substances

Colloidal silicon dioxide.

18 Comments

Hydrophobic grades have not been considered for use in food intended for human consumption but are permitted in food contact articles in Europe (listed as silicon dioxide, silanated) and as an anticaking agent in animal feed mineral premixes in Europe and the US.

Aerosil R972 is manufactured by modifying the surface of *Aerosil* 130[5] and thus has the same primary particle size and surface area, but the density of silanol groups is reduced from approximately 2.0 SiOH/nm^2 to 0.75 SiOH/nm^2.[4]

The EINECS number for hydrophobic colloidal silica is 271-893-4.

Hydroxyethyl Cellulose

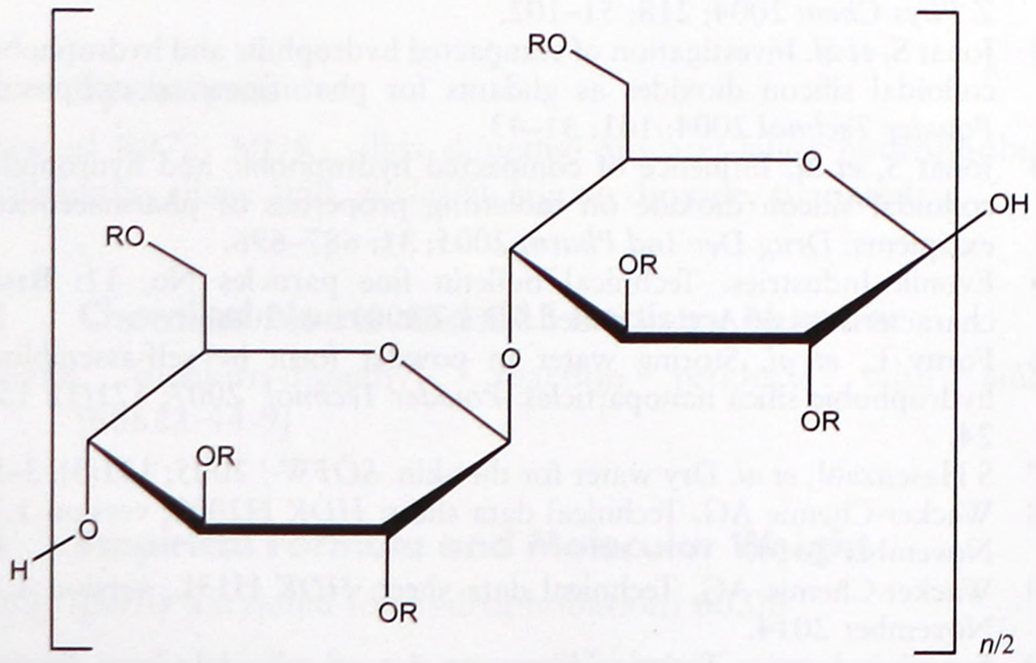
1 Nonproprietary Names

BP: Hydroxyethylcellulose
PhEur: Hydroxyethylcellulose
USP–NF: Hydroxyethyl Cellulose

2 Synonyms

Cellosize HEC; cellulose hydroxyethyl ether; cellulose 2-hydroxyethyl ether; cellulose hydroxyethylate; ethylhydroxy cellulose; ethylose; HEC; HE cellulose; hetastarch; 2-hydroxyethyl cellulose ether; hydroxyethylcellulosum; hydroxyethyl ether cellulose; hyetellose; *Natrosol*; oxycellulose; *Tylose H*; *Tylose PHA*.

3 Chemical Name and CAS Registry Number



Cellulose, 2-hydroxyethyl ether [9004-62-0]

4 Empirical Formula and Molecular Weight

Hydroxyethyl cellulose is a partially substituted poly(hydroxyethyl) ether of cellulose.[1] It is available in several grades that vary in viscosity and degree of substitution; some grades are modified to improve their dispersion in water.

See Section 10.

5 Structural Formula

R is H or $[—CH_2CH_2O—]_mH$ where m is a common integral number of cellulose derivatives.

6 Functional Category

Coating agent; suspending agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxyethyl cellulose is a nonionic, water-soluble polymer widely used in pharmaceutical formulations. It is primarily used as a thickening agent in ophthalmic[2] and topical formulations.[3] It is also used as a binder[4] and film-coating agent for tablets[4] and capsules, and in oral solutions and suspensions. The concentration of hydroxyethyl cellulose used in a formulation is dependent upon the solvent and the molecular weight of the grade. Hydroxyethyl cellulose hydrogels may be used in various delivery systems.[6]

Hydroxyethyl cellulose is also widely used in cosmetics, hair care and personal care products, including toothpastes, body lotions, and deodorants.[1,7]

8 Description

Hydroxyethyl cellulose occurs as a white, yellowish-white or grayish-white, odorless and tasteless, hygroscopic powder.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for hydroxyethyl cellulose.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance of solution	+	—
Viscosity	75.0–140.0%	+
pH	5.5–8.5	6.0–8.5
Loss on drying	≤10.0%	≤10.0%
Lead	—	≤0.001%
Residue on ignition	—	≤5.0%
Sulfated ash	≤4.0%	—
Chlorides	≤1.0%	—
Heavy metals	—	≤20 µg/g
Nitrates	+	—
Glyoxal	≤20 ppm	—
Ethylene oxide	≤1 ppm	—
2-Chloroethanol	≤10 ppm	—

10 Typical Properties

Acidity/alkalinity pH = 6–7 for a 2% w/v aqueous solution.[8]

Density (bulk)

0.35–0.61 g/cm^3 for *Cellosize*;[8]

0.60 g/cm^3 for *Natrosol*.[1]

Melting point Softens at 135–140°C;[1] browns at 205–210°C,[1] decomposes at about 280°C.[8]

Moisture content Commercially available grades of hydroxyethylcellulose contain less than 5% w/w of water.[1] However, as hydroxyethyl cellulose is hygroscopic, the amount of water absorbed depends upon the initial moisture content and the relative humidity of the surrounding air. Typical equilibrium moisture values for *Natrosol* 250 at 25°C are: 6% w/w at 50% relative humidity and 29% w/w at 84% relative humidity.[1]

Particle size distribution

Cellosize: 100% through a US #20 mesh (840 μm);[8]

Natrosol (regular grind): ≤10% retained on a US #40 mesh (420 μm);[1]

Natrosol (X-grind): ≤0.5% retained on a US #60 mesh (250 μm).[1]

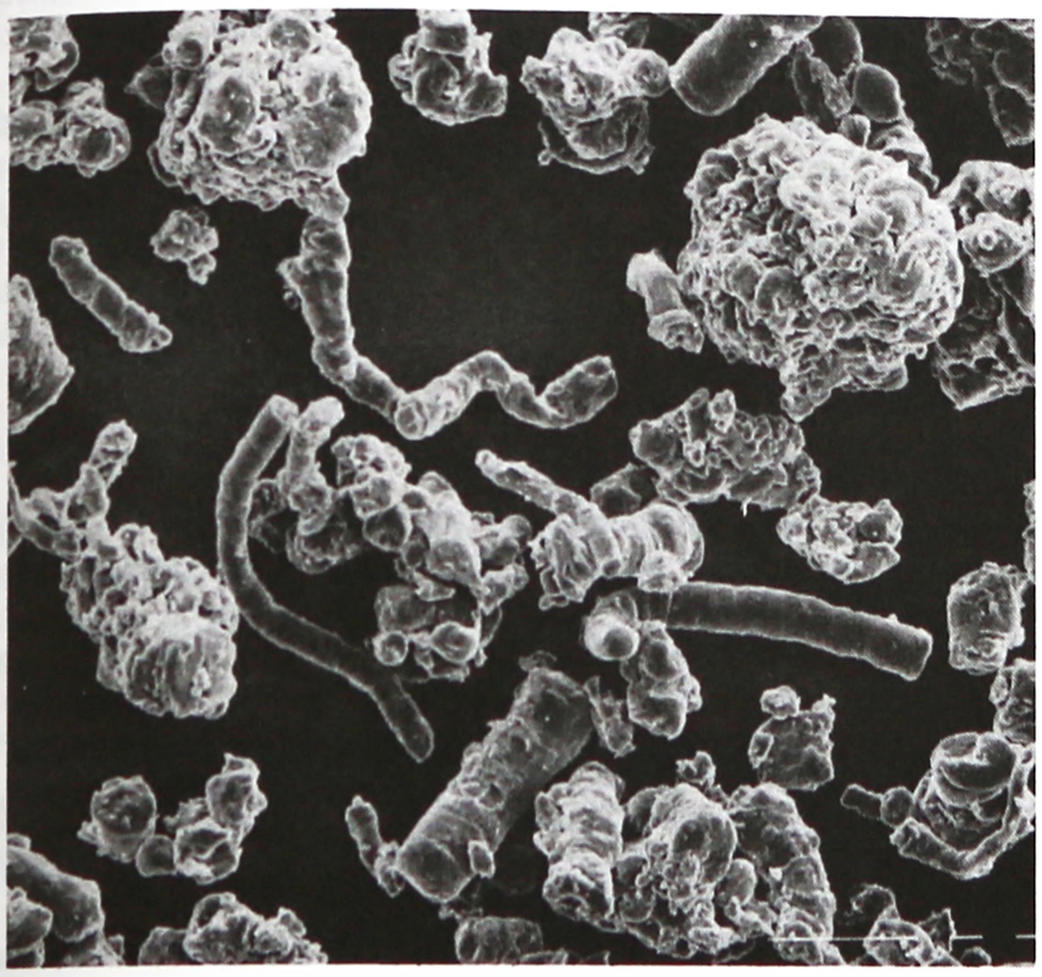
Refractive index n_D^{20} = 1.336 for a 2% w/v aqueous solution.[1,8]

Solubility Hydroxyethyl cellulose is nonionic and soluble in either hot or cold water, forming clear, smooth, uniform solutions. It does not form a 'cloud point' or precipitate from hot solutions.[1] Practically insoluble in acetone, ethanol (95%), ether, toluene, and most other organic solvents.[1] In some polar organic solvents, such as the glycols, hydroxyethyl cellulose either swells or is partially soluble.[1]

Specific gravity 1.38–1.40 for *Cellosize*; 1.0033 for a 2% w/v aqueous hydroxyethyl cellulose solution.[1]

Spectroscopy

IR spectrum *see* Figure 1.



NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Surface tension 66.8 mN/m for Natrosol 250LR at 0.1%.[1] *See also* Table II.

Viscosity (dynamic) Hydroxyethyl cellulose is available in a wide range of viscosity types; see Tables III and IV. *See also* Section 18. Aqueous solutions made using a rapidly dispersing material may be prepared by dispersing the hydroxyethyl cellulose in mildly agitated water at 20–25°C. When the hydroxyethyl cellulose has been thoroughly wetted, the temperature of the solution may be increased to 60–70°C to increase the rate of

dispersion. Making the solution slightly alkaline also increases the dispersion process. Typically, complete dispersion may be achieved in approximately an hour by controlling the temperature, pH, and rate of stirring.

Normally dispersing grades of hydroxyethyl cellulose require more careful handling to avoid agglomeration during dispersion; the water should be stirred vigorously. Alternatively, a slurry of hydroxyethyl cellulose may be prepared in a nonaqueous solvent, such as ethanol, prior to dispersion in water.

See also Section 11 for information on solution stability.

11 Stability and Storage Conditions

Hydroxyethyl cellulose powder is a stable though hygroscopic material. It should be stored in a well-closed container, in a cool, dry place.

Aqueous solutions of hydroxyethyl cellulose are relatively stable at pH 2–12 with the viscosity of solutions being largely unaffected. However, solutions are less stable below pH 5 owing to hydrolysis. At high pH, oxidation may occur.

Table IV: Approximate viscosities of various grades of aqueous *Natrosol 250* (Ashland Aqualon Functional Ingredients) solutions at 25°C.[1]

Type	Viscosity (mPa s) for varying concentrations (% w/v)		
	1%	2%	5%

ER	—	25–105	—
JR	—	—	150–400
LR	—	—	75–150

Increasing the temperature reduces the viscosity of aqueous hydroxyethyl cellulose solutions. However, on cooling, the original viscosity is restored. Solutions may be subjected to freeze–thawing, high-temperature storage, or boiling without precipitation or gelation occurring.

Hydroxyethyl cellulose is subject to enzymatic degradation, with consequent loss in viscosity of its solutions.[10] Enzymes that catalyze this degradation are produced by many bacteria and fungi present in the environment. For prolonged storage, an antimicrobial preservative should therefore be added to aqueous solutions. Aqueous solutions of hydroxyethyl cellulose may also be sterilized by autoclaving.

12 Incompatibilities

Hydroxyethyl cellulose is incompatible with zein and partially compatible with the following water-soluble compounds: casein, gelatin, methylcellulose, polyvinyl alcohol, and starch.[8]

Hydroxyethyl cellulose can be used with a wide variety of water-soluble antimicrobial preservatives. However, sodium pentachlorophenate produces an immediate increase in viscosity when added to hydroxyethyl cellulose solutions.

Hydroxyethyl cellulose has good tolerance for dissolved electrolytes, although it may be salted out of solution when mixed with certain salt solutions. *See also* Section 18.

Hydroxyethyl cellulose is also incompatible with certain fluorescent dyes or optical brighteners, and certain quaternary disinfectants that will increase the viscosity of aqueous solutions.

13 Method of Manufacture

A purified form of cellulose is reacted with sodium hydroxide to produce a swollen alkali cellulose, which is chemically more reactive than untreated cellulose. The alkali cellulose is then reacted with ethylene oxide to produce a series of hydroxyethyl cellulose ethers.[8]

The manner in which ethylene oxide is added to cellulose can be described by two terms, the degree of substitution (DS) and the molar substitution (MS).[8] The DS designates the average number of hydroxyl positions on the anhydroglucose unit that have been reacted with ethylene oxide. Since each anhydroglucose unit of the cellulose molecule has three hydroxyl groups, the maximum value for DS is 3. MS is defined as the average number of ethylene oxide molecules that have reacted with each anhydroglucose unit. Once a hydroxyethyl group is attached to each unit, it can further react with additional groups in an end-to-end formation. This reaction can continue and there is no theoretical limit for MS.[8]

14 Safety

Hydroxyethyl cellulose is primarily used in ophthalmic and topical pharmaceutical formulations. It is generally regarded as an essen-

tially nontoxic and nonirritant material[11–13] although it is reported in the EPA TSCA Inventory.[14]

Acute and subacute oral toxicity studies in rats have shown no toxic effects attributable to hydroxyethyl cellulose consumption, the hydroxyethyl cellulose being neither absorbed nor hydrolyzed in the rat gastrointestinal tract.[12] However, although used in oral pharmaceutical formulations, hydroxyethyl cellulose has not been approved for direct use in food products;[8] *see* Section 16.

Glyoxal-treated hydroxyethyl cellulose is not recommended for use in oral pharmaceutical formulations or topical preparations that may be used on mucous membranes. Hydroxyethyl cellulose is also not recommended for use in parenteral products.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Hydroxyethyl cellulose dust may be irritant to the eyes, and eye protection is recommended.

When heated to decomposition, hydroxyethyl cellulose emits acrid smoke and irritating vapors.[14] Hydroxyethyl cellulose powder and dust is combustible and precautions should be taken to minimize the risks of combustion or dust explosion.[15]

Surfaces covered with a hydroxyethyl cellulose solution can become extremely slippery. Good housekeeping and prompt cleanup of any spills or dust is recommended.[1]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (buccal films; ophthalmic preparations; oral syrups, capsules, and tablets; otic, topical, and transdermal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Hydroxyethyl cellulose is not currently approved for use in food products in Europe or the US, although it is permitted for use in indirect applications such as packaging. This restriction is due to the high levels of ethylene glycol residues that are formed during the manufacturing process.

17 Related Substances

Hydroxyethylmethyl cellulose; hydroxypropyl cellulose; hydroxypropyl cellulose, low-substituted; hypromellose; methylcellulose.

18 Comments

Hydroxyethyl cellulose is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The following salt solutions will precipitate a 10% w/v solution of *Cellosize* WP-09 and a 2% w/v solution of *Cellosize* WP-440:[8] sodium carbonate 50% and saturated solutions of aluminum sulfate; ammonium sulfate; chromic sulfate; disodium phosphate; magnesium sulfate; potassium ferrocyanide; sodium sulfate; sodium sulfite; sodium thiosulfate; and zinc sulfate.

Natrosol is soluble in most 10% salt solutions, excluding sodium carbonate and sodium sulfate, and many 50% salt solutions with the exception of the following: aluminum sulfate; ammonium sulfate; diammonium phosphate; disodium phosphate; ferric chloride; magnesium sulfate; potassium ferrocyanide; sodium metaborate; sodium nitrate; sodium sulfite; trisodium phosphate; and zinc sulfate. *Natrosol* 150 is generally more tolerant of dissolved salts than is *Natrosol* 250.

Cellosize is manufactured in 11 regular viscosity grades. Hydroxyethyl cellulose grades differ principally in their aqueous solution viscosities which range from 2–20 000 mPa s for a 2% w/v aqueous solution. Two types of *Cellosize* are produced, a WP-type, which is a normal-dissolving material, and a QP-type, which is a rapid-dispersing material. The lowest viscosity grade (02) is available only in the WP-type. Five viscosity grades (09, 3, 40, 300, and 4400) are produced in both WP- and QP-types. Five high-viscosity grades (10000, 15000, 30000, 52000, and 100 M) are produced only in the QP-type. For the standard *Cellosize* grades and types available and their respective viscosity ranges in aqueous solution, see Table III.

Natrosol 250 has a degree of substitution of 2.5 and is produced in 10 viscosity types. The suffix 'R' denotes that *Natrosol* has been surface-treated with glyoxal to aid in solution preparation; *see* Table IV.

Hydroxyethyl-β-cyclodextrin

1 Nonproprietary Names

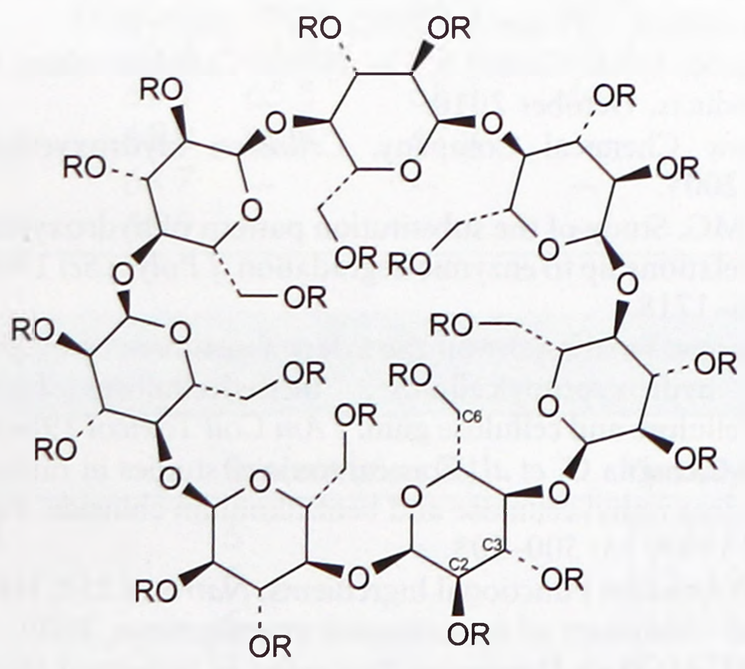
None adopted.

2 Synonyms

2-HE-β-CD; HE-β-CD; HEBCD; 2-hydroxyethyl-β-cyclodextrin; (2-hydroxyethyl)-β-cyclodextrin; hydroxyethyl-SS-cyclodextrin.

3 Chemical Name and CAS Registry Number

β-Cyclodextrin, 2-hydroxyethyl ether [128446-32-2] and [98513-20-3]



H

4 Empirical Formula and Molecular Weight

$C_{42}H_{70}O_{35}(C_2H_4O)_x$ (where x = molar substitution)

The molecular weight depends on the degree of substitution. The molecular weight of unsubstituted β-cyclodextrin is 1134.98.

5 Structural Formula

R = H or CH_2CH_2OH for 2-hydroxyethyl cyclodextrin depending on degree of substitution.

6 Functional Category

Complexing agent; modified-release agent; microencapsulating agent; solubilizing agent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxyethyl-β-cyclodextrin is used to improve dissolution, solubility, bioavailability, and stability of poorly water-soluble drugs through the formation of inclusion complexes in oral,[1,2] topical[3,4] and ophthalmic[5] pharmaceutical formulations. It is used in applications similar to those for β-cyclodextrin (*see* Cyclodextrins), and is more water-soluble than the unsubstituted β-cyclodextrin.

8 Description

Hydroxyethyl-β-cyclodextrin is a nonionic hydroxyalkyl β-cyclodextrin derivative. It occurs as a white crystalline powder.

9 Pharmacopeial Specifications

—

10 Typical Properties

Density (bulk) 0.681 g/cm^3
Density (tapped) 0.916 g/cm^3
Density (true) 1.378 g/cm^3
Hygroscopicity Hydroxyalkyl β-cyclodextrin derivatives have low hygroscopicity compared with the parent β-cyclodextrin, and dissolve in the presence of high humidity (>90%).[6]
Melting point 260°C
Solubility Greater than 1 in 2 parts of water at 25°C
Surface tension 68.0–71.0 mN/m (68–71 dynes/cm) at 25°C

11 Stability and Storage Conditions

Hydroxyethyl-β-cyclodextrin is stable in the solid state if protected from high humidity.

Store under inert gas in a cool, dry and well-ventilated place.

12 Incompatibilities

Hydroxyethyl-β-cyclodextrin is incompatible with strong oxidizing agents.

13 Method of Manufacture

Hydroxyethyl-β-cyclodextrin is produced by the condensation reaction of β-cyclodextrin with a hydroxyalkylating agent such as 2-chloroethanol, in alkaline medium.[6,7] The degree of substitution of hydroxyethyl groups can vary.[8]

14 Safety

Hydroxyethyl-β-cyclodextrin is considered to be of low toxicity for use as an excipient.[9] However, direct contact with the material may cause irritation.

Hydroxyethyl-β-cyclodextrin has been reported to be more toxic in mice than hydroxypropyl-β-cyclodextrin, although it was found to be the least potent cyclodextrin derivative in terms of hemolysis.[10]

The International Agency for Research on Cancer (IARC) reports that no component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen.[11]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Avoid contact with skin and eyes, and avoid breathing vapors, mist or gas. Gloves and eye protection are recommended. Handle in a well-ventilated environment.

16 Regulatory Status

—

17 Related Substances

Betadex sulfobutyl ether sodium; cyclodextrins (α, β and γ-cyclodextrin); dimethyl-β-cyclodextrin; hydroxypropyl betadex; trimethyl-β-cyclodextrin.

18 Comments

Hydroxyethyl-β-cyclodextrin may be used in foods to prolong shelf-life and as a taste-masking agent, and in cosmetic formulations.[12]

It is also used in organic chemistry techniques for the separation of enantiomers and diastereomers in thin-layer chromatography.[13]

Hydroxyethylmethyl Cellulose

1 Nonproprietary Names

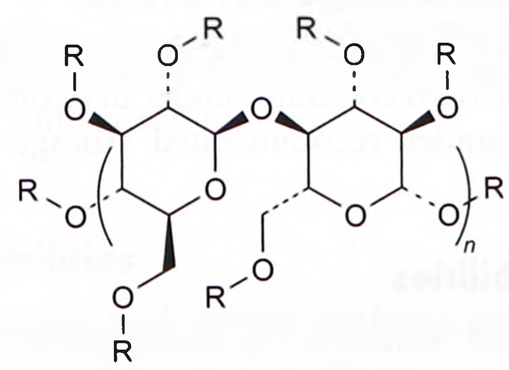
BP: Hydroxyethylmethylcellulose

PhEur: Methylhydroxyethylcellulose

USP-NF: Hymetellose

2 Synonyms

Cellulose, 2-hydroxyethyl methyl ester; *Culminal MHEC*; HEMC; hydroxyethyl methylcellulose; methyl 2-hydroxyethyl cellulose; methylhydroxyethylcellulosum; MHEC; *Tylopur MH*; *Tylopur MHB*; *Tylose MB*; *Tylose MH*; *Tylose MHB*.



3 Chemical Name and CAS Registry Number

Hydroxyethylmethylcellulose [9032-42-2]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 describes hydroxyethylmethyl cellulose as a partly *O*-methylated and *O*-(2-hydroxyethylated) cellulose. Various different grades are available, which are distinguished by appending a number indicative of the apparent viscosity in millipascal seconds (mPa s) of a 2% w/v solution measured at 20°C.

5 Structural Formula

R = $(CH_2CH_2O)_xH$, CH_3 or H

where *x* is a number of hydroxyethyl units.

6 Functional Category

Coating agent; emulsion stabilizing agent; modified-release agent; suspending agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxyethylmethyl cellulose is a nonionic polymer used as an excipient in a wide range of pharmaceutical products, including oral tablets and suspensions, emulsions and topical gel preparations.[1–4]

It is used as a stabilizing and thickening agent in emulsion formulations,[1,2] in film coatings in tablet formulations, and as a matrix-forming agent in extended-release tablet formulations.[4–8]

8 Description

Hydroxyethylmethyl cellulose occurs as a white, yellowish-white, or grayish-white, ordorless powder or granules, hygroscopic after drying.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydroxyethylmethyl cellulose.

Test	PhEur 9.2	USP-NF
Identification	+	+
Characters	+	—
Appearance of solution	+	+
pH	5.5–8.0	5.5–8.0
Apparent viscosity	75–140% of value stated on label	75–140% of value stated on label
Chlorides	≤0.5%	≤0.5%
Heavy metals	—	≤20 µg/g
Loss on drying	≤10.0%	≤10.0%
Sulfated ash	≤1.0%	≤1.0%

10 Typical Properties

Acidity/alkalinity pH = 5.5–8.0 (2% w/v aqueous solution)
Autoignition temperature >150°C
Density (bulk) 0.3–0.4 g/cm^3
Moisture content ≤10%
Solubility Hydroxyethylmethyl cellulose is practically insoluble in hot water (above 60°C), acetone, ethanol (95%), ether, and toluene; it dissolves in cold water to form a colloidal solution. It has better water solubility and electrolyte tolerance than methyl cellulose.[9]
Viscosity (dynamic) 8.5–11.5 mPa s (8.5–11.5 cP) for *Culminal MHEC 8000* 2% w/v aqueous solution at 20°C.

11 Stability and Storage Conditions

Hydroxyethylmethyl cellulose is hygroscopic and should therefore be stored in a well-closed container under dry conditions away from heat. It is stable under recommended storage and normal use conditions.

12 Incompatibilities

Hydroxyethylmethyl cellulose is incompatible with oxidizing materials, such as strong acids and strong bases.

13 Method of Manufacture

Hydroxyethylmethyl cellulose is produced from cellulose fibres obtained from wood pulp, which are heated in a sodium hydroxide solution that, in turn, is treated with methyl chloride and ethylene oxide. The fibrous reaction product is filtered, dried and subsequently ground into a fine uniform powder.

14 Safety

Hydroxyethylmethyl cellulose is used as an excipient in various oral and topical pharmaceutical preparations, and is generally regarded as an essentially nontoxic and nonirritant material. It does not exhibit skin irritation or skin sensitization but it causes mechanical irritation to the skin and eyes under extreme conditions.

According to the FDA Inactive Ingredients Database, the highest reported level used is 24 mg in an oral sustained-release tablet.

LD_{50} (rat, oral): >2.0 g/kg

See Hypromellose for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Hydroxyethylmethyl cellulose should be used in a well-ventilated area. Controlling of dusts is necessary for safe handling of the bulk product as it may form an explosive dust-air mixture, which can be ignited by static discharge. Spills of the dry powder should be cleaned up immediately. Do not use water for clean-up; the material becomes slippery when wet. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in Europe (oral suspensions, tablets, and topical preparations). Hydroxyethylmethyl cellulose of low hydroxyethyl ratio has been admitted as a food thickening and gelling agent in the EU.

17 Related Substances

Ethylcellulose; hydroxyethyl cellulose; hydroxypropyl cellulose; hypromellose; methylcellulose.

18 Comments

Hydroxyethylmethyl cellulose has been shown to have antioxidative, cholesterol- and blood glucose level-lowering functions.[10–12]

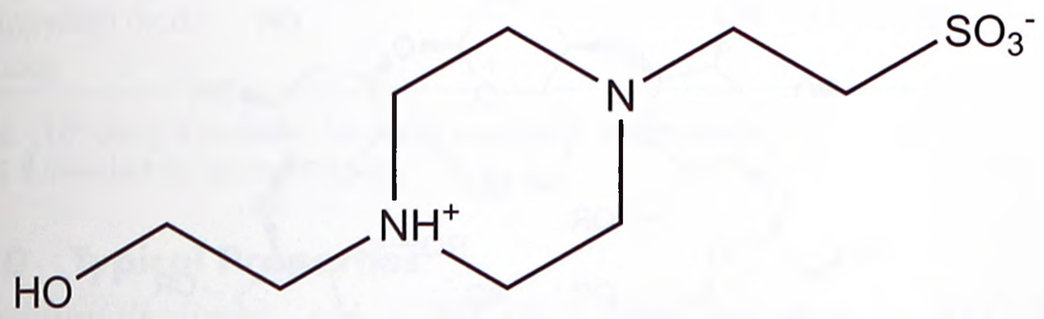
Hydroxyethylpiperazine Ethane Sulfonic Acid

1 Nonproprietary Names

None adopted.

2 Synonyms

HEPES; 1-[4-(2-hydroxyethyl)-1-piperazinyl]ethane-2-sulfonic acid; 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid; *N*-(2-hydroxyethyl)piperazine-*N*'-2-ethanesulfonic acid.



3 Chemical Name and CAS Registry Number

2-[4-(2-Hydroxyethyl)piperazin-1-yl]ethanesulfonic acid [7365-45-9]

4 Empirical Formula and Molecular Weight

$C_8H_{18}N_2O_4S$ 238.30

5 Structural Formula

6 Functional Category

Buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxyethylpiperazine ethane sulfonic acid (HEPES) is used as a buffering agent in injections.[1–3]

8 Description

HEPES occurs as an odorless white crystalline powder.

9 Pharmacopeial Specifications

–

10 Typical Properties

Acidity/alkalinity pH 5.0–6.5 (1 M aqueous solution)

Dissociation constants

$pK_{a1} \sim 3$;

$pK_{a2} = 7.55$ (20°C);

$\Delta pK_a/°C = -0.014$.

Melting point Approx. 236°C, with decomposition.

Solubility Soluble in water; saturated solution is 2.25 M at 0°C.

11 Stability and Storage Conditions

HEPES is hygroscopic. Store in the original container in a cool, dry place, protected from direct sunlight. Keep the container tightly closed and sealed until ready for use.

12 Incompatibilities

HEPES is incompatible with strong oxidizing agents.

13 Method of Manufacture

HEPES is synthetically manufactured via a sulfonation process from sodium bromoethanesulfonate and *N*-2–hydroxyethylpiperazine.

14 Safety

HEPES can cause irritation to the eyes, respiratory system, and skin if improperly handled. May be harmful if swallowed. Ingestion may cause gastrointestinal irritation, nausea, vomiting, and diarrhea. Hazardous thermal decomposition products may include carbon dioxide, carbon monoxide, nitrogen oxides, and sulfur oxides. Toxicological properties have not been fully investigated.

LD_{50} (oral, quail): > 0.316 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Avoid skin and eye contact; eye goggles should be worn, or a full face shield where splashing may occur. There are no specific fire or explosion hazards for HEPES.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IV, injection). Included in BP 2017 as a reagent.

17 Related Substances

–

18 Comments

HEPES is widely used in cell culture as a buffering agent where maintenance of pH near or at physiological pH is desired.[1–3] HEPES has been shown to be biologically active *in vitro* as a result of the inhibition of taurine uptake by cultured cells.[4] In addition, cell death has been shown to occur faster upon light exposure in the presence of HEPES.[5,6] HEPES has also been shown to adversely impact *in vitro* pregnancy and implantation rates due to a higher rate of triploid and degenerated oocytes after fertilization.[7]

The EINECS number for HEPES is 230-907-9. The PubChem Compound ID (CID) for HEPES is 23830.

Hydroxypropyl Betadex

1 Nonproprietary Names

BP: Hydroxypropylbetadex

PhEur: Hydroxypropylbetadex

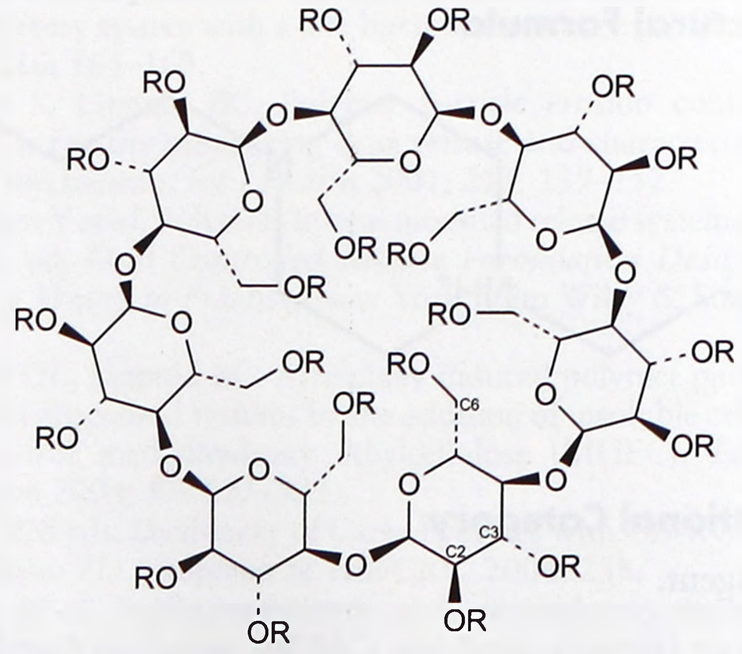
USP–NF: Hydroxypropyl Betadex

2 Synonyms

Cavasol W7 HP Pharma; 2-hydroxypropyl-β-cyclodextrin; 2-hydroxypropyl cyclomaltoheptaose; hidroksipropilbetadeksas; hydoxipropylbetadex; hydroksipropylbetadeksi; hydroxypropylbetadeksum; hydroxypropylbetadexum; *Kleptose HPB*.

3 Chemical Name and CAS Registry Number

β-Cyclodextrin, 2-hydroxypropyl ether [94035-02-6] and [128446-35-5]



4 Empirical Formula and Molecular Weight

$C_{42}H_{70}O_{35}(C_3H_6O)_x$ (where x = 7 molar substitution)

The molecular weight depends on the degree of substitution. The molecular weight of unsubstituted β-cyclodextrin is 1134.98.

5 Structural Formula

Hydroxpropyl betadex is a partially substituted ether of β-cyclodextrin. USP 40–NF 35 S1 requires that the molar substitution is between 0.4 and 1.5 hydroxypropyl groups per anhydroglucose unit.

R = H or $CH_2CH(CH_3)OH$

6 Functional Category

Complexing agent; modified-release agent; penetration enhancer; solubilizing agent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxypropyl betadex has been widely investigated and has principally been used as a solubilizer for hydrophobic molecules in oral liquids,[1,2] oral solids,[3] parenterals,[4–6] pressurized metered dose inhalers,[7] dry powder inhalers,[8,9] topical,[10] and ophthalmic[11] formulations.

Hydroxypropyl betadex has been investigated as an absorption (permeation) enhancer in oral,[12] transdermal,[13–15] and nasal[16] systems. It was found to be effective in increasing penetration in some studies, although the mechanism of action may be compound specific.

Hydroxypropyl betadex has also been shown to act as a stabilizer during processing[17] and storage of formulations.[18,19]

Hydroxypropyl betadex inclusion complexes have been reported to show mechanical properties distinct from the pure materials,[20] and may also show temperature dependency.[21] The reported advantage of hydroxypropyl betadex over unsubstituted β-cyclodextrin is its greater water solubility.[22]

8 Description

Hydroxypropyl betadex occurs as a white or almost white, amorphous or crystalline powder.

9 Pharmacopeial Specifications

See Table I.

Hygroscopicity Hydroxyalkyl β-cyclodextrin derivatives have low hygroscopicity compared with the parent β-cyclodextrin, and dissolve in the water adsorbed in the presence of high humidity (>90%).[22]

Ignition temperature

420°C for *Cavasol W7 HP*;

>400°C for *Cavasol W7 HP Pharma*.

Melting point 278°C; 120–160°C for *Cavasol W7 HP*

Specific rotation $[\alpha]_D^{25}$ = +140° to +145°

Solubility Freely soluble in water and propylene glycol. Soluble in ethanol, methanol, dimethyl sulfoxide and dimethylformamide.

2300 g/L in water at 24°C for *Cavasol W7 HP*;

2300 g/L in water at 25°C for *Cavasol W7 HP Pharma*.

Water content Typically <3.0%.

11 Stability and Storage Conditions

Hydroxypropyl betadex is considered to be a stable material. Store in a cool, dry place in well-closed containers.

12 Incompatibilities

Hydroxypropyl betadex is incompatible with strong oxidizing agents. The activity of some antimicrobial preservatives in aqueous solution can be reduced in the presence of hydroxypropyl betadex.[23–25]

13 Method of Manufacture

Hydroxypropyl betadex is prepared by the treatment of an alkaline solution of β-cyclodextrin with propylene oxide. The substitution pattern can be influenced by varying the pH. Formation of C6 and C2 substituted products is favored by high and low alkali concentration, respectively. The mixture of products produced may be refined by preparative chromatography.[26]

14 Safety

The pharmaceutical toxicology of hydroxypropyl betadex has been reviewed,[27] and in general, the material was found to be of low toxicity. However, in pure form it may cause eye, skin or respiratory tract irritation.[28]

It has been suggested that hydroxypropyl betadex may have a synergistic toxic effect with, for example, carcinogens, by increasing their solubility and thus bioavailability.[29]

LD_{50} (rat, oral): >2 g/kg[28]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, hydroxypropyl betadex emits toxic fumes.[28]

Eye protection and gloves are recommended. When working with small quantities in a well-ventilated area, respiratory protection may not be required. The use of an approved dust mask is recommended.[28]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral and parenteral preparations). Included in an injectable preparation licensed in the UK for intramuscular or intravenous administration.

17 Related Substances

Betadex sulfobutyl ether sodium; cyclodextrins (α, β and γ-cyclodextrin); 3-hydroxypropyl-β-cyclodextrin.

3-Hydroxypropyl-β-cyclodextrin

Synonyms 3-HP-β-CD.

Appearance White crystalline powder.

Solubility Greater than 1 in 2 parts of water at 25°C.

Surface tension 70.0–71.0 mN/m (70–71 dynes/cm) at 25°C.

Comments Used in applications similar to those for β-cyclodextrin. However, as it is not nephrotoxic it has been suggested for use in parenteral formulations. The degree of substitution of hydroxypropyl groups can vary.

H

18 Comments

Hydroxypropyl betadex has been used in a composite membrane based on chitosan with gallic acid, which showed improved antioxidant properties, and has potential use in food or food packaging, cosmetic, and pharmaceutical industries.[30]

Therapeutically, hydroxypropyl betadex has been used in the development of a treatment for Niemann-Pick disease type C1, a neurodegenerative, autosomal recessive rare disease.[31] It has also been used in contact lens materials,[32] surgical vascular prostheses implants and visceral meshes for controlled-drug release.[33,34]

There is a risk of drug precipitation if itraconazole concentrate formulations that contain hydroxypropyl betadex are diluted in solutions other than the one supplied.

Hydroxypropyl Cellulose

1 Nonproprietary Names

BP: Hydroxypropylcellulose

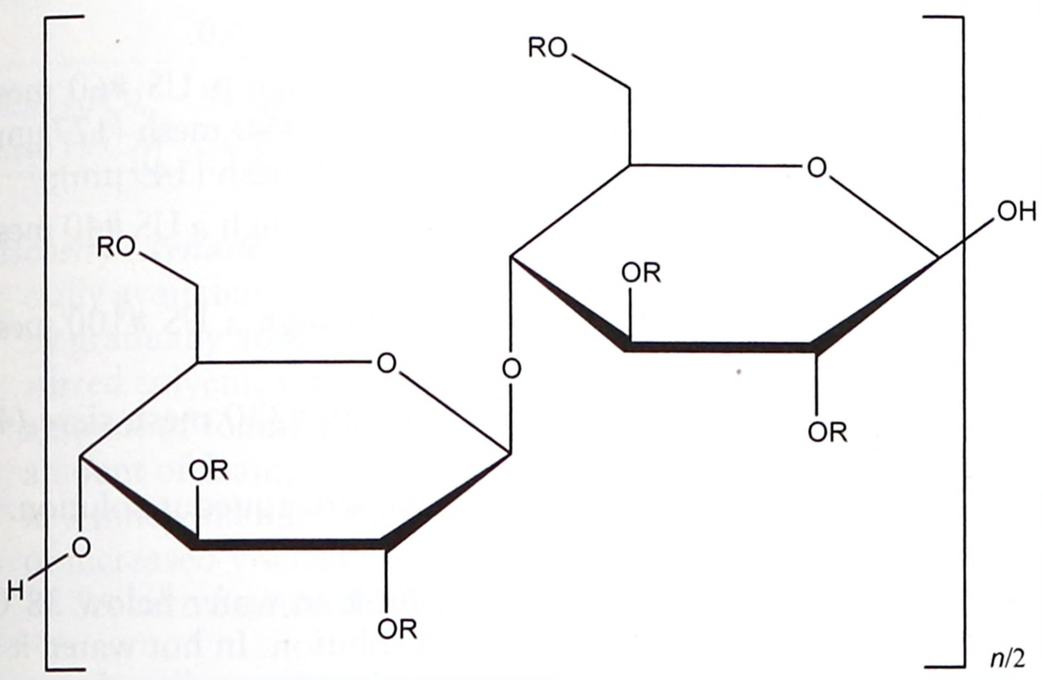
JP: Hydroxypropylcellulose

PhEur: Hydroxypropylcellulose

USP–NF: Hydroxypropyl Cellulose

2 Synonyms

AeroWhip; cellulose, hydroxypropyl ether; *Coatcel*; E463; HPC; hydroxypropylcellulosum; hyprolose; *Klucel*; *Nisso HPC*; oxypropylated cellulose.



3 Chemical Name and CAS Registry Number

Cellulose, 2-hydroxypropyl ether [9004-64-2]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 and USP 40–NF 35 S1 describe hydroxypropyl cellulose as a partially substituted poly(hydroxypropyl) ether of cellulose. It may contain not more than 0.6% of silica (SiO_2) or another suitable anticaking agent. Hydroxypropyl cellulose is commercially available in a number of different grades that have various solution viscosities and molecular weights; *see also* Section 10. Molecular weight is influenced by the degree of substitution. A molar substitution of 3 is achieved by complete substitution of the cellulose hydroxyl groups. The propylene oxide side chain contains a reactive hydroxyl group which may be subject to further substitution resulting in a higher degree of molar substitution.

5 Structural Formula

R is H or $[CH_2CH(CH_3)O]_mH$ where m is an integral number of hydroxypropyl units.

6 Functional Category

Coating agent; emulsifying agent; film-forming agent; modified-release agent; suspending agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxypropyl cellulose is widely used in oral and topical pharmaceutical formulations; *see* Table I.

In oral products, hydroxypropyl cellulose is primarily used in tableting as a binder,[1] film-coating,[2] and extended-release-matrix former.[3–5] Concentrations of hydroxypropyl cellulose of 2–6% w/w may be used as a binder in either wet-granulation or dry, direct-compression tableting processes.[6–10] Concentrations of 15–35% w/w of hydroxypropyl cellulose may be used to produce tablets with an extended drug release.[11] The release rate of a drug increases with decreasing viscosity of hydroxypropyl cellulose. Blends of hydroxypropyl cellulose and other cellulosic polymers have been used to improve wet granulation characteristics and tableting characteristics, as well as to achieve better control and manipulation of the rate of drug release.[12–15] As an alternative technology to wet granulation, dry granulation and direct compression of hydroxypropyl cellulose formulations have been reported to exhibit acceptable tableting and flow characteristics for application in extended-release matrix tablets.[16,17]

Solubility of hydroxypropyl cellulose in water as well as in polar organic solvents offers a wide choice in preparing solutions for casting films or for coating purposes. Typically, a 5% w/w solution of hydroxypropyl cellulose may be used to film-coat tablets. Aqueous solutions containing hydroxypropyl cellulose together with an amount of methyl cellulose or ethanolic solutions have been used.[18–22] Hydroxypropyl cellulose cast-films show excellent flexibility and heat sealability, lack tackiness, and provide barrier to oils and fats. It is not necessary to add plasticizers to cast films. In extruded films, plasticizers provide desirable die lubrication, and a reduction in melt viscosity. Plasticizer levels of 5% or less are recommended. Hydroxypropyl cellulose shows good compatibility with several plasticizers including propylene glycol, glycerine, triethylolpropane, and polyethylene glycols. Stearic acid or palmitic acids have also been used as plasticizers for hydroxypropyl cellulose especially in ethanolic solutions. Low-substituted hydroxypropyl cellulose is used as a tablet disintegrant; *see* Hydroxypropyl Cellulose, Low-substituted.

Hydroxypropyl cellulose is also used in microencapsulation processes[23] as a thickening agent. In topical formulations, hydroxypropyl cellulose is used in transdermal patches and also in ophthalmic preparations[24–27] to aid moisture retention, stabilize the tear film and lubricate the eye.[27] In addition, hydroxypropyl cellulose is used in capsule preparation by an injection molding process.[28,29]

Hydroxypropyl cellulose is also used in hot-melt extruded films for topical use. When it is produced with chlorpheniramine maleate, the matrix is stabilized, allowing film processing at lower temperatures.[30]

Mucoadhesive hydroxypropyl cellulose microspheres have been prepared for powder inhalation preparations.[31]

Table I: Typical uses of hydroxypropyl cellulose.

Use	Concentration (%)
Extended release-matrix former	15–35
Tablet binder	2–6
Tablet film coating	5

8 Description

Hydroxypropyl cellulose occurs as a white to off-white or slightly yellow-colored, odorless and tasteless powder.

9 Pharmacopeial Specifications

The pharmacopeial specifications for hydroxypropyl cellulose have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for hydroxypropyl cellulose.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters[a]	–	+	–
Apparent viscosity[a]	–	+	+
Appearance of solution	+	+	–
pH[b]	5.0–8.0	5.0–8.0	5.0–8.0
Loss on drying	≤5.0%	≤5.0%	≤5.0%

(a) These tests have not been fully harmonized at the time of publication.
(b) pH: 1 g in 100 mL.

10 Typical Properties

Angle of repose ≈50°

Density (bulk) ≈0.5 g/cm^3

Interfacial tension 12.5 mN/m for a 0.1% w/w aqueous solution compared with mineral oil.

Melting point Softens at 130°C; chars at 260–275°C.

Moisture content Hydroxypropyl cellulose absorbs moisture from the atmosphere; the amount of water absorbed depends upon the initial moisture content and the temperature and relative humidity of the surrounding air. Typical equilibrium moisture content values at 23°C are 4% w/w at 50% relative humidity and 12% w/w at 84% relative humidity. *See* Table III. *See also* Figure 1 and Figure 2.

Particle size distribution

Klucel (regular grind): minimum 85% (minimum 80% for *Klucel H* grades) through a US #30 mesh (590 µm), and minimum 99% through a US #20 mesh (840 µm);

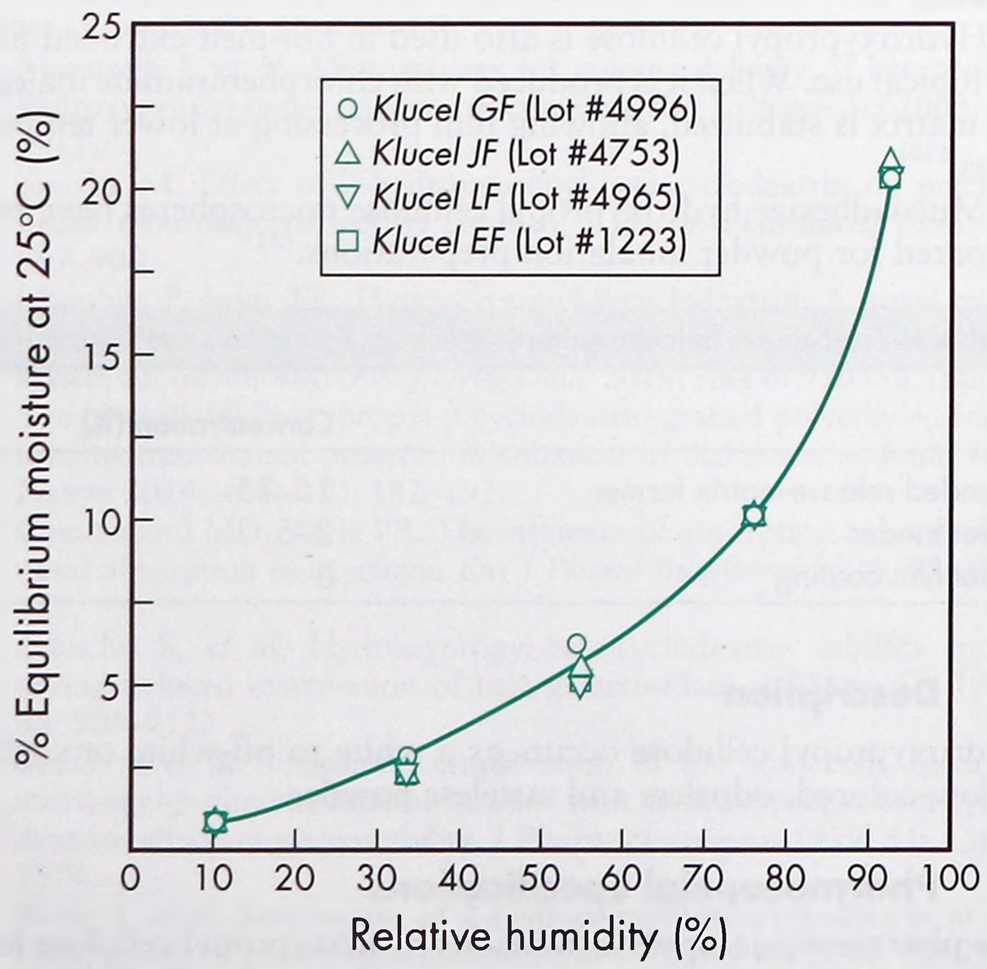

Figure 1: Equilibrium moisture content of various grades of hydroxypropyl cellulose (*Klucel*, Ashland Specialty Ingredients).

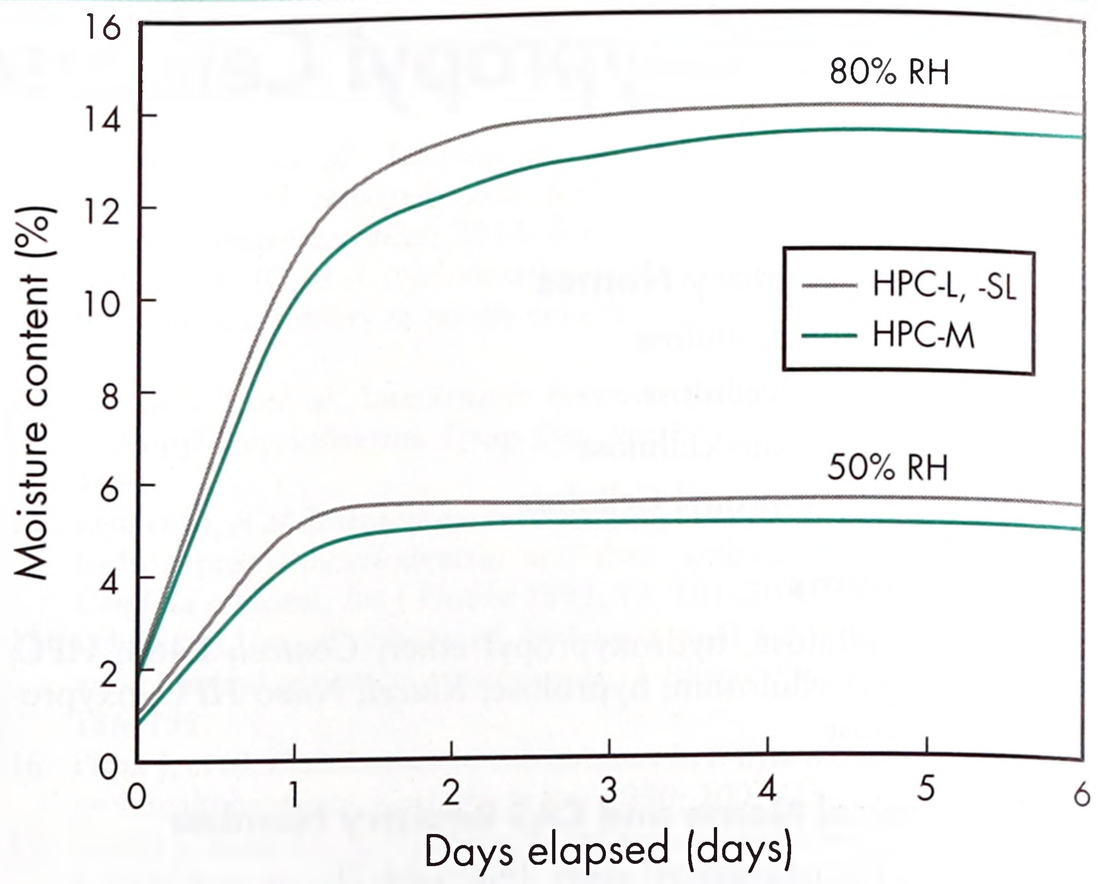

Figure 2: Moisture uptake at 25°C and 50%/80% relative humidity of hydroxypropyl cellulose grades HPC-L, HPC-SL, and HPC–M (*Nisso HPC*, Nippon Soda Co., Ltd.).

Table III: Moisture content of *Klucel* (Ashland Specialty Ingredients).

Grade	Molecular weight[a]	Moisture (%)
Klucel EF	≈80 000	0.59
Klucel LF	≈95 000	2.21
Klucel JF	≈140 000	1.44
Klucel GF	≈370 000	1.67
Klucel MF	≈850 000	1.52
Klucel HF	≈1 150 000	4.27

(a) Weight average molecular weight determined by size exclusion chromatography.

Klucel (fine grind): minimum 99.9% through a US #60 mesh (250 µm), minimum 90% through a US #80 mesh (177 µm), and minimum 80% through a US #100 mesh (149 µm);

Nisso HPC (regular powder type): 99% through a US #40 mesh sieve (350 µm), 50% ≤85–185 µm;

Nisso HPC (fine powder type): 99% through a US #100 mesh sieve (150 µm), 50% ≤80–110 µm;

Nisso HPC (super fine powder): 99% US #330 mesh sieve (45 µm), 50% ≤20 µm.

Refractive index n_D^{20} = 1.3370 for a 2% w/v aqueous solution.

Solubility

Hydroxypropyl cellulose is freely soluble in water below 38°C, forming a smooth, clear, colloidal solution. In hot water, it is insoluble and is precipitated as a highly swollen floc at a temperature between 40°C and 45°C; this precipitation is reversible. The polymer dissolves upon cooling the system below 40°C with restoration of original viscosity.

Hydroxypropyl cellulose is soluble in many cold or hot polar organic solvents such as dimethyl formamide; dimethyl sulfoxide; dioxane; ethanol (95%); methanol; propan-2-ol (95%); and propylene glycol. There is no tendency for precipitation in hot organic solvents. As a general rule, hydroxypropyl cellulose should be added to the solution before adding other soluble ingredients. The dissolved materials tend to compete for the solvent and slow down the dissolution rate of hydroxypropyl cellulose. However, the grade of hydroxypropyl cellulose can have a marked effect upon solution quality in some organic liquids that are borderline solvents, such as acetone; butyl acetate; cyclohexanol; dichloromethane; lactic acid; methyl acetate; methyl

ethyl ketone; propan-2-ol (99%); and *tert*-butanol. The higher-viscosity grades of hydroxypropyl cellulose tend to produce slightly inferior solutions. However, the solution quality in borderline solvents can often be greatly improved by the use of small quantities (5–15%) of a cosolvent. For example, dichloromethane is a borderline solvent for *Klucel HF* and solutions have a granular texture, but a smooth solution may be produced by adding 10% methanol.

Hydroxypropyl cellulose is compatible with a number of high-molecular-weight, high-boiling waxes and oils, and can be used to modify certain properties of these materials. Examples of materials that are good solvents for hydroxypropyl cellulose at an elevated temperature are acetylated monoglycerides, glycerides, pine oil, polyethylene glycol, and polypropylene glycol.

Hydroxypropyl cellulose is practically insoluble in aliphatic hydrocarbons, aromatic hydrocarbons, carbon tetrachloride, petroleum distillates, glycerin, and oils.

Specific gravity 1.2224 for particles; 1.0064 for a 2% w/v aqueous solution at 20°C; 1.010 for a 2% aqueous solution at 30°C.

Spectroscopy

IR spectrum *see* Figure 3.

NIR spectrum *see* Figure 4.

Raman spectrum *see* Figure 5.

Surface tension 43.6 mN/m for a 0.1% w/w aqueous solution; *see also* Table IV. Similar to other polymers, hydroxypropyl cellulose reduces the surface tension of water.

Table IV: Surface tension (mN/m) of aqueous solutions of *Nisso HPC* (Nippon Soda Co. Ltd.) at 20°C.

Grade	Surface tension (mN/m) at 20°C for aqueous solutions of stated concentration			
	0.01%	0.1%	1.0%	10.0%
Nisso HPC-L	51.0	49.1	46.3	45.8
Nisso HPC-M	54.8	49.7	46.3	—

Viscosity (dynamic) A wide range of viscosity types are commercially available; *see* Table V and VI. Solutions should be prepared by gradually adding the hydroxypropyl cellulose to a vigorously stirred solvent. Care should be taken not to create an excessive amount of foam; antifoaming agents may be used to reduce the amount of foam, or a vacuum may be used to dissipate the foam in a timely manner. Increasing concentration produces solutions of increased viscosity.

See also Section 11 for information on solution stability.

Table V: Viscosity of aqueous solutions of *Klucel* (Ashland Specialty Ingredients) at 25°C.

Grade	Molecular weight	Viscosity (mPa s) of various aqueous solutions of stated concentration			
		1%	2%	5%	10%
Klucel HF	1 150 000	1500–3000	—	—	—
Klucel MF	850 000	—	4000–6500	—	—
Klucel GF	370 000	—	150–400	—	—
Klucel JF	140 000	—	—	150–400	—
Klucel LF	95 000	—	—	75–150	—
Klucel EF	80 000	—	—	—	300–600
Klucel ELF	80 000	—	—	—	150-300

Table VI: Viscosity of 2% aqueous solutions of *Nisso HPC* (Nippon Soda Co. Ltd.) at 20°C.

Grades[a]	Molecular weight	Viscosity (mPa s) of 2% aqueous solution
SSL	40 000	2.0–2.9
SL	100 000	3.0–5.9
L	140 000	6.0–10.0
M	620 000	150–400

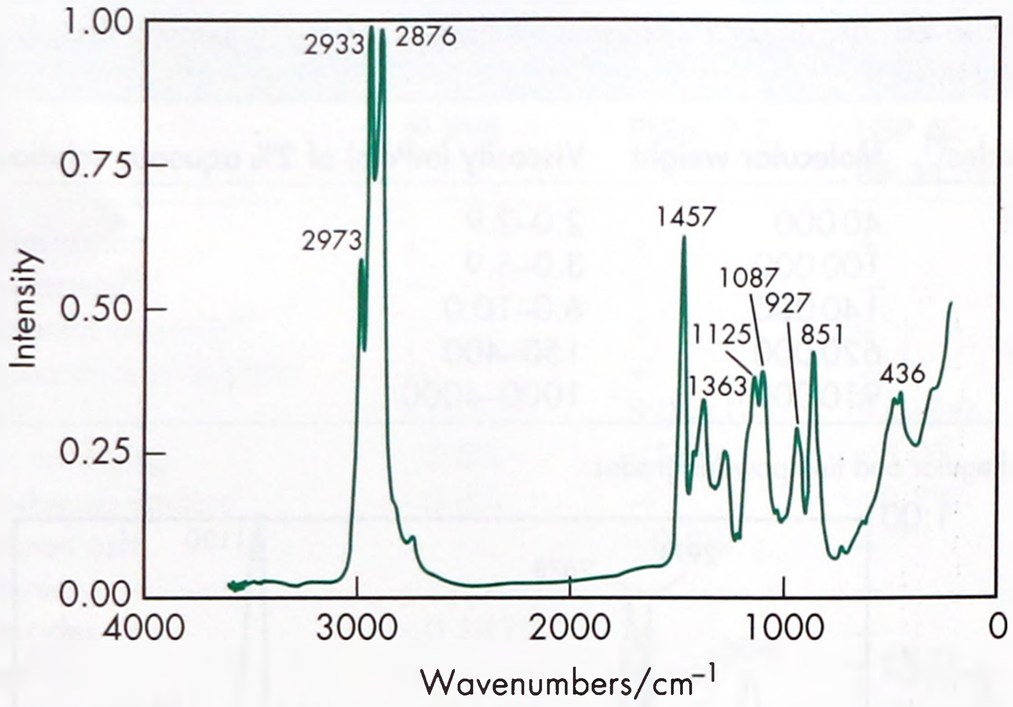
11 Stability and Storage Conditions

Hydroxypropyl cellulose powder stability is affected by the initial molecular weight of the polymer and storage conditions. High viscosity grades are more susceptible to viscosity loss over time. Testing after one year and quarterly thereafter is recommended. Hydroxypropyl cellulose also tends to absorb moisture depending on the relative humidity and the temperature of the environment, and should therefore be stored in tightly closed containers and in a dry atmosphere. Aqueous hydroxypropyl cellulose solutions have optimum stability when the pH is maintained at 6.0–8.0, and also when the solution is protected from light, heat, and the action of microorganisms. The viscosity of aqueous solutions, however, remains unchanged over a wide pH range (2–11). Being water-soluble, hydroxypropyl cellulose is susceptible to chemical and biological degradation, which results in a reduction in molecular



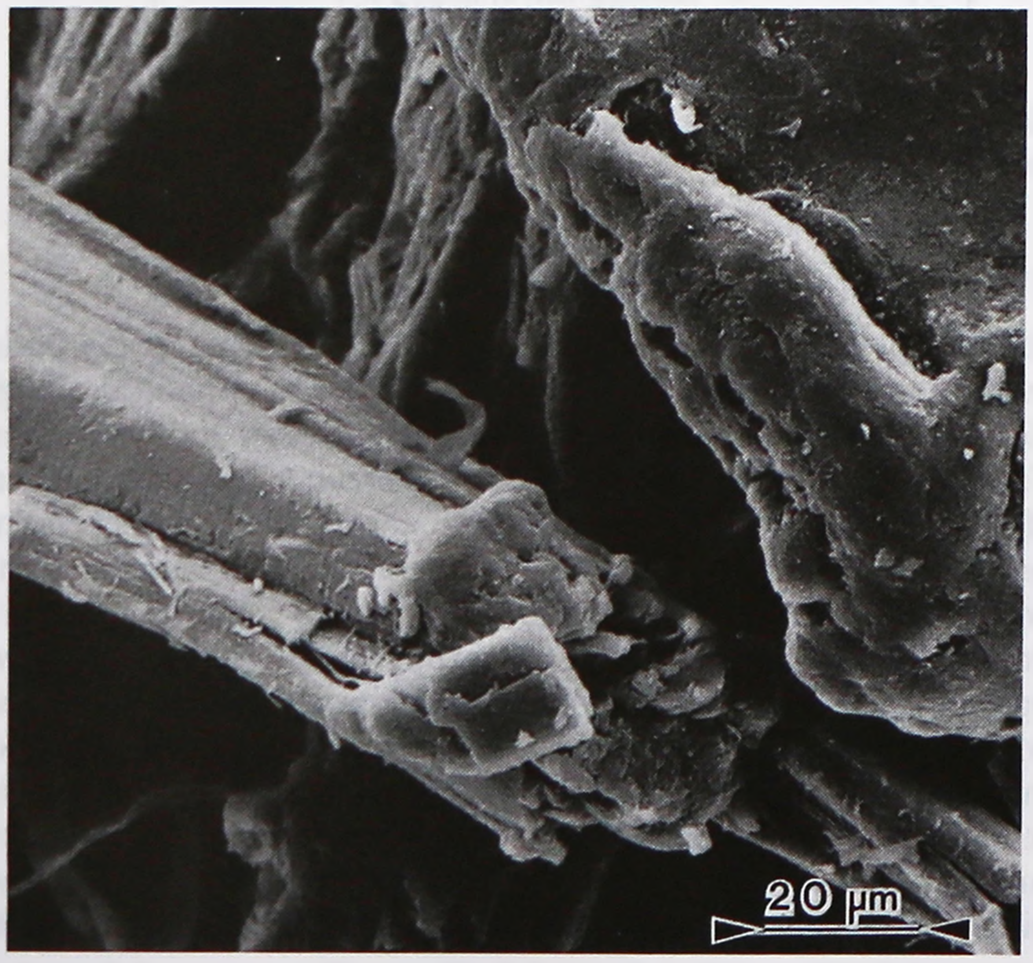


Figure 5: Raman spectrum of hydroxypropyl cellulose measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

weight of the dissolved polymer and a decrease in viscosity of the solution.

At low pH, aqueous solutions may undergo acid hydrolysis, resulting in chain scission and hence a decrease in solution viscosity. The rate of hydrolysis increases with increasing temperature and hydrogen ion concentration. At high pH, alkali-catalyzed oxidation may degrade the polymer and result in a decrease in viscosity of solutions. This degradation can occur owing to the presence of dissolved oxygen or oxidizing agents in a solution.

Increasing temperature causes the viscosity of aqueous solutions to decrease gradually until the viscosity drops suddenly at about 45°C owing to the limited solubility of hydroxypropyl cellulose. However, this process is reversible and on cooling the original viscosity is restored. Prolonged storage at room temperature or lower (-20°C) in a 2% aqueous solution does not result in a change in appearance, color, or viscosity.

The high level of substitution of hydroxypropyl cellulose improves the resistance of the polymer to degradation by molds and bacteria.[20] However, aqueous solutions are susceptible to degradation under severe conditions and a viscosity decrease may occur. Certain enzymes produced by microbial action will degrade hydroxypropyl cellulose in solution.[32] Therefore, for prolonged storage, an antimicrobial preservative should be added to aqueous solutions. Solutions of hydroxypropyl cellulose in organic solvents do not generally require preservatives.

Ultraviolet light will also degrade hydroxypropyl cellulose and aqueous solutions may therefore decrease slightly in viscosity if exposed to light for several months.

Hydroxypropyl cellulose powder should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Hydroxypropyl cellulose in solution demonstrates some incompatibility with substituted phenol derivatives, such as methylparaben and propylparaben. The presence of anionic polymers may increase the viscosity of hydroxypropyl cellulose solutions.

The compatibility of hydroxypropyl cellulose with inorganic salts varies depending upon the salt and its concentration; *see* Table VII. Hydroxypropyl cellulose may not tolerate high concentrations of other dissolved materials.

Table VII: Compatibility of hydroxypropyl cellulose (*Nisso HPC-L*) with inorganic salts in aqueous solutions.[a]

Sodium sulfite	S	S	I	I	I	I	I
Sodium thiosulfate	T	T	T	I	I	I	I

(a) S, completely soluble; T, turbid white; I, insoluble.

The balance of the hydrophilic–lipophilic properties of the polymer, which are required for dual solubility, reduces its ability to hydrate with water and it therefore tends to be salted out in the presence of high concentrations of other dissolved materials.

The precipitation temperature of hydroxypropyl cellulose is lower in the presence of relatively high concentrations of other dissolved materials that compete for the water in the system; *see* Table VIII.

Table VIII: Variation in precipitation temperature of hydroxypropyl cellulose (*Klucel H*) in the presence of other materials.

Ingredients and concentrations	Precipitation temperature (°C)
1% *Klucel H*	41
1% *Klucel H* + 1.0% sodium chloride	38
1% *Klucel H* + 5.0% sodium chloride	30
0.5% *Klucel H* + 10% sucrose	41
0.5% *Klucel H* + 20% sucrose	36
0.5% *Klucel H* + 30% sucrose	32
0.5% *Klucel H* + 40% sucrose	20
0.5% *Klucel H* + 50% sucrose	7

13 Method of Manufacture

A purified form of cellulose is reacted with sodium hydroxide to produce a swollen alkali cellulose that is chemically more reactive than untreated cellulose. The alkali cellulose is then reacted with propylene oxide at elevated temperature and pressure. The propylene oxide can be substituted on the cellulose through an ether linkage at the three reactive hydroxyls present on each anhydroglucose monomer unit of the cellulose chain. Etherification takes place in such a way that hydroxypropyl substituent groups contain almost entirely secondary hydroxyls. The secondary hydroxyl present in the side chain is available for further reaction with the propylene oxide, and 'chaining-out' may take place. This results in the formation of side chains containing more than 1 mole of combined propylene oxide.

14 Safety

Hydroxypropyl cellulose is widely used as an excipient in oral and topical pharmaceutical formulations. It is also used extensively in cosmetics and food products.

Hydroxypropyl cellulose is generally regarded as an essentially nontoxic and nonirritant material.[33,34] It is not absorbed from the gastrointestinal tract and is fully recovered in feces after oral administration in rats. It does not exhibit skin irritation or skin sensitization. However, the use of hydroxypropyl cellulose as a solid ocular insert has been associated with rare reports of discomfort or irritation, including hypersensitivity and edema of the eyelids. Adverse reactions to hydroxypropyl cellulose are rare. However, it has been reported that a single patient developed contact dermatitis due to hydroxypropyl cellulose in a transdermal estradiol patch.[35]

The WHO has specified an acceptable daily intake for hydroxypropyl cellulose of up to 1500 mg/kg body-weight.[36] Excessive consumption of hydroxypropyl cellulose may have a laxative effect.

LD_{50} (rat, IV): 0.25 g/kg[37]

LD_{50} (rat, oral): 10.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Hydroxypropyl cellulose dust may be irritant to the eyes; eye protection is recommended. Excessive dust generation should be avoided to minimize the risk of explosions.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules and tablets; buccal films and gums; topical and transdermal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Hydroxyethyl cellulose; hydroxypropyl cellulose, low-substituted; hypromellose.

18 Comments

Hydroxypropyl cellulose is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Hydroxypropyl cellulose is used in cosmetics and in food products as an emulsifier and stabilizer.[38]

Hydroxypropyl cellulose is a thermoplastic polymer that can be processed by virtually all fabrication methods used for plastics.

A specification for hydroxypropyl cellulose is included in the *Food Chemicals Codex* (FCC).[39]

The EINECS number for hydroxypropyl cellulose is 220-971-6.

Hydroxypropyl Cellulose, Low-substituted

1 Nonproprietary Names

BP: Low-Substituted Hydroxypropylcellulose

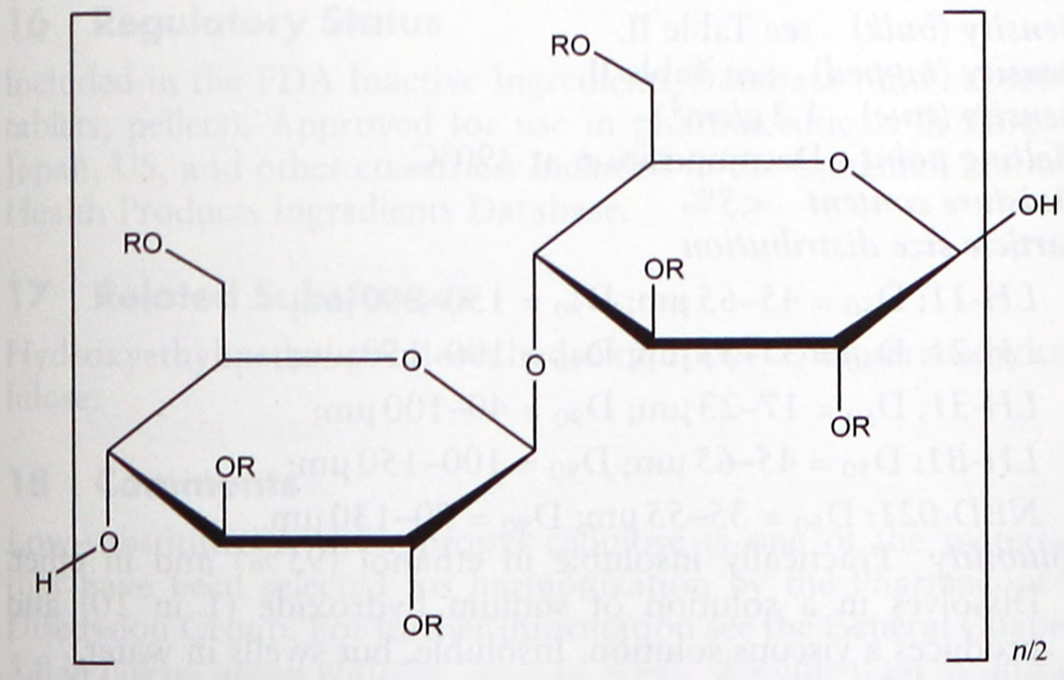
JP: Low Substituted Hydroxypropylcellulose

PhEur: Hydroxypropylcellulose, Low-Substituted

USP–NF: Low-Substituted Hydroxypropyl Cellulose

2 Synonyms

Cellulose, 2-hydroxypropyl ether; 2-hydroxypropyl ether (low-substituted) cellulose; hydroxypropylcellulosum substitutum humile; hyprolose, low-substituted; *L-HPC*; low-substituted *O*-(2-hydroxypropylated) cellulose; oxypropylated cellulose.



3 Chemical Name and CAS Registry Number

Cellulose, 2-hydroxypropyl ether (low-substituted) [9004-64-2]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes low-substituted hydroxypropyl cellulose as a low-substituted hydroxypropyl ether of cellulose. Compared to hydroxypropyl cellulose, low-substituted hydroxypropyl cellulose has only a small proportion of the three free hydroxyl groups per glucose subunit converted to a hydroxypropyl ether.[1] When dried at 105°C for 1 hour, it contains not less than 5.0% and not more than 16.0% of hydroxypropoxy groups (—$OCH_2CHOHCH_3$). Low-substituted hydroxypropyl cellulose is commercially available in a number of different grades that have different particle sizes, shapes and substitution levels.

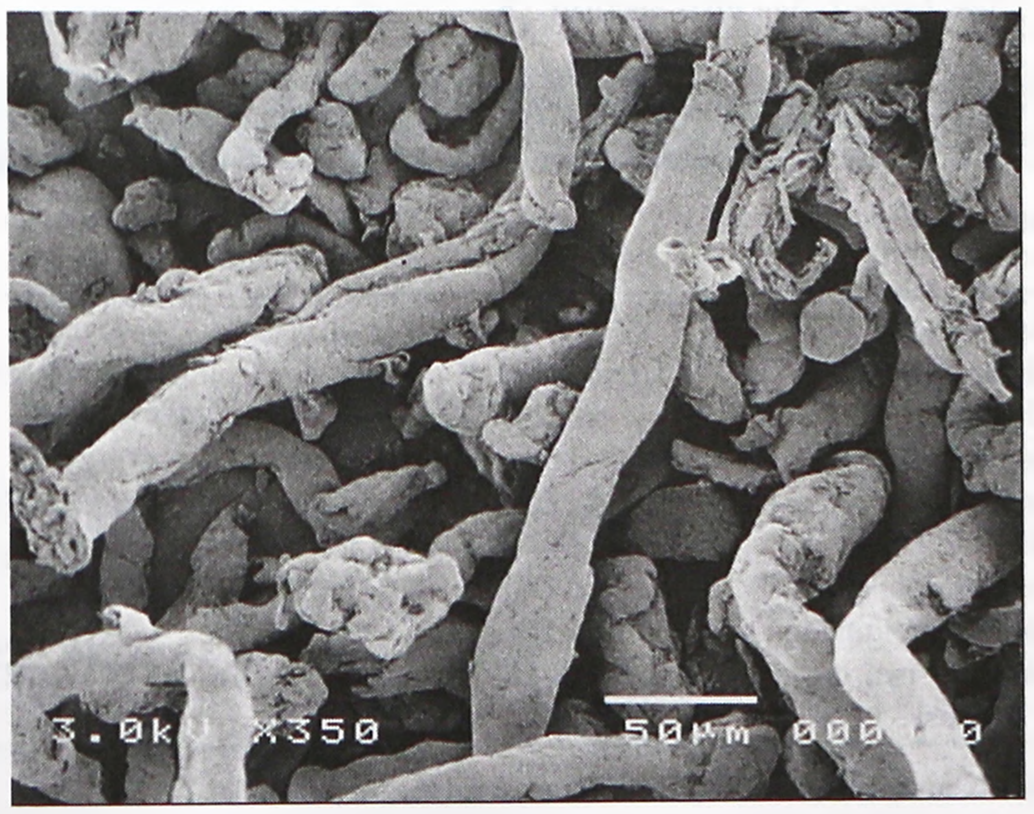
5 Structural Formula

R is H or $[CH_2CH(CH_3)O]_mH$

6 Functional Category

Tablet and capsule binder; tablet and capsule diluent; tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology



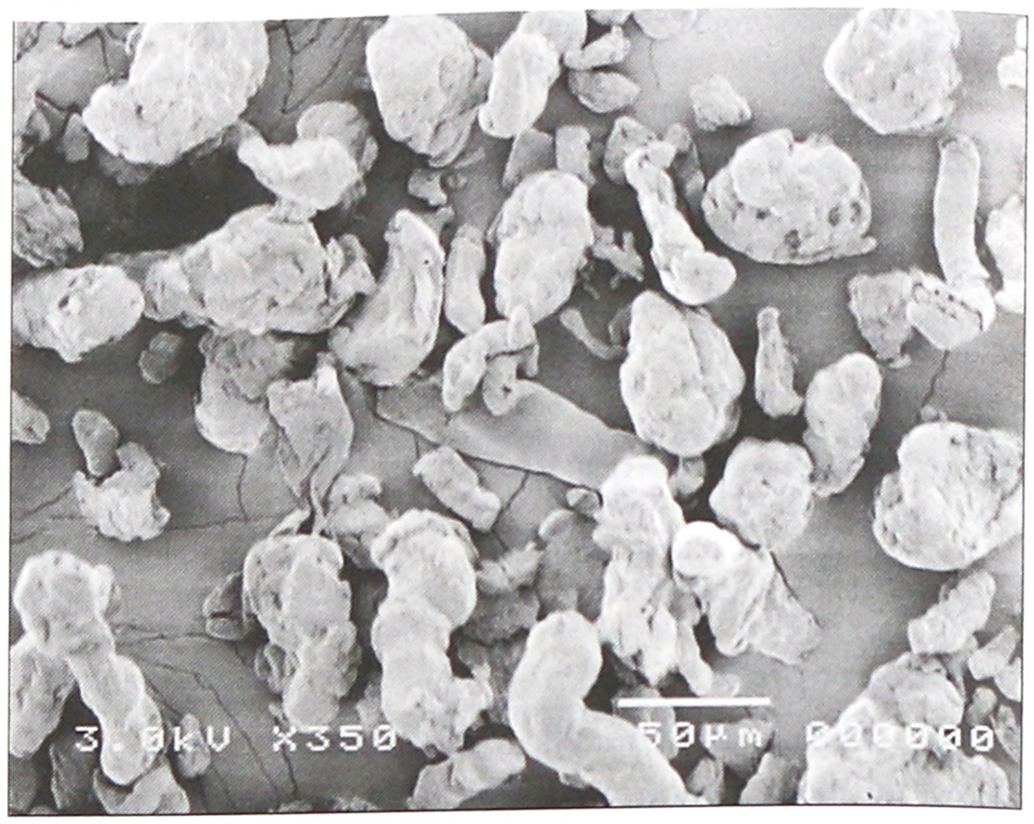
Low-substituted hydroxypropyl cellulose (L-HPC) is widely used in oral solid-dosage forms. It is primarily used as a disintegrant, and as a binder for tablets and granules in wet or dry granulation.[1] It has been used in the preparation of rapidly disintegrating tablets produced by direct compression methods.[2–4] In addition, L-HPC has been used as a binder/disintegrant included in the powder layering process on spherical cores and to prepare pellets by extrusion/spheronization.[1,5,6] A low particle size and high hydroxypropyl content is recommended to produce round spheres and rapid dissolution.[1,7]

The typical content of L-HPC in a formulation is approximately 5–50%.

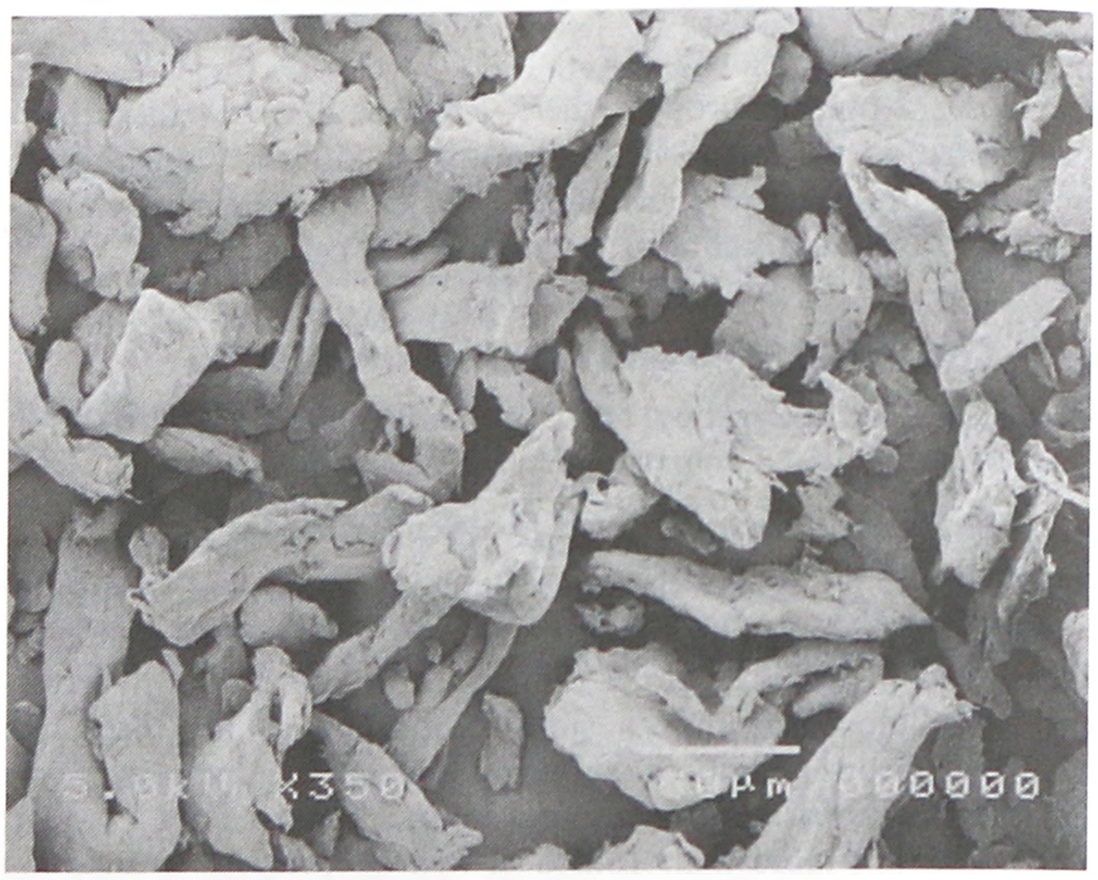
8 Description

Low-substituted hydroxypropyl cellulose occurs as a white to yellowish white hygroscopic powder or granules. It is odorless or has a slight, characteristic odor, and it is tasteless.

SEM 1: Excipient: low-substituted hydroxypropyl cellulose, type *LH-11*; manufacturer: Shin-Etsu Chemical Co. Ltd.; magnification: 350×; voltage: 3.0 kV.



SEM 2: Excipient: low-substituted hydroxypropyl cellulose, type *LH-21*; manufacturer: Shin-Etsu Chemical Co. Ltd.; magnification: 350×; voltage: 3.0 kV.



SEM 3: Excipient: low-substituted hydroxypropyl cellulose, type *LH-31*; manufacturer: Shin-Etsu Chemical Co. Ltd.; magnification: 350×; voltage: 3.0 kV.

SEM 4: Excipient: low-substituted hydroxypropyl cellulose, type *LH-B1*; manufacturer: Shin-Etsu Chemical Co. Ltd.; magnification: 350×; voltage: 3.0 kV.

SEM 5: Excipient: low-substituted hydroxypropyl cellulose, type *NBD-021*; manufacturer: Shin-Etsu Chemical Co. Ltd.; Magnification: 350×; voltage: 5.0 kV

9 Pharmacopeial Specifications

The pharmacopeial specifications for low-substitued hydroxypropyl cellulose have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for hydroxypropyl cellulose, low-substituted.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters[a]	+	+	–
Chloride	≤0.335%	–	≤0.36%
Heavy metals	≤10 ppm	–	≤0.001%
Arsenic	≤2 ppm	–	–
pH	5.0–7.5	5.0–7.5	–
Loss on drying	≤6.0%	≤5.0%	≤5.0%
Residue on ignition	≤1.0%	≤0.8%	≤0.5%
Assay (of hydroxypropoxy groups)	5.0–16.0%	5.0–16.0%	5.0–16.0%

(a) This test has not been fully harmonized at the time of publication.

10 Typical Properties

Acidity/alkalinity pH = 5.0–7.5 for 1% w/v aqueous suspension.
Angle of repose *see* Table II.
Ash 0.5%
Density (bulk) *see* Table II.
Density (tapped) *see* Table II.
Density (true) 1.3 g/cm^3
Melting point Decomposition at 290°C.
Moisture content <5%
Particle size distribution

LH-11: D_{50} = 45–65 µm; D_{90} = 150–200 µm;
LH-21: D_{50} = 35–55 µm; D_{90} = 100–150 µm;
LH-31: D_{50} = 17–23 µm; D_{90} = 40–100 µm;
LH-B1: D_{50} = 45–65 µm; D_{90} = 100–150 µm;
NBD-021: D_{50} = 35–55 µm; D_{90} = 70–130 µm.

Solubility Practically insoluble in ethanol (95%) and in ether. Dissolves in a solution of sodium hydroxide (1 in 10) and produces a viscous solution. Insoluble, but swells in water.
Specific surface area

0.8 m^2/g for *LH-21*;

0.5 m^2/g for *LH-B1*;
1.0 m^2/g for *NBD-021*.

11 Stability and Storage Conditions

Low-substituted hydroxypropyl cellulose is a stable, though hygroscopic, material. The powder should be stored in an airtight container.

Table II: Typical Properties of hydroxypropyl cellulose, low-substituted, for selected grades.

Grade	Hydroxypropoxy content (%)	Angle of repose (°)	Average particle size[a] (μm)	Density (bulk) (g/cm^3)	Density (tapped) (g/cm^3)
LH-11	11	54	55	0.33	0.56
LH-21	11	50	45	0.38	0.63
LH-B1	11	40	55	0.48	0.69
LH-31	11	55	20	0.28	0.59
LH-22	8	48	45	0.36	0.63
LH-32	8	53	20	0.21	0.55
NBD-020	14	43	45	0.33	0.53
NBD-021	11	43	45	0.33	0.53
NBD-022	8	43	45	0.33	0.53

(a) By laser diffraction.

12 Incompatibilities

—

13 Method of Manufacture

Low-substituted hydroxypropyl cellulose is manufactured by reacting alkaline cellulose with propylene oxide at elevated temperature. Following the reaction, the product is recrystallized by neutralization, washed, and milled.

14 Safety

Low-substituted hydroxypropyl cellulose is generally regarded as a nontoxic and nonirritant material.

Animal toxicity studies showed no adverse effects in rats fed orally 6 g/kg/day over 6 months. No teratogenic effects were noted in rabbits and rats fed 5 g/kg/day.[8–11]

LD_{50} (rat, oral): >15 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Excessive dust generation should be avoided to minimize the risk of explosions.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, tablets, pellets). Approved for use in pharmaceuticals in Europe, Japan, US, and other countries. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Hydroxyethylmethyl cellulose; hydroxypropyl cellulose; methylcellulose.

18 Comments

Low-substituted hydroxypropyl cellulose is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

There are a number of grades that have different particle sizes and substitution levels. *LH-11* (Shin-Etsu Chemical Co. Ltd, Japan) has the longest fibrous particles, and is typically used as an anticapping agent and disintegrant for direct compression. *LH-21* is less fibrous and is used as a binder and disintegrant for tablets through the wet-granulation process. *LH-31* is a small-particle grade used especially for extrusion to produce granules, as its small particle size is better for passing a screen. *LH-B1* is the nonfibrous, high-density grade designed for fluid-bed granulation, and can be used for direct compression and/or formulations with a high L-HPC loading. Lower substitution grades *LH-22* and *LH-32* can be used for better disintegration capability, depending on the characteristics of the active ingredients. More recently, *NBD* grades (Shin-Etsu Chemical Co. Ltd, Japan) have become available with better compressibility and flowability compared with conventional *LH* grades. Three grades are available in the NBD series: *NBD-022* for orally disintegrating tablets; *NBD-021* for tablets from direct compression; and *NBD-020* for wet granulation.

H

Hydroxypropyl Starch

1 Nonproprietary Names

PhEur: Starch, Hydroxypropyl

USP-NF: Hydroxypropyl Corn Starch
Hydroxypropyl Pea Starch
Hydroxypropyl Potato Starch

2 Synonyms

Amylum hydroxypropylum; E1440.

3 Chemical Name and CAS Registry Number

Hydroxypropyl starch [113894-92-1]

4 Empirical Formula and Molecular Weight

Hydroxypropyl starch is a derivative of natural starch. It is described in the USP 40–NF 35 S1 and PhEur 9.2 as a partially substituted 2-hydroxypropylether of corn starch, potato starch, tapioca starch, rice starch, or pea starch chemically modified by etherification with the reagent propylene oxide. It may be partially hydrolyzed using acids or enzymes to obtain 'thinned starch' with reduced viscosity

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; tablet and capsule disintegrant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydroxypropyl starch is a modified starch and has been used in combination with carrageenan in the production of soft capsules.[1,2] Blends of hydroxypropyl methylcellulose with up to 70% hydroxypropyl starch have been developed for use as hard capsule materials.[3] Hydroxypropyl starch is also used widely in cosmetics. *See also* Section 18.

8 Description

Hydroxypropyl starch occurs as a free-flowing white to off-white coarse powder.

9 Pharmacopeial Specifications

The pharmacopeial specifications for hydroxypropyl cellulose have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for hydroxypropyl starch.

Test	PhEur 9.2	USP 40–NF 35 S1[a]
Identification	+	+
Characters	+	—
pH	4.5–8.0	4.5–8.0
Foreign matter	+	+
Oxidizing substances	≤20 ppm	≤20 µg/g
Sulfur dioxide	≤50 ppm	≤50 ppm
Iron		
Corn, tapioca, potato, or rice starches	≤20 ppm	≤20 µg/g
Pea starch	≤50 ppm	≤50 µg/g
Loss on drying		
Corn, tapioca, pea, or rice starches	≤15.0%	≤15.0%
Potato starch	≤20.0%	≤20.0%
Sulfated ash	≤0.6%	≤0.6%
Microbial contamination		
Bacteria	10^3 cfu/g	10^3 cfu/g
Yeasts and molds	10^2 cfu/g	10^2 cfu/g
Assay (dried basis)	0.5–7.0%	2.0–7.0%

(a) USP 40–NF 35 S1 is for hydroxypropyl corn, pea, and potato starches only.

10 Typical Properties

Acidity/alkalinity pH = 4.5–7.0 (10% w/v aqueous dispersion)
Solubility Practically insoluble in water, ethanol (95%), and ether.

11 Stability and Storage Conditions

Hydroxypropyl starch is stable at high humidity and is considered to be inert under normal conditions. It is stable in emulsion systems at pH 3–9.

12 Incompatibilities

See Section 18.

13 Method of Manufacture

Hydroxypropyl starch is produced industrially from natural starch, using propylene oxide as the modifying reagent in the presence of alkali, adding hydroxypropyl ($CH(OH)CH_2CH_3$) groups at the OH positions by an ether linkage.

14 Safety

Hydroxypropyl starch is widely used in cosmetics and food products. It is also used in oral pharmaceutical formulations. The WHO has set an acceptable daily intake for hydroxypropyl starch at 'not limited' since it was well tolerated on oral consumption.[4]

LD_{50} (rat, oral): 0.218 g/kg[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe.

17 Related Substances

Pregelatinized hydroxypropyl starch; starch; starch, modified.

Pregelatinized hydroxypropyl starch

Synonyms Amylum hydroxypropylum pregelificatum
Description White or slightly yellow powder
Method of manufacture Pregelatinized hydroxypropyl starch is prepared from hydroxypropyl starch by mechanical processing in the presence of water, with or without heat, to rupture all or part of the starch granules, and subsequent drying.

Pharmacopeial specifications The PhEur 9.2 has a single monograph for pregelatinized hydroxypropyl starch covering corn (maize), pea, potato, rice, and tapioca (cassava) starches, whereas the USP 40–NF 35 S1 has separate monographs for pregelatinized hydroxypropyl corn, pea, and potato starch. *See* Table II.

Table II: Pharmacopeial specifications for pregelatinized hydroxypropyl starch.

18 Comments

Hydroxypropyl starch has been used experimentally in hydrophilic matrices, where it was shown to be an effective matrix for tablets designed for controlled-release drug delivery systems.[6,7] It has also been investigated for the production of hydrophilic matrices by direct compression.[8]

Hydroxypropyl starch–methyl methacrylate has also been used experimentally in hydrophilic matrices produced by direct compression.[9] Pregelatinized hydroxypropyl starch has been shown to exhibit good disintegrating properties, and can be used as a binder in wet granulation.[10]

Hydroxypropyl starch is compatible with cationic ingredients (monovalent, divalent), oils, emollients, and silicone. It is used analytically as a bioseparation aqueous-phase-forming polymer.[9]

A specification for hydroxypropyl starch is included in the *Japanese Pharmaceutical Excipients* (JPE).[11]

The EINECS number for hydroxypropyl starch is 232-679-6. The PubChem Compound ID (CID) for hydroxypropyl starch is 24847857.

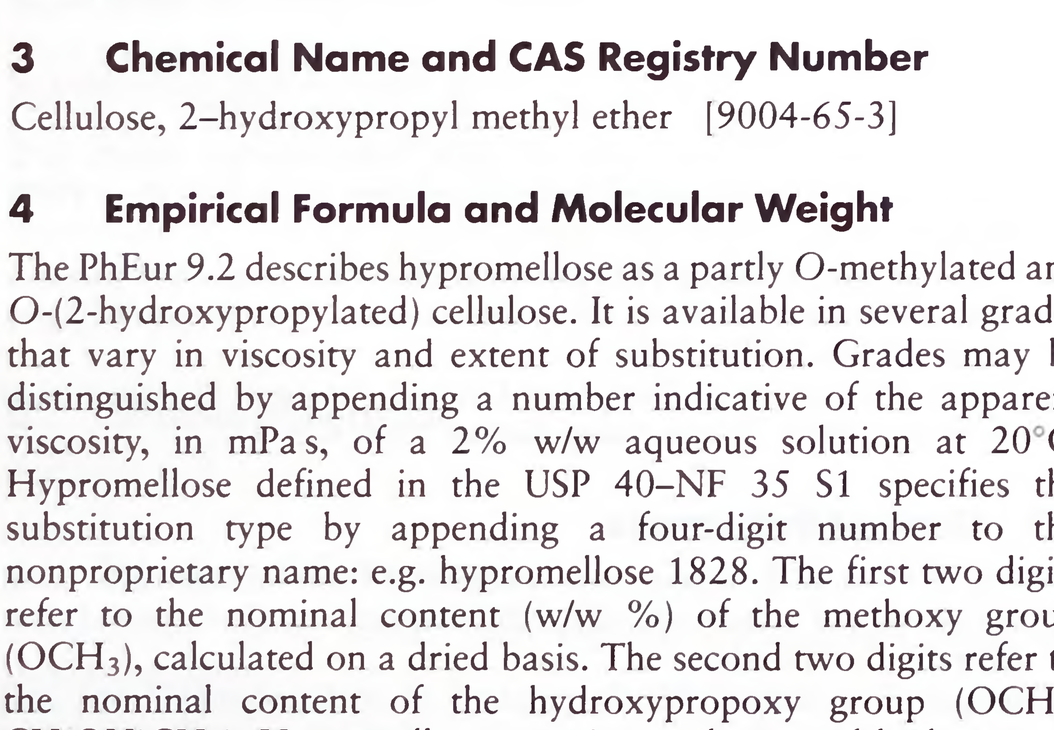
Hypromellose

1 Nonproprietary Names

BP: Hypromellose
JP: Hypromellose
PhEur: Hypromellose
USP–NF: Hypromellose

2 Synonyms

Anycoat C; *Benecel hypromellose*; *BonuCel*; E464; *Headcel Cellulose*; HPMC; hydroxypropyl methylcellulose; 2-hydroxypropyl methyl ether cellulose; hypromellosum; *Mecellose*; *Methocel*; methylcellulose propylene glycol ether; methyl hydroxypropylcellulose; *Metolose*; MHPC; *Pharmacoat*; *Rutocel*; *Vivapharm HPMC*.



3 Chemical Name and CAS Registry Number

Cellulose, 2–hydroxypropyl methyl ether [9004-65-3]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 describes hypromellose as a partly *O*-methylated and *O*-(2-hydroxypropylated) cellulose. It is available in several grades that vary in viscosity and extent of substitution. Grades may be distinguished by appending a number indicative of the apparent viscosity, in mPa s, of a 2% w/w aqueous solution at 20°C. Hypromellose defined in the USP 40–NF 35 S1 specifies the substitution type by appending a four-digit number to the nonproprietary name: e.g. hypromellose 1828. The first two digits refer to the nominal content (w/w %) of the methoxy group (OCH_3), calculated on a dried basis. The second two digits refer to the nominal content of the hydroxypropoxy group ($OCH_2CH(OH)CH_3$). Hypromellose contains methoxy and hydroxypropoxy contents conforming to the pharmacopeial limits for the various chemistries; *see* Section 9. Molecular weight ranges from approximately 10 000–1 500 000 Da.

5 Structural Formula

where R is H, CH_3, or $CH_2CH(OH)CH_3$

6 Functional Category

Capsule shell material; coating agent; dispersing agent; emulsifying agent; film-forming agent; modified-release agent; solubilizing agent; suspending agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

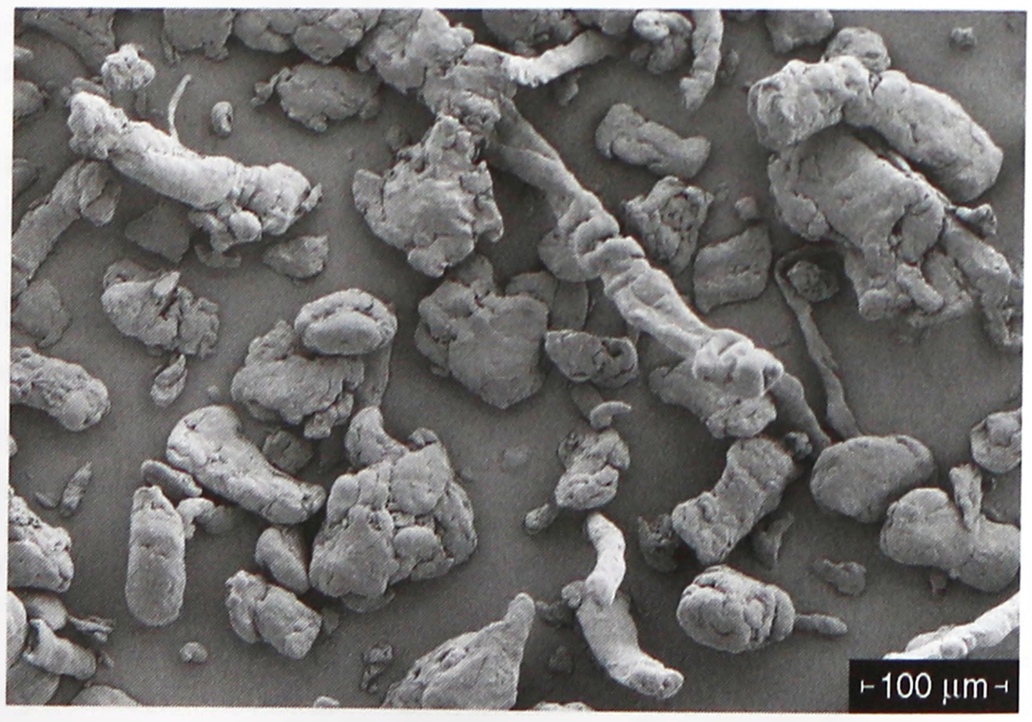
Hypromellose is widely used in oral, ophthalmic, nasal, and topical formulations.

In oral products, hypromellose is primarily used as a tablet binder,[1] in film-coating,[2–7] and as a matrix for use in extended-release tablet formulations.[8–12] Concentrations between 2% and 5% w/w may be used as a binder in either wet- or dry-granulation processes. Hypromellose is also used in liquid oral dosage forms as a suspending and/or thickening agent at concentrations ranging from 0.25–5.0%.[13] Hypromellose 2910 and hypromellose 2208 (more commonly) are used to retard the release of drugs from monolithic matrices at levels of 10–80% w/w.

Depending upon the viscosity grade, concentrations ranging from 2% to 25% (w/w) are used for film-forming solutions to coat tablets. Lower-viscosity grades are used in aqueous film-coating solutions, while higher-viscosity grades are used with organic solvents.

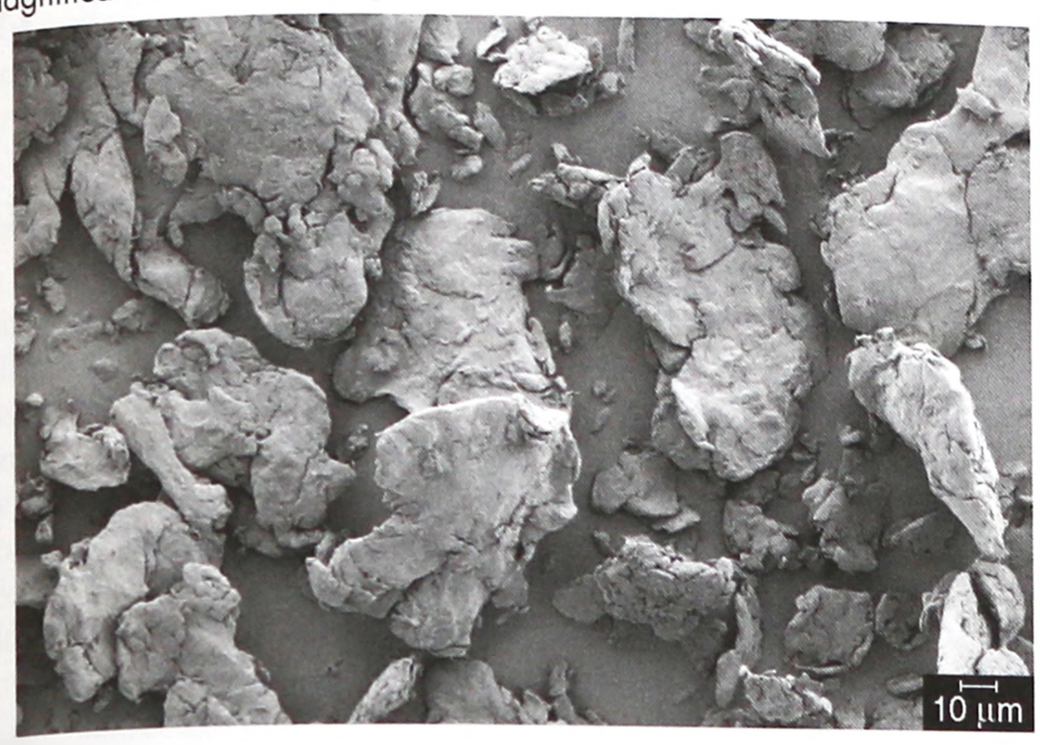
Hypromellose is also used as a suspending and/or thickening agent in topical formulations. Compared with methylcellulose, hypromellose produces aqueous solutions of greater clarity and with fewer undissolved fibers present, so it is preferentially used in ophthalmic formulations. Hypromellose at concentrations between 0.45% and 1.0% (w/w) may be added as a thickening agent in eye drop and artificial tear formulations. It is also used commercially in liquid nasal formulations at a concentration of 0.1%.[13]

Hypromellose is used as an emulsifier, suspending agent, and stabilizer in topical gels and ointments. As a protective colloid, it can minimize or prevent coalescence or agglomeration of droplets or particles.



Hypromellose is used as film-forming agent in the manufacture of hard-shell capsules, as an adhesive in plastic bandages, and as a wetting agent for hard contact lenses. It is also commonly used in cosmetics and food products.

8 Description



Hypromellose is an odorless and tasteless, white or creamy-white fibrous or granular powder, hygroscopic when dry.

See also Section 10.

(a) This test has not been fully harmonized at the time of publication.
(b) May be a functionality related characteristic.
(c) Of that stated for its nominal viscosity.

10 Typical Properties

Acidity/alkalinity pH = 5.0–8.0 for a 2% w/w aqueous solution.

Autoignition temperature 360°C

Density (bulk) 0.341 g/cm^3

Density (tapped) 0.557 g/cm^3

Density (true) 1.326 g/cm^3

Melting point None. Browns at 190–200°C; chars at 225–230°C. Glass transition temperature at 170–180°C.

Moisture content Hypromellose absorbs moisture from the atmosphere; the amount of water absorbed depends upon initial moisture content and the temperature and relative humidity of the surrounding air.

See Figure 1.

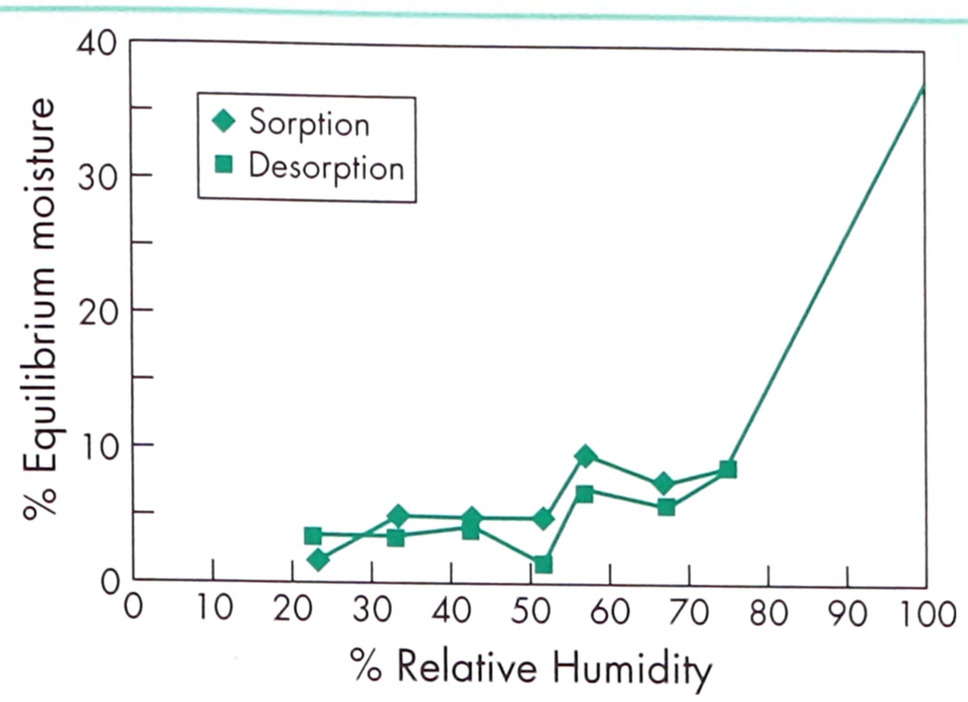

Figure 1: Absorption–desorption isotherm for hypromellose.

Solubility Soluble in cold water, forming a viscous colloidal solution; practically insoluble in hot water, chloroform, ethanol (95%), ether, and toluene, but soluble in mixtures of ethanol and dichloromethane, mixtures of methanol and dichloromethane, and mixtures of water and alcohol. Certain grades of hypromellose are soluble in aqueous acetone solutions, mixtures of dichloromethane and propan-2-ol, and other organic solvents. Some grades are swellable in ethanol.[14]

See also Section 11.

Specific gravity 1.26

Spectroscopy

IR spectra *see* Figures 2 and 3.

NIR spectrum *see* Figure 4.

Raman spectra *see* Figures 5 and 6.

Viscosity (dynamic)

A wide range of viscosity grades are commercially available; see Table II. Aqueous solutions are most commonly prepared, although hypromellose may also be dissolved in aqueous alcohols such as water/ethanol or water/propan-2-ol provided the alcohol content is less than 50% w/w. Dichloromethane/ethanol mixtures may also be used to prepare hypromellose solutions. Solutions prepared using organic solvents tend to be more viscous. Increasing polymer concentration also produces more viscous solutions.

To prepare an aqueous solution, it is recommended that hypromellose is dispersed and thoroughly hydrated in about 20–30% of the required amount of water. The water should be vigorously stirred and heated to 80–90°C, and then the hypromellose should be added. The heat source can be removed once the hypromellose has been thoroughly dispersed into the hot water. Sufficient cold water should then be added to produce the required volume while continuing to stir.

When aqueous/organic cosolvent mixtures are used for solution preparation, hypromellose should first be dispersed into the organic solvent at a ratio of 5–8 parts of solvent to 1 part of hypromellose. Cold water is then added to produce the final volume. Examples of suitable water-miscible organic solvents include ethanol and glycols. A similar preparation procedure should be used when ethanol or methanol and dichloromethane constitute a completely organic cosolvent mixture.

11 Stability and Storage Conditions

Hypromellose powder is a stable material, although it is hygroscopic after drying. It should be stored in a well-closed container, in a cool, dry place.

Solutions are stable at pH 3–11. Hypromellose undergoes a reversible sol–gel transformation upon heating and cooling, respectively. The gelation temperature ranges from 50°C to 90°C,

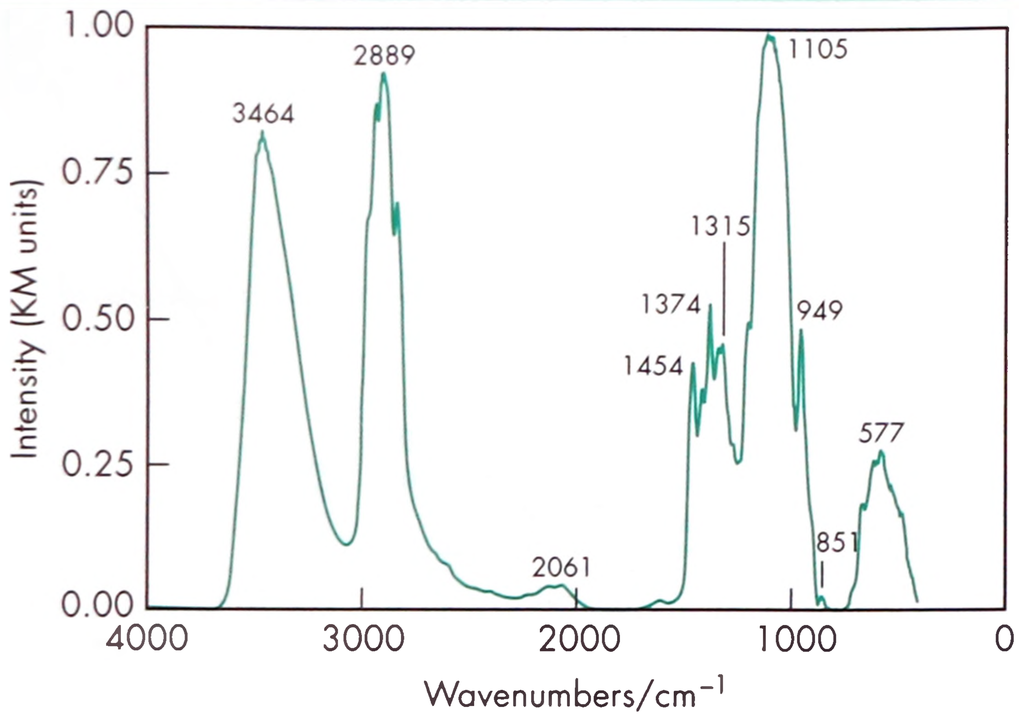

Figure 2: Infrared spectrum of hypromellose (K15M) measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

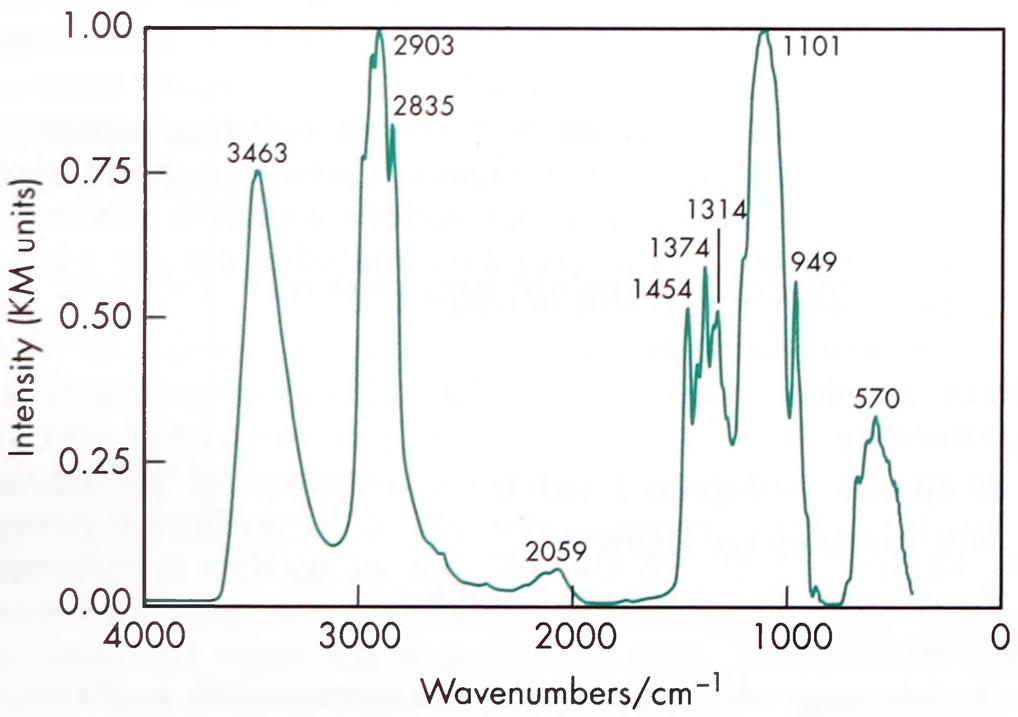

Figure 3: Infrared spectrum of hypromellose (E6) measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

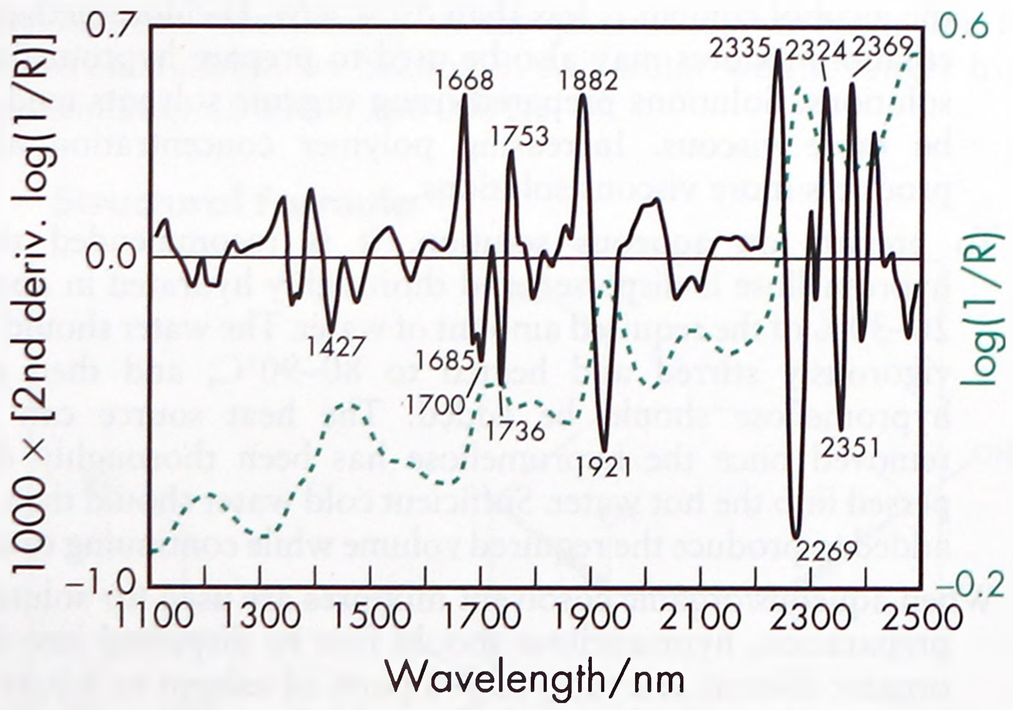

Figure 4: Near-infrared spectrum of hypromellose measured by reflectance.

depending upon hypromellose grade and concentration. For temperatures below the gelation temperature, viscosity of the solution decreases as temperature is increased. Beyond the gelation temperature, viscosity increases as temperature is increased.

Aqueous solutions are relatively enzyme-resistant, providing suitable viscosity stability during long-term storage.[15] Aqueous solutions are, however, susceptible to microbial spoilage and should be preserved with an antimicrobial preservative. When hypromellose is used as a viscosity-increasing agent in ophthalmic solutions, benzalkonium chloride is commonly used as the preservative. Aqueous solutions may also be sterilized by autoclaving. Once cooled, the coagulated polymer can be redispersed by agitation.

Metolose 65SH	2906	50, 400, 1500, 4000
Metolose 90SH	2208	100, 400, 4000, 15 000, 100 000

12 Incompatibilities

Hypromellose is incompatible with some oxidizing agents. Since it is nonionic, hypromellose will not complex with metallic salts or ionic organics to form insoluble precipitates.

13 Method of Manufacture

A purified form of cellulose, obtained from cotton linters or wood pulp, is reacted with sodium hydroxide solution to produce swollen alkali cellulose that is chemically more reactive than untreated cellulose. The alkali cellulose is then treated with chloromethane and propylene oxide to produce methyl hydroxypropyl ethers of cellulose. The fibrous reaction product is then purified and ground to a fine, uniform powder or granules. Hypromellose can then be exposed to anhydrous hydrogen chloride to induce depolymerization, thus producing low viscosity grades.

14 Safety

Hypromellose is widely used as an excipient in oral, ophthalmic, nasal, and topical pharmaceutical formulations. It is also used extensively in cosmetics and food products.

Hypromellose is generally regarded as a nontoxic and nonirritating material, although excessive oral consumption may have a laxative effect.[16] The WHO has not specified an acceptable daily intake for hypromellose since the levels consumed were not considered to represent a hazard to health.[17] In fact, high dosages of hypromellose are being investigated to treat various metabolic syndromes.[18,19]

LD_{50} (mouse, IP): 5 g/kg[20]

LD_{50} (rat, IP): 5.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Hypromellose dust may be irritating to the eyes, so eye protection is recommended. Hypromellose is combustible. Excessive dust generation should be avoided to minimize risk of explosion.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (ophthalmic and nasal preparations; oral capsules, suspensions, syrups, and tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ethylcellulose; hydroxyethyl cellulose; hydroxyethylmethyl cellulose; hydroxypropyl cellulose; hypromellose acetate succinate; hypromellose phthalate; lactose monohydrate and hypromellose, coprocessed; methylcellulose.

Lactose Monohydrate and Hypromellose, coprocessed

Synonyms *RetaLac*

Appearance Coprocessed lactose monohydrate and hypromellose occurs as a white to nearly white odorless powder containing 45–55% lactose monohydrate and 45–55% hypromellose as an integrated particle structure.

Angle of repose 36° for *RetaLac*

Density (bulk) 0.34 g/cm^3 for *RetaLac*

Density (tapped) 0.46 g/cm^3 for *RetaLac*

Hausner ratio 1.35 for *RetaLac*

Heavy metals ≤20 ppm for *RetaLac*

Loss on drying ≤3% for *RetaLac*

Microbial content

Total viable aerobic count (*RetaLac*): ≤1000 cfu/g

Yeasts and molds: ≤100 cfu/g

Escherichia coli and *Salmonella* species absent

Particle size distribution ≤25% <63 µm and ≥80% <250 µm for *RetaLac*

Solubility Partially soluble in water for *RetaLac*.

Sulfated ash ≤0.6% for *RetaLac*

Comments Coprocessed lactose monohydrate and hypromellose is prepared by co-agglomerating a mixture of the two ingredients. *See also* Lactose Monohydrate.

Coprocessed lactose monohydrate and hypromellose can be used in direct compression tablet formulations as well as in dry granulation processes, such as for filling hard, two-piece capsules or roller compaction for controlled release formulation development and manufacture.[21,22] *RetaLac* (Meggle) exhibits superior flow and binding properties compared to simple mixtures of its components.[23,24] Differences between *RetaLac* and simple admixtures have been evaluated.[25,26]

18 Comments

Hypromellose has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Hypromellose has been used in pharmaceutical dosage forms produced via hot-melt extrusion.[27] Premix coating formulations that contain hypromellose as film-forming agent include *Opadry* (Colorcon), *Advantia* Prime Coating Systems (ISP), *Aquapolish* (Biogrund) and *Aquarius* (Ashland Specialty Ingredients). *Methocel* K4M Premium DC and *Methocel* K100M Premium DC (Dow Wolff Cellulosics) have been developed to facilitate direct compression of extended-release tablets.

Powdered or granular, surface-treated grades of hypromellose are also available that are dispersible in cold water. These are not recommended for oral use.

A specification for hypromellose is contained in the *Food Chemicals Codex* (FCC).[28]

The PubChem Compound ID (CID) for hypromellose is 24832095.

Hypromellose Acetate Succinate

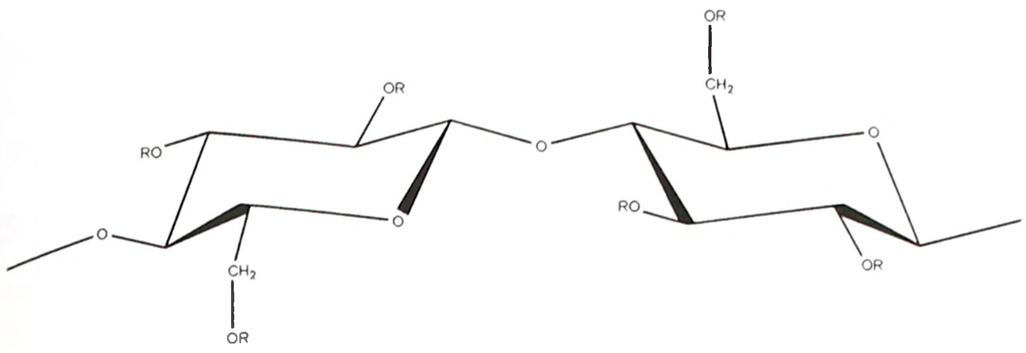
1 Nonproprietary Names

JP: Hypromellose Acetate Succinate
USP–NF: Hypromellose Acetate Succinate

2 Synonyms

Aqoat; *Aqoat AS-HF/HG*; *Aqoat AS-LF/LG*; *Aqoat AS-MF/MG*; cellulose, 2-hydroxypropyl methyl ether, acetate succinate; HPMCAS.

3 Chemical Name and CAS Registry Number



Cellulose, 2-hydroxypropylmethyl ether, acetate hydrogen butanedioate [71138-97-1]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes hypromellose acetate succinate as a mixture of acetic acid and monosuccinic acid esters of hydroxypropylmethyl cellulose. It is available in several subclasses, which vary in extent of substitution, mainly of acetyl and succinoyl groups, and in particle size (fine or granular). When dried at 105°C for one hour, it contains 12.0–28.0% of methoxy groups; 4.0–23.0% of hydroxypropoxy groups; 2.0–16.0% of acetyl groups; and 4.0–28.0% of succinoyl groups.

The molecular weight of hypromellose acetate succinate cannot be characterized by the external calibration or universal calibration methods. It can only be characterized using a mass sensitive detector such as triple detection or multiangle laser light scattering.[1]

5 Structural Formula

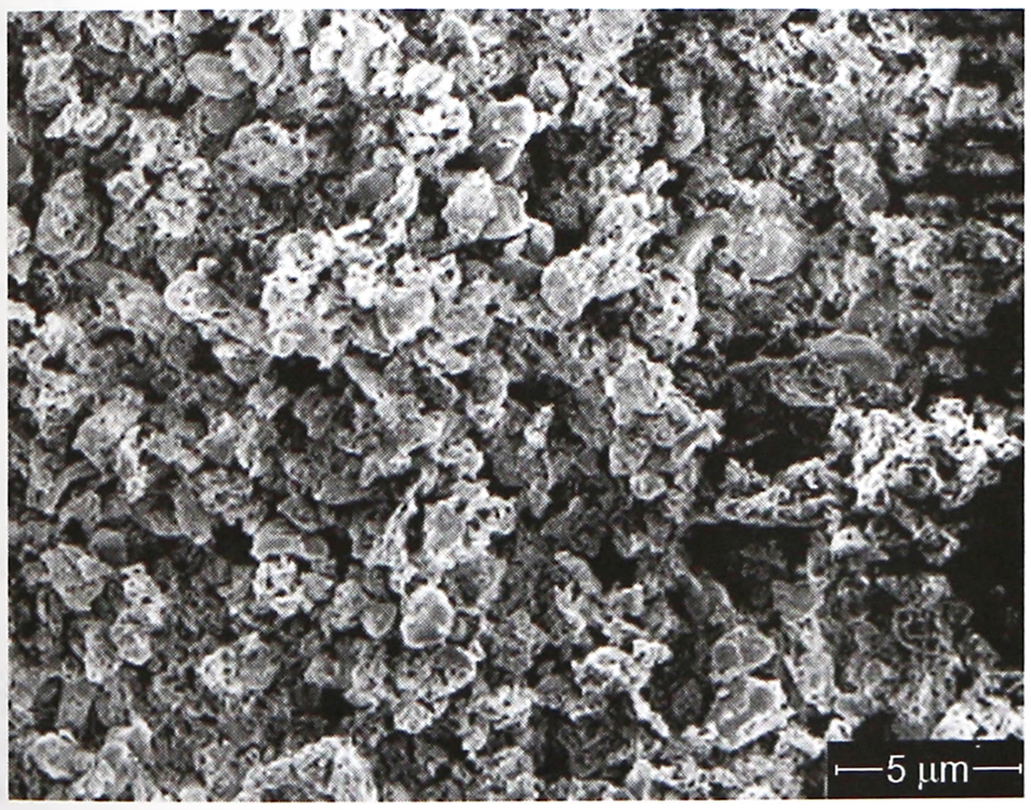
Where —OR represents one of the following functional groups: hydroxyl, methoxyl, 2-hydroxypropoxyl, acetyl, or succinoyl.

6 Functional Category

Coating agent; solubilizing agentmodified-release agent; film-forming agent.

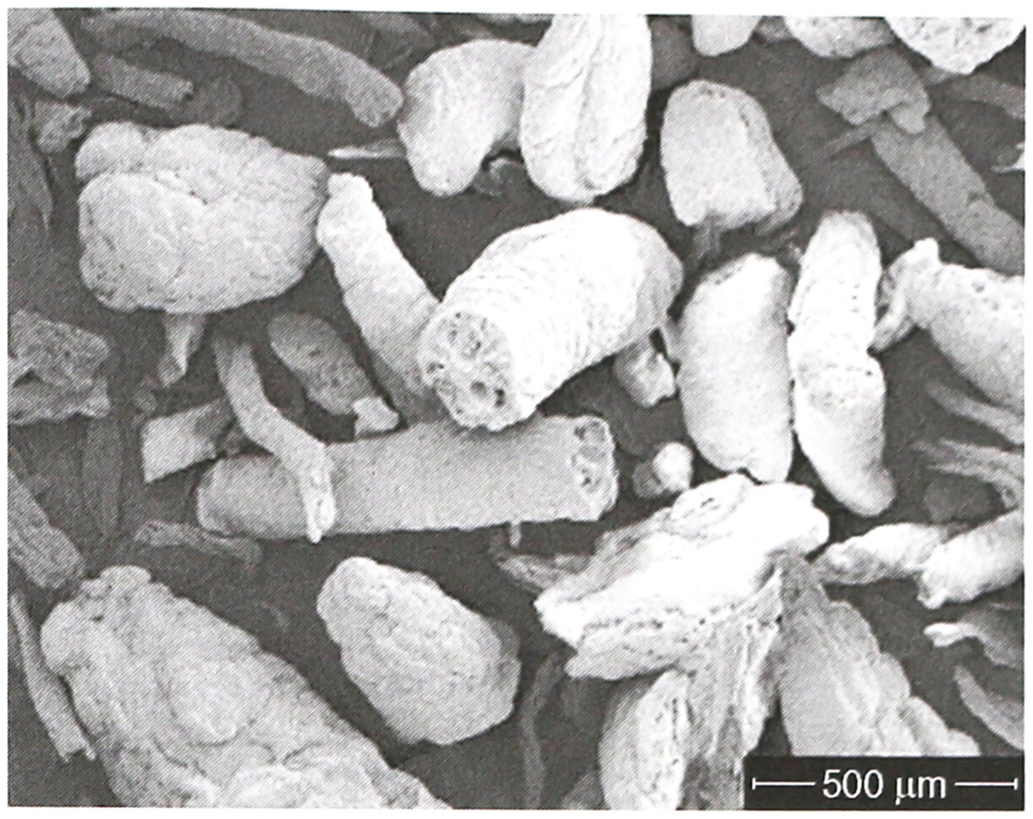
7 Applications in Pharmaceutical Formulation or Technology

Hypromellose acetate succinate is commonly used in oral pharmaceutical formulations as a film coating, as well as an enteric coating material for tablets or granules.[2–4] It is a solubility enhancing agent via solid dispersion. Hypromellose acetate succinate is insoluble in gastric fluid but will swell and dissolve rapidly in the upper intestine. For aqueous film-coating purposes, a dispersion of hypromellose acetate succinate fine powder and triethyl citrate (as a plasticizer) in water is commonly utilized.[5,6] Organic solvents can also be used as vehicles for applying this polymer as a film coating.



Hypromellose acetate succinate may be used alone or in combination with other soluble or insoluble binders in the preparation of granules with sustained drug-release properties; the release rate is pH-dependent.

Dispersions of poorly soluble drugs with hypromellose acetate succinate are prepared using techniques such as mechanical grinding, solvent evaporation, and melt extrusion.[7–15]



8 Description

Hypromellose acetate succinate is a white to off-white powder or granules. It has a faint acetic acid-like odor and a barely detectable taste. Hypromellose acetate succinate is available in several subclasses, according to the pH at which the polymer dissolves (low, L; medium, M; and high, H) and its predominant particle size (cohesive fine powder, F; or free-flowing granules, G).

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for hypromellose acetate succinate.

Test	JP XVII	USP 40–NF 35 S1
Identification	+	+
Viscosity	+	+
Loss on drying	≤5.0%	≤5.0%
Residue on ignition	≤0.2%	≤0.2%
Heavy metals	≤10ppm	≤0.001%
Limit of free acetic and succinic acids	+	+
Content of acetyl and succinyl groups	+	+
Content of methoxy and 2-hydroxypropoxy groups	+	+

10 Typical Properties

Density (bulk)
0.2–0.3 g/cm^3 for *Aqoat MF*;
0.2–0.5 g/cm^3 for *Aqoat MG*.

Density (tapped)
0.3–0.5 g/cm^3 for *Aqoat MF*;
0.3–0.6 g/cm^3 for *Aqoat MG*.

Density (true) 1.27–1.30 g/cm^3 for *Aqoat*.

Equilibrium moisture content 2–3% w/w at ambient temperature and humidity (≈25°C, 40% RH). *See also* Figure 1.

Glass transition temperature 113 ± 2°C (differential scanning calorimetry; dried sample)

Particle size distribution
10% <1 µm; 50% <5 µm; 90% <10 µm for *Aqoat MF*.
10% <200 µm; 50% <800 µm; 90% <1000 µm for *Aqoat MG*.

Solubility Practically insoluble in ethanol (95%), hexane, unbuffered water, and xylene. On the addition of acetone, or a mixture of ethanol (95%) and dichloromethane (1 : 1), a clear or turbid viscous solution is produced. Hypromellose acetate succinate also forms a clear or turbid solution in buffers of pH greater than 4.5 with the rank order of solubility for the various grades (*see* Section 8) increasing with the ratio of acetyl over succinoyl substitution. The exact pH value at which the polymer starts to swell and dissolve depends on the buffer type and ionic strength, although the rank order for the different subclasses is independent of the buffer used. No solvent has been found to completely dissolve hypromellose acetate succinate polymer; the resulting clear or turbid solutions significantly scatter light in both static

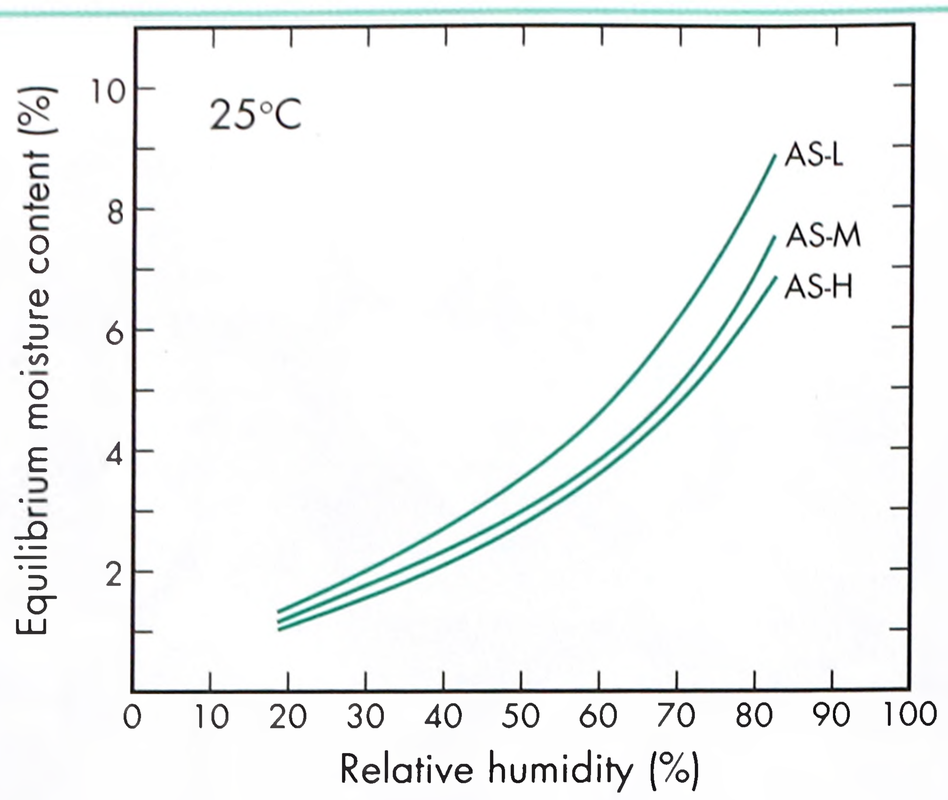

Figure 1: Equilibrium moisture content of *Aqoat* (Shin-Etsu Chemical Co. Ltd) at different relative humidities.[4]

and dynamic light scattering experiments, indicating that the polymer may exist as colloids or aggregates. The data is collated from the Shin-Etsu Chemical Co. Ltd and the research work of the authors (R Chen, BC Hancock, and RM Shanker).

11 Stability and Storage Conditions

Hypromellose acetate succinate should be stored in a well-closed container, in a cool, dry place. In such storage conditions, hypromellose acetate succinate is a stable material. Hypromellose acetate succinate is hygroscopic. It is hydrolyzed to acetic acid and succinic acid, and the hypromellose polymer starts to form if dissolved in 1 mol/L sodium hydroxide for more than two hours.[16] The hydrolysis is the main degradation pathway that is responsible for increasing amounts of free acids in storage, especially upon exposure to moisture. Free acids may cause incompatibility with certain active moieties upon storage of drug product formulations.[17]

12 Incompatibilities

Hypromellose acetate succinate is incompatible with strong acids or bases, oxidizing agents, and sustained levels of elevated humidity. It may interact with certain categories of active pharmceutical ingredients.[18]

13 Method of Manufacture

Hypromellose acetate succinate is produced by the esterification of hypromellose with acetic anhydride and succinic anhydride, in a reaction medium of a carboxylic acid, such as acetic acid, and using an alkali carboxylate, such as sodium acetate, as catalyst.[19] The fibrous reaction product is precipitated out by adding a large volume of water to the reaction medium. Purification is achieved by thorough washing with water. The granular grade of hypromellose acetate succinate that is so obtained can be pulverized to a fine powder if required.

14 Safety

The safety and pharmacological profiles of hypromellose acetate succinate are similar to those of other ether and ester derivatives of cellulose.[20–24] All nonclinical studies reported in the literature identify no target organs for toxicity by hypromellose acetate succinate.[25,26] It has also been reported that hypromellose acetate

succinate does not alter fertility in rats, does not produce any developmental anomalies in rats and rabbits, and does not alter perinatal and postnatal development in rats when assessed up to

2500 mg/kg body-weight.[27–30] No developmental and reproductive toxicity was observed at doses up to 2500 mg/kg maternal exposure.[32] Additionally a Type V DMF-containing supplemental pre-clinical safety and ADME information to enable chronic use of high doses of polymer in drug products has been filed with the FDA.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Hypromellose acetate succinate dust may be irritant to the eyes. Excessive dust generation should be avoided to minimize the risks of explosions. Avoid contact with open flame, heat, or sparks. Avoid contact with acids, peroxides, and other oxidizing materials. Eye protection is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database for use in oral preparations (capsules and delayed-action preparations). Hypromellose acetate succinate has been approved for use in commercial pharmaceutical products in the US and in Japan.

17 Related Substances

Carboxymethyl cellulose; cellulose acetate; cellulose acetate phthalate; cellulose, microcrystalline; ethylcellulose; hypromellose; hypromellose phthalate; hydroxyethyl cellulose; hydroxypropyl cellulose; methylcellulose.

18 Comments

A specification for hypromellose acetate succinate is included in the *Japanese Pharmaceutical Excipients* (JPE).[31]

Hypromellose Phthalate

1 Nonproprietary Names

BP: Hypromellose Phthalate

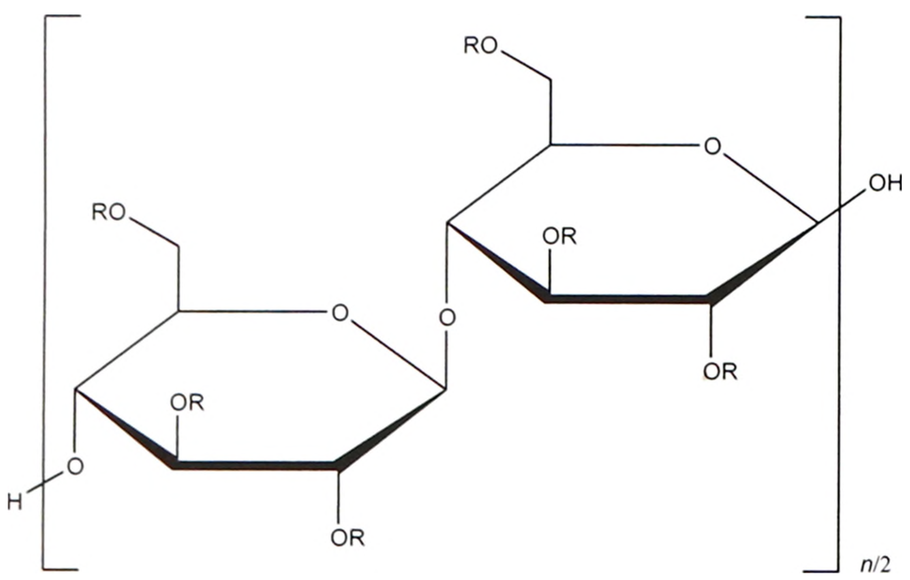
JP: Hypromellose Phthalate

PhEur: Hypromellose Phthalate

USP–NF: Hypromellose Phthalate

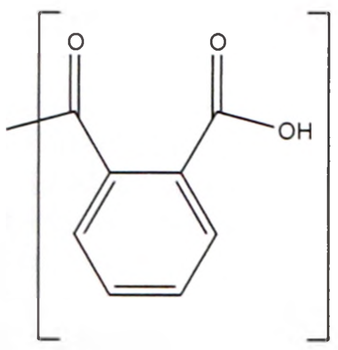
2 Synonyms

Cellulose phthalate hydroxypropyl methyl ether; *Deepcoat*; *HPMCP*; hydroxypropyl methylcellulose benzene-1,2-dicarboxylate; 2-hydroxypropyl methylcellulose phthalate; hypromellosi phthalas; *Mantrocel HP-55*; methylhydroxypropylcellulose phthalate.



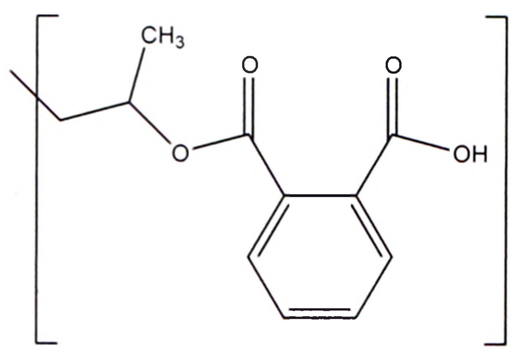
3 Chemical Name and CAS Registry Number

Cellulose, hydrogen 1,2-benzenedicarboxylate, 2-hydroxypropyl methyl ether [9050-31-1]



4 Empirical Formula and Molecular Weight

Hypromellose phthalate is a cellulose in which some of the hydroxyl groups are replaced with methyl ethers, 2-hydroxypropyl ethers, or phthalyl esters. Several different types of hypromellose phthalate are commercially available with molecular weights in the range 20 000–200 000. Typical average values are 80 000–130 000.[1]



5 Structural Formula

R = H, CH_3, $CH_2CH(OH)CH_3$,

or

6 Functional Category

Coating agent.

7 Applications in Pharmaceutical Formulation or Technology

Hypromellose phthalate is widely used in oral pharmaceutical formulations as an enteric coating material for tablets or granules.[2–8] Hypromellose phthalate is insoluble in gastric fluid but will swell and dissolve rapidly in the upper intestine. Generally, concentrations of 5–10% of hypromellose phthalate are employed with the material being dissolved in either a dichloromethane-ethanol (50:50) or an ethanol-water (80:20) solvent mixture. Hypromellose phthalate can normally be applied to tablets and granules without the addition of a plasticizer or other film formers, using established coating techniques. However, the addition of a small amount of plasticizer or water can avoid film cracking problems; many commonly used plasticizers, such as diacetin, triacetin, diethyl and dibutyl phthalate, castor oil, acetyl monoglyceride, and polyethylene glycols, are compatible with hypromellose phthalate. Tablets coated with hypromellose phthalate disintegrate more rapidly than tablets coated with cellulose acetate phthalate.

Hypromellose phthalate can be applied to tablet surfaces using a dispersion of the micronized hypromellose phthalate powder in an aqueous dispersion of a suitable plasticizer such as triacetin, triethyl citrate, or diethyl tartrate together with a wetting agent.[9]

Hypromellose phthalate may be used alone or in combination with other soluble or insoluble binders in the preparation of granules with sustained drug-release properties; the release rate is pH-dependent. Since hypromellose phthalate is tasteless and insoluble in saliva, it can also be used as a coating to mask the unpleasant taste of some tablet formulations. Hypromellose phthalate has also been co-precipitated with a poorly soluble drug to improve dissolution characteristics.[10]

8 Description

Hypromellose phthalate occurs as white to slightly off-white, free-flowing flakes or as a granular powder. It is odorless or with a slightly acidic odor and has a barely detectable taste.

9 Pharmacopeial Specifications

The pharmacopeial specifications for hypromellose phthalate have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for hypromellose phthalate.

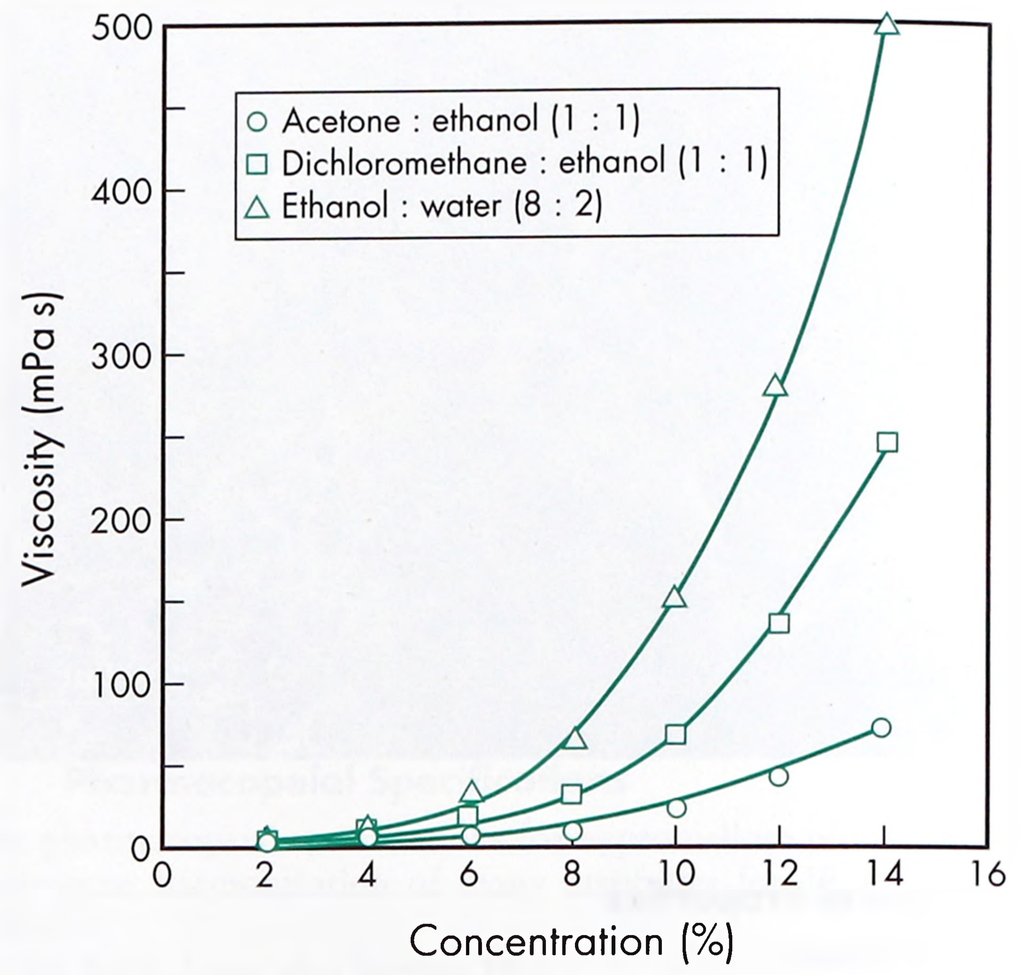

Figure 6: Dynamic viscosity of hypromellose phthalate (*HP-55*) (Shin-Etsu Chemical Co. Ltd) in various solvent mixtures at 20°C.[11]

11 Stability and Storage Conditions

Hypromellose phthalate is chemically and physically stable at ambient temperature for at least 3–4 years and for 2–3 months at 40°C and 75% relative humidity.[11] It is stable on exposure to UV light for up to 3 months at 25°C and 70% relative humidity. Drums stored in a cool, dry place should be brought to room temperature before opening to prevent condensation of moisture on inside surfaces. After 10 days at 60°C and 100% relative humidity, 8–9% of carbyoxybenzoyl group were hydrolyzed. In general, hypromellose phthalate is more stable than cellulose acetate phthalate. At ambient storage conditions, hypromellose phthalate is not susceptible to microbial attack.

12 Incompatibilities

Incompatible with strong oxidizing agents.

Splitting of film coatings has been reported rarely, most notably with coated tablets that contain microcrystalline cellulose and calcium carboxymethylcellulose. Film splitting has also occurred when a mixture of acetone-propan-2-ol or dichloromethane-propan-2-ol has been used as the coating solvent, or when coatings have been applied in conditions of low temperature and humidity. However, film splitting may be avoided by careful selection of formulation composition, including solvent, by use of a higher molecular weight grade of polymer, or by suitable selection of plasticizer.

The addition of more than about 10% titanium dioxide to a coating solution of hypromellose phthalate, which is used to produce a colored film coating, may result in coating with decreased elasticity and resistance to gastric fluid.[11]

13 Method of Manufacture

Hypromellose phthalate is prepared by the esterification of hypromellose with phthalic anhydride. The degree of alkyloxy and carboxybenzoyl substitution determines the properties of the polymer and in particular the pH at which it dissolves in aqueous media.

14 Safety

Hypromellose phthalate is widely used, primarily as an enteric coating agent, in oral pharmaceutical formulations. Chronic and acute animal feeding studies on several different species have shown no evidence of teratogenicity or toxicity associated with hypromellose phthalate.[13–17] Hypromellose phthalate is generally regarded as a nonirritant and nontoxic material.

LD_{50} (rat, oral): >15 g/kg[13]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Although no threshold limit value has been set for hypromellose phthalate, it should be handled in a well-ventilated environment and the generation of dust should be minimized.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cellulose acetate phthalate; hypromellose.

18 Comments

Hypromellose phthalate has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Various grades of hypromellose phthalate are available with differing degrees of substitution and physical properties, e.g. grades *HP-50*, *HP-55*, and *HP-55S* (Shin-Etsu Chemical Co. Ltd).

See Table III.

The number following 'HP' in each grade designation refers to the pH value (×10) at which the polymer dissolves in aqueous buffer solutions. The designation 'S' in *HP-55S* indicates a higher molecular weight grade, which produces films with a greater resistance to cracking.

Table III: Types of hypromellose phthalate available from Shin-Etsu Chemical Co. Ltd.

Property	Grade of hypromellose phthalate		
	HP-50	*HP-55*	*HP-55S*
Substitution type	220824	200731	200731
Hydroxypropoxy content	6–10%	5–9%	5–9%
Methoxy content	20–24%	18–22%	18–22%
Phthalyl content	21–27%	27–35%	27–35%
Molecular weight	84 000	78 000	132 000

In the US, the substitution type is indicated by a six digit number: the first two digits represent the approximate percentage content of methoxy groups; the next two digits represent the approximate percentage content of hydroxypropoxy groups; and the final two digits represent the approximate percentage content of phthalyl groups.

To dissolve hypromellose phthalate in acetone-ethanol (95%) or dichloromethane-alcohol solvent systems, the hypromellose phthalate should first be well dispersed in alcohol before adding acetone or dichloromethane. When using acetone-dichloromethane, hypromellose phthalate should be first dispersed in the dichloromethane and then the acetone added to the system.

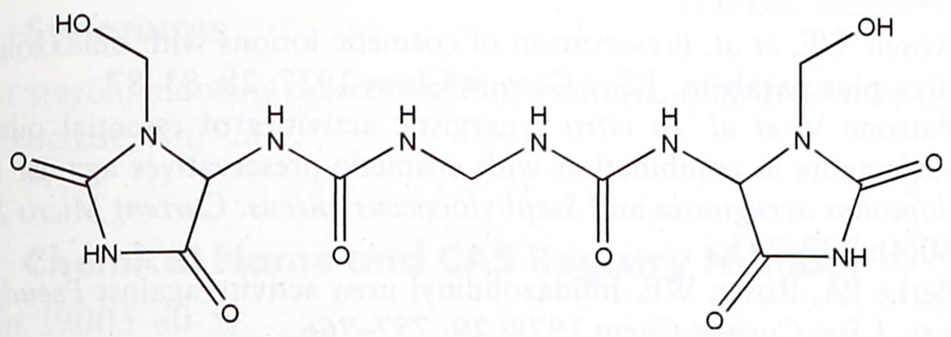
Imidurea

1 Nonproprietary Names

USP–NF: Imidurea

2 Synonyms

Biopure 100; *Germall 115*; imidazolidinyl urea; methanebis[*N*,*N*′(5-ureido-2,4-diketotetrahydroimidazole)-*N*,*N*-dimethylol]; 1,1′-methylenebis{3-[3-(hydroxymethyl)-2,5-dioxo-4-imidazolidinyl]urea}; *Tri-Stat IU*.



3 Chemical Name and CAS Registry Number

N,*N*″-Methylenebis{*N*′-[3-(hydroxymethyl)-2,5-dioxo-4-imidazolidinyl]urea} [39236-46-9] and [82852–50–4]

4 Empirical Formula and Molecular Weight

$C_{11}H_{16}N_8O_8$ 388.29 (for anhydrous)
$C_{11}H_{16}N_8O_8.H_2O$ 406.33 (for monohydrate)

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Imidurea is a broad-spectrum antimicrobial preservative used in cosmetics and topical pharmaceutical formulations; typical concentrations used are 0.03–0.5% w/w. It is effective at pH 3–9 and is reported to have synergistic effects when used with parabens; *see* Section 10.

8 Description

Imidurea occurs as a white, free-flowing, odorless powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for imidurea.

Test	USP 40–NF 35 S1
Identification	+
Color and clarity of solution	+
pH (1% w/v solution)	6.0–7.5
Loss on drying	≤3.0%
Residue on ignition	≤3.0%
Heavy metals	≤0.001%
Nitrogen content (dried basis)	26.0–28.0%

10 Typical Properties

Acidity/alkalinity pH = 6.0–7.5 (1% w/v aqueous solution)

Antimicrobial activity Predominantly an antibacterial preservative, imidurea also has some selective antifungal properties. Used at concentrations between 0.03–0.5% w/w it is effective at pH 3–9, although preservative efficacy is best seen in slightly acidic solutions. Synergistic effects have been reported, and preservative activity is considerably enhanced, particularly against fungi, when used in combination with parabens.[1–3] A cosmetic formulation containing 0.5% imidurea, 0.2% methylparaben, and 0.1% propylparaben was effectively preserved against various *Pseudomonas* species.[4] For reported minimum inhibitory concentrations (MICs), *see* Table II.[5]

Table II: Minimum inhibitory concentrations (MICs) for imidurea.

Microorganism	MIC (μg/mL)
Aspergillus niger	8000
Candida albicans	8000
Escherichia coli	2000
Klebsiella pneumoniae	2000
Penicillium notatum	8000
Pseudomonas aeruginosa	2000
Pseudomonas cepacia	2000
Pseudomonas fluorescens	2000
Staphylococcus aureus	1000

Density 1.85 g/cm^3

Melting point 150°C

Solubility Soluble in water and in glycerol, but insoluble in almost all organic solvents.[5] *See also* Table III.

Table III: Solubility of imidurea.

Solvent	Solubility at 20°C
Ethanol	Very slightly soluble
Ethanol (90%)	Very slightly soluble
Ethanol (70%)	1 in 330
Ethanol (60%)	1 in 25
Ethanol (50%)	1 in 2.5
Ethanol (30%)	1 in 0.8
Ethylene glycol[a]	1 in 0.7
Glycerin[a]	1 in 1
Methanol	Very slightly soluble
Mineral oil	Practically insoluble
Propan-2-ol	Practically insoluble
Propylene glycol[a]	1 in 0.8
Sesame oil	Very slightly soluble
Water	1 in 0.5

(a) Slow to dissolve and requires heating and stirring.

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Imidurea is hygroscopic and should be stored in a well-closed container in a cool, dry place.

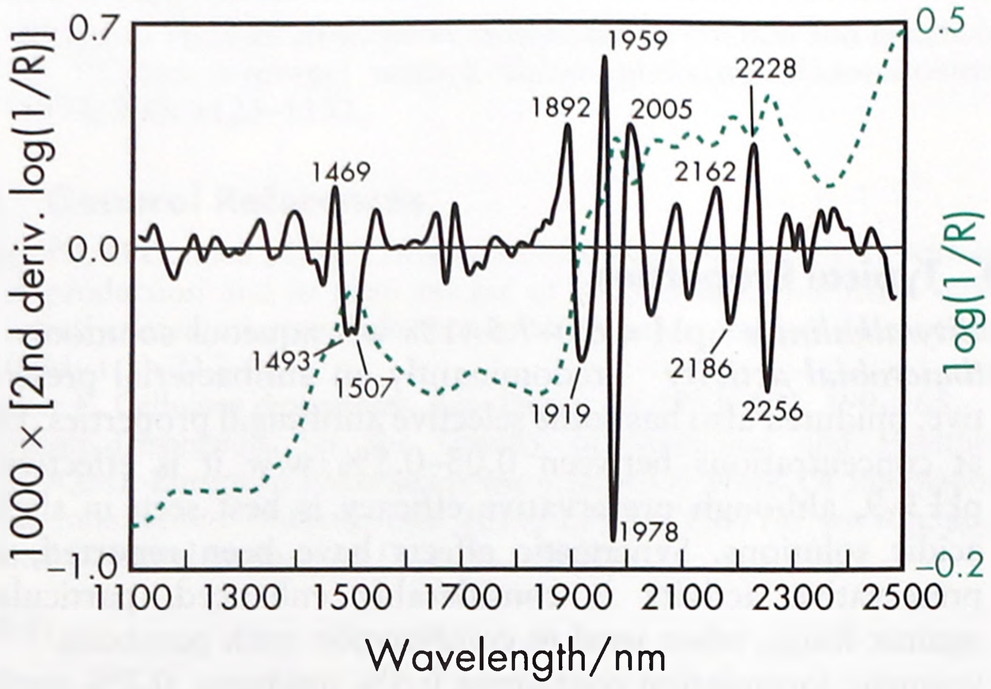


Figure 1: Near-infrared spectrum of imidurea measured by reflectance.

12 Incompatibilities

Imidurea is incompatible with strong oxidants. It is compatible with other preservatives including sorbic acid and quaternary ammonium compounds.[6] It is also compatible with other pharmaceutical and cosmetic excipients including proteins, nonionic surfactants, and lecithin.[7]

13 Method of Manufacture

Imidurea is produced by the condensation of allantoin with formaldehyde.

14 Safety

Imidurea is widely used in cosmetics and topical pharmaceutical formulations, and is generally regarded as a nontoxic and nonirritant material.[6] However, there have been some reports of contact dermatitis associated with imidurea, although these are relatively few considering its widespread use in cosmetics.[8–14]

Although imidurea releases formaldehyde, it does not appear to be associated with cross-sensitization with formaldehyde or other formaldehyde-releasing compounds.

LD_{50} (mouse, oral): 7.2 g/kg[15,16]

LD_{50} (rabbit, skin): >8 g/kg

LD_{50} (rat, oral): 11.3 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Imidurea may be irritant to the eyes. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical preparations). Accepted for use in cosmetics in Europe and the US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Diazolidinyl urea.

Diazolidinyl urea

Empirical formula $C_8H_{14}N_4O_7$
Molecular weight 278.23
CAS number [78491-02-8]
Synonyms *Germall II*; *N*-(hydroxymethyl)-*N*-(1,3-dihydroxymethyl-2,5-dioxo-4-imidazolidinyl)-*N*′-(hydroxymethyl)urea.
Appearance White, free-flowing hygroscopic powder, with a faint characteristic odor.

Antimicrobial activity Similar to imidurea.[17,18] Diazolidinyl urea is the most active of the imidazolidinyl family of preservatives. Used in concentrations of 0.1–0.5% w/w, at pH 3–9, it has predominantly antibacterial properties. Typical MICs are: *Aspergillus niger* 4000 µg/mL; *Candida albicans* 8000 µg/mL; *Escherichia coli* 1000 µg/mL; *Pseudomonas aeruginosa* 1000 µg/mL; *Staphylococcus aureus* 250 µg/mL.
Solubility Very soluble in water; insoluble in fats.
Safety

LD_{50} (mouse, oral): 3.7 g/kg[19]

LD_{50} (rat, oral): 2.6 g/kg

Comments The EINECS number for diazolidinyl urea is 278-928-2.

18 Comments

Imidurea is the best known of a family of heterocyclic urea derivatives that are effective antimicrobial preservatives. Diazolidinyl urea has the greatest antimicrobial activity.

The EINECS number for imidurea is 254-372-6. The PubChem Compound ID (CID) for imidurea is 38258.

Inulin

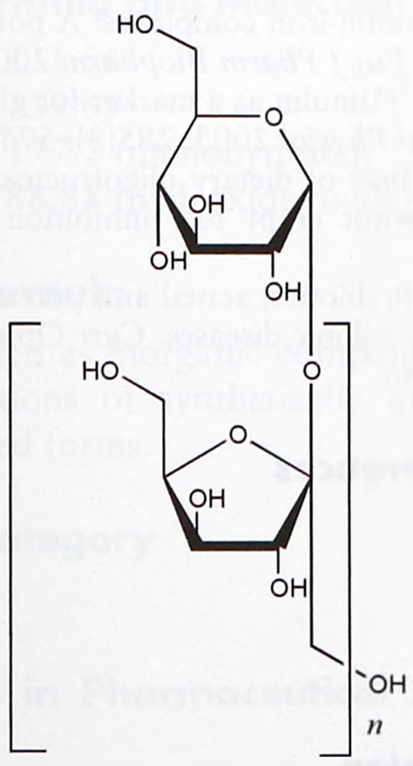
1 Nonproprietary Names

BP: Inulin

USP–NF: Inulin

2 Synonyms

Alant starch; alantin; *Beneo*; dahlin; *Frutafit*; oligofructose; *Orafti*; polyfructose; *Raftiline*.



3 Chemical Name and CAS Registry Number

Inulin [9005-80-5]

4 Empirical Formula and Molecular Weight

$C_6H_{11}O_5(C_6H_{11}O_5)_nOH$ ≈5 000

5 Structural Formula

Inulin is a naturally occurring polysaccharide consisting of a linear chain of linked D-fructose molecules, having one terminal glucose molecule.

6 Functional Category

Lyophilization aid; sweetening agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Inulin has many potential uses in pharmaceutical applications, as a filler–binder in tablet formulations,[1,2] to stabilize therapeutic proteins,[3,4] vaccines,[5] and PEGylated lipoplexes[6] during freeze-drying, or to enhance the dissolution of lipophilic drugs.[7–9] Inulin has also been used as a stabilizer for recombinant human deoxyribonuclease when spray-dried to produce a powder for inhalation.[10] *See also* Section 18.

Inulin is used in the food industry as a sweetener and stabilizer.

8 Description

Inulin occurs as an odorless, friable, white amorphous powder with a neutral to slightly sweet taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for inulin.

Test	BP 2017	USP 40–NF 35 S1
Identification	+	–
Characters	+	–
Acidity	+	4.5–7.0
Clarity and color of solution	+	+
Microbial limit	–	≤1000/g
Loss on drying	≤10.0%	≤10.0%
Specific rotation	–36.5° to –40.5°	–32.0° to –40.0°
Residue on ignition	≤0.1%	≤0.05%
Sulfate	≤200 ppm	≤0.05%
Calcium	≤270 ppm	≤0.1%
Chloride	≤170 ppm	≤0.014%
Iron	–	+
Heavy metals	–	≤5 ppm
Arsenic	≤1 ppm	–
Lead	≤2 ppm	–
Oxalate	+	–
Reducing sugars	+	+
Free fructose	–	+
Content of combined glucose	–	+
Assay (dried basis)	–	94.0–102.0%

10 Typical Properties

Acidity/alkalinity pH = 4.5–7.0 (10% w/v aqueous solution)
Density 1.35 g/cm^3
Hygroscopicity Hygroscopic in moist air.
Melting point 178°C
Solubility Soluble in hot water and solutions of dilute acids and alkalis; slightly soluble in cold water and organic solvents.
Specific gravity 1.35
Specific rotation -36.5° to -40.5° (determined on a 2% solution prepared with the aid of heat)

11 Stability and Storage Conditions

Inulin is slightly hygroscopic and should be stored at cool to normal temperatures, in air-tight and water-tight containers. Hydrolysis of inulin yields mainly D-fructose. Crystals of inulin may be deposited on storage of injections; the injection should be heated for not more than 15 minutes to dissolve the crystals and then cooled to a suitable temperature before use. Solutions of inulin for injection are sterilized by filtration.

12 Incompatibilities

Inulin is incompatible with strong oxidizing agents.

13 Method of Manufacture

Inulin is extracted from the tubers of *Dahlia variabilis*, Helianthus, in a procedure similar to the extraction of sugar from sugar beet.

14 Safety

Inulin is a naturally occurring plant polysaccharide and is one of the major constituents of the Compositae family. Inulin is recommended to diabetics, as it has a mild sweet taste, but is not absorbed and does not affect blood sugar levels. It is used widely in the food industry as a sweetener and stabilizer.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Inulin may cause mild irritation to the skin and the eyes. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed.

17 Related Substances

—

18 Comments

Hollow spheres of inulin have been found to have both brittle and ductile properties. On compression, these spheres will undergo fragmentation followed by plastic deformation, resulting in better compressibility over solid inulin spheres. In its amorphous state, inulin has a high glass transition temperature, slow crystallization, and low hygroscopicity. As a binder in solid dosage forms, inulin can increase the dissolution rate of drugs such as diazepam and can enhance the stability of other lipophilic drug molecules.[2,9]

Experimentally, methacrylated inulin hydrogels have been investigated for the development of colon-specific drug delivery systems,[11–13] and coatings composed of inulin and shellac have been shown to release drug in simulated colonic fluid.[14] An inulin-iron complex has been proposed as a potential treatment for iron deficiency anemia.[15]

Inulin is used intravenously as a diagnostic agent to measure the glomerular filtration rate.[16] Inulin has also entered the food supplement market as a prebiotic, where it has been shown to provide protection against inflammatory and malignant colonic diseases in animals,[17,18] and it is used as a noncaloric dietary fiber supplement. Radio-labelled forms of inulin are available as radiochemicals for research.

Iron Oxides

1 Nonproprietary Names

USP–NF: Ferric Oxide

2 Synonyms

(a) Iron oxide black: *Bayferrox 306*; black magnetic oxide; black oxide, precipitated; black rouge; CI 77499; E172; ethiops iron; ferric ferrous oxide; ferrosoferric oxide; *Ferroxide 78P*; *Ferroxide 88P*; iron oxide; iron (II, III) oxide; iron oxides (Fe_3O_4); magnetite; *Mapico Black EC*; pigment black 11; *Sicovit B80*; *Sicovit B84*; *Sicovit B85*; triiron tetraoxide.

(b) Iron oxide red: anhydrous ferric oxide; anhydrous iron (III) oxide; *Bayferrox 105M*; CI 77491; diiron trioxide; E172; *Ferroxide 212P*; *Ferroxide 226P*; hematite; iron sesquioxide; jeweler's rouge; pigment red 101; red ferric oxide; *Sicovit R30*.

(c) Iron oxide yellow monohydrate: E172; hydrated ferric oxide; iron (III) oxide monohydrate, yellow; pigment yellow 42; yellow ferric oxide. Iron (III) oxide hydrated: *Bayferrox 920Z*; CI 77492; ferric hydroxide; ferric hydroxide oxide; ferric hydrate; ferric oxide hydrated; *Ferroxide 505P*; *Ferroxide 510P*; iron hydrate; iron hydroxide; iron hydroxide oxide; *Mapico Yellow EC*; *Sicovit Y10*; yellow ochre; yellow iron oxide.

3 Chemical Name and CAS Registry Number

Iron oxides [1332-37-2]

(a) Iron oxide black [1317-61-9] and [12227–89–3]

(b) Iron oxide red [1309-37-1]

(c) Iron oxide yellow [51274-00-1] (monohydrate); [20344-49-4] (ferric hydroxide oxide); [12259–21–1] (hydrated ferric oxide).

4 Empirical Formula and Molecular Weight

(a) $FeO{\cdot}Fe_2O_3$	231.54
(b) Fe_2O_3	159.69
(c) $Fe_2O_3{\cdot}H_2O$	177.7 (monohydrate);
FeO(OH)	88.85 (hydroxide oxide).

5 Structural Formula

Iron oxides are defined as inorganic compounds consisting of any one of or combinations of synthetically prepared iron oxides, including the hydrated forms.

6 Functional Category

Colorant.

7 Applications in Pharmaceutical Formulation or Technology

Iron oxides are widely used in cosmetics, foods, and pharmaceutical applications as colorants and UV absorbers.[1–3] As as a result of the regulations affecting some synthetic organic dyestuffs, the use of iron oxides (inorganic colorants) is becoming increasingly important. However, iron oxides also have restrictions in some countries on the quantities that may be consumed, and technically their use is restricted because of their limited color range and their abrasiveness.

8 Description

Iron oxides occur as yellow, red, black, or brown powder. The color depends on the particle size and shape, and crystal structure.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for iron oxide (red and yellow).

Mercury	≤3 µg/g
Arsenic	≤3 µg/g
Lead	0.001%
Assay (on ignited basis)	97.0–100.5%

10 Typical Properties

Density

5.1 g/cm^3 for iron oxide black ($FeO{\cdot}Fe_2O_3$);

5.2 g/cm^3 for iron oxide red (Fe_2O_3);

4.1 g/cm^3 for iron oxide yellow ($Fe_2O_3{\cdot}H_2O$).

Melting point 1565°C for iron oxide red (Fe_2O_3). Iron oxide yellow ($Fe_2O_3{\cdot}H_2O$) and iron oxide black ($FeO{\cdot}Fe_2O_3$) are not stable above 80-120°C and undergo dehydration (iron oxide yellow) or oxidation (iron oxide black) transforming into iron oxide red.

Solubility Soluble in mineral acids; insoluble in water.

11 Stability and Storage Conditions

Iron oxides should be stored in well-closed containers in a cool, dry place.

12 Incompatibilities

Iron oxides have been reported to make hard gelatin capsules brittle at higher temperatures when the residual moisture is 11–12%. This factor affects the use of iron oxides for coloring hard gelatin capsules, and will limit the amount that can be incorporated into the gelatin material.

13 Method of Manufacture

Three main manufacturing processes are currently applied for iron oxide pigments:[4]

(a) Solid-state reactions (red, black and brown): calcination of black or yellow iron oxides to red iron oxide; thermal decomposition of ferrous sulfate.

(b) Precipitation process (red, orange, yellow and black): treatment of ferrous sulfate solutions with alkali and oxidation. The Penniman–Zoph process uses ferrous sulfate, alkali, iron powder and air or oxygen.

(c) Laux process or aniline process (red, yellow, and black): reduction of nitrobenzene to aniline with iron.

14 Safety

Iron oxides are widely used in cosmetics, foods, and oral and topical pharmaceutical applications. They are generally regarded as nontoxic and nonirritant excipients. The use of iron oxide colorants is limited in some countries, such as the US, to a maximum ingestion of 5 mg of elemental iron per day.

LD_{50} (mouse, IP): 5.4 g/kg[5]
LD_{50} (rat, IP): 5.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. In the UK, the workplace exposure limits for iron oxide fumes (as Fe) are 5 mg/m^3 long-term (8-hour TWA) and 10 mg/m^3 short-term.[6]

16 Regulatory Status

Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules, tablets, and suspensions); iron oxide red is also listed for use in oral drops and buccal films, and iron oxide yellow is listed for use in buccal tablets. Included in nonparenteral medicines licensed in many countries including Japan, UK, and US.

Isomalt

1 Nonproprietary Names

BP: Isomalt

PhEur: Isomalt

USP–NF: Isomalt

2 Synonyms

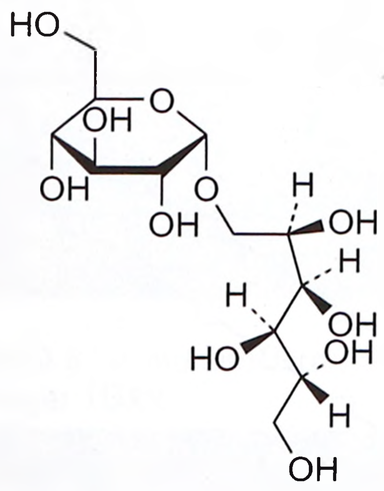
*C*PharmIsoMaltidex*; E953; *galenIQ*; hydrogenated isomaltulose; hydrogenated palatinose; *IsoMaltidex 16500*; isomaltum; *Palatinit*.

3 Chemical Name and CAS Registry Number

Isomalt [64519-82-0]

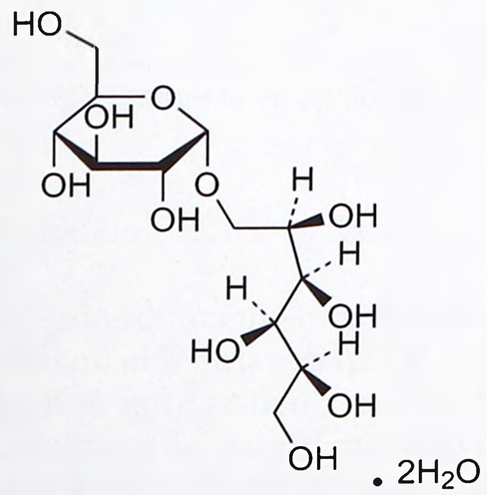
Isomalt is a mixture of two stereoisomers:

6-*O*-α-D-glucopyranosyl-D-sorbitol (1,6-GPS) [534-73-6]



1-*O*-α-D-glucopyranosyl-D-mannitol dihydrate (1,1-GPM) [20942-99-8]

4 Empirical Formula and Molecular Weight



$C_{12}H_{24}O_{11}$ 344.32 (for anhydrous)

$C_{12}H_{24}O_{11}\cdot 2H_2O$ 380.32 (for dihydrate)

5 Structural Formula

$C_{12}H_{24}O_{11}$
(1,6-GPS)

$C_{12}H_{24}O_{11}\cdot 2H_2O$
(1,1-GPM)

Generally, isomalt comprises a mixture of 1,6-GPS and 1,1-GPM. 1,6-GPS crystallizes without water and is more soluble than 1,1-GPM. By shifting the ratio of the two components, the solubility and crystal water content can be adjusted; *see* Section 10. *GalenIQ 720* has a GPM : GPS ratio of 1 : 1; *galenIQ 721* has a GPM : GPS ratio of 1 : 3.

6 Functional Category

Coating agent; direct compression excipient; suspending agent; sweetening agent; tablet and capsule binder; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Isomalt is a noncariogenic excipient used in a variety of pharmaceutical preparations including tablets or capsules, in coatings as a sugar-free coating agent, sachets, dry powder for suspension, and in effervescent tablets. It can also be used in direct compression, roller compaction, and wet granulation.[1]

In buccal applications such as chewable tablets it is commonly used because of its negligible negative heat of solution, mild sweetness, and 'mouth feel'.[2,3] It is also used widely in medicated high-boiled lozenges such as cough drops, as a sweetening agent in medicated confectionery for diabetics, and in sugar-free chewing gum.

See also Section 18.

8 Description

Isomalt is a sugar alcohol (polyol) that occurs as a white or almost white powder or granular or crystalline substance. It has a pleasant sugar-like taste with a mild sweetness approximately 50–60% of that of sucrose.[2–4]

9 Pharmacopeial Specifications

The pharmacopeial specifications for isomalt have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I.

approximately 99% >200 µm for *galenIQ 960*.

pH 3–10[3]

Solubility *see* Figure 3.

11 Stability and Storage Conditions

Isomalt has very good thermal and chemical stability. When it is melted, no changes in the molecular structure are observed. It exhibits considerable resistance to acids and microbial influences.[1] Isomalt is non-hygroscopic, and at 25°C does not significantly absorb additional water up to a relative humidity (RH) of 85%; acetaminophen (paracetamol) tablets based on isomalt were stored for 6 months at 85% RH at 20°C and retained their physical aspect.[1]

If stored under normal ambient conditions, isomalt is chemically stable for many years. When it is stored in an unopened container at 20°C and 60% RH, a re-evaluation after 3 years is recommended.

Isomalt does not undergo browning reactions; it has no reducing groups, and therefore it does not react with other ingredients in a formulation (e.g. with amines in Maillard reactions).

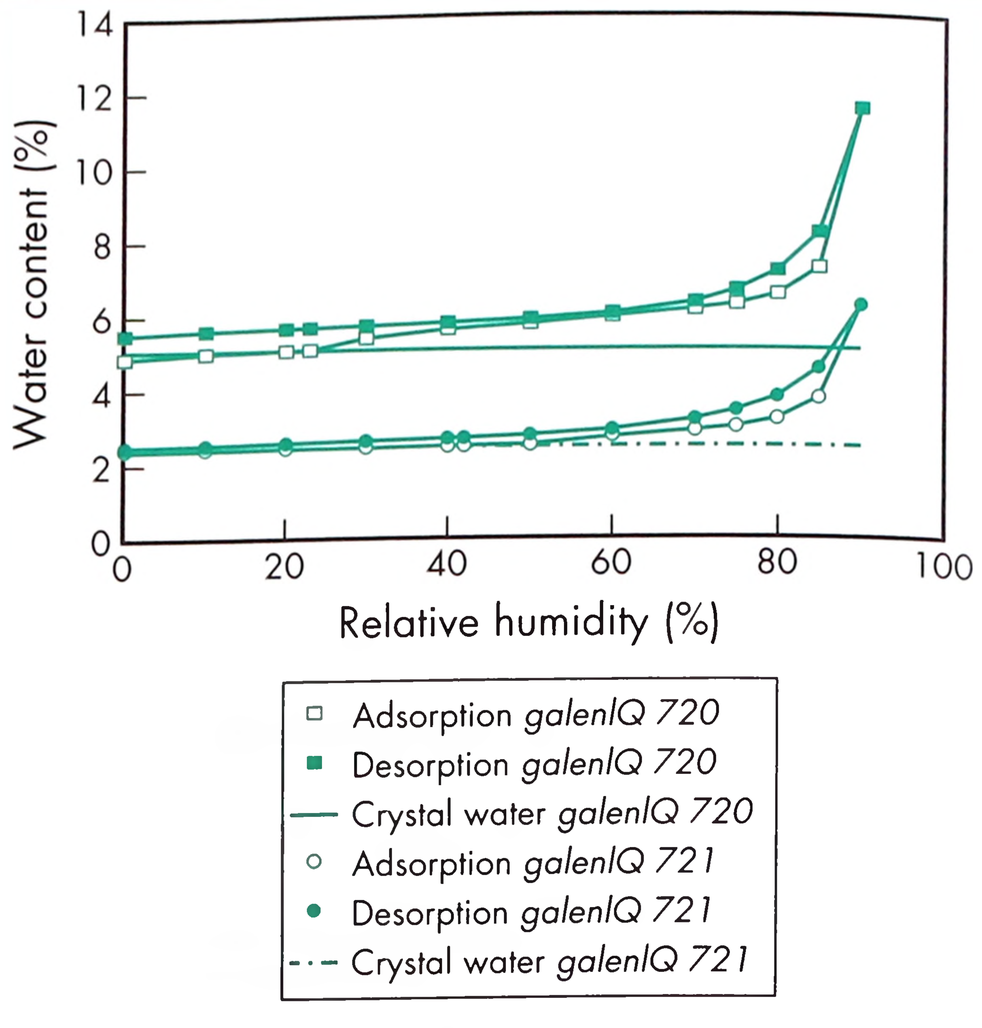

Figure 2: Sorption isotherms of isomalt DC types (*galenIQ*, BENEO-Palatinit GmbH).
Measured using Dynamic Vapor Sorption, Südzucker AG.
1,6-GPS occurs without crystal water and 1,1-GPM crystallizes with 2 mol crystal water (the initial water content in commercial forms, *see* Section 18. The starting point of the curves depends on the water content. The content of free water in the product is typically 0.1–0.5%.

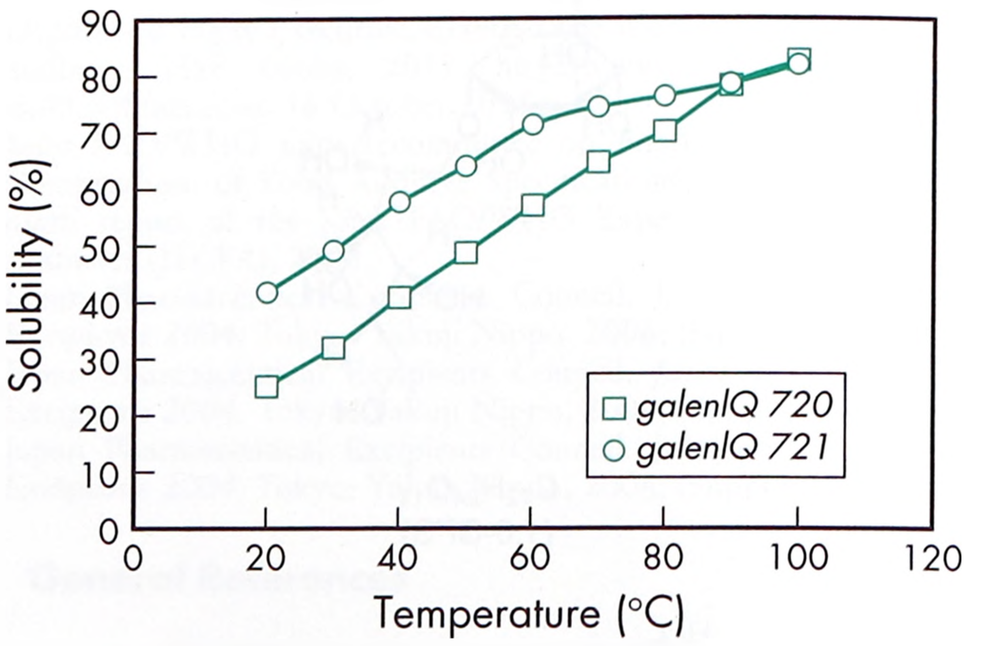

Figure 3: Solubility of isomalt types in water (*galenIQ*, BENEO-Palatinit GmbH).[2]

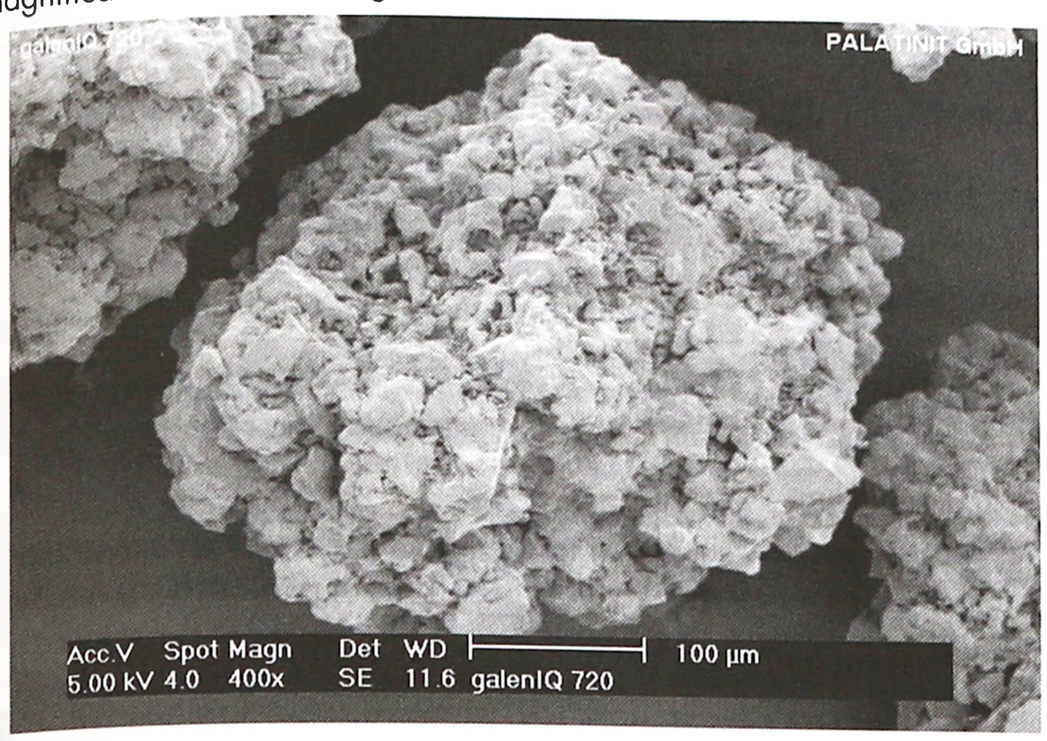
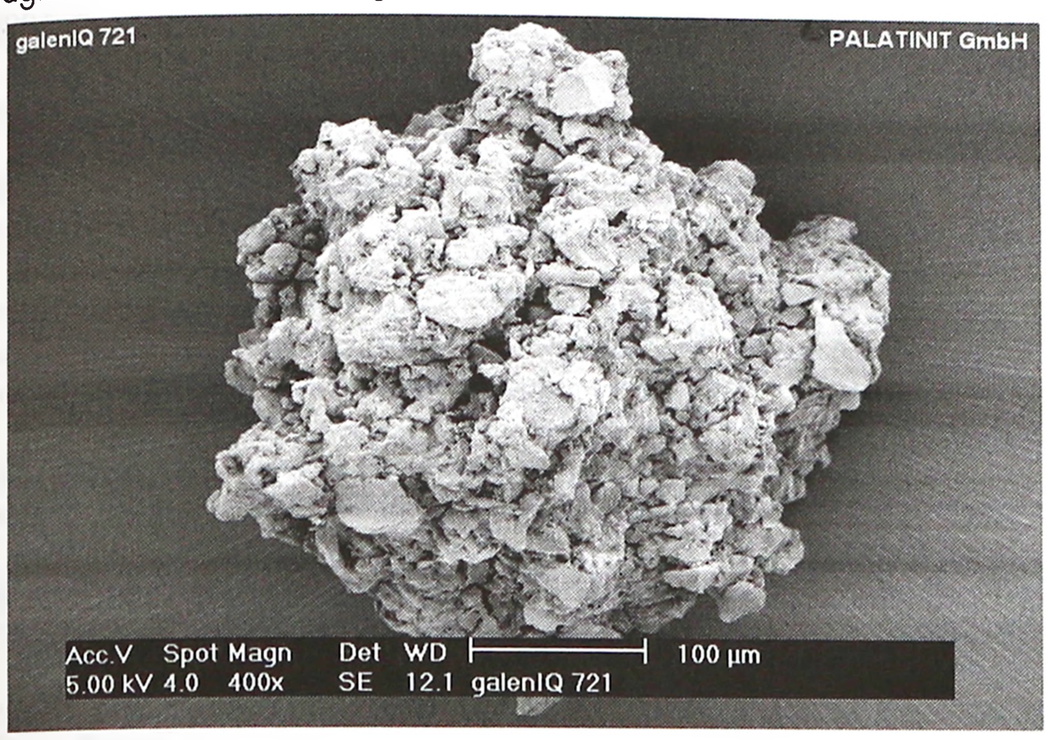


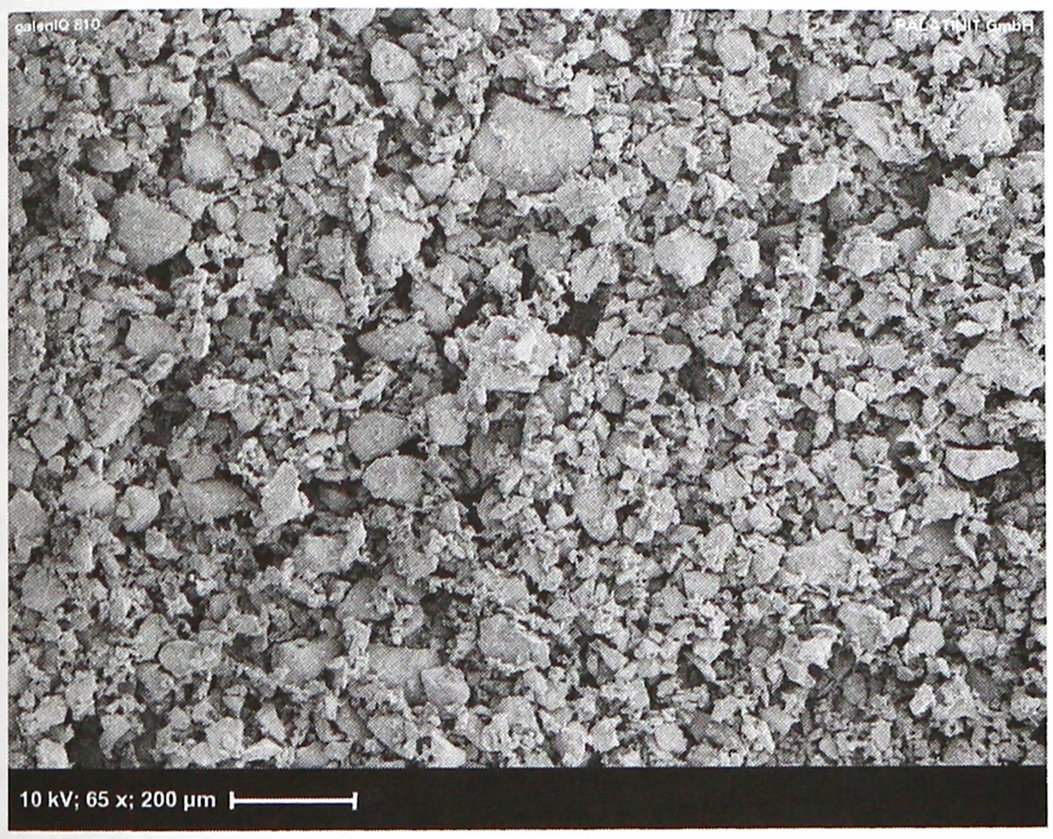
12 Incompatibilities

—



13 Method of Manufacture

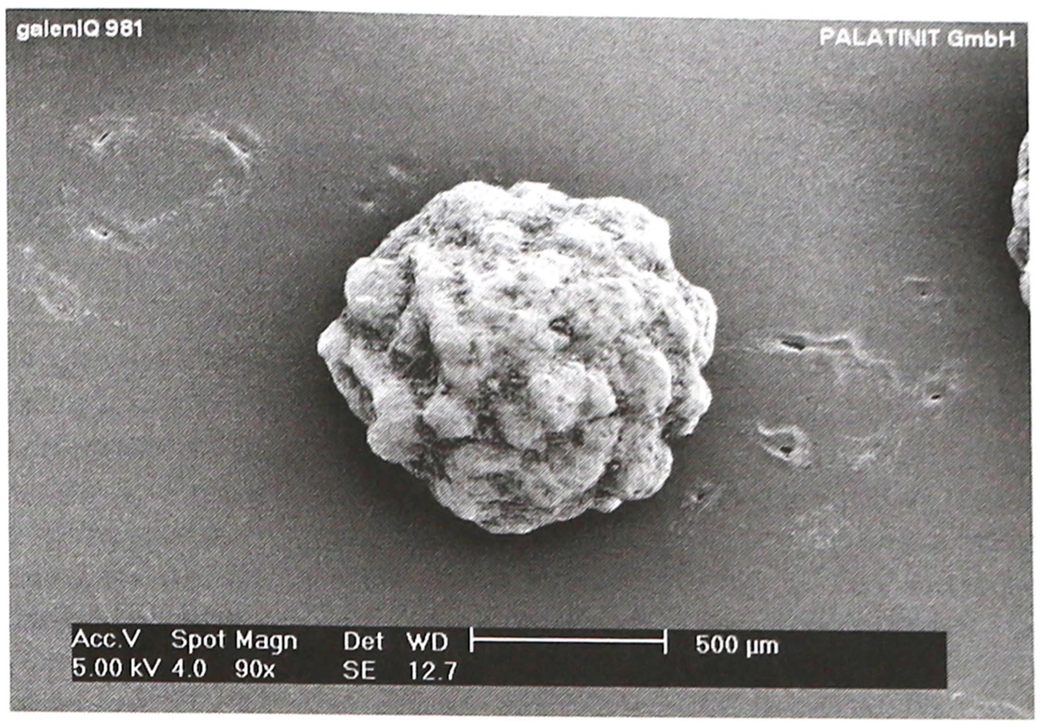
Isomalt is produced from food-grade sucrose in a two-stage process. Beet sugar is converted by enzymatic transglucosidation into the



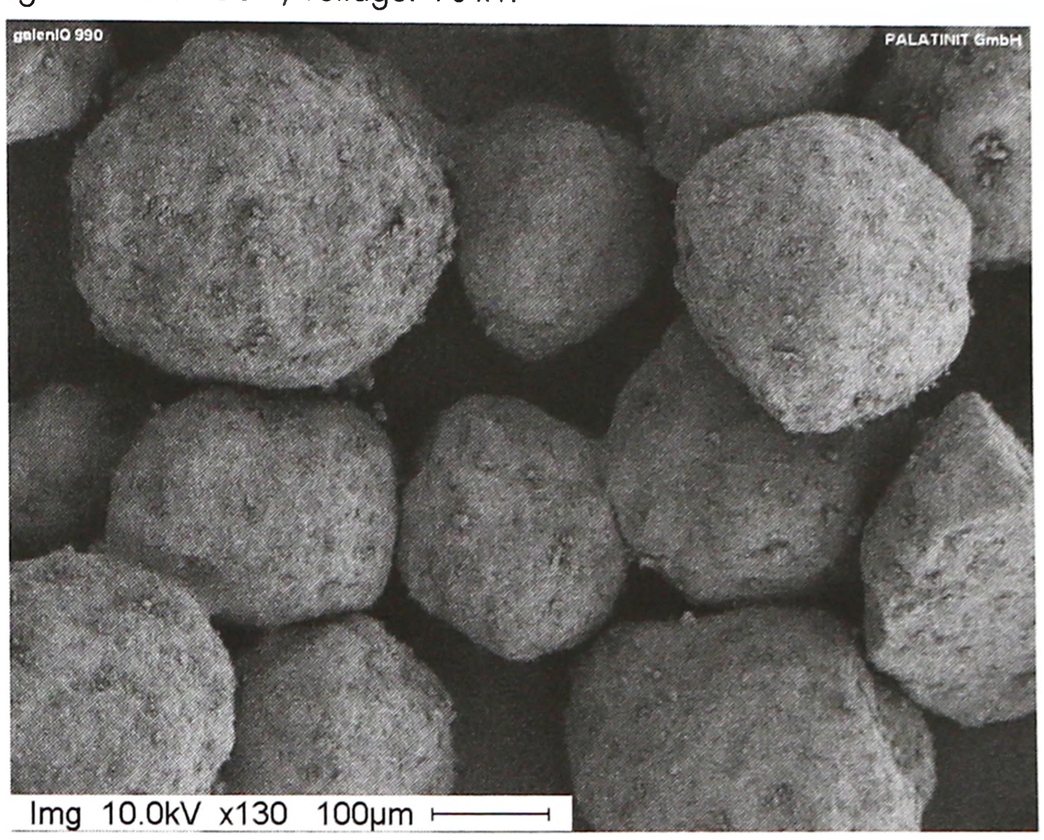
SEM 1: Excipient: *galenIQ 720*; manufacturer: BENEO-Palatinit GmbH; magnification: 400×; voltage: 5 kV.

SEM 2: Excipient: *galenIQ 721*; manufacturer: BENEO-Palatinit GmbH; magnification: 400×; voltage: 5 kV.

SEM 3: Excipient: *galenIQ 810*; manufacturer: BENEO-Palatinit GmbH; magnification: 65×; voltage: 10 kV.



reducing disaccharide isomaltulose. This undergoes catalytical hydrogenation to produce isomalt.



14 Safety

Isomalt is used in oral pharmaceutical formulations, confectionery, and food products. It is generally regarded as a nontoxic, nonallergenic, and nonirritant material.

SEM 4: Excipent: *galenIQ 981*; manufacturer: BENEO-Palatinit GmbH; magnification: 90×; voltage: 5 kV.

SEM 5: Excipent: *galenIQ 990*; manufacturer: BENEO-Palatinit GmbH; magnification: 130×; voltage: 10 kV.

Toxicological and metabolic studies on isomalt[5–10] have been summarized in a WHO report prepared by the FAO/WHO Expert Committee (JECFA), resulting in an acceptable daily intake of 'not specified'.[11]

The glycosidic linkage between the mannitol or sorbitol moiety and the glucose moiety is very stable, limiting the hydrolysis and absorption of isomalt in the small intestine. There is no significant increase in the blood glucose level after oral intake, and glycemic response is very low, making isomalt suitable for diabetics. The majority of isomalt is fermented in the large intestine. In general, isomalt is tolerated very well, although excessive consumption may result in laxative effects.[12–14]

Isomalt is not fermented by bacteria present in the mouth; therefore no significant amount of organic acid is produced that attacks tooth enamel.[15–17]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, gloves, and a dust mask or respirator are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral tablets). Accepted as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Isomalt has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Compression of isomalt without lubrication is difficult, and problems such as die wall sticking, capping, and lamination have been observed. The addition of a lubricant such as magnesium stearate will reduce die wall adhesion. Co-extrusion of isomalt with acetaminophen (paracetamol) significantly improved the tableting properties of the mixtures, compared to physical mixtures of drug and isomalt.[18] Direct molding is also a potentially suitable technique for producing isomalt-based tablets.[18]

A variety of different grades of isomalt are commercially available that have different applications, e.g. *galenIQ 720* and *721* are used in direct compression and in orally dispersible powders, *galenIQ 801* is used in wet granulation, *galenIQ 981* is used in sugar-free coatings, and *galenIQ 990* is used in high-boiled lozenges.

A specification for isomalt is contained in the *Food Chemicals Codex* (FCC).[19]

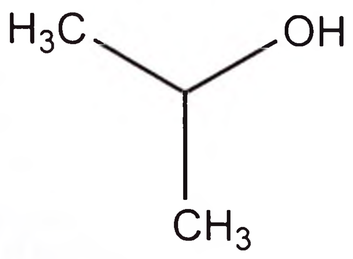
Isopropyl Alcohol

1 Nonproprietary Names

BP: Isopropyl Alcohol
JP: Isopropanol
PhEur: Isopropyl Alcohol
USP–NF: Isopropyl Alcohol

2 Synonyms

Alcohol isopropylicus; dimethyl carbinol; IPA; isopropanol; petrohol; 2-propanol; *sec*-propyl alcohol; rubbing alcohol.



3 Chemical Name and CAS Registry Number

Propan-2-ol [67-63-0]

4 Empirical Formula and Molecular Weight

C_3H_8O 60.1

5 Structural Formula

6 Functional Category

Antimicrobial preservative; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Isopropyl alcohol (propan-2-ol) is used in cosmetics and pharmaceutical formulations, primarily as a solvent in topical formulations.[1] It is not recommended for oral use owing to its toxicity; *see* Section 14.

Although it is used in lotions, the marked degreasing properties of isopropyl alcohol may limit its usefulness in preparations used repeatedly. Isopropyl alcohol is also used as a solvent both for tablet film-coating and for tablet granulation,[2] where the isopropyl alcohol is subsequently removed by evaporation. It has also been shown to significantly increase the skin permeability of nimesulide from carbomer 934.[3]

8 Description

Isopropyl alcohol occurs as a clear, colorless, mobile, volatile, flammable liquid with a characteristic, spirituous odor resembling that of a mixture of ethanol and acetone; it has a slightly bitter taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for isopropyl alcohol.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Appearance of solution	+	+	–
Absorbance	–	+	–
Characters	–	+	–
Specific gravity	0.785–0.788	0.785–0.789	0.783–0.787
Refractive index	–	1.376–1.379	1.376–1.378
Acidity or alkalinity	+	+	+
Water	≤0.75%	≤0.5%	≤0.5%

Distillation range	81–83°C	–	–
Benzene	–	+	–
Peroxides	–	+	–
Assay	–	–	≥99.0%

10 Typical Properties

Antimicrobial activity Isopropyl alcohol is bactericidal; at concentrations greater than 70% v/v it is a more effective antibacterial preservative than ethanol (95%). The bactericidal effect of aqueous solutions increases steadily as the concentration approaches 100% v/v. Isopropyl alcohol is ineffective against bacterial spores.

Autoignition temperature 425°C
Boiling point 82.4°C
Dielectric constant D^{20} = 18.62
Explosive limits 2.5–12.0% v/v in air
Flammability Flammable.
Flash point 11.7°C (closed cup); 13°C (open cup). The water azeotrope has a flash point of 16°C.
Freezing point −89.5°C
Melting point −88.5°C
Moisture content 0.1–13% w/w for commercial grades (13% w/w corresponds to the water azeotrope).
Refractive index

n_D^{20} = 1.3776;
n_D^{25} = 1.3749.

Solubility Miscible with benzene, chloroform, ethanol (95%), ether, glycerin, and water. Soluble in acetone; insoluble in salt solutions. Forms an azeotrope with water, containing 87.4% w/w isopropyl alcohol (boiling point 80.37°C).
Specific gravity 0.786
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Vapor density (relative) 2.07 (air = 1)
Vapor pressure

133.3 Pa (1 mmHg) at −26.1°C;
4.32 kPa (32.4 mmHg) at 20°C;
5.33 kPa (40 mmHg) at 23.8°C;
13.33 kPa (100 mmHg) at 39.5°C.

Viscosity (dynamic) 2.43 mPa s (2.43 cP) at 20°C

11 Stability and Storage Conditions

Isopropyl alcohol should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Incompatible with oxidizing agents such as hydrogen peroxide and nitric acid, which cause decomposition. Isopropyl alcohol may be salted out from aqueous mixtures by the addition of sodium

chloride, sodium sulfate, and other salts, or by the addition of sodium hydroxide.

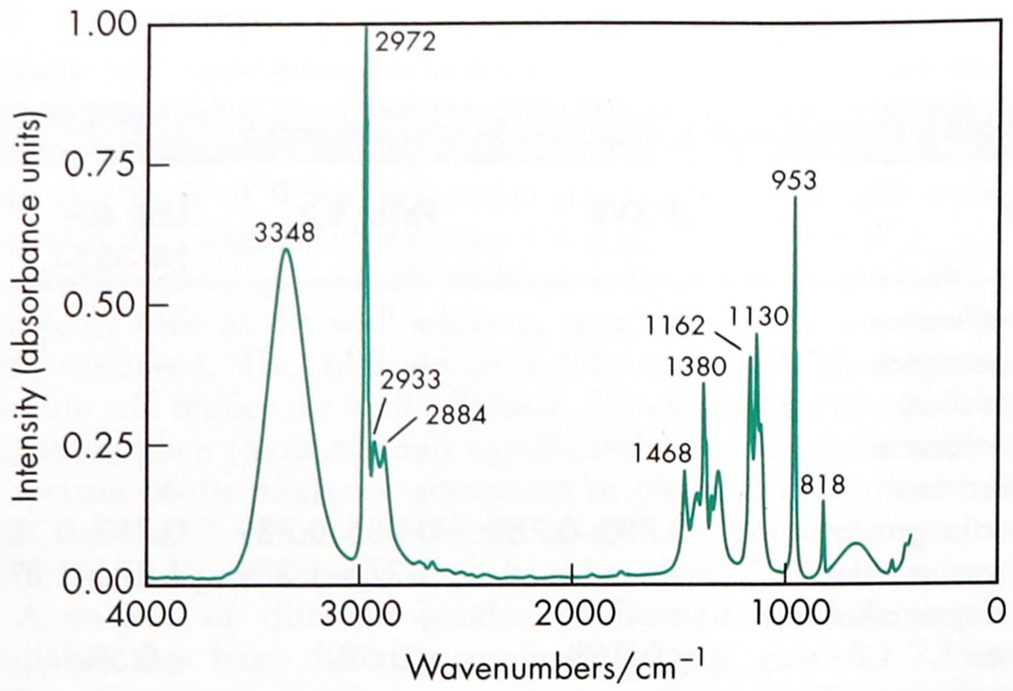

Figure 1: Infrared spectrum of isopropyl alcohol measured by transmission. Adapted with permission of Informa Healthcare.

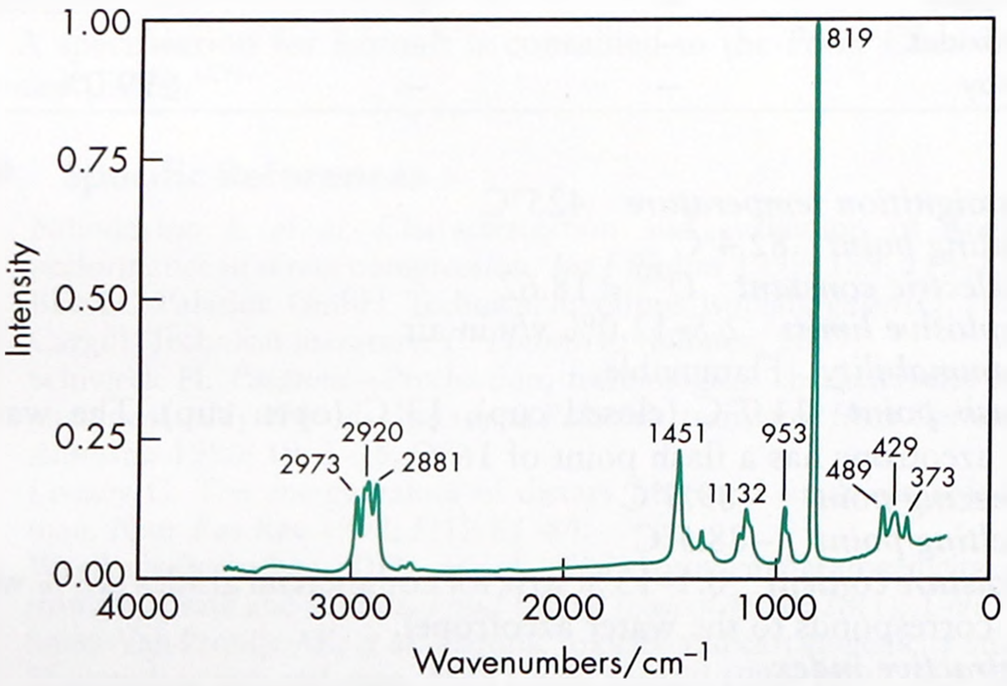

Figure 2: Raman spectrum of isopropyl alcohol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Isopropyl alcohol may be prepared from propylene; by the catalytic reduction of acetone; or by fermentation of certain carbohydrates.

14 Safety

Isopropyl alcohol is widely used in cosmetics and topical pharmaceutical formulations. It is readily absorbed from the gastrointestinal tract and may be slowly absorbed through intact skin. Prolonged direct exposure of isopropyl alcohol to the skin may result in cardiac and neurological deficits.[4] In neonates, isopropyl alcohol has been reported to cause chemical burns following topical application.[5,6]

Isopropyl alcohol is metabolized more slowly than ethanol, primarily to acetone. Metabolites and unchanged isopropyl alcohol are mainly excreted in the urine.

Isopropyl alcohol is about twice as toxic as ethanol and should therefore not be administered orally; isopropyl alcohol also has an unpleasant taste. Symptoms of isopropyl alcohol toxicity are similar to those for ethanol except that isopropyl alcohol has no initial euphoric action, and gastritis and vomiting are more prominent; *see* Ethanol. Delta osmolality may be useful as rapid screen test to identify patients at risk of complications from ingestion of isopropyl alcohol.[7] The lethal oral dose is estimated to be about 120–250 mL although toxic symptoms may be produced by 20 mL.

Adverse effects following parenteral administration of up to 20 mL of isopropyl alcohol diluted with water have included only a sensation of heat and a slight lowering of blood pressure. However, isopropyl alcohol is not commonly used in parenteral products.

Although inhalation can cause irritation and coma, the inhalation of isopropyl alcohol has been investigated in therapeutic applications.[3]

Isopropyl alcohol is most frequently used in topical pharmaceutical formulations where it may act as a local irritant.[8] When applied to the eye it can cause corneal burns and eye damage.

LD_{50} (rat, IP): 2.74 g/kg
LD_{50} (rat, IV): 1.10 g/kg
LD_{50} (rat, oral): 5.05 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Isopropyl alcohol may be irritant to the skin, eyes, and mucous membranes upon inhalation. Eye protection and gloves are recommended. Isopropyl alcohol should be handled in a well-ventilated environment. In the UK, the long-term (8-hour TWA) workplace exposure limit for isopropyl alcohol is 999 mg/m^3 (400 ppm); the short-term (15-minute) workplace exposure limit is 1250 mg/m^3 (500 ppm).[9] OSHA standards state that IPA 8-hour time weighted average airborne level in the workplace cannot exceed 400 ppm. Isopropyl alcohol is flammable and produces toxic fumes on combustion.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, tablets, and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Propan-1-ol.

Propan-1-ol

Empirical formula C_3H_8O
Molecular weight 60.1
CAS number [71-23-8]
Synonyms Propanol; *n*-propanol; propyl alcohol; propylic alcohol.
Autoignition temperature 540°C
Boiling point 97.2°C
Dielectric constant $D^{25} = 22.20$
Explosive limits 2.15–13.15% v/v in air
Flash point 15°C (closed cup)
Melting point −127°C
Refractive index $n_D^{20} = 1.3862$
Solubility Miscible with ethanol (95%), ether, and water.
Specific gravity 0.8053 at 20°C
Viscosity (dynamic) 2.3 mPa s (2.3 cP) at 20°C
Comments Propan-1-ol is more toxic than isopropyl alcohol. In the UK, the long-term (8-hour TWA) exposure limit for propan-1-ol is 500 mg/m^3 (200 ppm); the short-term (15-minute) exposure limit is 625 mg/m^3 (250 ppm).[9]

18 Comments

Therapeutically, isopropyl alcohol has been investigated for the treatment of postoperative nausea or vomiting.[10]

Isopropyl alcohol has some antimicrobial activity (*see* Section 10) and a 70% v/v aqueous solution is used as a topical disinfectant.

A specification for isopropyl alcohol is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for isopropyl alcohol is 200-661-7. The PubChem Compound ID (CID) for isopropyl alcohol is 3776.

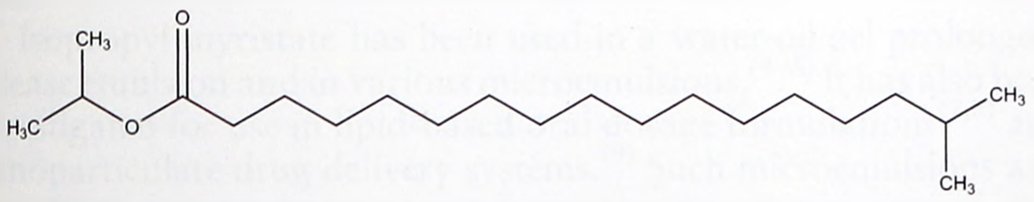
Isopropyl Isostearate

1 Nonproprietary Names

None adopted.

2 Synonyms

Crodamol IPIS; *DUBCARE TRIISO*; isostearic acid, isopropyl ester; 1-methylethyl isooctadecanoate; *Nikkol IPIS*; 2-propyl isooctadecanoate; *Schercemol 318 Ester*; *Wickenol 131*.



3 Chemical Name and CAS Registry Number

Propan-2-yl 16-methylheptadecanoate [68171-33-5]

4 Empirical Formula and Molecular Weight

$C_{21}H_{42}O_2$ 326.56

5 Structural Formula

6 Functional Category

Emollient.

7 Applications in Pharmaceutical Formulation or Technology

Isopropyl isostearate is used as an emollient in pharmaceutical formulations, such as topical creams and emulsions. It has also been studied for use in nanoparticulate drug delivery systems.[1]

8 Description

Isopropyl isostearate occurs as a clear liquid with a bland odor.

9 Pharmacopeial Specifications

—

10 Typical Properties

Acid value ≤1 for *Schercemol 318 Ester*[2]
Boiling point 360.7°C at 760 mmHg[2(2)]
Contact angle 19.1 for *Schercemol 318 Ester*[2]
Density 0.86 g/cm^3[3(3)]
Flash point 183.6°C[3]
Freezing point −28°C for *Schercemol 318 Ester*[2]
Interfacial tension 25.8 mN/m for *Schercemol 318 Ester*[2]
Iodine value ≤3 for *Schercemol 318 Ester*[2]
Refractive index Typically 1.445; 1.443 for *Schercemol 318 Ester*[2]
Saponification value 160–180 for *Schercemol 318 Ester*[2]
Solubility Soluble in acetone, ethanol (95%), ethyl acetate, isopropyl alcohol, and mineral oil. Insoluble in water, glycerol, and propylene glycol.
Surface tension 29.8 dyne/cm[3]
Vapor pressure 2.18×10^{-5} mmHg at 25°C[3]
Viscosity 15 mPa s (15 cP)

11 Stability and Storage Conditions

Isopropyl isostearate is resistant to oxidation and hydrolysis, and does not become rancid. It should be stored in a well-closed container in a cool, dry place and protected from light.

12 Incompatibilities

Isopropyl isostearate is incompatible with strong oxidizing agents. Prolonged contact with plastics can result in softening.

13 Method of Manufacture

Isopropyl isostearate may be prepared by the esterification of isostearic acid with propan-2-ol in the presence of a catalyst.

14 Safety

The Cosmetic Ingredient Review (CIR) Expert Panel has found isopropyl isostearate to be safe as presently used in cosmetics at a maximum concentration of 50%.[4] Undiluted isopropyl isostearate has been classified as a slight ocular irritant.[4,5] Repeated applications of a 10.0% aqueous suspension of isopropyl isostearate to the skin of albino rabbits was well-tolerated.[4]

LD_{50} (rat, oral): >64 g/kg[6]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, isopropyl isostearate emits acrid smoke and irritating vapors.[5]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical creams and sustained-release emulsions). Included in nonparenteral medicines (topical creams) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Isopropyl myristate; isopropyl palmitate; isopropyl stearate.

Isopropyl stearate

Empirical formula $C_{21}H_{42}O_2$
Molecular weight 326.32
CAS number [112-10-7]
Synonyms Octadecanoic acid; 1-methylethyl ester; *Wickenol 127*; *DUB SIP.*
Boiling point 368.2°C at 760 mmHg
Density 0.861 g/cm^3
Flash point 179.3°C
Melting point 28°C
Partition coefficient Log *P* (octanol : water) = 9.14
Refractive index 1.445
Vapor pressure 1.3×10^{-5} mmHg at 25°C
Surface tension 30.3 dyne/cm
Solubility Soluble in acetone, chloroform, ethanol (95%), ethyl acetate, fats, fatty alcohols, fixed oils, liquid hydrocarbons, toluene, and waxes. Practically insoluble in glycerin, glycols, and water.
Safety

LD_{Lo} (rat, oral): 8 g/kg[3(4)]

Comments Used as an emollient. The EINECS number for isopropyl stearate is 203-934-9.

18 Comments

Isopropyl isostearate has a low freezing point and exhibits lubricity without oiliness. It is used in cosmetic products, such as bath oils, creams, lotions, and lipsticks, as it imparts good spreadability and slip to topical products.[2]

The EINECS number for isopropyl isostearate is 269-023-3.

4 Empirical Formula and Molecular Weight

$C_{17}H_{34}O_2$ 270.5

5 Structural Formula

6 Functional Category

Emollient; oleaginous vehicle; penetration enhancer; solvent; transdermal delivery component.

7 Applications in Pharmaceutical Formulation or Technology

Isopropyl myristate is a nongreasy emollient that is absorbed readily by the skin. It is mainly used as a component of semisolid bases and as a solvent for many substances applied topically. Applications in topical pharmaceutical formulations include creams, lotions, sprays,[1] otic suspensions, and vaginal creams; *see* Table I.

Isopropyl myristate is used as a penetration enhancer for transdermal formulations.[1] For example, it is a self-emulsifying component of a proposed cold cream formula that is suitable for use as a vehicle for drugs or dermatological actives,[2] and it has also used in conjunction with therapeutic ultrasound and iontophoresis.[3]

Isopropyl myristate has been used in a water-oil gel prolonged-release emulsion and in various microemulsions.[4–6] It has also been investigated for use in lipid-based oral dosage formulations[7,8] and nanoparticulate drug delivery systems.[9] Such microemulsions and nanoformulations may increase bioavailability in oral, topical, and transdermal applications.

Isopropyl myristate has also been investigated in the production of microspheres in controlled drug release systems and has been found to significantly increase the release of drug from etopside-loaded microspheres.[10]

8 Description

Isopropyl myristate occurs as a clear, colorless, practically odorless liquid of low viscosity that congeals at about 5°C. It consists of esters of propan-2-ol and saturated high molecular weight fatty acids, principally myristic acid.

Table I: Uses of isopropyl myristate.

Use	Concentration (%)
Detergent	0.003–0.03
Otic suspension	0.024
Perfumes	0.5–2.0
Microemulsions	<50
Soap	0.03–0.3
Topical aerosols	2.0–98.0
Topical creams and lotions	1.0–10.0

10 Typical Properties

Boiling point 140.2°C at 266 Pa (2 mmHg); 192.6°C at 2.67 kPa (20 mmHg) with decomposition at 208°C

Flash point 153.5°C (closed cup)

Freezing point ≈5°C

Solubility Soluble in acetone, chloroform, ethanol (95%), ethyl acetate, fats, fatty alcohols, fixed oils, liquid hydrocarbons, toluene, and waxes. Dissolves many waxes, cholesterol, or lanolin. Practically insoluble in glycerin, glycols, and water.

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (dynamic) 5–7 mPa s (5–7 cP) at 25°C

11 Stability and Storage Conditions

Isopropyl myristate is resistant to oxidation and hydrolysis and does not become rancid. It should be stored in a well-closed container in a cool, dry place and protected from light.

12 Incompatibilities

When isopropyl myristate comes into contact with rubber, there is a drop in viscosity with concomitant swelling and partial dissolution of the rubber; contact with plastics, e.g. nylon and polyethylene, results in swelling. Isopropyl myristate is incompatible with hard

paraffin, producing a granular mixture. It is also incompatible with strong oxidizing agents.

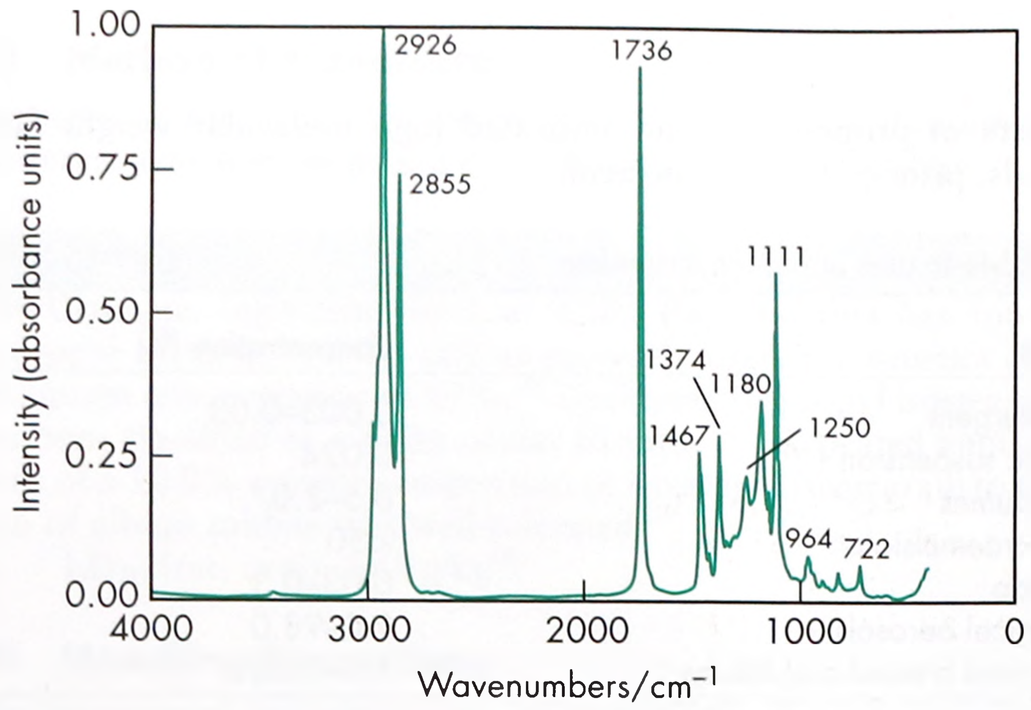

Figure 1: Infrared spectrum of isopropyl myristate measured by transmission. Adapted with permission of Informa Healthcare.

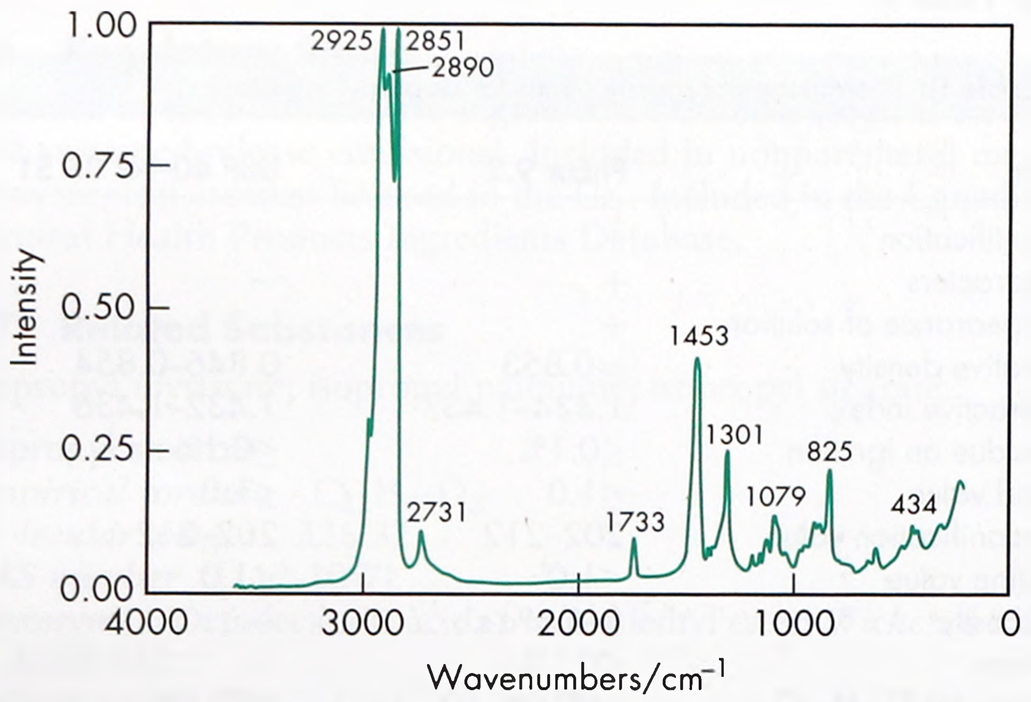

Figure 2: Raman spectrum of isopropyl myristate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Isopropyl myristate may be prepared either by the esterification of myristic acid with propan-2-ol or by the reaction of myristoyl chloride and propan-2-ol with the aid of a suitable dehydrochlorinating agent. A high-purity material is also commercially available, produced by enzymatic esterification at low temperature.

14 Safety

Isopropyl myristate is widely used in cosmetics and topical pharmaceutical formulations, and is generally regarded as a nontoxic and nonirritant material.[11–13]

LD_{50} (mouse, oral): 49.7 g/kg[14]

LD_{50} (rabbit, skin): 5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition isopropyl myristate emits toxic smoke and fumes.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (otic, topical, transdermal, and vaginal preparations). Used in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Isopropyl palmitate.

18 Comments

Isopropyl myristate is widely used in topical cosmetic formulations, including bath oils, make-up, hair and nail care products, creams, lotions, lip products, shaving products, skin lubricants, and deodorants. It is also used cosmetically in stable mixtures of water and glycerol.[15]

Therapeutically, isopropyl myristate 50% has been shown to be an effective pediculicide for the control of head lice.[16] It is also used in soft adhesives for pressure-sensitive adhesive tapes.[17]

Although not GRAS listed, isopropyl myristate is listed as a food additive in the EAFUS list compiled by the FDA. A specification for isopropyl myristate is included in the *Japanese Pharmaceutical Excipients* (JPE).[18]

The EINECS number for isopropyl myristate is 203-751-4. The PubChem Compound ID (CID) for isopropyl myristate is 8042.

4 Empirical Formula and Molecular Weight

$C_{19}H_{38}O_2$ 298.51

5 Structural Formula

6 Functional Category

Emollient; oleaginous vehicle; penetration enhancer; solvent; transdermal delivery component.

7 Applications in Pharmaceutical Formulation or Technology

Isopropyl palmitate is a nongreasy emollient with good spreading characteristics used in topical pharmaceutical formulations such as creams, lotions, gels, ointments and sprays; *see also* Table I.

Isopropyl palmitate is an established penetration enhancer for transdermal systems. It has also been used in controlled-release percutaneous films.

Isopropyl palmitate has been investigated in the production of reversed sucrose ester vehicles[1] and used in nanoparticulate drug delivery systems.[2] It has also been investigated in microemulsion systems[3] for transdermal delivery, and as the organic phase for formation of lecithin organogels,[4] which may also be used in transdermal delivery systems.

Table I: Uses of isopropyl palmitate.

Use	Concentration (%)
Detergent	0.005–0.02
Perfume	0.2–0.8
Soap	0.05–0.2
Topical aerosol spray	3.36
Topical creams and lotions	0.05–5.5

8 Description

Isopropyl palmitate occurs as a clear, colorless to pale yellow-colored, practically odorless viscous liquid that solidifies at less than 16°C.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for isopropyl palmitate.

Viscosity (dynamic) 5–10 mPa s (5–10 cP) at 25°C; 5–6 mPa s (5–6 cP) at 20°C for *Tegosoft P*.

11 Stability and Storage Conditions

Isopropyl palmitate is resistant to oxidation and hydrolysis, and does not become rancid. It should be stored in a well-closed container above 16°C, and protected from light.

12 Incompatibilities

See Isopropyl Myristate.

13 Method of Manufacture

Isopropyl palmitate is prepared by the reaction of palmitic acid with propan-2-ol in the presence of an acid catalyst. A high-purity material is also commercially available, which is produced by enzymatic esterification at low temperatures.

14 Safety

Isopropyl palmitate is widely used in cosmetics and topical pharmaceutical formulations, and is generally regarded as a relatively nontoxic and nonirritant material.[5–7]

LD_{50} (mouse, IP): 0.1 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical and transdermal preparations). Used in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Isopropyl myristate.

18 Comments

Isopropyl palmitate is widely used in cosmetics, including bath oils, creams, lotions, make-up, hair care products, deodorants, lip products, suntan preparations, and pressed powders.

Although not GRAS listed, isopropyl palmitate is listed as a food additive in the EAFUS list compiled by the FDA. A specification for isopropyl palmitate is included in the *Japanese Pharmaceutical Excipients* (JPE).[9]

The EINECS number for isopropyl palmitate is 205-571-1. The PubChem Compound ID (CID) for isopropyl palmitate is 8907.

Kaolin

1 Nonproprietary Names

BP: Heavy Kaolin

JP: Kaolin

PhEur: Kaolin, Heavy

USP–NF: Kaolin

Note that the PhEur 9.2 contains a monograph on heavy kaolin. The BP 2017, in addition to the monograph for heavy kaolin, also contains monographs for light kaolin (natural) and light kaolin.

See also Sections 4 and 9.

2 Synonyms

Argilla; bolus alba; China clay; E559; kaolinite; kaolinum ponderosum; *Lion*; porcelain clay; *Sim 90*; weisserton; white bole.

3 Chemical Name and CAS Registry Number

Hydrated aluminum silicate [1332-58-7]

4 Empirical Formula and Molecular Weight

$Al_2H_4O_9Si_2$ 258.16

The USP 40–NF 35 S1 describes kaolin as a native hydrated aluminum silicate, powdered and freed from gritty particles by elutriation. The BP 2017 similarly describes light kaolin but additionally states that it contains a suitable dispersing agent. Light kaolin (natural) BP contains no dispersing agent. Heavy kaolin is described in the BP 2017 and PhEur 9.2 as a purified, natural hydrated aluminum silicate of variable composition. The JP XVII describes kaolin as a native hydrous aluminum silicate.

5 Structural Formula

See Section 4.

6 Functional Category

Adsorbent; suspending agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Kaolin is a naturally occurring mineral used in oral and topical pharmaceutical formulations.

In oral medicines, kaolin has been used as a diluent in tablet and capsule formulations; it has also been used as a suspending vehicle. In topical preparations, sterilized kaolin has been used in poultices and as a dusting powder.[1]

8 Description

Kaolin occurs as a white to grayish-white colored, unctuous powder free from gritty particles. It has a characteristic earthy or claylike taste, and when moistened with water it becomes darker in color and develops a claylike odor.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 4.0–7.5 for a 20% w/v aqueous slurry

Hardness (Mohs) 2.0, very low

Hygroscopicity At relative humidities between about 15–65%, the equilibrium moisture content at 25°C is about 1% w/w, but at relative humidities above about 75%, kaolin absorbs small amounts of moisture.

Particle size distribution Median size = 0.6–0.8 μm

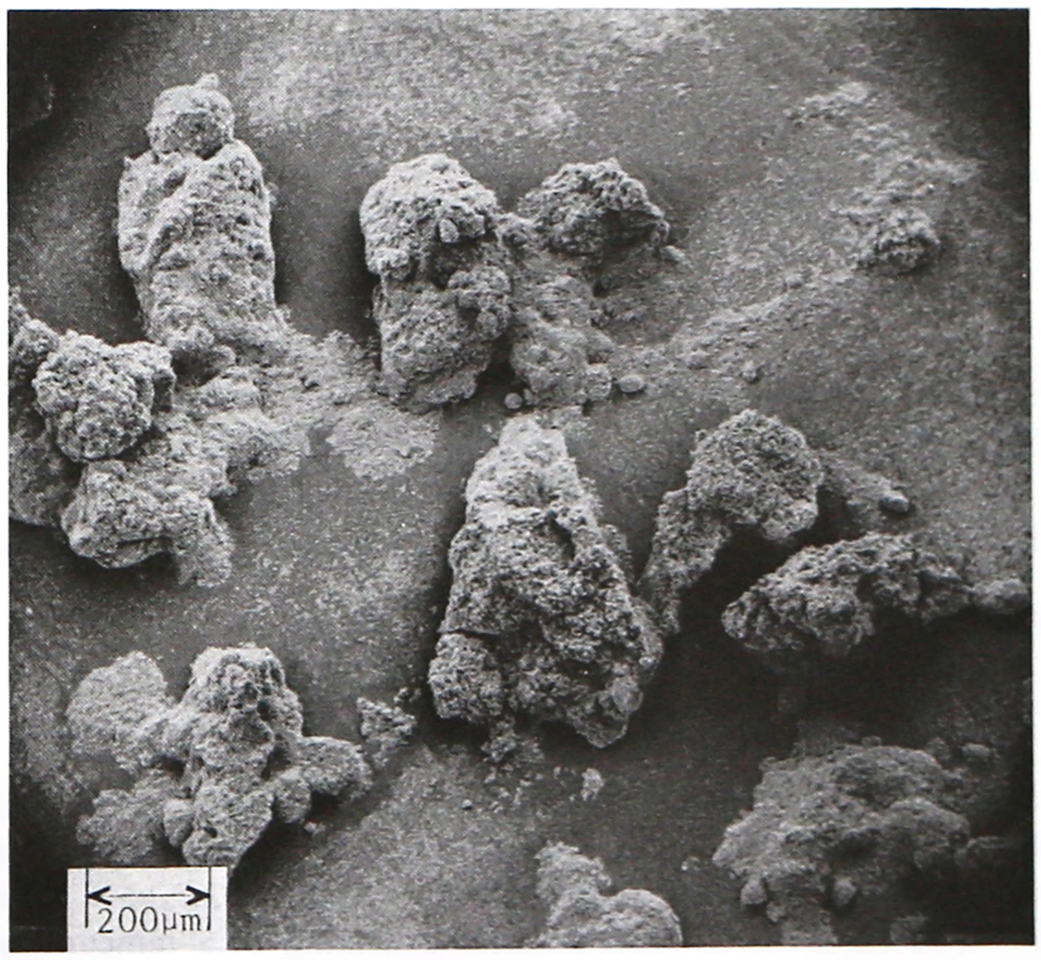
Refractive index 1.56

Solubility Practically insoluble in diethyl ether, ethanol (95%), water, other organic solvents, cold dilute acids, and solutions of alkali hydroxides.

Specific gravity 2.6

Spectroscopy

IR spectrum *see* Figure 1.



NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Whiteness 85–90% of the brightness of MgO

11 Stability and Storage Conditions

Kaolin is a stable material. Since it is a naturally occurring material, kaolin is commonly contaminated with microorganisms such as *Bacillus anthracis*, *Clostridium tetani*, and *Clostridium welchii*. However, kaolin may be sterilized by heating at a temperature greater than 160°C for not less than 1 hour. When moistened with water, kaolin darkens and becomes plastic.

Kaolin should be stored in a well-closed container in a cool, dry place.

SEM 2: Excipient: Kaolin USP; manufacturer: Georgia Kaolin Co.; lot no.: 1672; magnification: 600×; voltage: 10 kV.

12 Incompatibilities

The adsorbent properties of kaolin may influence the absorption of other orally administered drugs. Drugs reportedly affected by kaolin include amoxicillin;[3] ampicillin;[3] cimetidine;[4] digoxin;[5] lincomycin; phenytoin;[6] and tetracycline. Warfarin absorption by rat intestine *in vitro* was reported not to be affected by kaolin.[7] With clindamycin, the rate (but not the amount) of absorption was affected by kaolin.[8]

13 Method of Manufacture

Kaolin is a hydrated aluminum silicate obtained by mining naturally occurring mineral deposits. Large deposits are found in Georgia, US and in Cornwall, England.

Mined kaolin is powdered and freed of coarse, gritty particles either by elutriation or by screening. Impurities such as ferric oxide, calcium carbonate, and magnesium carbonate are removed with an electromagnet and by treatment with hydrochloric acid and/or sulfuric acids.

14 Safety

Kaolin is used in oral and topical pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material.

LD_{50} (rat, oral): 149 g/kg[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Kaolin is considered to be a nuisance dust.[9] The chronic inhalation of kaolin dust can cause diseases of the lung (silicosis or kaolinosis).[10] Eye protection and a dust mask are recommended. In the UK, the long-term (8-hour TWA) workplace exposure limit for kaolin respirable dust is 2 mg/m^3.[11]

16 Regulatory Status

Accepted in Europe as a food additive in certain applications. Included in the FDA Inactive Ingredients Database (oral capsules,

powders, syrups, solutions, and tablets; topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Bentonite; magnesium aluminum silicate.

18 Comments

Kaolin is considered in most countries to be an archaic diluent.

The name kaolinite was historically used to describe the processed mineral, while the name kaolin was used for the unprocessed clay. However, the two names have effectively become synonymous and kaolin is now generally the only name used.

Therapeutically, kaolin has been used in antacids, anorectals, skin protectants, digestive aids and antidiarrheal preparations.[2] It is also used in paints, ceramics, flooring, inks, pastes, fertilizers, textiles, and as a filler in rubbers and plastics.[2] A specification for kaolin is contained in the *Food Chemicals Codex (FCC)*.[12]

The EINECS number for kaolin is 310-127-6.

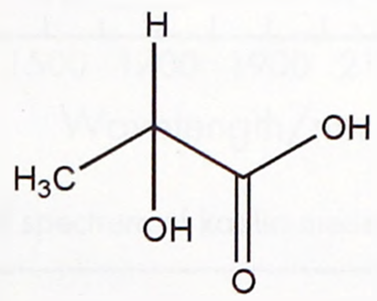
Lactic Acid

1 Nonproprietary Names

BP: Lactic Acid
JP: Lactic Acid
PhEur: Lactic Acid
USP–NF: Lactic Acid

2 Synonyms

Acidum lacticum; E270; *Eco-Lac*; 2-hydroxypropanoic acid; α-hydroxypropionic acid; DL-lactic acid; L-lactic acid; *Lexalt L*; milk acid; *Patlac LA*; *Purac 88 PH*; *Purac PF 90*; racemic lactic acid.



3 Chemical Name and CAS Registry Number

2-Hydroxypropionic acid [50-21-5]
(*R*)-(−)-2-Hydroxypropionic acid [10326-41-7]
(*S*)-(+)-2-Hydroxypropionic acid [79-33-44]
(*RS*)-(±)-2-Hydroxypropionic acid [598-82-3]
See also Section 8.

4 Empirical Formula and Molecular Weight

$C_3H_6O_3$ 90.08

5 Structural Formula

6 Functional Category

Acidulant.

7 Applications in Pharmaceutical Formulation or Technology

Lactic acid is used in beverages, foods, cosmetics, and pharmaceuticals (*see* Table I) as an acidulant.

In topical formulations, particularly cosmetics, it is used for its softening and conditioning effect on the skin. Lactic acid may also be used in the production of biodegradable polymers and microspheres, such as poly(D-lactic acid), used in drug delivery systems.[1,2] *See also* Aliphatic Polyesters.

Lactic acid is also used as a food preservative.

Table I: Uses of lactic acid.

Use	Concentration (%)
Injections	0.012–1.16
Topical preparations	0.015–6.6

8 Description

Lactic acid consists of a mixture of 2-hydroxypropionic acid, its condensation products, such as lactoyllactic acid and other polylactic acids, and water. It is usually in the form of the racemate, (*RS*)-lactic acid, but in some cases the (*S*)-(+)-isomer is predominant.

Lactic acid is a practically odorless, colorless or slightly yellow-colored, viscous, hygroscopic, nonvolatile liquid.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Boiling point 122°C at 2 kPa (15 mmHg)
Dissociation constant pK_a = 4.14 at 22.5°C
Flash point >110°C
Heat of combustion 15.13 kJ/kg (3615 cal/kg)
Melting point 17°C
Osmolarity A 2.3% w/v aqueous solution is isoosmotic with serum.
Refractive index n_D^{20} = 1.4251
Solubility Miscible with ethanol (95%), ether, and water; practically insoluble in chloroform.
Specific heat 2.11 J/g (0.505 cal/g) at 20°C
Specific gravity 1.21
Specific rotation $[\alpha]_D^{21}$ = −2.6° (8% w/v aqueous solution) for (*R*)-form; +2.6° (2.5% w/v aqueous solution) for (*S*)-form.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (dynamic) 28.5 mPa s (28.5 cP) for 85% aqueous solution at 25°C.

11 Stability and Storage Conditions

Lactic acid is hygroscopic and will form condensation products such as polylactic acids on contact with water. The equilibrium between the polylactic acids and lactic acid is dependent on concentration and temperature. At elevated temperatures lactic acid will form lactide, which is readily hydrolyzed back to lactic acid.

Lactic acid should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Incompatible with oxidizing agents, iodides, and albumin. Reacts violently with hydrofluoric acid and nitric acid.

13 Method of Manufacture

Lactic acid is prepared by the fermentation of carbohydrates, such as glucose, sucrose, and lactose, with *Bacillus acidi lacti* or related microorganisms. On a commercial scale, whey, corn starch, potatoes, or molasses are used as a source of carbohydrate. Lactic acid may also be prepared synthetically by the reaction between acetaldehyde and carbon monoxide at 130–200°C under high pressure, or by the hydrolysis of hexoses with sodium hydroxide.[3]

Lactic acid prepared by the fermentation of sugars is levorotatory; lactic acid prepared synthetically is racemic. However, lactic acid prepared by fermentation becomes dextrorotatory on dilution with water owing to the hydrolysis of (*R*)-lactic acid lactate to (*S*)-lactic acid.

14 Safety

Lactic acid occurs in appreciable quantities in the body as an end product of the anaerobic metabolism of carbohydrates and, while

harmful in the concentrated form (*see* Section 15), can be considered nontoxic at the levels at which it is used as an excipient. A 1% v/v solution, for example, is harmless when applied to the skin.

There is evidence that neonates have difficulty in metabolizing (*R*)-lactic acid, and this isomer and the racemate should therefore not be used in foods intended for infants aged less than 3 months old.[4]

There is no evidence that lactic acid is carcinogenic, teratogenic, or mutagenic.

LD_{50} (guinea pig, oral): 1.81 g/kg[5]
LD_{50} (mouse, oral): 4.88 g/kg
LD_{50} (mouse, SC): 4.5 g/kg
LD_{50} (rat, oral): 3.73 g/kg

15 Handling Precautions

Lactic acid is caustic in concentrated form and can cause burns on contact with the skin and eyes. It is harmful if swallowed, inhaled, or absorbed through the skin. Observe precautions appropriate to the circumstances and quantity of material handled. Eye protection, rubber gloves, and respirator are recommended. It is advisable to handle the compound in a chemical fume hood and to avoid repeated or prolonged exposure. Spillages should be diluted with copious quantities of water. In case of excessive inhalation, remove the patient to a well-ventilated environment and seek medical attention. Lactic acid presents no fire or explosion hazard but emits acrid smoke and fumes when heated to decomposition.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM, IV, and SC injections; oral syrups and tablets; topical and vaginal preparations). Included in medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Aliphatic polyesters; sodium lactate.

18 Comments

Therapeutically, lactic acid is used in injections, in the form of lactate, as a source of bicarbonate for the treatment of metabolic acidosis; as a spermicidal agent; in pessaries for the treatment of leukorrhea; in infant feeds; and in topical formulations for the treatment of warts.

A specification for lactic acid is contained in the *Food Chemicals Codex* (FCC).[6]

The EINECS number for lactic acid is 200-018-0. The PubChem Compound ID (CID) for lactic acid includes 612, 107689 and 61503.

5 Structural Formula

6 Functional Category

Direct compression excipient; sweetening agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Lactitol is used as a noncariogenic replacement for sucrose. It is also used in tablet formulations as a diluent in direct-compression processes.[1–4]

8 Description

Lactitol occurs as white orthorhombic crystals. It is odorless with a sweet taste that imparts a cooling sensation. It is available in powdered form and in a range of crystal sizes. The directly

compressible form is a water-granulated product of microcrystalline aggregates.

9 Pharmacopeial Specifications

See Table I.

3.4 mPa s (3.4 cP) for 30% solution at 20°C;
6.9 mPa s (6.9 cP) for 40% solution at 20°C;
18.9 mPa s (18.9 cP) for 50% solution at 20°C;
80.0 mPa s (80.0 cP) for 60% solution at 20°C.

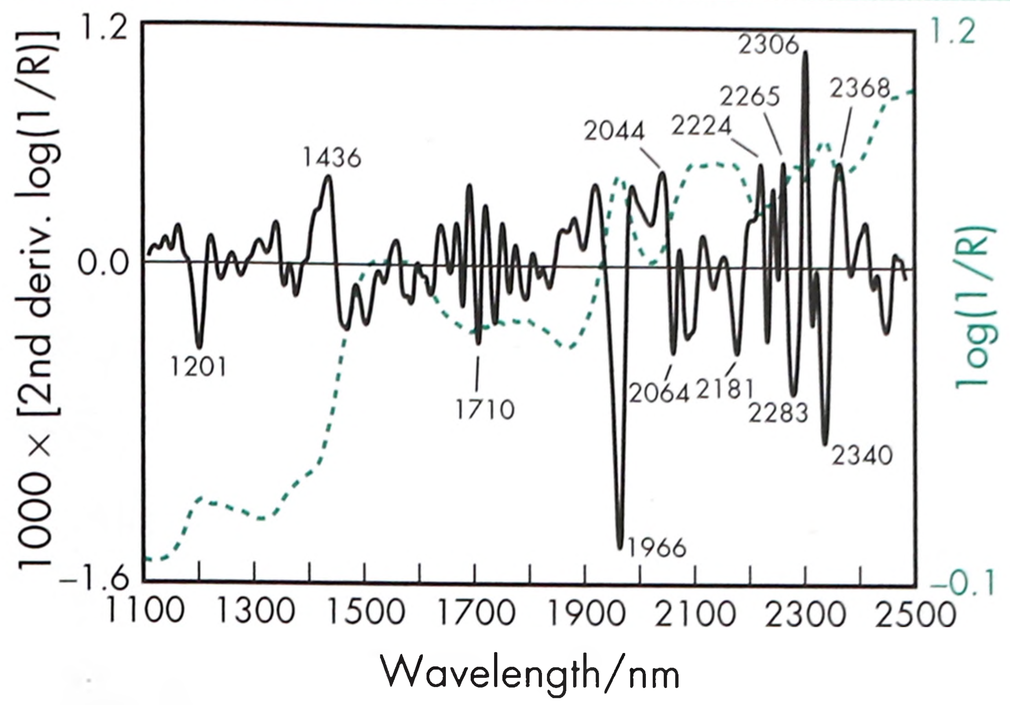

Figure 1: Near-infrared spectrum of lactitol monohydrate measured by reflectance.

11 Stability and Storage Conditions

Lactitol as the monohydrate is nonhygroscopic and is stable under humid conditions; the anhydrous form is strongly hygroscopic. It is stable to heat and does not take part in the Maillard reaction. In acidic solution, lactitol slowly hydrolyzes to sorbitol and galactose. Lactitol is very resistant to microbiological breakdown and fermentation. Store in a well-closed container. When the compound is stored in an unopened container at 25°C and 60% relative humidity, a shelf-life in excess of 3 years is appropriate.

12 Incompatibilities

—

13 Method of Manufacture

Lactitol is produced by the catalytic hydrogenation of lactose.

14 Safety

Lactitol is regarded as a nontoxic and nonirritant substance. It is not fermented significantly in the mouth, and is not cariogenic.[5] It is not absorbed in the small intestine, but is broken down by microflora in the large intestine,[6] and is metabolized independently of insulin. In large doses it has a laxative effect; therapeutically, 10–20 g daily in a single oral dose is administered for this purpose.

The European Food Safety Authority have stated that it is unlikely that lactitol will cause adverse reactions in lactose intolerant individuals.[5]

Monohydrate:
LD_{50} (mouse, oral): >23 g/kg[8]
LD_{50} (rat, oral): >30 g/kg[8]
Dihydrate:
LD_{50} (rat, oral): 27.5 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database as lactitol monohydrate (oral and capsule). Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Lactitol has a sweetening power about one-third that of sucrose. It does not promote dental caries and has a caloric value of 9.9 J/g (2.4 cal/g).

Lactitol is used therapeutically in the treatment of hepatic encephalopathy and as a laxative;[9] *see also* Section 14.

Lactitol has been investigated for use as a binder, but its high water solubility and hygroscopicity was found to limit its practical use.[3]

A specification for lactitol is included in the *Food Chemicals Codex* (FCC).[10]

The EINECS numbers for lactitol are 209-566-6 (anhydrous) and 209-566-5 (monohydrate).

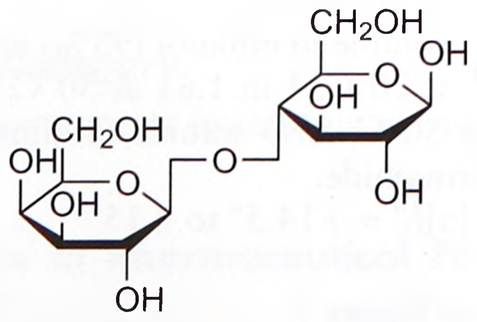
3 Chemical Name and CAS Registry Number

O-β-D-Galactopyranosyl-(1→4)-β-D-glucopyranose [63-42-3]



4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30

5 Structural Formula

Anhydrous α-lactose

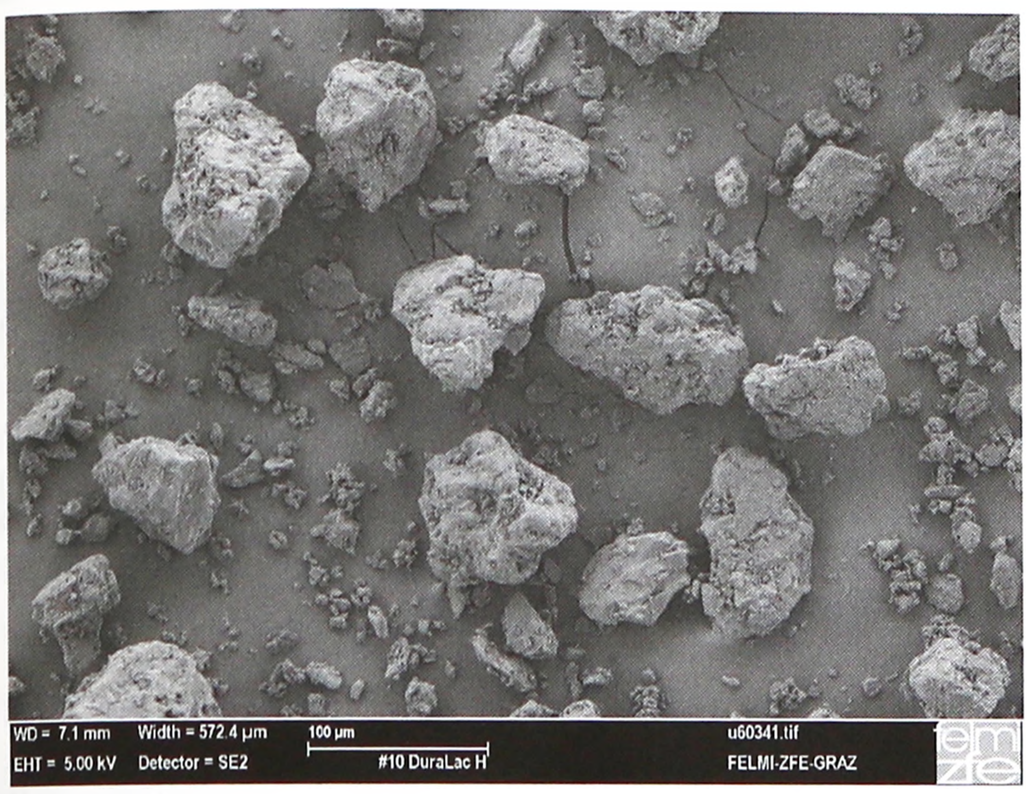
Anhydrous β-lactose

The PhEur 9.2 and USP 40–NF 35 S1 describe anhydrous lactose as O-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose; or a mixture of O-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose and O-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose. The JP XVII describes anhydrous lactose as β-lactose or a mixture of β-lactose and α-lactose, and defines these as per the PhEur and USP–NF.

6 Functional Category

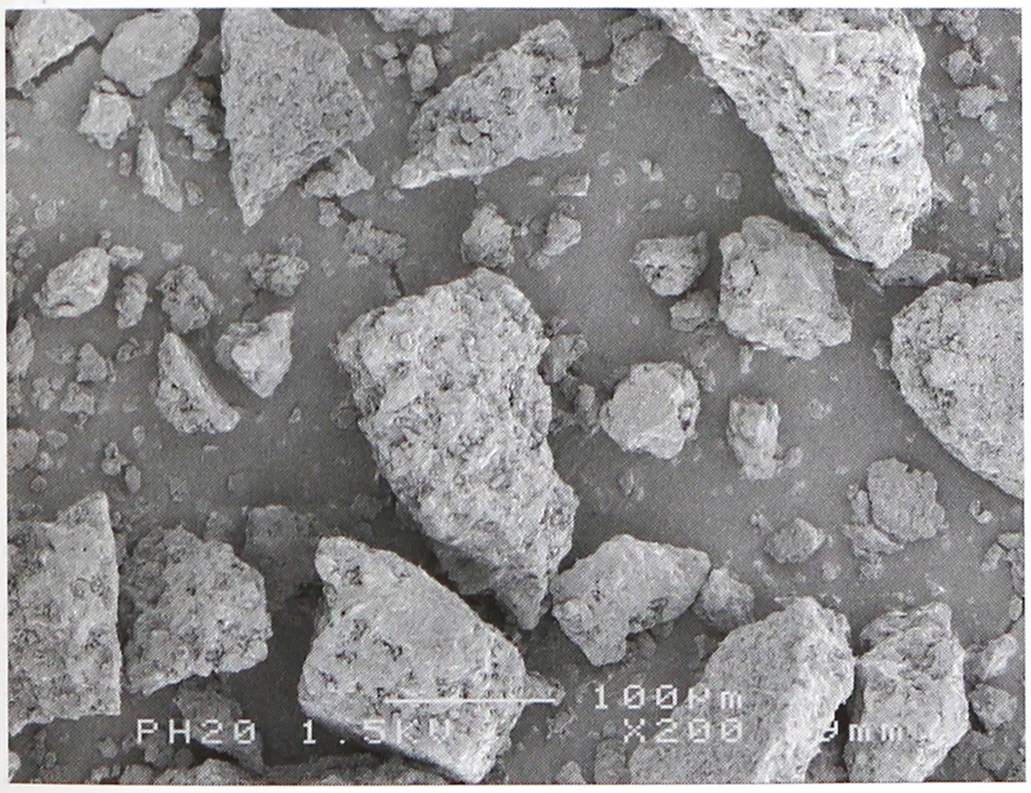
Direct compression excipient; dry powder inhaler carrier; lyophilization aid; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology



Anhydrous lactose is widely used for direct compression tableting applications as a binder and as a tablet and capsule filler or diluent. Anhydrous lactose can be used with moisture-sensitive drugs due to its low moisture content. It may also be used in intravenous injections.

See also Lactose, Inhalation; Lactose Monohydrate; Lactose, Spray-Dried.



8 Description

Anhydrous lactose occurs as white to nearly white crystalline particles or powder. Several different brands of anhydrous lactose are commercially available, comprising anhydrous β-lactose and anhydrous α-lactose. Commercially available anhydrous lactose typically contains 70–80% anhydrous β-lactose and 20–30% anhydrous α-lactose.

10 Typical Properties

Density (true) 1.589 g/cm^3 for anhydrous β-lactose

Density (bulk)

0.70 g/cm^3 for *DuraLac H*;

0.71 g/cm^3 for *SuperTab 21AN*;

0.66 g/cm^3 for *Super-Tab 22AN*.

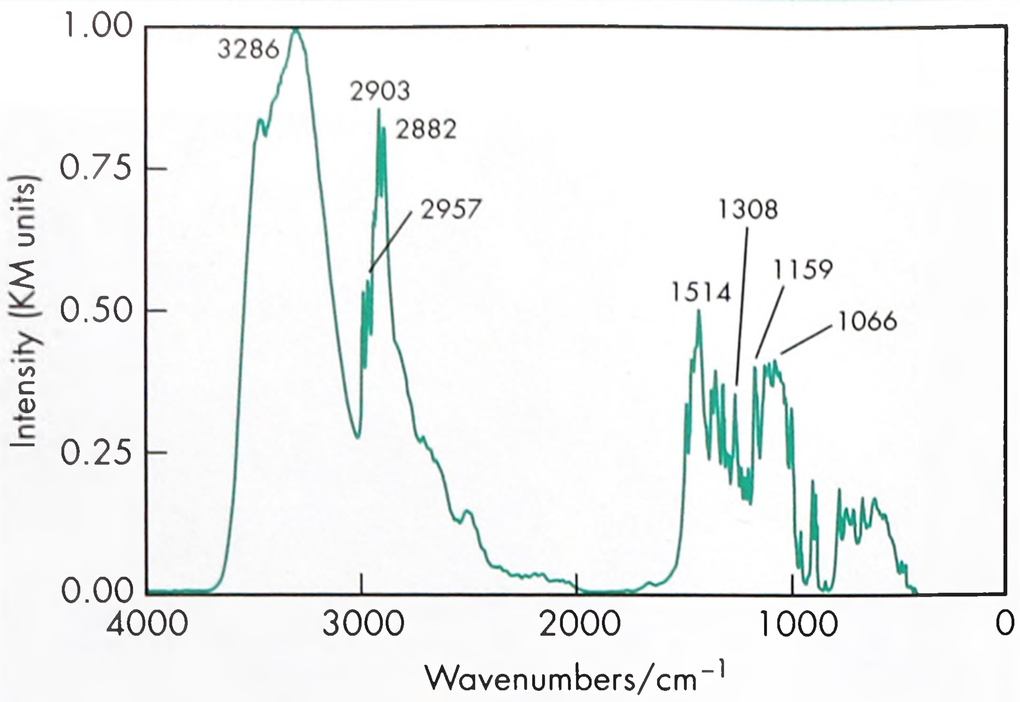

Figure 1: Infrared spectrum of anhydrous lactose measured by reflectance.

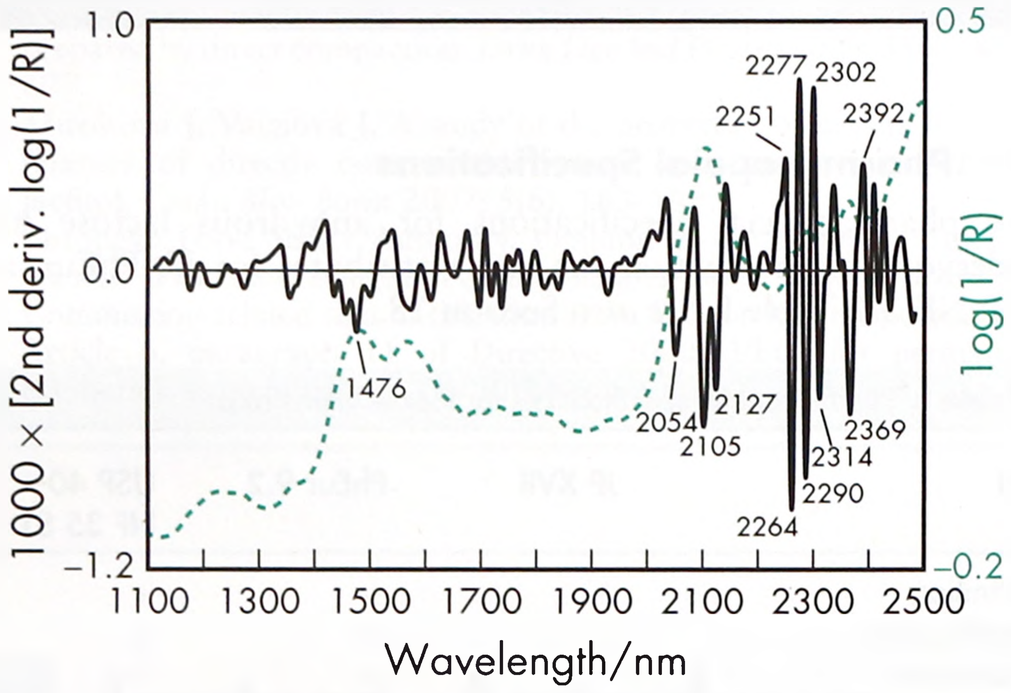

Figure 2: Near-infrared spectrum of anhydrous lactose measured by reflectance.

Density (tapped)

0.91 g/cm^3 for *DuraLac H*;

0.88 g/cm^3 for *SuperTab 21AN*;

0.78 g/cm^3 for *Super-Tab 22AN*.

Melting point

223.0°C for anhydrous α-lactose;

252.2°C for anhydrous β-lactose;

232.0°C (typical) for commercial anhydrous lactose.

Particle size distribution *see* Table II.

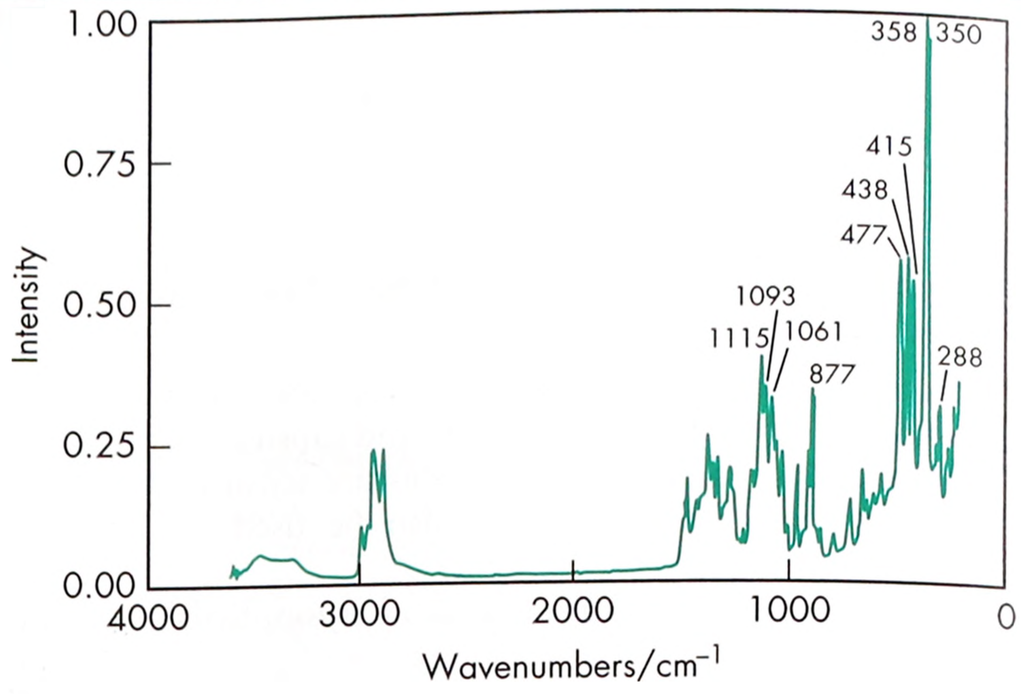

Figure 3: Raman spectrum of anhydrous lactose measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Solubility Soluble in water (20 g/100 mL at 25°C for *Lactose Anhydrous DT*); sparingly soluble in ether; practically insoluble in ethanol (96%).

Specific rotation $[\alpha]_D^{20}$ = +54.4° to +55.9° (10% w/v solution).

Lactose exhibits mutarotation, and an equilibrium mixture containing 62% β-lactose and 38% α-lactose is obtained.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Mold growth may occur under humid conditions (80% RH and above). Lactose may develop a brown coloration on storage, the reaction being accelerated by warm, damp conditions; *see* Section 12. At 80°C and 80% RH, tablets containing anhydrous lactose have been shown to expand 1.2 times after one day.[1]

Lactose anhydrous has been shown to absorb odors from its surroundings. It should be stored in a well-closed container in a cool, dry, odor-free place.

12 Incompatibilities

Lactose anhydrous is incompatible with strong oxidizers. When mixtures containing a hydrophobic leukotriene antagonist and anhydrous lactose or lactose monohydrate were stored for six weeks at 40°C and 75% RH, the mixture containing anhydrous lactose showed greater moisture uptake and drug degradation.[2]

Table II: Particle size distribution of selected commercially available anhydrous lactose.

Supplier/grade	Percentage less than stated size			
	<45 μm	<53 μm	<150 μm	<250 μm
DFE Pharma				
Lactopress Anhydrous	–	≤30	–	≥80
Lactopress Anhydrous 250	≤20	–	40–65	≥80
SuperTab 21AN	≤20	–	40–65	≥80
SuperTab 22AN	≤7	–	25–50	≥65
Meggle				
DuraLac H	≤20	–	40–65	≥80
Sheffield Bio-Science				
Lactose Anhydrous DT	–	–	35-68	80-90
Lactose Anhydrous DT High Velocity	≤15	–	≤55	60-90

Studies have also shown that in blends of roxifiban acetate (DMP-754) and lactose anhydrous, the presence of lactose anhydrous accelerated the hydrolysis of the ester and amidine groups.[3]

Lactose anhydrous is a reducing sugar with the potential to interact with primary[4] and secondary[5] amines when stored under high-humidity conditions for extended periods. A Maillard-type condensation reaction is likely to occur between lactose and compounds with primary and secondary amines, forming brown or yellow-brown colored products.

See Lactose Monohydrate.

13 Method of Manufacture

There are two anhydrous lactose forms: α-lactose and β-lactose, with β-lactose typically present in greater concentration than α-lactose. The temperature of crystallization influences the α- and β-lactose ratio formed. The anhydrous forms that are commercially available may exhibit hygroscopicity at high relative humidity. Anhydrous lactose is produced by roller drying a lactose solution at temperatures above 93.5°C. The resulting product is then milled and sieved to desired particle size. Two anhydrous α-lactoses forms can be prepared using special drying techniques: one is unstable and hygroscopic; the other exhibits good compaction properties.[6,7] However, these materials are not commercially available.

14 Safety

See Lactose Monohydrate.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of materials handled. Avoid excessive dust generation or inhalation.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, intracavitary: powder for injection solution; buccal; sublingual; vaginal; oral: solution, capsules, tablets and granules; powder for inhalation). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lactose, inhalation; lactose monohydrate; lactose, spray-dried.

18 Comments

Lactose anhydrous has undergone harmonization for many attributes for JP, PhEur, and USP-NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Lactose anhydrous has been used experimentally in hydrophilic matrix tablet formulations[8] and evaluated for dry powder inhalation applications.[9,10] Hydration of anhydrous lactose increases the specific surface area and reduces powder flow properties but has no effect on compactibility.[11,12] A specification for lactose is included in the *Food Chemicals Codex* (FCC);[13] *see* Lactose Monohydrate.

The EINECS number for lactose is 200-559-2. The PubChem Compound ID (CID) for lactose anhydrous includes 6134 and 84571.

Lactose, Inhalation

1 Nonproprietary Names

None adopted.

2 Synonyms

InhaLac; inhalation lactose; *Lactohale*; *Respitose*.
For grades, *see* Tables I and II.

3 Chemical Name and CAS Registry Number

Inhalation lactose is lactose monohydrate, O-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose monohydrate (*see* Lactose Monohydrate), or anhydrous lactose, O-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose, or a mixture of O-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose and O-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose (*see* Lactose, Anhydrous).

CAS numbers for lactose monohydrate include [5989-81-1] (lactose monohydrate); [10039-26-6] (lactose monohydrate, cyclic), and [64044-51-5] (lactose monohydrate, open form). The CAS number for anhydrous lactose is [63-42-3].

L

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30 (for anhydrous)
$C_{12}H_{22}O_{11}\cdot H_2O$ 360.31 (for monohydrate)

5 Structural Formula

See Lactose, Anhydrous; Lactose Monohydrate.

6 Functional Category

Dry powder inhaler carrier.

7 Applications in Pharmaceutical Formulation or Technology

Inhalation lactose is widely used as a carrier, diluent, and flow aid in dry powder inhalation formulations. Inhalation lactose of suitable particle size can also be used to prepare soft pellets of dry powder inhaler formulations.

See also Lactose, Anhydrous; Lactose Monohydrate.

8 Description

Lactose occurs as white to nearly white crystalline particles or powder. It is odorless and slightly sweet-tasting.

9 Pharmacopeial Specifications

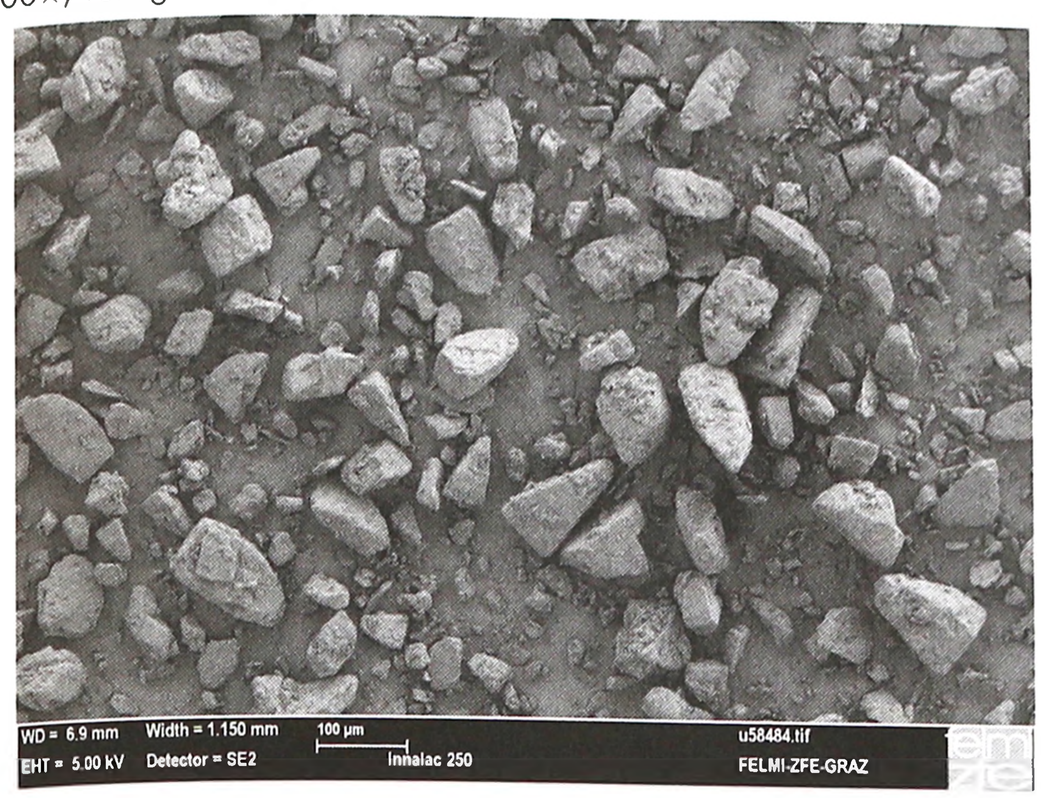
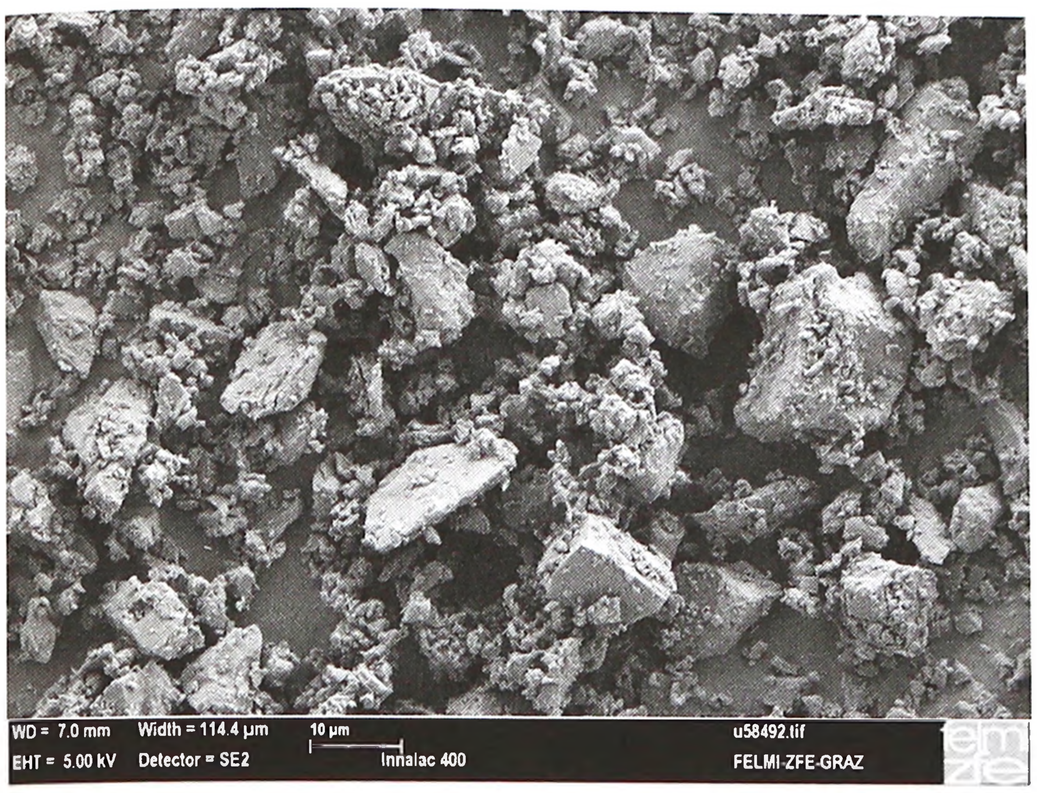
(b) Malvern (wet) laser diffraction.

12 Incompatibilities



Lactose is a reducing sugar. Typical reactions include the Maillard reaction with either primary[1] or secondary amines.[2]

See also Lactose, Anhydrous; Lactose Monohydrate.



13 Method of Manufacture

Inhalation lactose is manufactured by milling, sieving, air classifying, micronizing and/or blending pharmaceutical grade lactose, typically in dedicated facilities with suitable equipment in place to

SEM 1: Excipient: *InhaLac 250*; manufacturer: Meggle; magnification: 100×; voltage: 5.0 kV.

SEM 2: Excipient: *InhaLac 400*; manufacturer: Meggle; magnification: 1000×; voltage: 5.0 kV.

ensure low endotoxin levels. Although off-the-shelf grades are available, lactose manufacturing processes can be tailored to produce properties for specific applications.

14 Safety

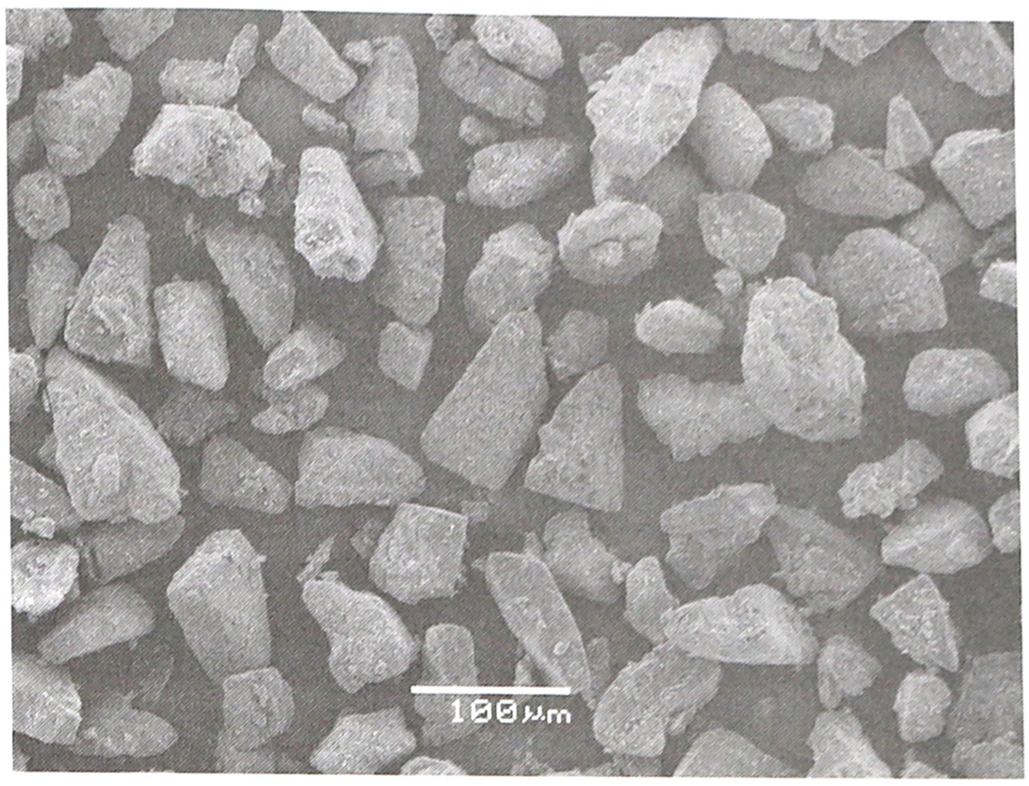
See Lactose Monohydrate.

In view of the route of administration, inhalation lactose should be tested to additional microbiological specifications, for example, endotoxins, as requested by regulatory authorities. Inhalation lactose is typically supplied with increased microbiological tests.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material being handled. Avoid excessive dust generation and inhalation.

16 Regulatory Status



GRAS listed. Lactose monohydrate and lactose anhydrous are included in the FDA Inactive Ingredients Database (powder for inhalation). Lactose monohydrate and lactose anhydrous are included in inhaled products licensed in the UK.

See also Lactose, Anhydrous; Lactose Monohydrate.

SEM 4: Excipient: *Respitose ML001*; manufacturer: DFE Pharma; magnification: 1000×; voltage: 5 kV.

L

18 Comments

Lactose is one of a very few excipients used in marketed dry powder inhaler products. Specific grades of inhalation lactose can be produced from the wide range of pharmaceutical lactose grades readily available using standard pharmaceutical manufacturing processes. Lactose is found in capsule, blister, and reservoir-based dry powder inhaler products. The relatively low mass per lactose dose in dry powder inhaler products results in a relatively low lactose level being ingested by the patient compared with traditional oral solid dosage forms.

In view of the importance of particle characteristics for lactose processing (micronization, milling, etc), powder blending and drug product performance,[3–12] it has been suggested that pharmacopeial monograph acceptance criteria are not adequate for controlling key physicochemical characteristics for inhalation applications of this excipient. Accordingly, further material controls may be required to ensure consistent drug product pharmaceutical performance, for example the control of surface properties.

The effect of modifying the surfaces of lactose particles by particle smoothing, crystallization, and coprocessing with other excipients on the aerosolization performance has been reported.[13–19]

Lactose Monohydrate

1 Nonproprietary Names

BP: Lactose Monohydrate

JP: Lactose Hydrate

PhEur: Lactose Monohydrate

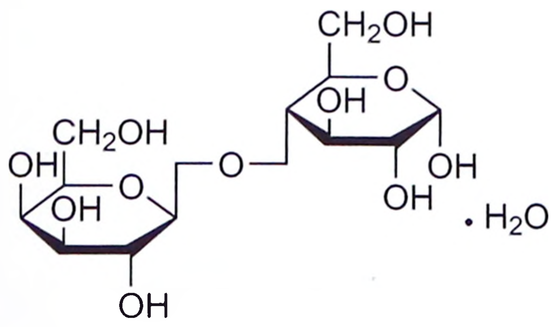
USP–NF: Lactose Monohydrate

2 Synonyms

CapsuLac; *Foremost*; *GranuLac*; *Lactochem*; lactosum monohydricum; *Monohydrate*; *Pharmatose*; *Lactopress Granulated*; *PrismaLac*; *SacheLac*; *SorboLac*; *SpheroLac*; *SuperTab 30GR*; *Tablettose*.

For grades, *see* Tables II and III in Section 10.

3 Chemical Name and CAS Registry Number



O-β-D-Galactopyranosyl-(1→4)-α-D-glucopyranose monohydrate

CAS Registry numbers for lactose monohydrate include [5989-81-1] (lactose monohydrate), [10039-26-6] (lactose monohydrate, cyclic), and [64044-51-5] (lactose monohydrate, open form).

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}\cdot H_2O$ 360.31

5 Structural Formula

α-Lactose monohydrate

The USP 40–NF 35 S1, PhEur 9.2 and JP XVII describe lactose monohydrate as the monohydrate of O-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose. It is stated in the USP 40–NF 35 S1 that the physical characteristics of lactose monohydrate may be modified and may contain varying proportions of amorphous lactose.

6 Functional Category

Dry powder inhaler carrier; lyophilization aid; tablet and capsule binder; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Lactose is widely used as a filler and diluent in tablets and capsules, and to a more limited extent in lyophilized products and infant formulas.[1–9] Lactose is also used as a diluent in dry-powder inhalation drug delivery; *see* Lactose, Inhalation. Various lactose grades are commercially available that have different physical properties such as median particle size and particle size distribution, flow characteristics, and physical form (sieved, milled, or agglomerated). This permits the selection of the most suitable material for a particular application; for example, the particle size range selected for capsule formulation is often dependent on the type of encapsulating machine used. Fine or milled lactose grades are typically used for tablets prepared by the wet-granulation processes or when milling during manufacture is performed, since the smaller particle size allows better mixing with other formulation ingredients and utilizes the binder more efficiently.

Other applications of lactose include use in lyophilized products, where lactose is added to freeze-dried solutions to increase plug size and aid cohesion. Lactose is also used in combination with sucrose (approximately 1 : 3) to prepare sugar-coating solutions. It may also be used in intravenous injections. Lactose is also used in dry powder formulation manufacture and aqueous film-coating solutions or suspensions.

Direct-compression grades of lactose monohydrate are available as granulated/agglomerated α-lactose monohydrate, which may contain low levels of anhydrous lactose.

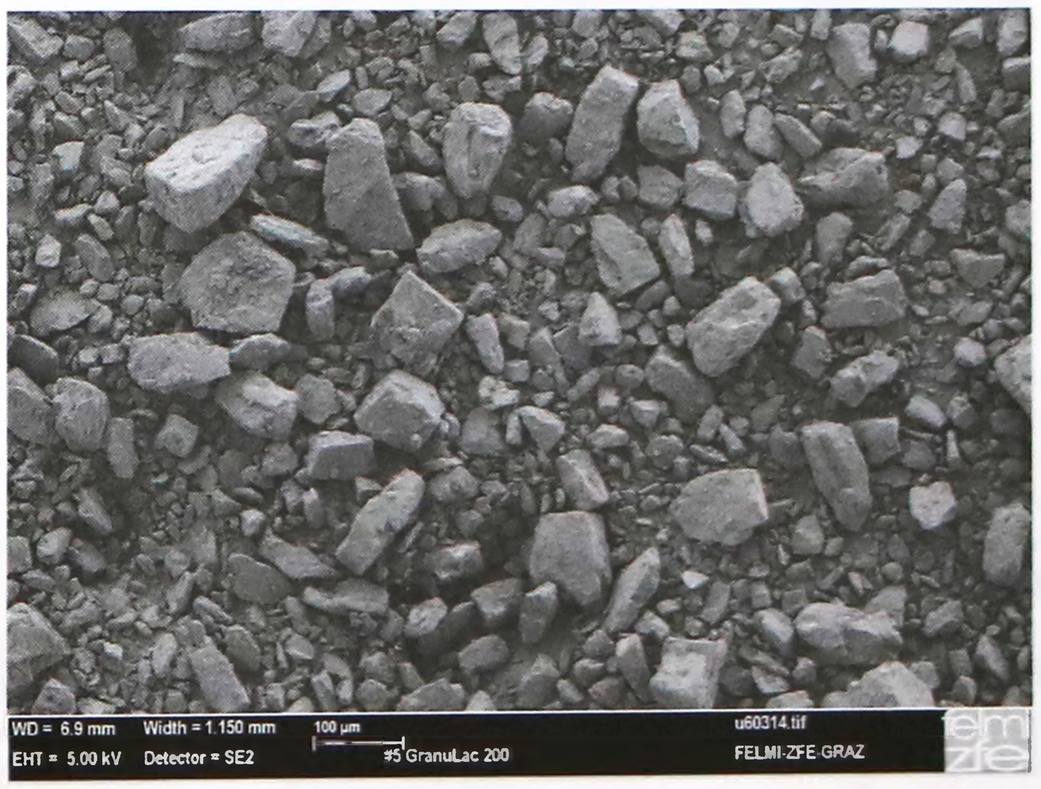
Direct-compression grades are often used to carry lower drug quantities, permitting tablets to be made without granulation processing.

Other directly compressible lactose grades include spray-dried lactose and anhydrous lactose; *see* Lactose, Spray-Dried and Lactose, Anhydrous.

8 Description

In the solid state, lactose appears as various isomeric forms, depending on crystallization and drying conditions, i.e. α-lactose monohydrate, β-lactose anhydrous, and α-lactose anhydrous. Stable lactose crystalline forms include α-lactose monohydrate, β-lactose anhydrous, and α-lactose anhydrous.

Lactose occurs as white to nearly white crystalline particles or powder. Lactose is odorless and slightly sweet-tasting; α-lactose is approximately 20% as sweet as sucrose, while β-lactose is 40% as sweet.

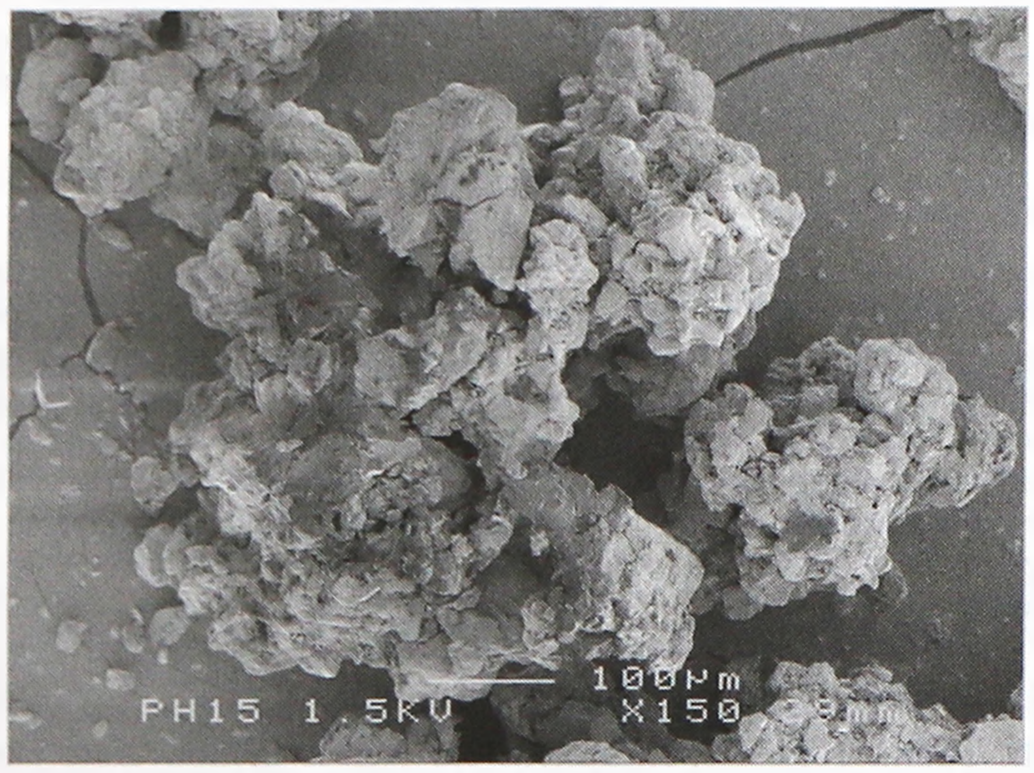


9 Pharmacopeial Specifications

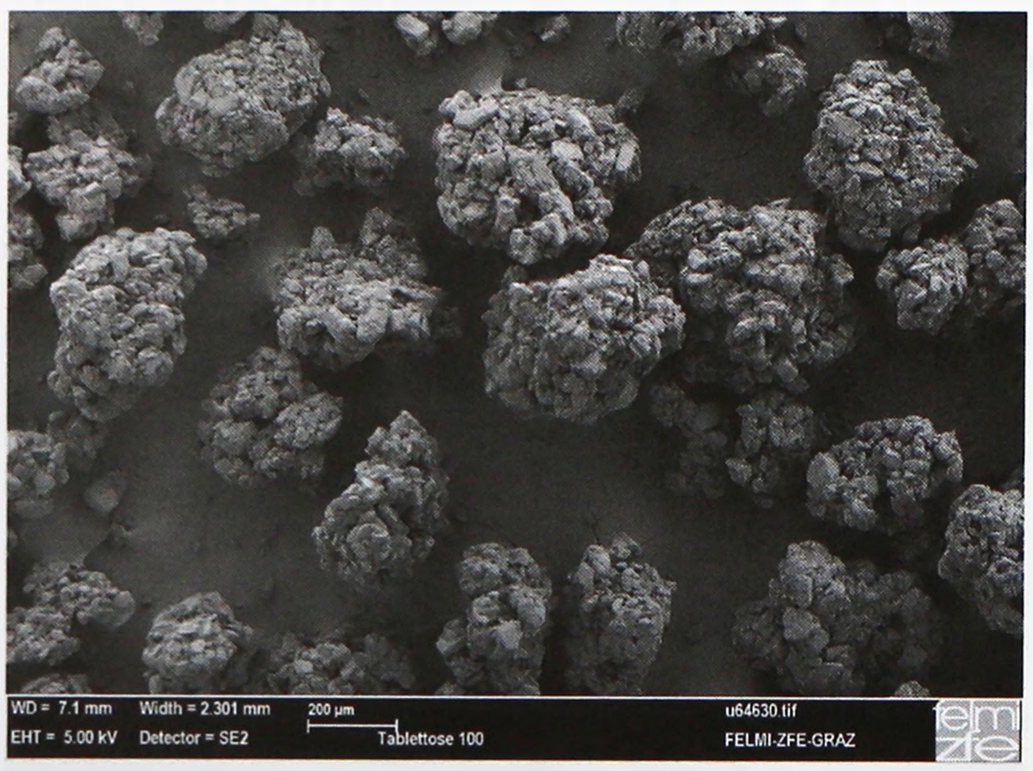
The pharmacopeial specifications for lactose monohydrate have undergone harmonization of many attributes for JP, PhEur, and USP-NF. *See* Table I. *See also* Section 18.

10 Typical Properties

Density (true) 1.545 g/cm^3 (for α-lactose monohydrate)
Density (bulk) *see* Table II.



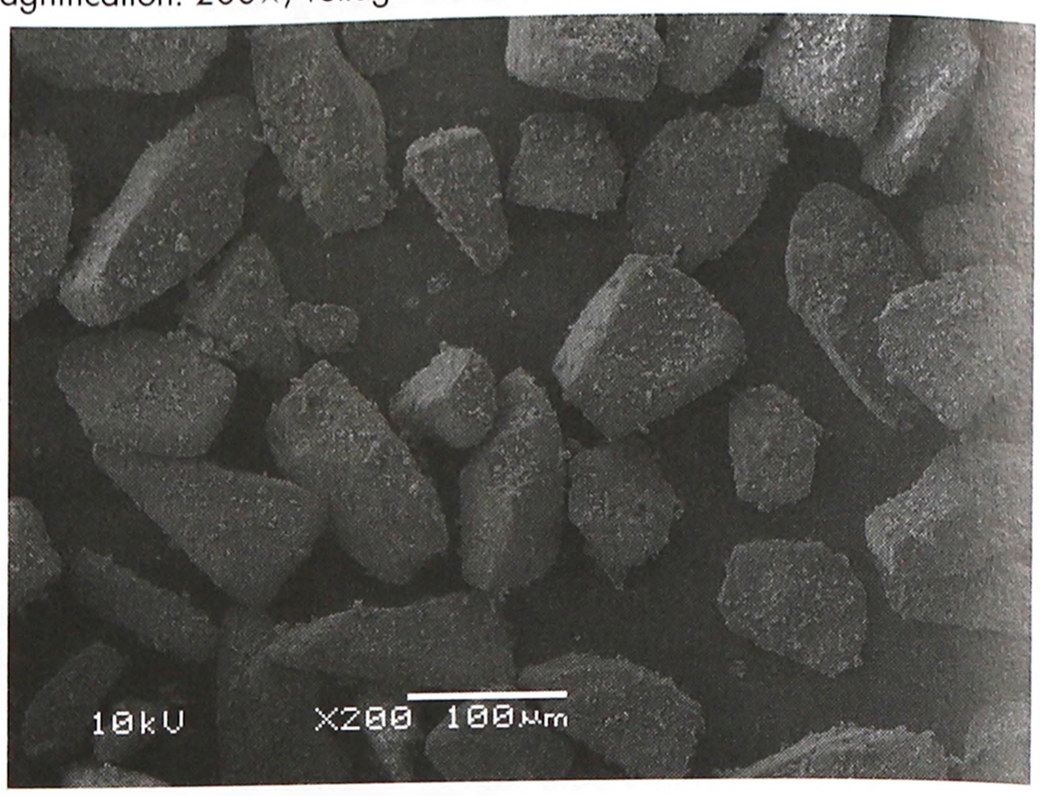
SEM 1: Excipient: *GranuLac 200*; manufacturer: Meggle; magnification: 100×; voltage: 1.5 kV.



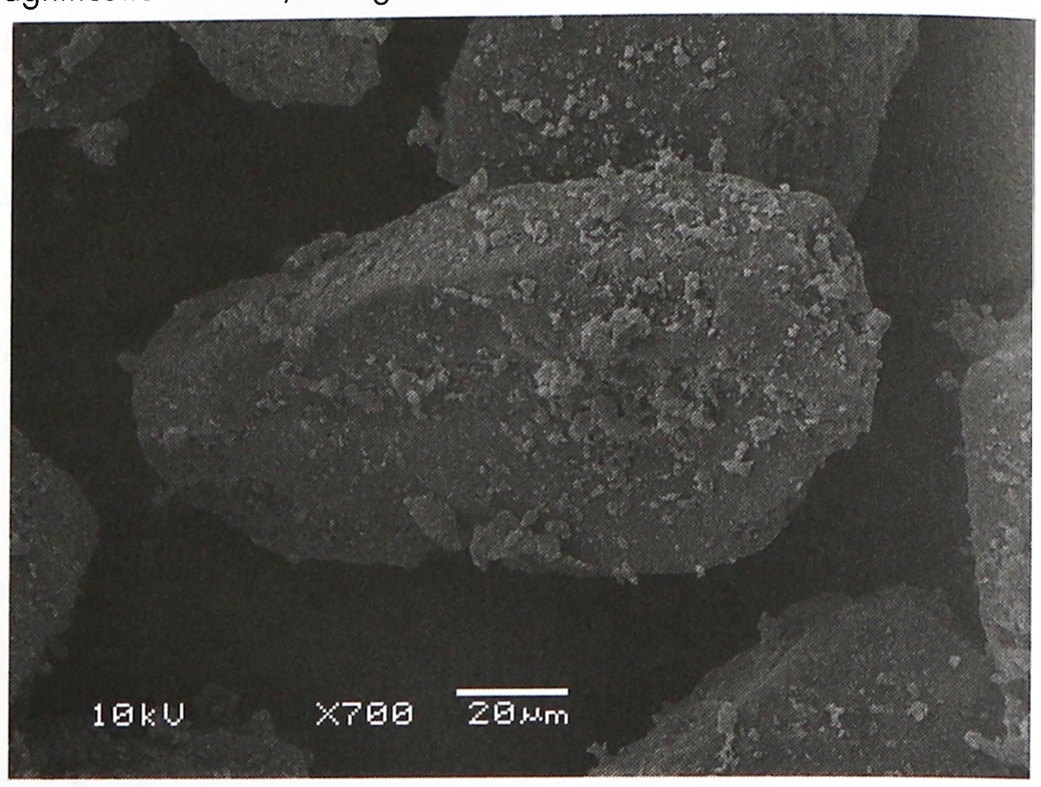
SEM 2: Excipient: *Pharmatose 125M*; manufacturer: DFE Pharma; magnification: 100×; voltage: 1.5 kV.

SEM 3: Excipient: *SuperTab 30GR*; manufacturer: DFE Pharma; magnification: 150×; voltage: 1.5 kV.

SEM 4: Excipient: *Tablettose 100*; manufacturer: Meggle; magnification: 50×; voltage: 5.0 kV.



Density (tapped) *see* Table II.



Melting point 201–202°C (for dehydrated α-lactose monohydrate)

Moisture content Lactose monohydrate contains approximately 5% w/w water of crystallization and normally has a range of 4.5–5.5% w/w water content.

SEM 5: Excipient: *Lactochem Crystals*; manufacturer: DFE Pharma; magnification: 200×; voltage: 10 kV.

SEM 6: Excipient: *Lactochem Crystals*; manufacturer: DFE Pharma; magnification: 700×; voltage: 10 kV.

Particle size distribution *see* Table III.

Solubility *see* Table IV.

Specific rotation $[\alpha]_D^{20}$ = +54.4° to +55.9° as a 10% w/v solution. Lactose exhibits mutarotation, and an equilibrium mixture containing 62% β-lactose and 38% α-lactose is obtained instantly on trace ammonia addition or under acidic conditions.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Mold growth may occur under humid conditions (80% relative humidity and above). Lactose may develop a brown coloration on storage, the reaction being accelerated by warm, damp conditions; *see* Section 12. The purities of different lactoses types/grades can vary and color evaluation may be important, particularly if white tablets are being formulated. The color stabilities of various lactoses types/grades also differ.

Solutions show mutarotation; *see* Section 10.

Lactose monohydrate has been shown to absorb odors from its surroundings. It should be stored in a well-closed container in a cool, dry, odor-free place.

(a) For USP–NF, lactose monohydrate may be modified as to its physical characteristics. It may contain varying proportions of amorphous lactose.
(b) The definition of JP also covers granulated lactose, with a lower limit of 4.0% of water, i.e. 4.0–5.5%.
(c) For granulated powder, ≤1.0%.
(d) For modified monohydrate form, ≤1.0%.

12 Incompatibilities

Lactose monohydrate is a reducing sugar with the potential to react with primary[10] and, with much less frequency, secondary[11] amines when stored under high-humidity conditions for extended periods. A Maillard-type condensation reaction occurs, forming yellow-brown to brown or darker-colored products. The chemistry underlying the Maillard reaction is very complex, encompassing more than one reaction pathway. For example, one reaction sequence stops with the formation of the imine, and no yellow-brown coloration develops. It has been reported that minor components such as lactose phosphates may enhance the degradation of steroids.[12]

Examples of APIs incompatible with lactose include amino acids, amphetamines,[13] and lisinopril.[14]

13 Method of Manufacture

Lactose is a natural disaccharide consisting of galactose and glucose moieties bridged by a 1→4 glycosidic bond, and is present in the milk of most mammals. Commercially, lactose is produced from the whey of cows' (bovine) milk; whey being the residual liquid of milk following cheese and casein production. Cows' milk contains 4.4–5.2% lactose; lactose constitutes approximately 38% of the total solid content of milk.

α-Lactose monohydrate is prepared by crystallization from supersaturated solutions below 93.5°C. Various crystalline shapes include prism, pyramidal, and monoclinic sphenoidal or 'tomahawk'. These shapes are dependent on the precipitation and crystallization method. Direct compression grades of α-lactose monohydrate are prepared by granulation/agglomeration and spray-drying.

14 Safety

Lactose is widely used in pharmaceutical formulations as a filler and filler-binder in oral capsule and tablet formulation development and manufacture. It may also be used in intravenous injections. Adverse reactions to lactose are largely attributed to lactose intolerance, which occurs in individuals with a low intestinal lactase enzyme activity.[15–18] This results in lactose being undigested and may lead to cramping, diarrhea, distension, and flatulence. In lactose-tolerant individuals, lactase hydrolyzes lactose in the small intestine to glucose and galactose, which are then absorbed. Lactase levels are normally high at birth, declining rapidly in early childhood. Lactose malabsorption (hypolactasia) may occur as early as age 4–8 years and varies among different ethnic groups. Lactose is excreted unchanged when administered intravenously.

Lactose intolerance symptoms are predominantly caused by the osmotic effect of the unabsorbed lactose, which increases water and sodium levels in the lumen. Unabsorbed lactose, upon reaching the colon, can be fermented by colonic flora, which produces gas and other pharmacologically active metabolites, causing abdominal

distension and discomfort as well as flatulence. A lactose tolerance test has been developed based on the measurement of blood glucose level and the hydrogen level in the breath. However, its usefulness has been questioned as the test is based on a 50 g dose of lactose. Lactose meeting pharmacopeial requirements is purified so that milk proteins, which may cause lactose intolerance, are significantly reduced compared to less refined lactose.

Approximately 10–20% of lactose-intolerant individuals, in two studies, showed clinical symptoms of intolerance after ingestion of 3–5 g of lactose.[15,16] In one of the studies,[15] 75% of the subjects had symptoms with 12 g of lactose (equivalent to 250 mL of milk). In another,[16] eight out of 13 individuals developed diarrhea after the administration of 20 g of lactose, and nine out of 13 after the administration of 25 g.

Lower doses of lactose produce fewer adverse effects, and lactose is better tolerated if taken with other foods. As a result, there is a significant population with lactose malabsorption who are still able to ingest 'normal' amounts of lactose, such as that in milk, without the development of adverse side-effects.[17]

Most adults consume about 25 g of lactose per day (500 mL of milk) without symptoms.[18,19] When symptoms appear, they are usually mild and dose-related. A common threshold for lactose intolerance symptoms is a glass of milk, which is equivalent to approximately 250 mL, and therefore 12 g lactose.[20] The dose of lactose in most pharmaceutical products seldom exceeds 2 g per day. It is unlikely that severe gastrointestinal symptoms can be attributed to the lactose in conventional oral solid-dosage forms, especially in adults who have not previously been diagnosed as severely lactose-intolerant. However, anecdotal reports of drug-induced diarrhea due to lactose intolerance have been made following administration of pharmaceutical preparations containing lactose.

It has also been suggested that lactose intolerance may have a role in irritable bowel syndrome, but this role is currently unclear.[21]

In the past, there have been concerns over the transmissible spongiform encephalopathies (TSE) contamination of animal-derived products. However, in the light of current scientific knowledge, and irrespective of geographical origin, milk and milk derivatives are reported as unlikely to present any risk of TSE contamination; TSE risk is negligible if the calf rennet is produced in accordance with regulations.[22]

LD_{50} (rat, IP): >10 g/kg
LD_{50} (rat, oral): >10 g/kg
LD_{50} (rat, SC): >5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Avoid excessive dust generation or inhalation.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, and SC: powder for injection; oral: capsules, tablets and granules/powders for suspension; inhalation preparations; vaginal preparations; buccal and sublingual tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lactose, anhydrous; lactose, inhalation; lactose monohydrate and corn starch, coprocessed; lactose monohydrate and microcrystalline

cellulose, coprocessed; lactose monohydrate and povidone, coprocessed; lactose monohydrate and powdered cellulose, coprocessed; lactose, spray-dried.

18 Comments

Lactose monohydrate has undergone harmonization for many attributes for JP, PhEur, and USP-NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

A number of different grades of lactose are commercially available varying in physical properties. Many studies have been reported in the literature comparing the behavior of these various materials in different formulations.[5,8,9] A number of co-processed excipients containing lactose are available for direct compression applications: co-processed lactose and starch (*StarLac*, Meggle/Roquette Frères),[23] lactose and microcrystalline cellulose (*MicroceLac 100*, Meggle);[24] lactose and cellulose powder (*Cellactose 80*, Meggle);[25,26] lactose and hypromellose (*RetaLac*, Meggle); lactose, povidone, and crospovidone (*Ludipress*, *Ludipress LCE*, BASF).[27]

Lactose may exhibit complex thermoanalytical transitions because of its various crystalline and amorphous forms. Differential scanning calorimetry (DSC) can be used effectively to characterize lactose composition.[28–30] For example, α-lactose becomes anhydrous at approximately 120°C. α-Lactose monohydrate may also contain a small quantity of the β-form. Additionally, lactose monohydrate has been reported to be the least prone to caking compared to anhydrous and spray-dried lactose.[31]

A specification for lactose is included in the *Food Chemicals Codex* (FCC).[32]

The EINECS number for lactose is 200-559-2. The PubChem Compound ID (CID) for lactose monohydrate includes 62223 and 104938.

Lactose Monohydrate and Corn Starch, Coprocessed

1 Nonproprietary Names

None adopted.

2 Synonyms

StarLac.

3 Chemical Name and CAS Registry Number

See Section 8.

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Direct compression excipient; tablet and capsule diluent; tablet and capsule disintegrant.

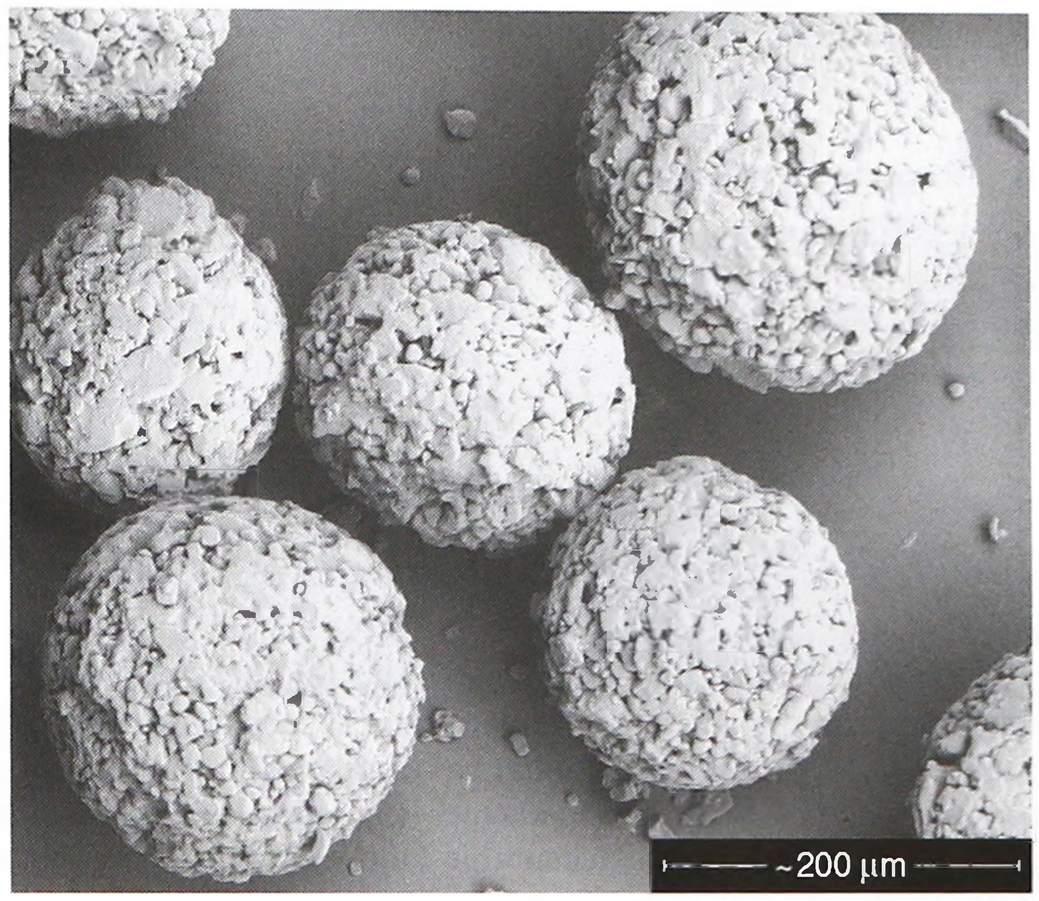
7 Applications in Pharmaceutical Formulation or Technology

Coprocessed lactose monohydrate and corn starch can be used in tablets to improve compressibility, powder flow, and disintegration properties.[1] In addition to its traditional low- to mid-dose pharmaceutical formulation applications, it is used in homeopathic formulations to enable direct compression.

8 Description

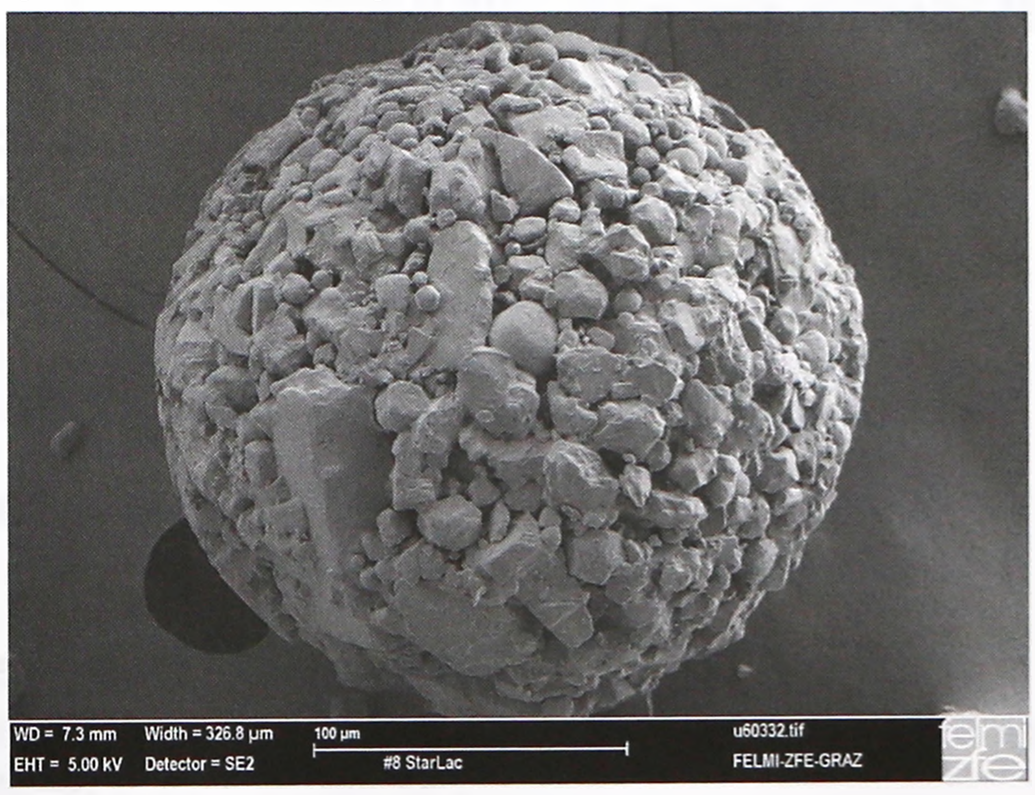
Coprocessed α-lactose monohydrate and corn starch occurs as a white to nearly white odorless powder comprising of 82–88% lactose monohydrate and 12–18% corn (maize) starch in an integrated particle, which cannot be achieved via simple blending. It is a free-flowing powder owing to its spherical structure and typical median particle size.

9 Pharmacopeial Specifications



Both lactose monohydrate and corn (maize) starch are listed as separate monographs in the JP, PhEur, and USP–NF, but the combination is not currently listed. The pharmacopeial specifications for lactose monohydrate and corn starch have been harmonized for JP, PhEur, and USP–NF.

See Lactose Monohydrate, and Starch. *See also* Section 18.



10 Typical Properties

Angle of repose ≤29° for *StarLac*
Density (bulk) 0.57 g/cm^3 for *StarLac*
Density (tapped) 0.68 g/cm^3 for *StarLac*

SEM 1: Excipient: *StarLac*; manufacturer: Meggle/Roquette; magnification: 200×; voltage: 2 kV.

SEM 2: Excipient: *StarLac*; manufacturer: Meggle/Roquette; magnification: 350×; voltage: 5 kV.

Hausner ratio 1.19 for *StarLac*
Heavy metals 5 ppm for *StarLac*
Loss on drying ≤3.0% for *StarLac*
Microbial content Total viable aerobic count ≤100 cfu/g, molds <10 cfu/g, yeasts <10 cfu/g (*Escherichia coli* and *Salmonella* species absent) for *StarLac*.
Particle size distribution ≤15% <32 µm, 35–65% <160 µm, ≥80% <250 µm for *StarLac*.
Sulfated ash ≤0.25% for *StarLac*
Solubility Partially soluble in cold water for *StarLac*.

11 Stability and Storage Conditions

Store in well-closed containers under dry and odor-free conditions.

12 Incompatibilities

See Lactose Monohydrate, and Starch.

13 Method of Manufacture

Coprocessed lactose monohydrate and corn starch is prepared by co-spray-drying a mixture of the two ingredients.

14 Safety

See Lactose Monohydrate, and Starch.

L

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Coprocessed lactose monohydrate and corn starch is a mixture of two materials both of which are generally regarded as nontoxic:
Lactose monohydrate GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, and SC: powder for injection; oral: capsules, tablets and granules/powders for suspension; inhalation preparations; vaginal preparations; buccal and sublingual tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian List of Acceptable Non-medicinal Ingredients.
Starch GRAS listed. Included in the FDA Inactive Ingredients Database (buccal tablets; oral capsules, powders, suspensions, syrups, drops, pastilles, and tablets; topical preparations; vaginal tablets; IM injections; sublingual and rectal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian List of Acceptable Non-medicinal Ingredients.

17 Related Substances

Lactose Monohydrate; starch.

18 Comments

StarLac has been designed for direct compression, combining good flowability, compressibility, and fast disintegration properties. Excipients or formulations containing a variety of drugs, namely ascorbic acid, acetaminophen [paracetamol] and theophylline monohydrate show it to be superior to simple mixtures of its component ingredients in terms of flowability, tablet breaking force, friability and disintegration time.[1,2] Lactose and starch particles are integrated into a matrix mainly consisting of crystalline α-lactose monohydrate (~85%) and corn starch (~15%), with very low amorphous lactose levels detected. Its balanced plastic and brittle properties make it suitable for roller compaction. Specific quantitative, analytical methods for the assay of starch and lactose in *StarLac* have been developed and validated.[3]

Lactose Monohydrate and Microcrystalline Cellulose, Coprocessed

1 Nonproprietary Names

None adopted.

2 Synonyms

MicroceLac 100.

3 Chemical Name and CAS Registry Number

See Section 8.

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Tablet and capsule diluent; direct compression excipient.

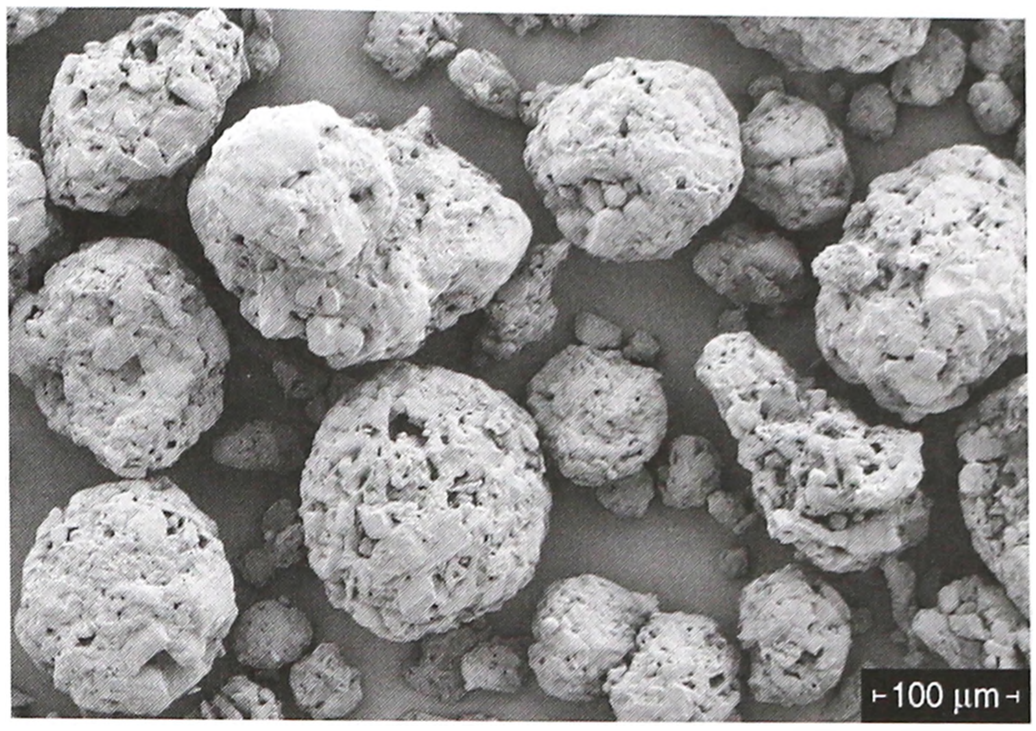
7 Applications in Pharmaceutical Formulation or Technology

Coprocessed lactose monohydrate and microcrystalline cellulose can be used in tablets for direct compression, as a capsule diluent, and as a filler-binder in roller compaction processes.[1]

8 Description

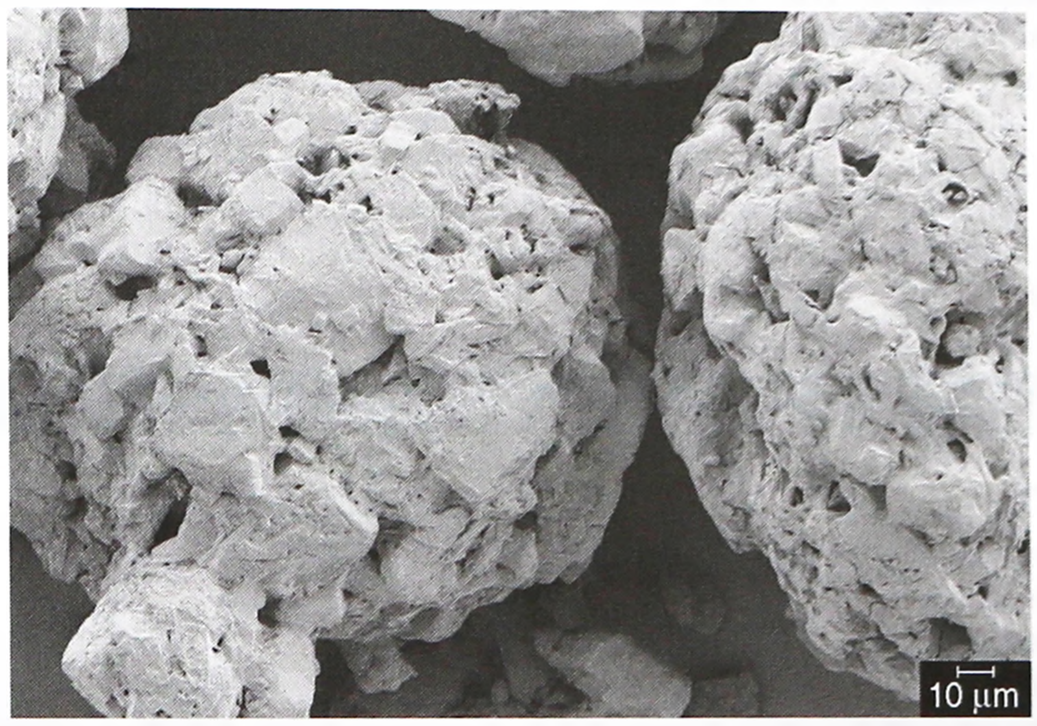
Coprocessed lactose monohydrate and microcrystalline cellulose occurs as a white to nearly white odorless powder comprising of 73–77% lactose monohydrate and 23–27% microcrystalline cellulose in an integrated particle, which cannot be achieved via simple blending. It is a free-flowing powder due to its spherical structure and typical median particle size.

9 Pharmacopeial Specifications



Both lactose monohydrate and microcrystalline cellulose are listed as separate monographs in the JP, PhEur, and USP–NF, but the combination is not currently listed. The pharmacopeial specifications for both lactose monohydrate and microcrystalline cellulose have undergone harmonization for many attributes for JP, PhEur, and USP-NF.

See Lactose Monohydrate, and Cellulose, Microcrystalline. *See also* Section 18.



10 Typical Properties

Acidity/alkalinity pH = 4.0–7.0 for *MicroceLac 100*
Angle of repose 34° for *MicroceLac 100*
Density (bulk) 0.5 g/cm^3 for *MicroceLac 100*
Density (tapped) 0.61 g/cm^3 for *MicroceLac 100*
Hausner ratio 1.16 for *MicroceLac 100*
Heavy metals ≤5 ppm for *MicroceLac 100*
Loss on drying ≤1.5% for *MicroceLac 100*
Microbial content Total viable aerobic count ≤100 cfu/g, molds ≤10 cfu/g, yeasts ≤10 cfu/g (*Escherichia coli* and *Salmonella* species absent) for *MicroceLac 100.*
Particle size distribution ≤15% <32 µm, 45–70% <160 µm, ≥90% <250 µm for *MicroceLac 100.*
Solubility Partially soluble in water for *MicroceLac 100*

SEM 1: Excipient: *MicroceLac 100*; manufacturer: Meggle; magnification: 200×; voltage: 3 kV.

SEM 2: Excipient: *MicroceLac 100*; manufacturer: Meggle; magnification: 500×; voltage: 3 kV.

Sulfated ash ≤0.1% for *MicroceLac 100*
Water content 4–6% for *MicroceLac 100*

11 Stability and Storage Conditions

Store at room temperature in well-closed containers under dry and odor-free conditions.

12 Incompatibilities

See Lactose Monohydrate, and Cellulose, Microcrystalline.

13 Method of Manufacture

Coprocessed lactose monohydrate and microcrystalline cellulose is prepared by co-spray-drying a mixture of the two ingredients.

14 Safety

See Lactose Monohydrate, and Cellulose, Microcrystalline.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Coprocessed lactose monohydrate and microcrystalline cellulose is a mixture of two materials, both of which are generally regarded as nontoxic:

Lactose monohydrate GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, and SC: powder for injection; oral: capsules, tablets and granules/powders for suspension and tablets; inhalation preparations; vaginal preparations; buccal and sublingual tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Microcrystalline cellulose Although not GRAS listed, the Select Committee on GRAS Substances (SCOGS) regard the current and future use of Microcrystalline Cellulose as non-hazardous.[2] Included in the FDA Inactive Ingredients Database (inhalations; injections; oral capsules, powders, granules, suspensions, syrups, and tablets; topical and vaginal preparations; transdermal patches). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Accepted for use as a food additive in Europe.

17 Related Substances

Cellulose, Microcrystalline; lactose monohydrate.

18 Comments

MicroceLac 100 has been designed for formulating high-dose tablets with poorly flowing and compacting active ingredients. It showed superior flow and binding properties compared to simple mixtures of its components.[3,4] Differences between *MicroceLac 100* and *Cellactose 80* have recently been evaluated.[5]

A specification for lactose and microcrystalline cellulose spheres is contained in the *Japanese Pharmaceutical Excipients* (JPE);[6] *see* Table I.

Table I: JPE specification for lactose and microcrystalline cellulose spheres.

Test	JPE 2004
Description	+
Identification	+
Heavy metals	≤5 ppm
Arsenic	≤2 ppm
Loss on drying	≤5.0%
Water	≤9.0%
Residue on ignition	≤0.1%
Assay (dried basis)	
Lactose	60-80%
Microcrystalline cellulose	20-40%

Lactose Monohydrate and Povidone, Coprocessed

1 Nonproprietary Names

None adopted.

2 Synonyms

Ludipress LCE.

3 Chemical Name and CAS Registry Number

See Section 8.

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Tablet and capsule diluent; direct compression excipient.

7 Applications in Pharmaceutical Formulation or Technology

Coprocessed lactose monohydrate and povidone can be used to formulate chewable tablets, lozenges, effervescent tablets, and controlled-release tablets by direct compression.[1,2] It is suitable for low-dose drugs.[3]

8 Description

Coprocessed lactose monohydrate and povidone occurs as white free-flowing granules, odorless with a neutral taste, containing 96.5% ± 1.8% lactose monohydrate and 3.5% ± 0.5% povidone K30.

9 Pharmacopeial Specifications

Both lactose monohydrate and povidone are listed as separate monographs in the JP, PhEur, and USP–NF, but the combination is not currently listed. The pharmacopeial specifications for both lactose monohydrate and povidone have undergone harmonization for many attributes for JP, PhEur, and USP-NF.

See Lactose Monohydrate, and Povidone. *See also* Section 18.

10 Typical Properties

Angle of repose 29.5° for *Ludipress LCE*
Density (bulk) 0.56 ± 0.6 g/cm^3 for *Ludipress LCE*
Hausner ratio 1.20 ± 0.10 for *Ludipress LCE*
Heavy metals ≤10 ppm for *Ludipress LCE*
Loss on drying 5.75% for *Ludipress LCE*
Microbial content Mesophilic aerobes ≤1000 cfu/g, yeasts and fungi ≤100 cfu/g (*Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Salmonella* species absent), other Enterobacteriaceae ≤100 cfu/g) for *Ludipress LCE.*
Particle size distribution ≤20% <63 µm, 40–65% <200 µm, ≤20% <400 µm for *Ludipress LCE.*
Solubility Soluble in water for *Ludipress LCE*
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Water content ≤6.0% for *Ludipress LCE*

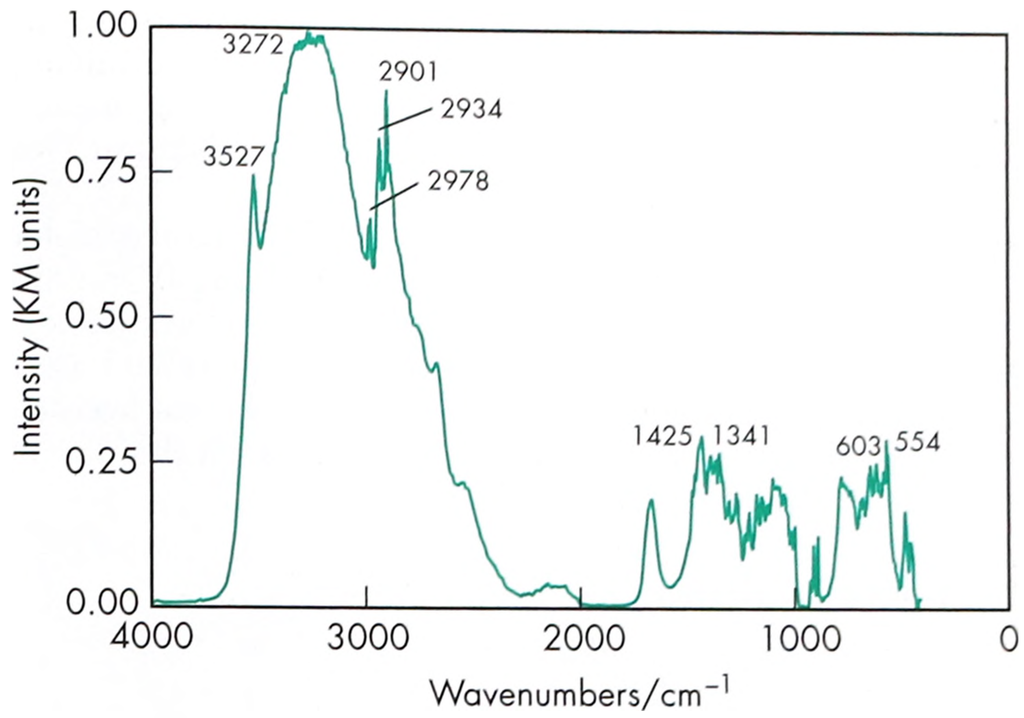

Figure 1: Infrared spectrum of coprocessed lactose monohydrate and povidone measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

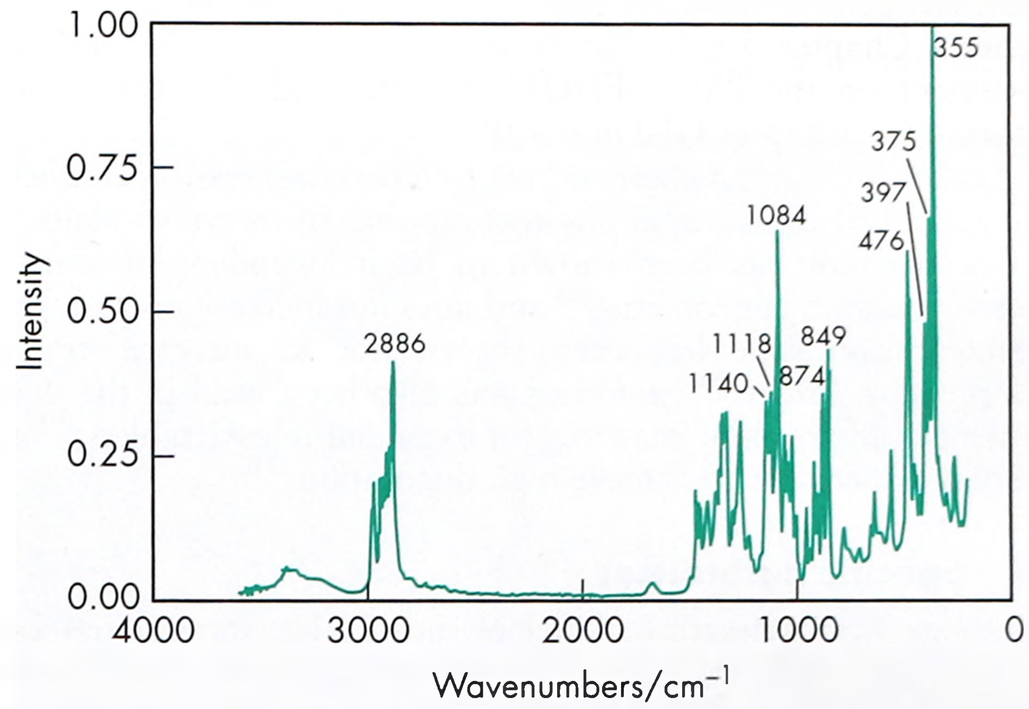

Figure 2: Raman spectrum of coprocessed lactose monohydrate and povidone measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Store at room temperature in tightly closed containers.

12 Incompatibilities

See Lactose Monohydrate, and Povidone.

13 Method of Manufacture

Coprocessed lactose monohydrate and povidone is manufactured by a proprietary agglomeration process.

14 Safety

See Lactose Monohydrate, and Povidone.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Coprocessed lactose monohydrate and povidone is a mixture of two materials both of which are generally regarded as nontoxic:

Lactose monohydrate GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, and SC: powder for injection; oral: capsules, tablets and granules/powders for suspension; inhalation preparations; vaginal preparations; buccal and sublingual tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Povidone Accepted for use in Europe as a food additive. Included in the FDA Inactive Ingredients Database (IM and IV injections; ophthalmic preparations; oral capsules, drops, granules, suspensions, and tablets; sublingual tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lactose monohydrate; povidone.

18 Comments

Lactose monohydrate and povidone have both undergone harmonization for many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Ludipress LCE has been shown to have compression characteristics superior to a simple physical mixture of its constituents.[4,5] Tablet strength has been shown to be independent of machine speed[5] and tablet geometry,[6] and does not increase on storage.[7] Disintegration time has been shown not to increase at high compression forces.[8] *Ludipress* has also been used in the development of hydrophilic matrices for extended-release tablets,[9] and in solid dispersions to achieve high dissolution.[10]

Lactose Monohydrate and Powdered Cellulose, Coprocessed

1 Nonproprietary Names

None adopted.

2 Synonyms

Cellactose 80.

3 Chemical Name and CAS Registry Number

See Section 8.

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Tablet and capsule diluent.

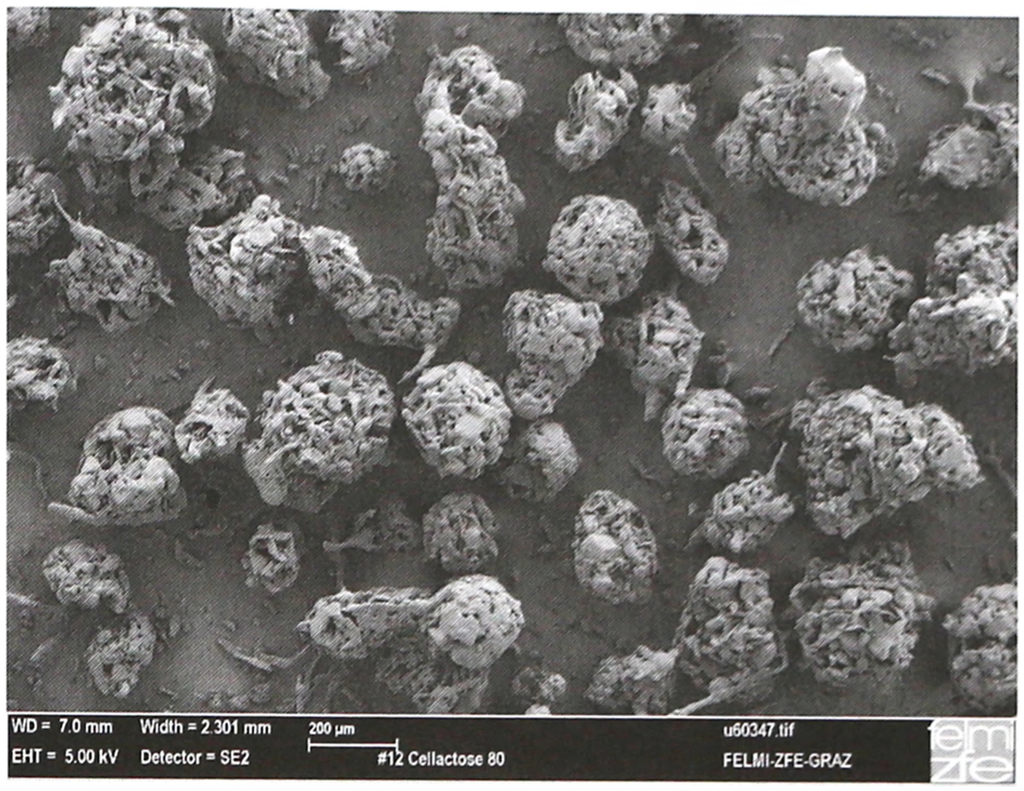
7 Applications in Pharmaceutical Formulation or Technology

Coprocessed lactose monohydrate and powdered cellulose can be used for tablet manufacture by direct compression to improve compressibility and mouth-feel.[1] Coprocessed lactose monohydrate and powdered cellulose has also been investigated for roller compaction processes.[2]

8 Description

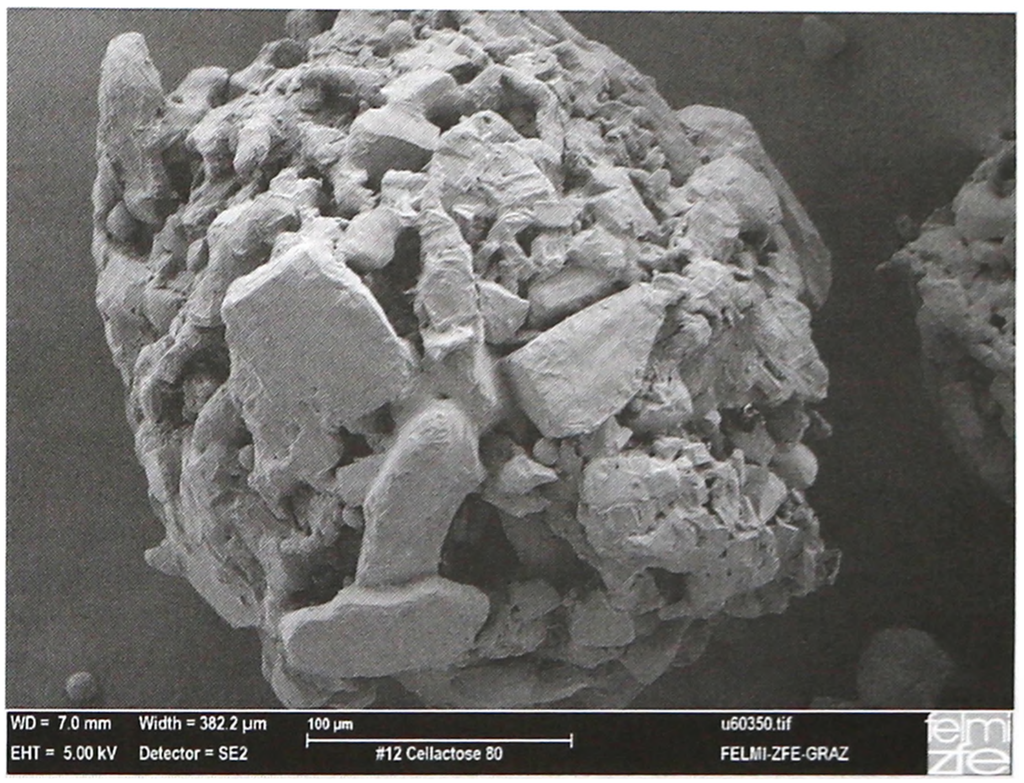
Coprocessed lactose monohydrate and powdered cellulose occurs as a white to nearly white odorless powder comprising of 73–77% lactose monohydrate and 23–27% cellulose powder in an integrated particle, which cannot be achieved via simple blending. It is a free-flowing powder due to its spherical structure and typical median particle size.

9 Pharmacopeial Specifications



Both lactose monohydrate and powdered cellulose are listed as separate monographs in the JP, PhEur, and USP–NF, but the combination is not currently listed. The pharmacopeial specifications for both lactose monohydrate and powdered cellulose have undergone harmonization for many attributes for JP, PhEur, and USP–NF.

See Lactose Monohydrate, and Cellulose, Powdered. *See also* Section 18.



10 Typical Properties

Acidity/alkalinity pH = 4.0–7.0 for *Cellactose 80*
Angle of repose 32–35° for *Cellactose 80*
Density (bulk) 0.38 g/cm^3 for *Cellactose 80*
Density (tapped) 0.5 g/cm^3 for *Cellactose 80*
Hausner ratio 1.24 for *Cellactose 80*
Heavy metals ≤5 ppm for *Cellactose 80*
Loss on drying ≤3.5% for *Cellactose 80*
Microbial content Total viable aerobic count ≤100 cfu/g, molds ≤10 cfu/g, yeast ≤10 cfu/g (*Escherichia coli* and *Salmonella* species absent) for *Cellactose 80.*
Particle size distribution ≤20% <32 µm, 35–65% <160 µm, ≥80% <250 µm for *Cellactose 80.*
Sulfated ash ≤0.2% for *Cellactose 80*
Solubility Partially soluble in water for *Cellactose 80*
Water content 4–7% for *Cellactose 80*

SEM 1: Excipient: *Cellactose 80*; manufacturer: Meggle; magnification: 50×; voltage: 5.0 kV.

SEM 2: Excipient: *Cellactose 80*; manufacturer: Meggle; magnification: 300×; voltage: 5.0 kV.

11 Stability and Storage Conditions

Store at room temperature in well-closed containers under dry and odor-free conditions.

12 Incompatibilities

See Lactose Monohydrate, and Cellulose, Powdered.

13 Method of Manufacture

Coprocessed lactose monohydrate and powdered cellulose is prepared by co-spray-drying a mixture of the two ingredients.

14 Safety

See Lactose Monohydrate, and Cellulose, Powdered.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Coprocessed lactose monohydrate and powdered cellulose is a mixture of two materials both of which are generally regarded as nontoxic:

Lactose monohydrate GRAS listed. Included in the FDA Inactive Ingredients Database (IM, IV, and SC: powder for injection; oral: capsules, tablets and granules/powders for suspension; inhalation preparations; vaginal preparations; buccal and sublingual tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Powdered cellulose GRAS listed. Accepted for use as a food additive in Europe (except for infant food in the UK). Included in nonparenteral medicines licensed in the UK. Included in the Canadian List of Acceptable Natural Health Products Ingredients Database.

17 Related Substances

Lactose monohydrate; cellulose, powdered.

18 Comments

Lactose monohydrate and powdered cellulose have undergone harmonization for many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Cellactose 80 has been designed especially for direct compression. It has been shown to be superior to a simple mixture of its components in terms of dilution potential,[3] compressibility,[4] tensile strength,[5,6] lubricant sensitivity,[7,8] and subsequent tablet properties for a range of drugs.[9] *Cellactose* has been investigated for use in capsules[10] and modified-release tablets,[11,12] and also as a tablet disintegrant.[13]

Lactose, Spray-Dried

1 Nonproprietary Names

None adopted.

2 Synonyms

FlowLac 90; *FlowLac 100*; *Lactopress Spray-Dried*; *Lactopress Spray-Dried 250*; *Lactopress Spray-Dried 260*; *Foremost Lactose 315*; *Foremost Lactose 316 Fast Flo*; *SuperTab 11SD*; *SuperTab 14SD*.

3 Chemical Name and CAS Registry Number

Spray-dried lactose is a mixture of amorphous and crystalline lactose monohydrate, O-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose monohydrate.

CAS numbers for lactose monohydrate include [5989-81-1] (lactose monohydrate); [10039-26-6] (lactose monohydrate, cyclic); [64044-51-5] (lactose monohydrate, open form).

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30 (for amorphous)
$C_{12}H_{22}O_{11}\cdot H_2O$ 360.31 (for monohydrate)

5 Structural Formula

See Lactose, Anhydrous and Lactose Monohydrate.

6 Functional Category

Direct compression excipient; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Spray-dried lactose is widely used as a binder, filler-binder, and flow aid in direct compression tablet manufacture.

See also Lactose Monohydrate; Lactose, Anhydrous.

8 Description

Spray-dried lactose occurs as white to nearly white crystalline particles or powder. It is odorless and slightly sweet-tasting. Spray-dried, direct-compression lactose grades are generally composed of 80–90% crystalline α-lactose monohydrate, which is brittle in nature, and 10–20% amorphous lactose, which is plastically deforming.[1]

9 Pharmacopeial Specifications

See Section 18. *See also* Lactose Monohydrate.

10 Typical Properties

Angle of repose 29° for *FlowLac 90*.
Density bulk *see* Table I.
Loss on drying ≤1.0% for *FlowLac 90*
Particle size distribution *see* Table II.

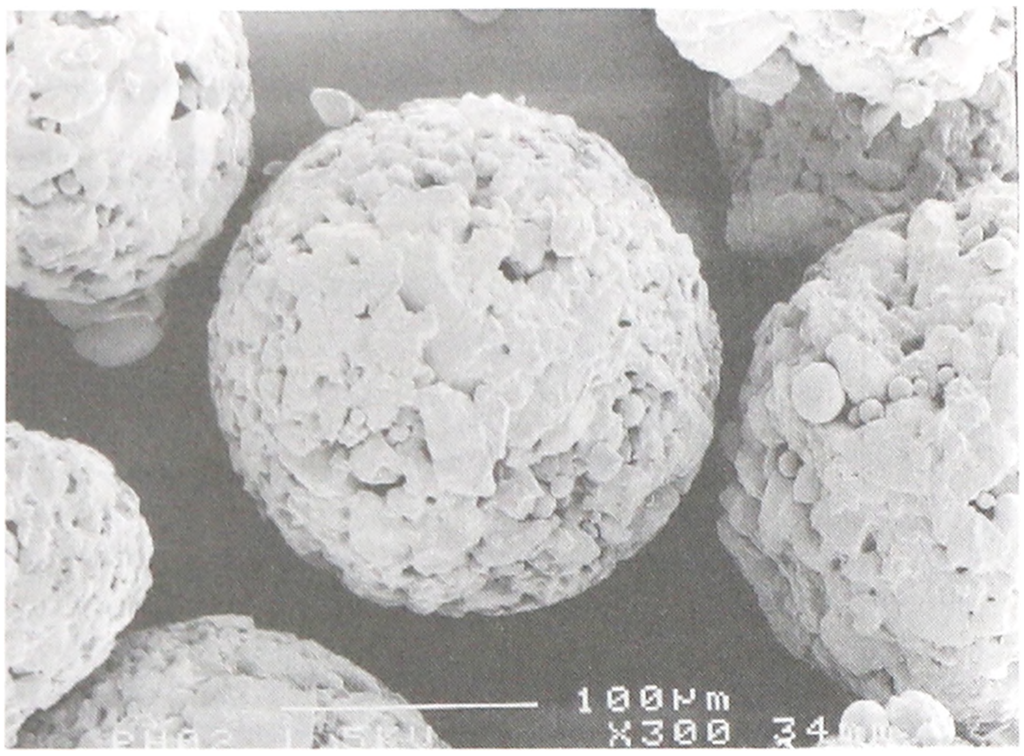
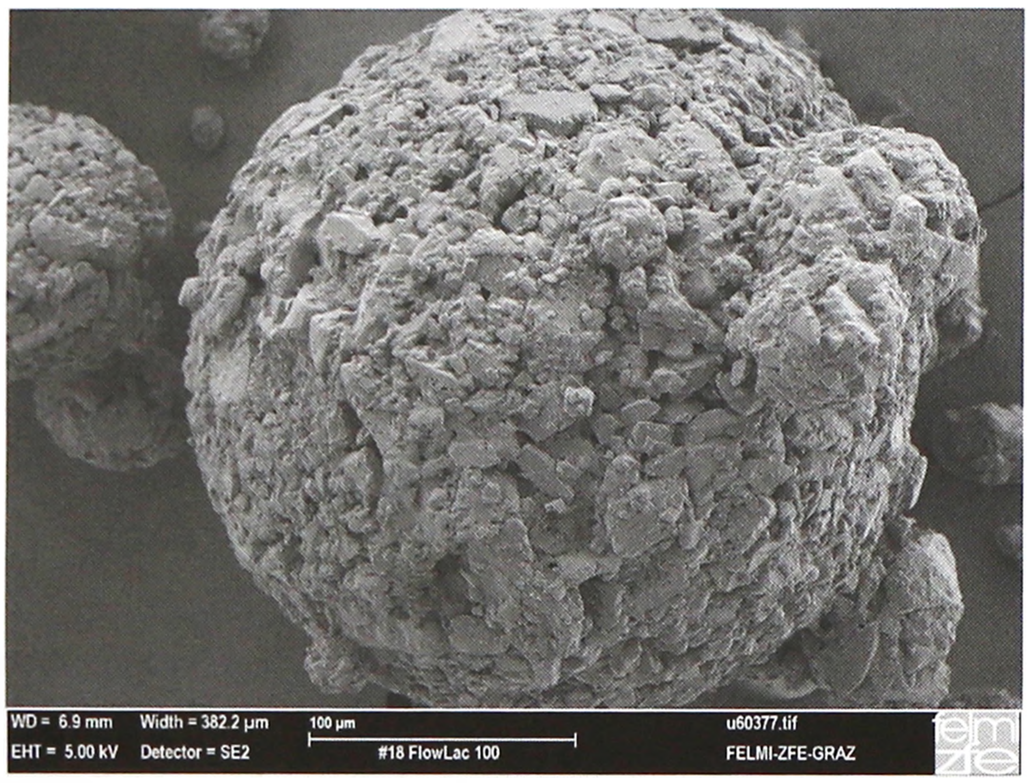
Supplier/grade	Density (bulk) (g/cm³)	Density (tapped) (g/cm³)
DFE Pharma		
SuperTab 11SD	0.60	0.71
SuperTab 14SD	0.62	0.72
Meggle GmbH		
FlowLac 90	0.57	0.67
FlowLac 100	0.62	0.71



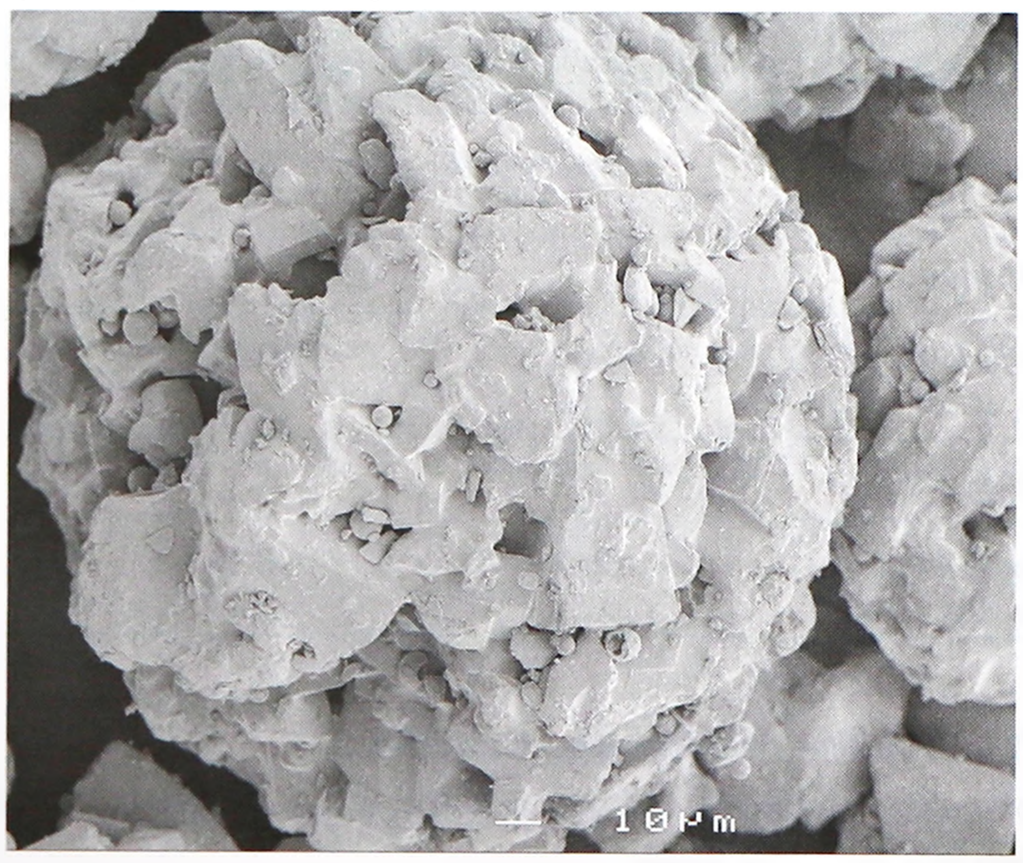
11 Stability and Storage Conditions

Spray-dried lactose should be stored in a well-closed container in a cool, dry, odor-free place.



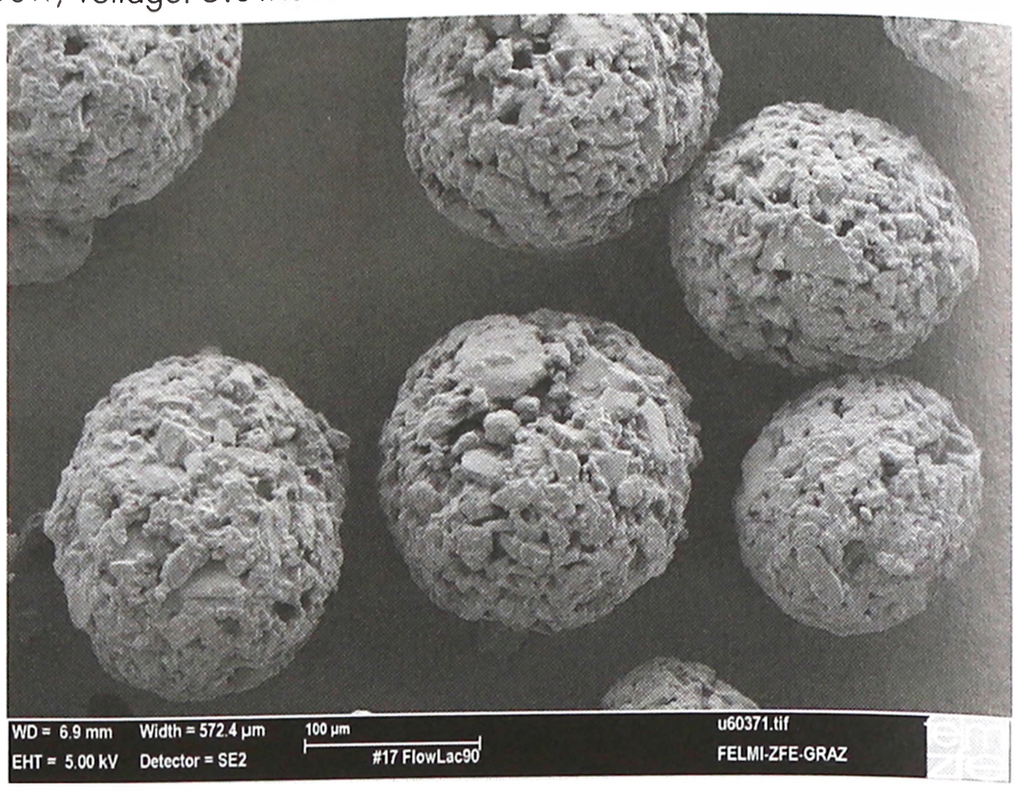
12 Incompatibilities

Lactose is a reducing sugar. The amorphous lactose, which is the most reactive form of lactose present in spray-dried lactose, will

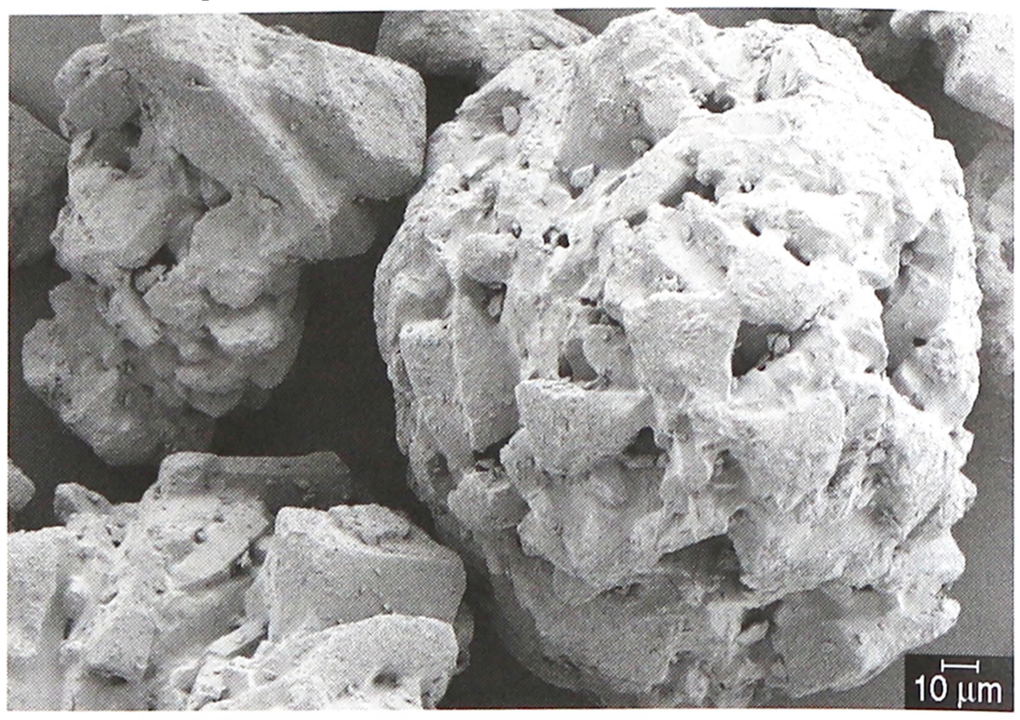


SEM 1: Excipient: *SuperTab 11SD*; manufacturer: DFE Pharma; magnification: 300×; voltage: 5 kV.

SEM 2: Excipient: *FlowLac* 100; manufacturer: Meggle; magnification: 300×; voltage: 5.0 kV.



SEM 3: Excipient: *Lactopress Spray-Dried*; manufacturer: DFE Pharma; magnification: 500×; voltage: 3 kV.



interact more readily than conventional crystalline grades.[2,3] Typical reactions include the Maillard reaction with either primary[4] or secondary[5] amines.

See Lactose, Anhydrous and Lactose Monohydrate.

SEM 4: Excipient: *FlowLac* 90; manufacturer: Meggle; magnification: 200×; voltage: 5.0 kV.

SEM 5: Excipient: *Foremost Lactose 316 Fast Flo*; manufacturer: Sheffield Bio-Science; magnification: 500×; voltage: 3 kV.

13 Method of Manufacture

A suspension of α-lactose monohydrate crystals in a lactose solution is atomized and dried in a spray-drier.[6,7] Approximately 10–20% of the total amount of lactose is in solution and the remaining 80–90% is present in crystalline form. The spray-drying process predominantly produces spherical particles containing amorphous and crystalline lactose. The amorphous and crystalline lactose ratio can vary depending on spray-drying conditions. Spray-dried lactose compactibility and flow characteristics are a function of the lactose monohydrate primary particle size and the amorphous lactose level.[8]

14 Safety

See Lactose Monohydrate.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material being handled. Avoid excessive dust generation or dust inhalation.

16 Regulatory Status

See Lactose Monohydrate.

Table II: Particle size distribution of selected commercially available spray-dried lactose.

17 Related Substances

Lactose, anhydrous; lactose, inhalation; lactose monohydrate.

18 Comments

Spray-dried lactose was one of the first direct-compression excipients. Spray-dried lactose typically comprises lactose monohydrate and amorphous lactose (*see* Section 8); *see* Lactose Monohydrate for the relevant pharmacopeial information.

It has been shown that during the spray-drying process the effects of nozzle orifice diameter and atomization air flow control the droplet size during atomization; however, it has also been demonstrated that increasing feed concentration results in increased shell thickness of hollow particles that are formed.[9] The physical properties of spray-dried lactose produced from alcoholic media are directly affected by the ethanol-to-water ratio in the feed solution. Lactose spray-dried from pure ethanol was shown to be 100% crystalline, whereas lactose spray-dried from pure water was 100% amorphous. Furthermore, the surface area of the spray-dried lactose increased as a function of amorphous content.[10] Spray-dried lactoses exhibit good flow properties.[11]

Polyethylene glycol (PEG) 4000, when spray-dried with lactose, has been shown to accelerate the rate and extent of crystallization of lactose.[12] It has also been shown that spray-dried lactose composite particles containing an ion complex of chitosan are suitable for the dry-coating of tablets.[13] Spray-dried lactose and crystallized spray-dried lactose have been evaluated for dry powder inhalation application.[14,15] Amorphous spray-dried lactose has also been studied in composites with PVP.[16]

Spray-dried lactose has been reported to be more prone to caking than lactose monohydrate due to the amorphous content.[17]

Lanolin

L

1 Nonproprietary Names

BP: Wool Fat
JP: Purified Lanolin
PhEur: Wool Fat
USP–NF: Lanolin

2 Synonyms

Adeps lanae; adeps lanae rurificatus; cera lanae; *Coronet*; E913; *Lanis*; lanolina; lanolin anhydrous; *Lantrol 1650*; *Pharmalan*; *Protalan anhydrous*; purified lanolin; refined wool fat.

3 Chemical Name and CAS Registry Number

Anhydrous lanolin [8006-54-0]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes lanolin as the purified wax-like substance obtained from the wool of the sheep, *Ovis aries* Linné (Fam. Bovidae), that has been cleaned, decolorized, and deodorized. Lanolin is a complex mixture of naturally occurring esters and polyesters of high molecular weight alcohols (principally sterols) and fatty acids, and is chemically classified as a wax. It contains no less than 98% esters, comprised approximately of a 1:1 ratio fatty alcohols to fatty acids. It also contains not more than 0.25% w/w of water and may contain up to 0.02% w/w of a suitable antioxidant; the PhEur 9.2 specifies up to 200 ppm of butylated hydroxytoluene as an antioxidant.

See also Section 18.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; emulsifying agent; ointment base.

7 Applications in Pharmaceutical Formulation or Technology

Lanolin is widely used in topical pharmaceutical formulations as an emulsifying agent and emollient.

Lanolin may be used as a hydrophobic vehicle and in the preparation of water-in-oil creams and ointments. When mixed with suitable vegetable oils or with soft paraffin, it produces emollient creams that penetrate the skin and hence facilitate the absorption of drugs. Lanolin mixes with about twice its own weight of water, without separation, to produce stable emulsions that do not readily become rancid on storage. Lanolin-based topical products owe their excellent emollient properties to the unique chemical and physical resemblance of lanolin to human skin lipids. In addition to its semiocclusive capabilities, it is also capable of allowing the bidirectional transportation of water.

Lanolin has also been used in pigmented medications (e.g. zinc oxide) as a dispersing agent; in topical products for cutaneous infections (e.g. acne); in burn dressings, as it supports the wound healing process and enhances dermal repair; in deodorizing toiletries as an antimicrobial;[1] in ophthalmic ointments as an emollient;[1,2] in suppositories as a carrier for active ingredients; and in surgical adhesive tapes as an impregnating agent and plasticizer.[1]

Lanolin and its many derivatives are used extensively in personal care products, such as facial cosmetics and lip products. It is also used in protective skin treatments for infants.

See also Section 18.

8 Description

Lanolin occurs as a pale yellow-colored, unctuous, waxy substance with a faint, characteristic odor. Melted lanolin is a clear or almost clear, yellow liquid.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Autoignition temperature 445°C
Density 0.95 g/cm^3 at 20°C
Flash point 238°C
Refractive index n_D^{40} = 1.478–1.482
Solubility Freely soluble in chloroform, ether, tetrahydrofuran, and toluene; soluble in diethyl ether and cyclohexane; sparingly soluble in cold ethanol (95%), more soluble in boiling ethanol (95%); practically insoluble in water.

11 Stability and Storage Conditions

Lanolin may gradually undergo autoxidation during storage. To inhibit this process, the inclusion of butylated hydroxytoluene is permitted as an antioxidant. Exposure to excessive or prolonged

heating may cause anhydrous lanolin to darken in color and develop a strong rancid like odor. However, lanolin may be sterilized by dry heat at 150°C. Ophthalmic ointments containing lanolin may be sterilized by filtration or by exposure to gamma irradiation.[3]

Lanolin should be stored in a well-filled, well-closed container protected from light, in a cool, dry place, with temperatures not exceeding 25°C. Normal storage life is 2 years.

12 Incompatibilities

Lanolins are incompatible with strong oxidizing agents. Lanolin may contain prooxidants, which may affect the stability of certain active drugs.

13 Method of Manufacture

Lanolin is a naturally occurring wax-like material obtained from the wool of sheep, *Ovis aries* Linné (Fam. Bovidae), and is extracted by washing the wool in hot water with a special wool scouring detergent to remove dirt, crude lanolin, and suint (sweat salts). The crude lanolin is continuously removed during the washing process by centrifugal separators, which concentrate it into a wax-like substance melting at approximately 38°C. The crude lanolin is saponified with a weak alkali and the resultant saponified fat emulsion is centrifuged to remove the aqueous phase. The aqueous phase contains a soap solution from which, on standing, a layer of partially purified lanolin separates. This material is then further refined by treatment with calcium chloride, followed by fusion with unslaked lime to dehydrate the lanolin. The lanolin is finally extracted with acetone and the solvent is removed by distillation.

14 Safety

Although generally regarded as a nontoxic and nonirritant material, lanolin and lanolin derivatives are associated with skin hypersensitivity reactions, and the use of lanolin in subjects with known sensitivity should be avoided.[4–6] Lanolin can sensitize patients with eczema and ulcerated skin more easily than those with normal skin.[7–10] Other reports suggest that 'sensitivity' arises from false positives in patch testing.[11] However, skin hypersensitivity is relatively uncommon;[12] the incidence of hypersensitivity to lanolin in the general population is estimated to be around 5 per million.[13]

Sensitivity is thought to be associated with the content of free fatty alcohols present in lanolin products rather than the total alcohol content.[14–16] The safety of pesticide residues in lanolin products has also been of concern.[17,18] However, highly refined 'hypoallergenic' grades of lanolin and grades with low pesticide residues are commercially available.[19]

Lanolin has also been shown to be a mild irritant to the eyes.[20]

See also Section 18.

LD_{50} (rabbit, skin): >10 ml/kg[20]
LD_{50} (rat, oral): >16 g/kg[20]
LD_{50} (rat, oral): >20 g/kg (25% in corn oil)[20]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (ophthalmic, topical, transdermal, rectal and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cholesterol; hydrogenated lanolin; lanolin, hydrous; lanolin alcohols; modified lanolin.

See also Section 18.

Hydrogenated lanolin

Synonyms Adeps lanae hydrogenatus; hydrogenated wool fat.
Acid value ≤1.0
Hydroxyl value 140–180
Melting point 45–55°C
Saponification value ≤8.0
Water ≤3.0%
Comments Some pharmacopeias, such as the PhEur 9.2, contain a monograph for hydrogenated lanolin. This material is a mixture of higher aliphatic alcohols and sterols obtained from the direct, high-pressure, high-temperature hydrogenation of lanolin during which the esters and acids present are reduced to the corresponding alcohols. Hydrogenated lanolin may contain a suitable antioxidant; the PhEur 9.2 specifies not more than 200 ppm of butylated hydroxytoluene.

Modified lanolin

Comments Some pharmacopeias, such as the USP 40–NF 35 S1, contain a monograph for modified lanolin. This material is lanolin that has been processed to reduce the contents of free lanolin alcohols and detergent and pesticide residues. It contains not more than 0.25% w/w of water. The USP 40–NF 35 S1 specifies that it may contain not more than 0.02% w/w of a suitable antioxidant.

18 Comments

Lanolin is widely used in cosmetics and a variety of pharmaceutical formulations.

Lanolin (the anhydrous material) may be confused in some instances with hydrous lanolin since the USP formerly contained monographs for 'lanolin' and 'anhydrous lanolin' in which the name 'lanolin' referred to the material containing 25–30% w/w of purified water. However, in the USP 40–NF 35 S1 the former lanolin monograph (hydrous lanolin) is deleted and the monograph for anhydrous lanolin is renamed 'lanolin'.

Since lanolin is a natural product obtained from various geographical sources, its physical characteristics such as color, consistency, iodine value, saponification value, and hydroxyl value may vary for the products from different sources. Consequently,

formulations containing lanolin from different sources may also have different physical properties.

A wide range of grades of lanolin are commercially available that have been refined to different extents in order to produce hypoallergenic grades or grades with low pesticide contents.

Many lanolin derivatives are also commercially available that have properties similar to those of the parent material and include: acetylated lanolin; ethoxylated or polyoxyl lanolin (water-soluble); hydrogenated lanolin; isopropyl lanolate; lanolin oil; lanolin wax; liquid lanolin; and water-soluble lanolin.

Highly purified lanolin is very effective in reducing nipple pain and promoting healing of nipple trauma for breastfeeding/lactating mothers.[21] It is used in burns dressings and wound sprays to support the wound healing process. Lanolin topical ointment has also been evaluated for the treatment of acute anal fissure in children.[22] Lanolin has shown to be effective in reducing the signs of lip dryness.[23]

A specification for anhydrous lanolin is contained in the *Food Chemicals Codex* (FCC),[24] where it is described as being used as a masticatory substance in chewing gum base. The EINECS number for lanolin is 232-348-6.

Lanolin Alcohols

1 Nonproprietary Names

BP: Wool Alcohols

PhEur: Wool Alcohols

USP–NF: Lanolin Alcohols

2 Synonyms

Alcoholes adipis lanae; alcoholia lanae; alcolanum; *Argowax*; lanalcolum; *Lanis AL*; *Lantrol 1780*; *Ritawax*; *Super Hartolan*; wool wax alcohols.

3 Chemical Name and CAS Registry Number

Lanolin alcohols [8027-33-6]

4 Empirical Formula and Molecular Weight

Lanolin alcohols is a mixture of aliphatic alcohols, triterpenoid alcohols, and sterols obtained by hydrolysis of lanolin, including not less than 30% cholesterol. The cholesterol found in lanolin is a mixture of different stereochemical isomers.

The USP 40–NF 35 S1 permits the inclusion of up to 0.1% w/w of a suitable antioxidant, while the PhEur 9.2 specifies that lanolin alcohols may contain up to 200 ppm of butylated hydroxytoluene as an antioxidant.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; emulsifying agent; ointment base; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Lanolin alcohols is used in topical pharmaceutical formulations as an absorption base with emollient properties. It is also used in the preparation of water-in-oil creams and ointments at concentrations as low as 2% w/w. Lanolin alcohols have been used as carrier systems to deliver pharmacologically active substances through the skin.

The proportion of water that can be incorporated into petrolatum is increased threefold by the addition of 5% lanolin alcohols. It is stable over a wide pH range and can be used in acidic and alkaline water-in-oil emulsions, where it acts as a viscosity-increasing agent. Such emulsions do not crack upon the addition of citric, lactic, or tartaric acids.

Lanolin alcohols is also used as a nongelling thickener and emollient in cosmetic creams, lotions, lip balms, lipsticks, and other stick cosmetics.

8 Description

Lanolin alcohols occurs as a pale yellow to golden-brown-colored solid that is plastic when warm but brittle when cold. It has a faint characteristic odor. *See also* Section 4.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for lanolin alcohols.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Melting range	≥56°C	≥56°C
Acidity/alkalinity	+	+
Clarity of solution	+	–
Loss on drying	≤0.5%	≤0.5%
Residue on ignition	≤0.1%	≤0.15%
Copper	–	≤5 ppm
Acid value	≤2.0	≤2.0
Hydroxyl value	120–180	120–180
Peroxide value	≤15	≤15
Saponification value	≤12	≤12
Water absorption capacity	+	–
Content of sterols (as cholesterol)	≥30.0%	≥30.0%

10 Typical Properties

Density 0.98 g/cm^3

Solubility Freely soluble in chloroform, dichloromethane, ether, and light petroleum; soluble 1 part in 25 parts of boiling ethanol (95%); slightly soluble in ethanol (90%); practically insoluble in water.

11 Stability and Storage Conditions

Lanolin alcohols may gradually undergo autoxidation during storage. Store in a well-closed, well-filled container, protected from light, in a cool, dry place. Normal storage life is approximately 2 years.

12 Incompatibilities

Incompatible with coal tar, ichthammol, phenol, and resorcinol.

13 Method of Manufacture

Lanolin alcohols is prepared by the saponification of lanolin followed by separation of the fraction containing cholesterol and other alcohols. It is further refined during a multistage molecular distillation process, which improves color and odor, producing a purified, semicrystalline wax.

14 Safety

Lanolin alcohols is widely used in cosmetics and topical pharmaceutical formulations and is generally regarded as a nontoxic material. However, lanolin alcohols may be irritant to the skin and hypersensitivity can occur in some individuals.[1,2] It has been shown to be a mild irritant to the eyes.[3]

LD_{50} (rat, oral): >20 ml/kg[3]

LD_{50} (rat, oral): >42.7 g/kg (66% in corn oil)[3]

See also Lanolin.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (ophthalmic and topical preparations). Included in nonparenteral medicines licensed

in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cholesterol; lanolin; lanolin, hydrous; petrolatum and lanolin alcohols; mineral oil.

18 Comments

Water-in-oil emulsions prepared with lanolin alcohols, unlike those made with lanolin, do not show surface darkening, nor do they develop an objectionable odor in hot weather.

Therapeutically, lanolin alcohols may help in the wound-healing process.

The EINECS number for lanolin alcohols is 232-430-1.

L

Lanolin, Hydrous

1 Nonproprietary Names

BP: Hydrous Wool Fat

JP: Hydrous Lanolin

PhEur: Wool Fat, Hydrous

2 Synonyms

Adeps lanae cum aqua; adeps lanae hydrosus.

3 Chemical Name and CAS Registry Number

Hydrous lanolin [8020-84-6]

4 Empirical Formula and Molecular Weight

The JP XVII describes hydrous lanolin as a mixture of purified lanolin and 25–30% w/w purified water. The PhEur 9.2 describes hydrous lanolin as a mixture of 75% w/w lanolin and 25% w/w purified water; *see also* Section 18. The PhEur 9.2 additionally permits the inclusion of up to 150 ppm of butylated hydroxytoluene as an antioxidant.

See also Lanolin.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; emulsifying agent; ointment base.

7 Applications in Pharmaceutical Formulation or Technology

Hydrous lanolin is widely used in topical pharmaceutical formulations and cosmetics in applications similar to those for lanolin.

See also Section 18 and Lanolin.

8 Description

Hydrous lanolin is a pale yellow-colored, unctuous substance with a faint characteristic odor. When melted by heating on a water bath, hydrous lanolin separates into a clear oily layer and a clear water layer.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydrous lanolin.

Test	JP XVII	PhEur 9.2
Identification	+	+
Characters	+	+
Melting point	39°C	38–44°C
Acidity/alkalinity	+	–
Water absorption capacity	–	+
Water-soluble acids and alkalis	–	+
Water-soluble oxidizable substances	+	+
Chloride	≤0.036%	≤115 ppm
Ammonia	+	–
Paraffins	–	≤1.0%
Petrolatum	+	–
Acid value	≤1.0	≤0.8
Peroxide value	–	≤15
Iodine value	18–36	–
Saponification value	–	67–79
Residue on evaporation (wool fat content)	70–75%	72.5–77.5%
Sulfated ash	–	≤0.1%

10 Typical Properties

Solubility Soluble in diethyl ether and in cyclohexane, with the separation of water; practically insoluble in chloroform, ether, and water.

11 Stability and Storage Conditions

Hydrous lanolin should be stored in a well-filled, well-closed container protected from light, in a cool, dry place. Normal storage life is 2 years. It is a stable material and does not become rancid.

See also Lanolin.

12 Incompatibilities

See Lanolin.

13 Method of Manufacture

Lanolin is melted, and sufficient purified water is gradually added with constant stirring.

14 Safety

Hydrous lanolin is used in cosmetics and a number of topical pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material, although it has been associated with hypersensitivity reactions. *See* Lanolin for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lanolin; lanolin alcohols.

18 Comments

Lanolin (the anhydrous material) may be confused in some instances with hydrous lanolin since the USP formerly contained monographs for 'lanolin' and 'anhydrous lanolin' in which the name 'lanolin' referred to the material containing 25–30% w/w of purified water.

Therapeutically, hydrous lanolin is used in burns dressings to support the wound healing process and enhance dermal repair. It has also been used for treatment of chapped lips, cracked hands, sore nipples, and diaper rash.

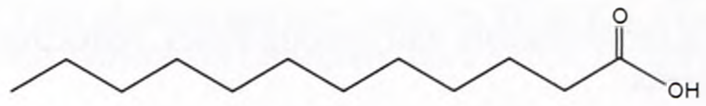
Lauric Acid

1 Nonproprietary Names

USP–NF: Lauric Acid

2 Synonyms

C-1297; dodecanoic acid; 1-dodecanoic acid; *n*-dodecanoic acid; dodecoic acid; dodecylic acid; duodecylic acid; *Hydrofol acid 1255*; *Hydrofol acid 1295*; *Hystrene 9512*; *Kortacid 1299*; laurostearic acid; *Lunac L70*; *Neo-fat 12*; *Neo-fat 12–43*; *Ninol AA62 Extra*; *Prifac 2920*; 1-undecanecarboxylic acid; *Univol U314*; vulvic acid; *Wecoline 1295*.



3 Chemical Name and CAS Registry Number

Dodecanoic acid [143-07-7]

4 Empirical Formula and Molecular Weight

$C_{12}H_{24}O_2$ 200.32

5 Structural Formula

6 Functional Category

Anionic surfactant; antifoaming agent; emulsifying agent; lubricant; penetration enhancer.

7 Applications in Pharmaceutical Formulation or Technology

Lauric acid has been used as an enhancer for topical penetration and transdermal absorption,[1–12] rectal absorption,[13,14] buccal delivery,[15] and intestinal absorption.[16,17] It is also useful for stabilizing oil-in-water emulsions.[18]

8 Description

Lauric acid occurs as a white crystalline powder with a slight odor of bay oil.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for lauric acid.

Test	USP 40–NF 35 S1
Identification	+
Residue on ignition	≤0.1%
Iodine value	≤3.0
Peroxide value	≤10.0
Water determination	≤0.2%
Assay (anhydrous basis)	98.0-102.0%

10 Typical Properties

Boiling point 298.9°C at 760 mmHg; 225°C at 100 mmHg.[19]
Density
0.883 g/cm^3 at 20°C;[20]
0.8679 g/cm^3 at 50°C.[19]
Dissociation constant pK_a= 5.3 at 20°C.[21]
Enthalpy of fusion 36.6 kJ mol^{-1};[20] also reported as 36.03 kJ mol^{-1}.[22]
Melting point 44.2°C;[20] also reported as 43.8°C[19] and 48°C.[23]
Partition coefficient Log *P* (octanol : water) = 4.6[24]
Refractive index
n_D^{82} = 1.418;[19]
n_D^{70} = 1.423.[22]
Solubility 4.81 mg/mL in water at 25°C.[24] Very soluble in ether, ethanol (95%), and methanol; soluble in acetone; slightly soluble in chloroform; miscible with benzene.
Surface tension 26.6 mN/m at 70°C[20]
Vapor pressure
10 Pa at 100°C;
100 Pa at 128°C.
Viscosity (dynamic) 7.3 mPa s at 50°C[20]
Viscosity (kinematic) 8.41 mPa s at 50°C[25]

11 Stability and Storage Conditions

Lauric acid is stable at normal temperatures and should be stored in a cool, dry place. Avoid sources of ignition and contact with incompatible materials.

12 Incompatibilities

Lauric acid is incompatible with strong bases, reducing agents, and oxidizing agents.

13 Method of Manufacture

Lauric acid is a fatty carboxylic acid isolated from vegetable and animal fats or oils. For example, coconut oil and palm kernel oil both contain high proportions of lauric acid. Isolation from natural fats and oils involves hydrolysis, separation of the fatty acids, hydrogenation to convert unsaturated fatty acids to saturated acids, and finally distillation of the specific fatty acid of interest.

14 Safety

Lauric acid is widely used in cosmetic preparations, in the manufacture of food-grade additives, and in pharmaceutical formulations. General exposure to lauric acid occurs through the consumption of food and through dermal contact with cosmetics, soaps, and detergent products. Lauric acid is toxic when administered intravenously.

Occupational exposure may cause local irritation of eyes, nose, throat, and respiratory tract,[26] although lauric acid is considered safe and nonirritating for use in cosmetics.[27] No toxicological effects were observed when lauric acid was administered to rats at 35% of the diet for 2 years.[28] Acute exposure tests in rabbits indicate mild irritation.[27] Lauric acid has been investigated for carcinogenicity in mice using various modes of exposure[26,29] including subcutaneous injection.[30]

LD_{50} (mouse, IV): 0.13 g/kg[31,32]
LD_{50} (rat, oral): 12 g/kg[31]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. No occupational exposure limits have been established. Under conditions of frequent use or heavy exposure, respiratory protection may be required. When heated, lauric acid emits an acrid smoke and irritating fumes; therefore, use in a well-ventilated area is recommended. It is combustible when exposed to heat or flame.

16 Regulatory Status

GRAS listed. Lauric acid is listed as a food additive in the EAFUS list compiled by the FDA. Reported in the EPA TSCA Inventory. Lauric acid is a food additive permitted for direct addition to food for human consumption in compliance with 21 CFR 172.860 (USFDA).

17 Related Substances

Capric acid; myristic acid; palmitic acid; sodium laurate; stearic acid.

Capric acid

Empirical formula $C_{10}H_{20}O_2$
Molecular weight 172.27
CAS number [334-48-5]
Synonyms *n*-Capric acid; caprinic acid; caprynic acid; carboxylic acid C_{10}; decanoic acid; *n*-decanoic acid; decoic acid; decyclic acid; *n*-decylic acid; 1-nonanecarboxylic acid.
Appearance White to pale yellow crystals with an unpleasant odor.
Acid value 320–330
Boiling point 270°C
Dissociation constant pK_a = 4.9
Melting point 31.5°C (also reported as 31.4°C or 31.6°C)
Partition coefficient Log *P* (octanol : water) = 4.09
Refractive index n_D^{40} = 1.4288
Comments Capric acid is used as a flavoring agent in pharmaceutical preparations, providing a citrus-like flavor. It is used in cosmetics as an emulsifying agent. A specification for capric acid is included in the *Food Chemicals Codex* (FCC).[33] The EINECS number for capric acid is 206-376-4.

Sodium laurate

Empirical formula $C_{12}H_{23}O_2Na$
Molecular weight 222.34
CAS number [629-25-4]
Comments Sodium laurate is used as an emulsifying agent and surfactant in cosmetics. The EINECS number for sodium laurate is 211-082-4.

18 Comments

Lauric acid is listed in the BP 2017 and PhEur 9.2 appendices as a general reagent when used in the assay of total fatty acids in saw palmetto fruit. The content of lauric acid complies with the requirement of being not less than 98% by gas chromatography.

Lauric acid has been evaluated for use in aerosol formulations.[34] It has also been studied for use in sustained-release capsule formulations in combination with drugs and water-soluble polymers.[35] Solid core delivery platforms using lauric acid as a shell

material have been prepared using supercritical fluid technology.[36] Lauric acid has been reported to form a eutectic with ibuprofen.[37] The virucidal properties of lauric acid in nasal formulations administered to rats have been investigated.[38]

A specification for lauric acid is contained in the *Food Chemicals Codex* (FCC).[33]

Lauric acid is widely used in cosmetics and food products.

The EINECS number for lauric acid is 205-582-1.

Lecithin

1 Nonproprietary Names

USP–NF: Lecithin

See also Section 4.

2 Synonyms

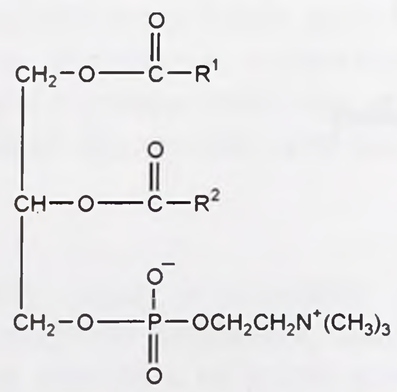
Coatsome NC; E322; egg lecithin; *Epikuron*; *Lecigran*; *Lipoid*; mixed soybean phosphatides; ovolecithin; *Phosal 53 MCT*; *Phospholipon 100 H*; *ProKote LSC*; soybean lecithin; soybean phospholipids; *Sternfine*; *Sternpur*; *Topcithin*; vegetable lecithin; *Yelkin*.

3 Chemical Name and CAS Registry Number

Lecithin [8002-43-5]

The chemical nomenclature and CAS Registry numbering of lecithin is complex. The commercially available lecithin, used in cosmetics, pharmaceuticals, and food products, is a complex mixture of phospholipids and other materials. However, it may be referred to in some literature sources as 1,2-diacyl-*sn*-glycero-3-phosphocholine (trivial chemical name, phosphatidylcholine). This material is the principal constituent of egg lecithin and has the same CAS Registry Number. The name lecithin and the CAS Registry Number above are thus used to refer to both lecithin and phosphatidylcholine in some literature sources.

Another principal source of lecithin is from an extract of soybeans (CAS [8030-76-0]). Egg yolk lecithin (CAS [93685-90-6]) is also listed in *Chemical Abstracts*.



See also Section 4.

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes lecithin as a complex mixture of acetone-insoluble phosphatides that consists chiefly of phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, and phosphatidic acid, present in conjuction with various amounts of other substances such as triglycerides, fatty acids, and carbohydrates as separated from a crude vegetable oil source.

The composition of lecithin (and hence also its physical properties) varies enormously depending upon the source of the lecithin and the degree of purification. Egg lecithin, for example, contains 80.5% phosphatidylcholine and 11.7% phosphatidylethanolamine, along with lysophosphatidylcholine, sphingomyelin, and neutral lipids in minor quantities.[1] Soybean lecithin contains 21% phosphatidylcholine, 22% phosphatidylethanolamine, and 19% phosphatidylinositol, along with other components.[2]

5 Structural Formula

α-Phosphatidylcholine

R^1 and R^2 are fatty acids, which may be different or identical.

Lecithin is a complex mixture of materials; *see* Section 4. The structure above shows phosphatidylcholine, the principal component of egg lecithin, in its α-form. In the β-form, the phosphorus-containing group and the R^2 group exchange positions.

6 Functional Category

Emollient; emulsifying agent; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Lecithins are used in a wide variety of pharmaceutical applications; *see* Table I. They are also used in cosmetics[3] and food products.

Lecithins are mainly used in pharmaceutical products as dispersing, emulsifying, and stabilizing agents, and are included in intramuscular and intravenous injections, parenteral nutrition formulations, and topical products such as emulsions, creams, and ointments.

Lecithins are also used in suppository bases,[4] to reduce the brittleness of suppositories, and have been investigated for their absorption-enhancing properties in an intranasal insulin formulation.[5] Lecithins are also commonly used as a component of enteral and parenteral nutrition formulations.

Table I: Uses of lecithin.

Use	Concentration (%)
Aerosol inhalation	0.1
Biorelevant dissolution media	0.059–0.295
IM injection	0.3–2.3
Oral suspensions	0.25–10.0

8 Description

Lecithins vary greatly in their physical form, from viscous semiliquids to powders, depending upon the free fatty acid content. They may also vary in color from brown to light yellow, depending upon whether they are bleached or unbleached or on the degree of purity. When they are exposed to air, rapid oxidation occurs, also resulting in a dark yellow or brown color.

Lecithins have practically no odor. Those derived from vegetable sources have a bland or nutlike taste, similar to that of soybean oil.

9 Pharmacopeial Specifications

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for lecithin.

Test	USP 40–NF 35 S1
Identification	+
Water	≤2.0%
Lead	≤10 ppm
Heavy metals	≤20 ppm
Microbial contamination	
Aerobic microbial count	$\leq 10^3$ cfu/g
Yeasts and molds	$\leq 10^2$ cfu/g
Acid value	≤36
Peroxide value	≤10[a]
Hexane-insoluble matter	≤0.3%[b]
Acetone-insoluble matter	≥50.0%[c]
Phospholipids	+

(a) ≤3 if intended for use in injectable dosage forms.
(b) ≤1.0% for sunflower lecithin.
(c) ≥80.0% if intended for use in injectable dosage forms.

10 Typical Properties

Density

0.97 g/cm^3 for liquid lecithin;

0.5 g/cm^3 for powdered lecithin.

Iodine number

95–100 for liquid lecithin;

82–88 for powdered lecithin.

Isoelectric point ≈3.5

Saponification value 196

Solubility Lecithins are soluble in diethyl ether, chloroform, petroleum ether, mineral oil, and fatty acids. Sparingly soluble in benzene. Practically insoluble in cold vegetable and animal oils, polar solvents, and water. When mixed with water, however, lecithins hydrate to form emulsions.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Lecithins decompose at extreme pH. They are also hygroscopic and subject to microbial degradation. When heated, lecithins oxidize, darken, and decompose. Temperatures of 160–180°C will cause degradation within 24 hours.

Store below 25°C, preferably at 2–6°C.

All lecithin grades should be stored in well-closed containers protected from light and oxidation. Purified solid lecithins should be stored in tightly closed containers at subfreezing temperatures.

12 Incompatibilities

Lecithin is incompatible with esterases owing to hydrolysis. It is also incompatible with chlorine, fluorine, and other oxidizing agents.

13 Method of Manufacture

Lecithins are essential components of cell membranes and, in principle, may be obtained from a wide variety of living matter. In practice, however, lecithins are usually obtained from vegetable products such as soybean, peanut, cottonseed, sunflower, rapeseed, corn, or groundnut oils. Soybean lecithin is the most commercially important vegetable lecithin. Lecithin obtained from eggs is also commercially important and was the first lecithin to be discovered.

Vegetable lecithins are obtained as a by-product in the vegetable oil refining process. During the degumming process the crude oil is heated to about 70°C, mixed with 2% water and subjected to thorough stirring for about half an hour to an hour. The addition of water hydrates the polar lipids in the oil, making them insoluble. The resulting lecithin sludge is then separated by centrifugation. This sludge is made up of water, phospholipids and glycolipids, some triglycerides, carbohydrates, traces of sterols, free fatty acids and carotenoids. Polar lipids are extracted with hexane and, after removal of the solvent, a crude vegetable oil is obtained. The crude plant lecithin is obtained by careful drying. The composition and quality of the crude lecithin product are considerably influenced by the quality and origin of the oilseeds as well as the conditions during the degumming process. Following drying, the lecithin may be further purified.[2]

With egg lecithin, a different manufacturing process must be used since the lecithin in egg yolks is more tightly bound to proteins than in vegetable sources. Egg lecithin is thus obtained by solvent extraction from liquid egg yolks using acetone or from freeze-dried egg yolks using ethanol (95%).[2]

Synthetic lecithins may also be produced.

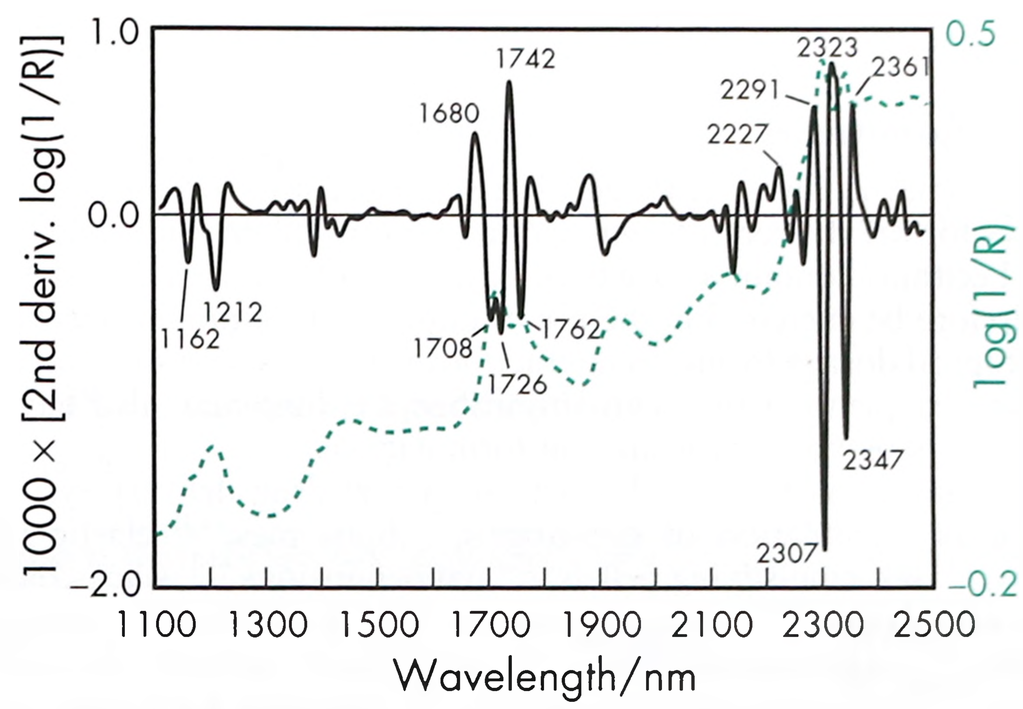

Figure 2: Near-infrared spectrum of lecithin measured by reflectance.

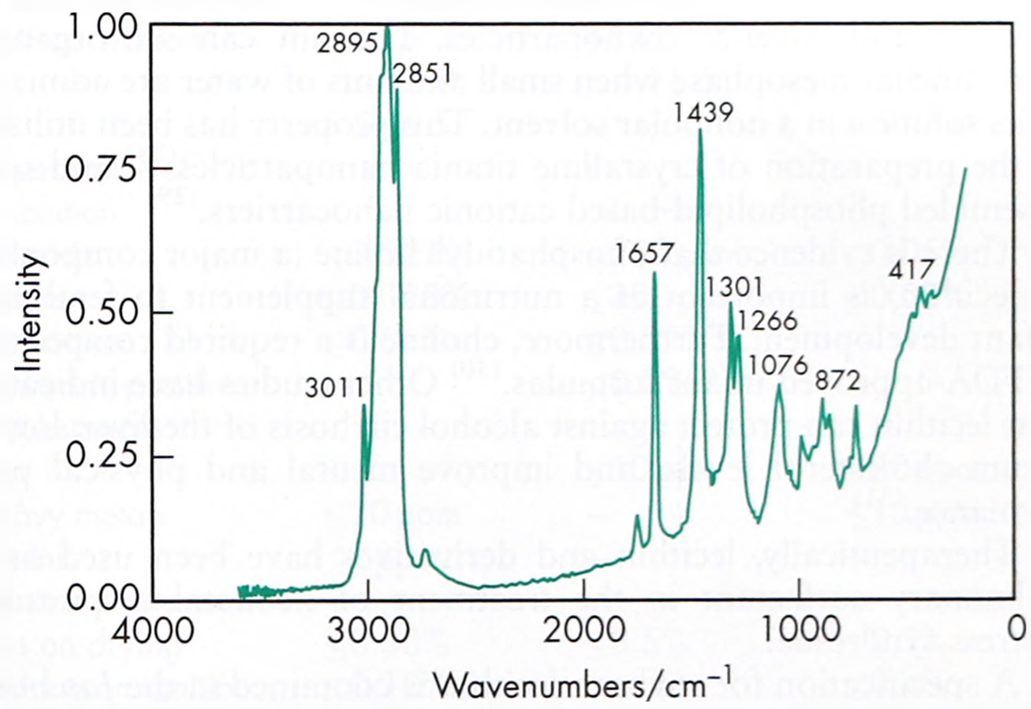

Figure 3: Raman spectrum of lecithin measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

14 Safety

Lecithin is a component of cell membranes and is therefore consumed as a normal part of the diet. Although excessive consumption may be harmful, it is highly biocompatible and oral doses of up to 80 g daily have been used therapeutically in the treatment of tardive dyskinesia.[6] When used in topical formulations, lecithin is generally regarded as a nonirritant and nonsensitizing material.[3] The Cosmetic Ingredients Review Expert Panel (CIR) has reviewed lecithin and issued a tentative report revising the safe concentration of the material from 1.95% to 15.0% in rinse-off

and leave-in products. They note, however, that there are insufficient data to rule on products that are likely to be inhaled.[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Lecithins may be irritant to the eyes; eye protection and gloves are recommended. Avoid inhalation.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (inhalations; IM and IV injections; otic preparations; oral capsules, suspensions and tablets; rectal, topical, transdermal, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Phospholipids.

18 Comments

Poloxamer lecithin organogels have been used in topical formulations for the delivery of non-steroidal anti-inflammatory drugs.[8]

Lecithins contain a variety of unspecified materials; care should therefore be exercised in the use of unpurified lecithin in injectable or topical dosage forms, as interactions with the active substance or other excipients may occur. Unpurified lecithins may also have a greater potential for irritancy in formulations.

Lecithin has been used in various novel drug delivery systems such as formulation of organogels,[9] liposomes,[10] elastic vesicles,[11] self-emulsifying pellets,[12] nanoemulsions,[13] silica-coated nanoemulsions,[14] microemulsions,[15] microcrystal suspensions,[16] nanosuspensions,[17,18] silica-lipid hybrid microcapsules,[19] and mucoadhesive patches.[20] Lecithins have also been employed in stabilizing various types of nanoparticles including solid lipid,[21–23] PLGA/human albumin,[24] chitosan/PLGA,[25] gold,[26] and silver[27] nanoparticles. Lecithin can self-organize into lamellar mesophase when small amounts of water are admixed in its solution in a nonpolar solvent. This property has been utilized in the preparation of crystalline titania nanoparticles[28] and self-assembled phospholipid-based cationic nanocarriers.[29]

There is evidence that phosphatidylcholine (a major component of lecithin) is important as a nutritional supplement to fetal and infant development. Furthermore, choline is a required component of FDA-approved infant formulas.[30] Other studies have indicated that lecithin can protect against alcohol cirrhosis of the liver, lower serum cholesterol levels, and improve mental and physical performance.[31]

Therapeutically, lecithin and derivatives have been used as a pulmonary surfactant in the treatment of neonatal respiratory distress syndrome.

A specification for soybean lecithin is contained in the *Japanese Pharmaceutical Excipients* (JPE).[32] Suppliers' literature should be consulted for information on the different grades of lecithin available and their applications in formulations.

A specification for lecithin is contained in the *Food Chemicals Codex* (FCC).[33]

The EINECS number for lecithin is 232-307-2. The PubChem Compound ID (CID) for lecithin is 24798685.

Leucine

1 Nonproprietary Names

BP: Leucine

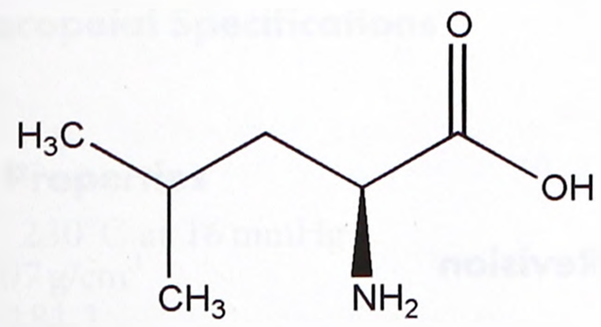
JP: L-Leucine

PhEur: Leucine

USP–NF: Leucine

2 Synonyms

α-Aminoisocaproic acid; 1-α-aminoisocaproic acid; (*S*)–2-amino-4-methylpentanoic acid; 2–amino-4-methylpentanoic acid; L-2-amino-4-methylvaleric acid; 2–amino-4-methylvaleric acid; α-amino-γ-methylvaleric acid; 1,2-amino-4-methylvaleric acid; D L-leucine; L;L-leucine; Leu; leucinum; 4-methylnorvaline.



3 Chemical Name and CAS Registry Number

L-Leucine [61-90-5]

4 Empirical Formula and Molecular Weight

$C_6H_{13}NO_2$ 131.17

5 Structural Formula

6 Functional Category

Antiadherent; flavoring agent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Leucine is used in pharmaceutical formulations as a flavoring agent.[1] It has been used experimentally as an antiadherent to improve the deagglomeration of disodium cromoglycate microparticles and other compounds in inhalation preparations;[2–4] and as a tablet lubricant.[5,6] Leucine copolymers have been shown to successfully produce stable drug nanocrystals in water.[7]

8 Description

Leucine occurs as a white or almost off-white crystalline powder or shiny flakes.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for leucine.

Dissociation constant

pK_{a1} = 2.36;

pK_{a2} = 9.60.

Isoelectric point 6.04

Solubility Soluble in acetic acid, ethanol (99%), and water. Practically insoluble in ether.

11 Stability and Storage Conditions

Leucine is sensitive to light and moisture, and should be stored in an airtight container in a cool, dark, dry place.

Leucine sublimes at 145–148°C and decomposes at 293–295°C.

12 Incompatibilities

Leucine is incompatible with strong oxidizing agents.

13 Method of Manufacture

Leucine is produced microbially by incubating an amino-acid-producing microorganism including but not exclusive to *Pseudomonas*, *Escherichia*, *Bacillus*, or *Staphylococcus* in the presence of oxygen and a hydrocarbon. The nutrient medium should contain an inhibitory amount of a growth inhibitor that is a chemically similar derivative of leucine (e.g. methylallylglycine, α-hydrozinoisocaproic acid, or β-cyclopentanealanine) to inhibit the growth of the organism except for at least one mutant that is resistant to the inhibitory effect. The resistant mutant is then isolated and grown in the presence of oxygen and the hydrocarbon in the absence of the inhibitor. The mutant cells are then harvested and a nutrient medium is formed that includes a hydrocarbon as the sole source of carbon. Finally, the harvested cells are incubated in the medium in the presence of oxygen.[8]

14 Safety

Leucine is an essential amino acid and is consumed as part of a normal diet. It is generally regarded as a nontoxic and nonirritant material. It is moderately toxic by the subcutaneous route.

LD_{50} (rat, IP): 5.379 g/kg[9]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IV infusion; oral tablets and capsules). Included in nonparenteral medicines licensed in the UK.

17 Related Substances

DL-Leucine; leucine hydrochloride.

DL-Leucine

Empirical formula $C_6H_{13}NO_2$
Molecular weight 131.17
CAS number [328-39-2]
Appearance White leaflets.
Dissociation constant

$pK_{a1} = 2.36$;
$pK_{a2} = 9.60$.

Solubility Soluble in ethanol (90%) and water (24.26 g/L). Insoluble in ether.
Comments A specification for DL-Leucine is included in the *Food Chemical Codex*. The EINECS number is 206-328-2

Leucine hydrochloride

Empirical formula $C_6H_{14}ClNO_2$
Molecular weight 167.63
CAS number [760–84–9]
Synonyms L-Leucine hydrochloride
Comments An essential branched-chain amino acid important for hemoglobin formation. The EINECS number for leucine hydrochloride is 212-083-2.

18 Comments

A specification for leucine is included in the *Food Chemicals Codex* (FCC).[10] The EINECS number for leucine is 200-522-0.

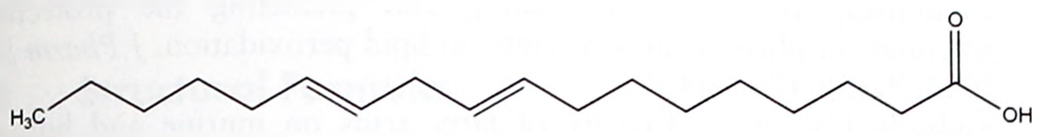
Linoleic Acid

1 Nonproprietary Names

None adopted.

2 Synonyms

Emersol 310; *Emersol 315*; leinoleic acid; 9-*cis*,12-*cis*-linoleic acid; 9,12-linoleic acid; linolic acid; *cis*,*cis*-9,12-octadecadienoic acid; *Pamolyn*; *Polylin No. 515*; telfairic acid.



3 Chemical Name and CAS Registry Number

(Z,Z)-9,12-Octadecadienoic acid [60-33-3]

4 Empirical Formula and Molecular Weight

$C_{18}H_{32}O_2$ 280.45

5 Structural Formula

6 Functional Category

Emulsifying agent; penetration enhancer; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Linoleic acid is used in topical and transdermal pharmaceutical formulations as an emulsifying agent and penetration enhancer,[1–6] in oral formulations as an absorption enhancer,[7–10] and in intravenous formulations as a solubilizer.[11] It is also used pharmaceutically as a component in hepato-targeting nanoparticles,[12–14] as well as in topical cosmetic formulations.[15]

8 Description

Linoleic acid occurs as a colorless to light-yellow-colored oil.

9 Pharmacopeial Specifications

See Section 18.

10 Typical Properties

Boiling point 230°C at 16 mmHg
Density 0.9007 g/cm^3
Iodine value 181.1
Melting point −5°C
Refractive index n_D^{20} = 1.4699
Solubility Freely soluble in ether; soluble in ethanol (95%); miscible with dimethylformamide, fat solvents, and oils.

11 Stability and Storage Conditions

Linoleic acid is sensitive to air, light, moisture, and heat. It should be stored in a tightly sealed container under an inert atmosphere and refrigerated.

12 Incompatibilities

Linoleic acid is incompatible with bases, strong oxidizing agents, and reducing agents.

13 Method of Manufacture

Linoleic acid is obtained by extraction from various vegetable oils such as safflower oil.

14 Safety

Linoleic acid is widely used in cosmetics and topical pharmaceutical formulations, and is generally regarded as a nontoxic material. On exposure to the eyes, skin, and mucous membranes, linoleic acid can cause mild irritation.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Gloves and eye protection are recommended.

16 Regulatory Status

GRAS listed. Approved for use in foods in Europe and the US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ethyl linoleate; methyl linoleate.

Ethyl linoleate

Empirical formula $C_{20}H_{36}O_2$
CAS number [544-35-4]
Synonyms Linoleic acid ethyl ester; 9,12-octadecadienoic acid ethyl ester; vitamin F.
Comments Ethyl linoleate is used in pharmaceutical formulations as an emollient and humectant. It is also used as a solvent for fats. The EINECS number for ethyl linoleate is 208-868-4.

Methyl linoleate

Empirical formula $C_{19}H_{34}O_2$
CAS number [112-63-0]
Synonyms 9,12-Octadecadienoic acid, methyl ester.
Comments Methyl linoleate is used in cosmetics as an emollient. The EINECS number for methyl linoleate is 203-993-0.

18 Comments

Conjugated linoleic acids are a family of linoleic acid isomers in which the double bonds are conjugated. Antioxidant and anticancer properties have been attributed to conjugated linoleic acids, although the different isomers can have markedly different effects. Studies have shown that conjugated linoleic acid increases paracellular permeability across human intestinal-like Caco-2 cell monolayers, and consequently may also, as a dietary supplement, increase calcium absorption *in vivo*.[10]

Linoleic acid is used in parenteral emulsions for total parenteral nutrition and in nonprescription oral dietary supplements.

Linoleic acid and other polyunsaturated fatty acids have been cited as potential tumor-targeting aids, due to their being readily incorporated into the lipid bilayers of tumor cells. In this capacity, they are believed to play a role in enhancing the therapeutic efficacy of chemotherapy.[16] Similarly, linoleic acid was shown to have a synergistic anti-tumor effect when used as a formulation component in an intraveneous microemulsion of docetaxel.[11]

Linoleic acid has been shown to reduce skin irritation following acute perturbations, exhibiting clinical effects that are comparable to glucocorticoids.[17]

A pre-emulsified linoleic acid system has been used to investigate the protective actions of phenolic compounds against lipid peroxidation.[18]

Linoleic acid was found to have a toxic effect on melanoma cells, causing loss of membrane integrity and/or DNA fragmentation.[19]

Linoleic acid was also found to promote apoptosis and necrosis of human lymphocytes[20] and Jurkat cell death[21] (Jurkat cells are a T-lymphocyte cell line) by mitochondrial depolarization. As a result, it has been suggested that oleic acid may offer a less immunologically problematic alternative to linoleic acid in parenteral nutritional emulsions. However, linoleic acid also reduced genetic damage to normal human lymphocytes caused by benzo(a)-pyrene.[22]

Evidence suggests that linoleate-enriched oil such as sunflower seed oil may enhance skin barrier function,[23] and it has also been shown that linoleic acid is capable of improving epithelial integrity following mucosal injury.[24]

Linoleic acid has been shown to act as a comedolytic agent in acne-prone patients[25] and may have a possible use as a cosmeceutical in acne juvenilis therapy.[26]

Linoleic acid was found to selectively modulate vascular cytotoxicity caused by TNF-alpha and persistent organic pollutants such as polychlorinated biphenyls.[27]

Although not included in any pharmacopeias, a specification for linoleic acid is contained in the *Food Chemicals Codex* (FCC);[28] *see* Table I.

The EINECS number for linoleic acid is 200-470-9.

Table I: FCC specification for linoleic acid.[28]

Test	FCC 10 S2
Identification	+
Acid value	196–202
Lead	≤2 mg/kg
Iodine value	145–160

Lysine Acetate

1 Nonproprietary Names

BP: Lysine Acetate

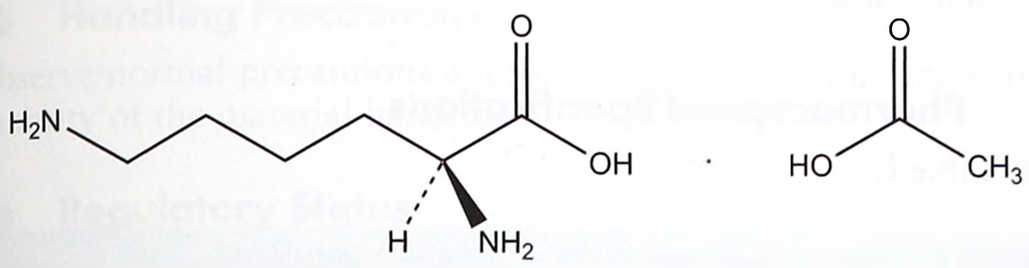
JP: L-Lysine Acetate

PhEur: Lysine Acetate

USP–NF: Lysine Acetate

2 Synonyms

(2*S*)-2,6-Diaminohexanoic acid acetate; lysini acetas; L-lysine acetate; L-lysine monoacetate.



3 Chemical Name and CAS Registry Number

L-Lysine monoacetate [57282-49-2]

4 Empirical Formula and Molecular Weight

$C_8H_{18}N_2O_4$ 206.24

5 Structural Formula

6 Functional Category

Buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Lysine acetate is used as a buffering agent and neutralizing agent for antipyretics and analgesics such as acetylsalicylic acid and ibuprofen. It has been investigated as a component of vaginal sponge-like dressings for treatment of vaginal infections and delivery of peptidic drugs.[1]

8 Description

Lysine acetate occurs as a white or almost white, crystalline powder or colorless crystals.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for lysine acetate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—

Assay	98.5–101.0%	98.5–101.0%	98.0–102.0%

10 Typical Properties

Melting point 281°C[2]

Solubility Freely soluble in water; very slightly soluble in ethanol (96%).

11 Stability and Storage Conditions

Store in well-closed containers protected from light.

12 Incompatibilities

—

13 Method of Manufacture

L-Lysine is manufactured by fermentation from carbohydrate sources. The solution is mixed with acetic acid to produce L-lysine acetate.[3]

14 Safety

Lysine acetate in pure form is moderately toxic by IP, IV, and SC routes, and mildly toxic by ingestion.[4]

LD_{50} (mouse, oral): 14.4 g/kg[4]

LD_{50} (mouse, IP): 5.1 g/kg

LD_{50} (mouse, IV): 3.7 g/kg

LD_{50} (mouse, SC): 5.8 g/kg

LD_{50} (rat, oral): 11.4 g/kg

LD_{50} (rat, IP): 3.7 g/kg

LD_{50} (rat, IV): 2.85 g/kg

LD_{50} (rat, SC): 4.0 g/kg

15 Handling Precautions

When heated to decomposition lysine acetate emits toxic fumes of NO_x.[4]

16 Regulatory Status

Included in the FDA Inactive Ingredient Database (IV injections).

17 Related Substances

Lysine hydrochloride.

18 Comments

The PhEur 9.2 states that lysine acetate exhibits polymorphism.

Therapeutically, lysine acetate is an essential amino acid and is used as a dietary supplement.[5] It is also used for the treatment of mouth and genital lesions caused by herpes zoster viruses.[3]

The EINECS number for lysine acetate is 260-664-4.

Assay (dried basis)	≥ 98.5%	98.5–101.0%	98.5–101.5%

10 Typical Properties

Melting point 263–264°C
Dissociation constant

$pK_{a1} = 2.18$;
$pK_{a2} = 8.95$;
$pK_{a3} = 10.53$ at 25.9°C.

Solubility Freely soluble 1 in 11 parts in water; slightly soluble in ethanol.

11 Stability and Storage Conditions

Store in well-closed containers protected from light.

12 Incompatibilities

Lysine hydrochloride is incompatible with strong oxidizing agents. Lysine can undergo Maillard reactions with reducing sugars to produce browning.[1] Milling and compression of lactose-containing formulations have been shown to increase the rate of such reactions.[2]

13 Method of Manufacture

Lysine hydrochloride is prepared by titration of an ethanol solution of lysine dihydrochloride with pyridine, and subsequent crystallization from an aqueous solution with the addition of ethanol.[3]

14 Safety

Lysine hydrochloride is commonly used as a dietary supplement. The required dietary allowance in adults is 12 mg/kg/day.

LD_{50} (rat, IP): 4.02 g/kg[4]
LD_{50} (rat, oral): 10.0 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Accepted for use as a food additive in Europe.

17 Related Substances

Lysine; lysine acetate.

Lysine

Empirical formula $C_6H_{14}N_2O_2$
Molecular weight 146.19
CAS number [56-87-1]
Synonyms K; lys.
Melting point 210–224°C (with decomposition)
Comments Included in the FDA Inactive Ingredient Database (IM and IV injections). Included in the German Pharmacopeia (Deutsches Arzeibuch) as the monohydrate. Lysine is an essential amino acid and is commonly used as a dietary supplement. L-Lysine can be isolated from acid-hydrolyzed proteins, produced by fermentation, or made synthetically.[5] Lysine is considered a Class I counterion for producing salts of drugs.[6]

18 Comments

A specification for lysine hydrochloride is contained in the *Food Chemicals Codex*.[7]

The EINECS for lysine hydrochloride is 211-519-9. The PubChem Compound ID (CID) for lysine hydrochloride includes 69568, 12047, and 517015.

Magnesium Aluminum Silicate

1 Nonproprietary Names

BP: Aluminium Magnesium Silicate
PhEur: Aluminium Magnesium Silicate
USP–NF: Magnesium Aluminum Silicate

2 Synonyms

Aluminii magnesii silicas; aluminosilicic acid, magnesium salt; aluminum magnesium silicate; *Carrisorb*; *Gelsorb*; *Magnabrite*; magnesium aluminosilicate; magnesium aluminum silicate, colloidal; magnesium aluminum silicate, complex colloidal; *Neusilin*; *Pharmasorb*; silicic acid, aluminum magnesium salt; *Veegum*.

3 Chemical Name and CAS Registry Number

Aluminum magnesium silicate [12511-31-8]
Magnesium aluminum silicate [1327-43-1]

4 Empirical Formula and Molecular Weight

Magnesium aluminum silicate is a polymeric complex of magnesium, aluminum, silicon, oxygen, and water. The average chemical analysis is conventionally expressed as oxides:

Silicon dioxide 61.1%
Magnesium oxide 13.7%
Aluminum oxide 9.3%
Titanium dioxide 0.1%
Ferric oxide 0.9%
Calcium oxide 2.7%
Sodium oxide 2.9%
Potassium oxide 0.3%
Carbon dioxide 1.8%
Water of combination 7.2%

5 Structural Formula

The complex is composed of a three-lattice layer of octahedral alumina and two tetrahedral silica sheets. The aluminum is substituted to varying degrees by magnesium (with sodium or potassium for balance of electrical charge). Additional elements present in small amounts include iron, lithium, titanium, calcium, and carbon.

6 Functional Category

Adsorbent; suspending agent; tablet and capsule binder; tablet and capsule disintegrant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium aluminum silicate has been used for many years in the formulation of tablets, ointments, and creams. It is used in oral and topical formulations as a suspending and stabilizing agent either alone or in combination with other suspending agents.[1–3] The viscosity of aqueous dispersions may be greatly increased by combination with other suspending agents, such as xanthan gum, owing to synergistic effects; *see* Xanthan Gum. In tablets, magnesium aluminum silicate is used as a binder and disintegrant in conventional or slow-release formulations, and solid self-emulsifying drug delivery systems.[4–7] *See* Table I. It has also been investigated for use with chitosan in nanocomposite tablet film coatings.[8]

Magnesium aluminum silicate may cause bioavailability problems with certain drugs; *see* Section 12.

Table I: Uses of magnesium aluminum silicate.

Use	Concentration (%)
Adsorbent	10–50
Binding agent	2–10
Disintegrating agent	2–10
Emulsion stabilizer (oral)	1–5
Emulsion stabilizer (topical)	2–5
Suspending agent (oral)	0.5–2.5
Suspending agent (topical)	1–10
Stabilizing agent	0.5–2.5
Viscosity modifier	2–10

8 Description

The USP 40–NF 35 S1 describes magnesium aluminum silicate as a blend of colloidal montmorillonite and saponite that has been processed to remove grit and nonswellable ore components. Four types of magnesium aluminum silicate are defined: types IA, IB, IC, and IIA. These types differ according to their viscosity and ratio of aluminum and magnesium content; *see* Table II.

The PhEur 9.2 describes magnesium aluminum silicate (aluminium magnesium silicate) as a mixture of particles with colloidal particle size of montmorillonite and saponite, free from grit and nonswellable ore.

Magnesium aluminum silicate occurs as off-white to creamy white, odorless, tasteless, soft, slippery small flakes, or as a fine, micronized powder. Flakes vary in shape and size from about 0.3 × 0.4 mm to 1.0 × 2.0 mm and about 25–240 µm thick. Many flakes are perforated by scattered circular holes 20–120 µm in diameter. Under dark-field polarized light, innumerable bright specks are observed scattered over the flakes. The powder varies from 45 to 297 µm in size.

Table II: Magnesium aluminum silicate types defined in the USP34–NF29 S1.

Type	Viscosity (mPa s)	Al content/Mg content
IA	225–600	0.5–1.2
IB	150–450	0.5–1.2
IC	800–2200	0.5–1.2
IIA	100–300	1.4–2.8

9 Pharmacopeial Specifications

See Table III.

Table III: Pharmacopeial specifications for magnesium aluminum silicate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Viscosity (5% w/v suspension)	–	*See* Table II
Microbial limits	≤10^3 cfu/g	≤10^3 cfu/g
pH (5% w/v suspension)	9.0–10.0	9.0–10.0
Acid demand	–	+
Loss on drying	≤8.0%	≤8.0%
Arsenic	≤3 ppm	≤3 µg/g
Lead	≤15 ppm	≤15 µg/g
Assay for Al and Mg content	95.0–105.0	+

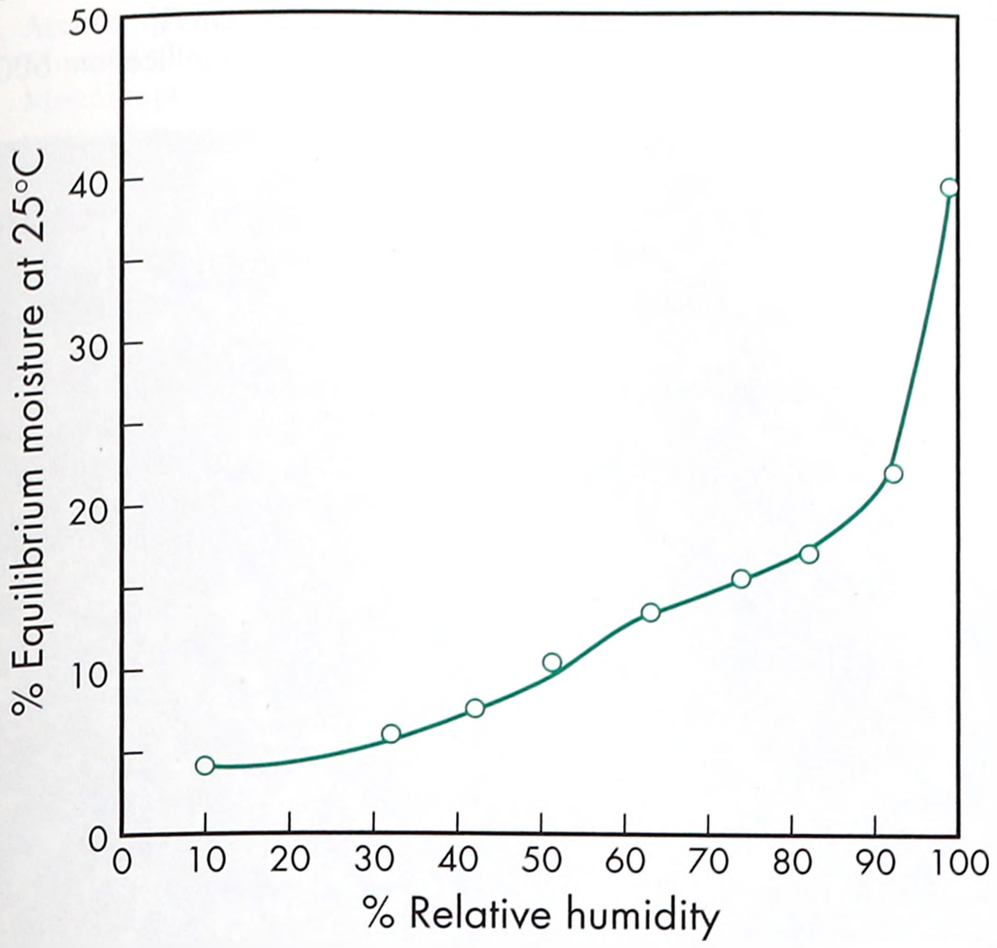

Figure 1: Equilibrium moisture content of magnesium aluminum silicate (*Veegum HV*, RT Vanderbilt Co., Inc.).

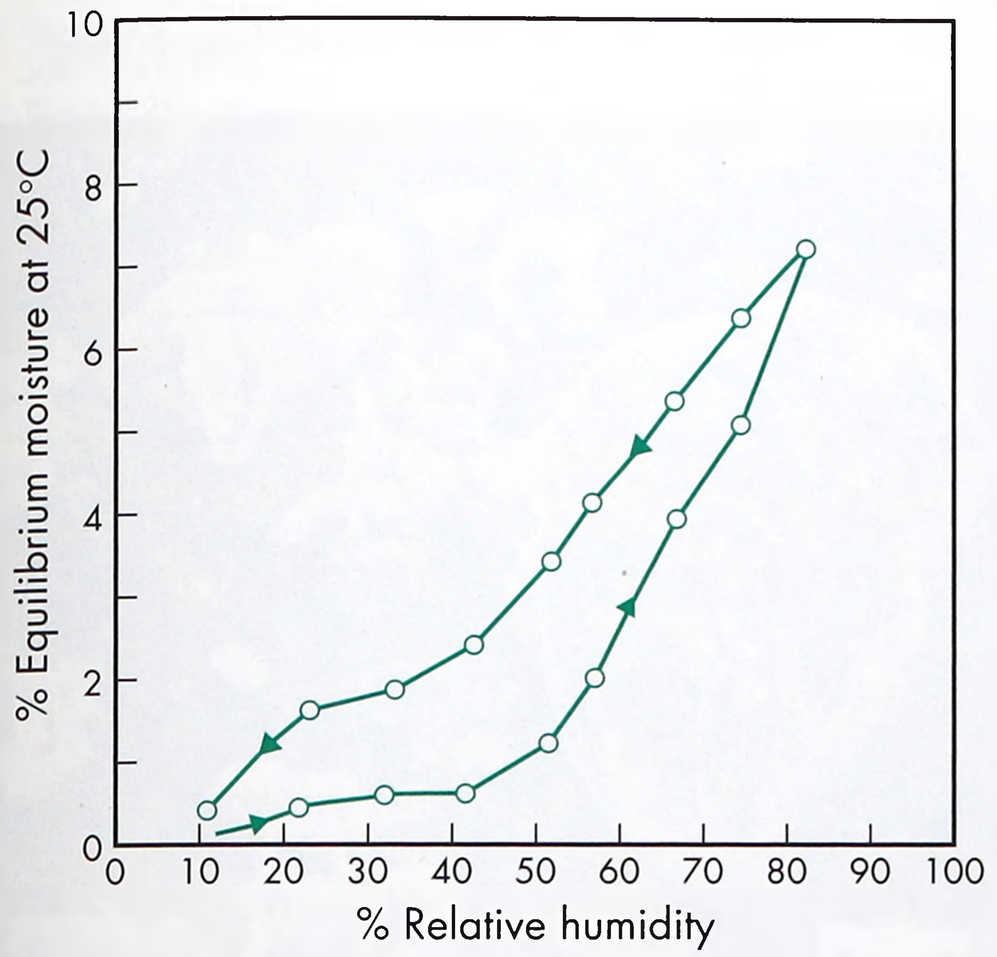

Figure 2: Sorption–desorption isotherm of magnesium aluminum silicate (*Pharmasorb*, BASF).

10 Typical Properties

Acid demand 6–8 mL of 0.1 N HCl is required to reduce the pH of 1 g to pH 4.

Density 2.418 g/cm^3

Moisture content 6.0–9.98%.[9] *See also* Figures 1, 2, and 3.[9]

Particle size distribution *see* Section 8.

Solubility Practically insoluble in alcohols, water, and organic solvents.

Swelling capacity Swelling properties are reversible. Magnesium aluminum silicate swells to many times its original volume in water to form colloidal dispersions, and may be dried and rehydrated any number of times.

Viscosity (dynamic) Dispersions in water at the 1–2% w/v level are thin colloidal suspensions. At 3% w/v and above, dispersions are opaque. As the concentration is increased above 3% w/v, the viscosity of aqueous dispersions increases rapidly; at 4–5% w/v, dispersions are thick, white colloidal sols, while at 10% w/v firm gels are formed. Dispersions are thixotropic at concentrations greater than 3% w/v. The viscosity of the suspension increases with heating or addition of electrolytes, and at higher concentrations with aging.

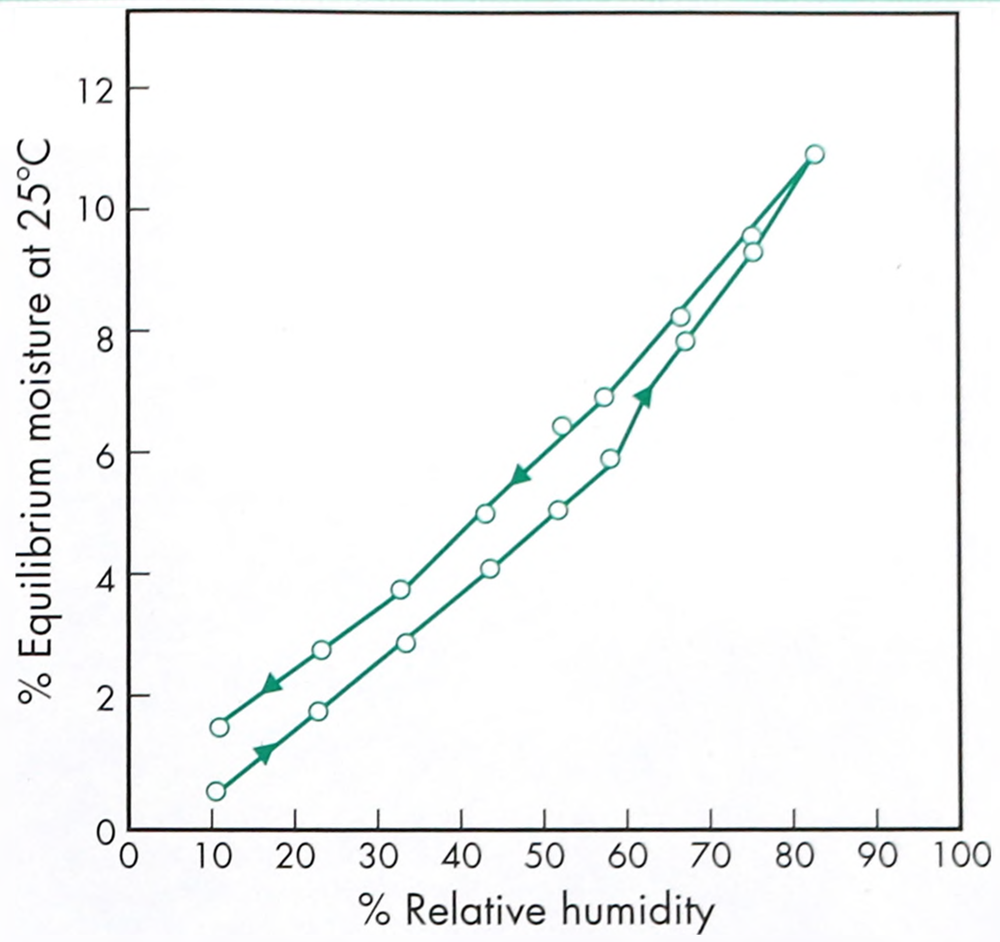

Figure 3: Sorption–desorption isotherm of magnesium aluminum silicate (*Pharmasorb Colloidal*, BASF).

11 Stability and Storage Conditions

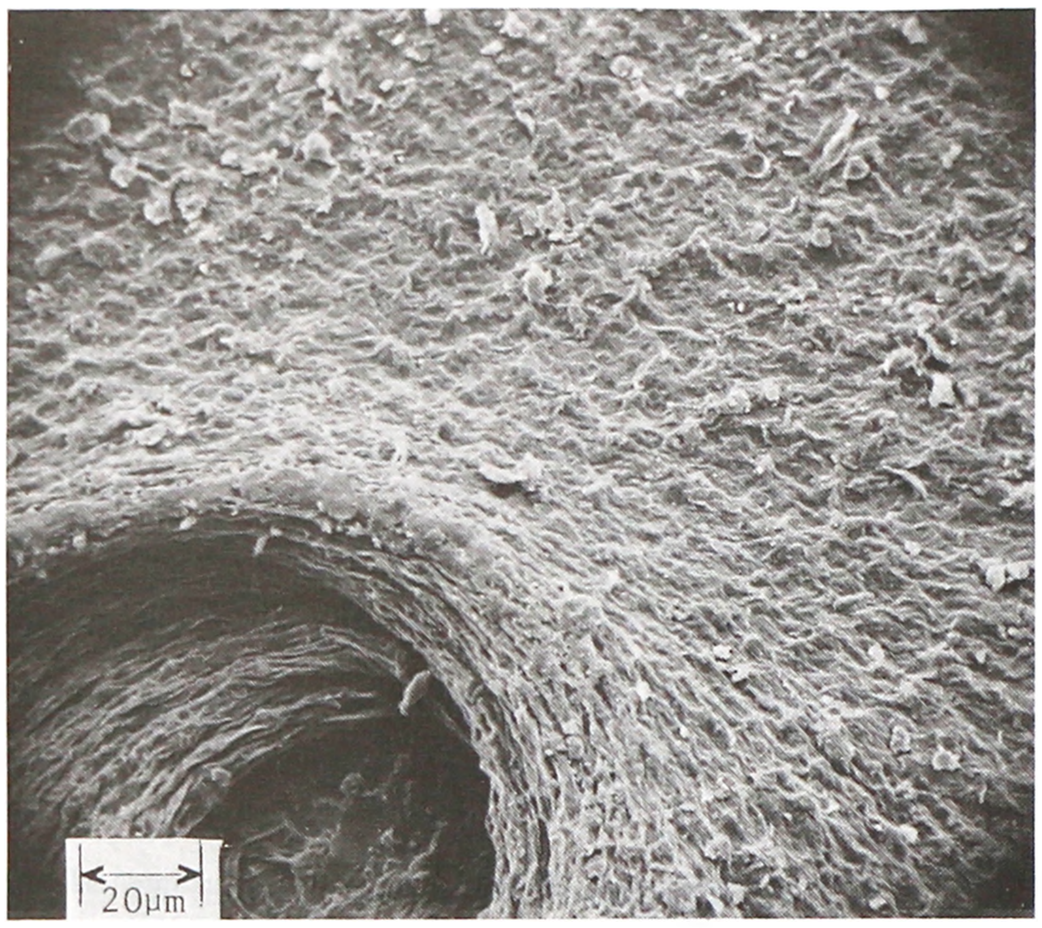
Magnesium aluminum silicate is stable indefinitely when stored under dry conditions. It is stable over a wide pH range, has base-exchange capacity, absorbs some organic substances, and is compatible with organic solvents.

Magnesium aluminum silicate should be stored in a well-closed container, in a cool, dry place.

12 Incompatibilities

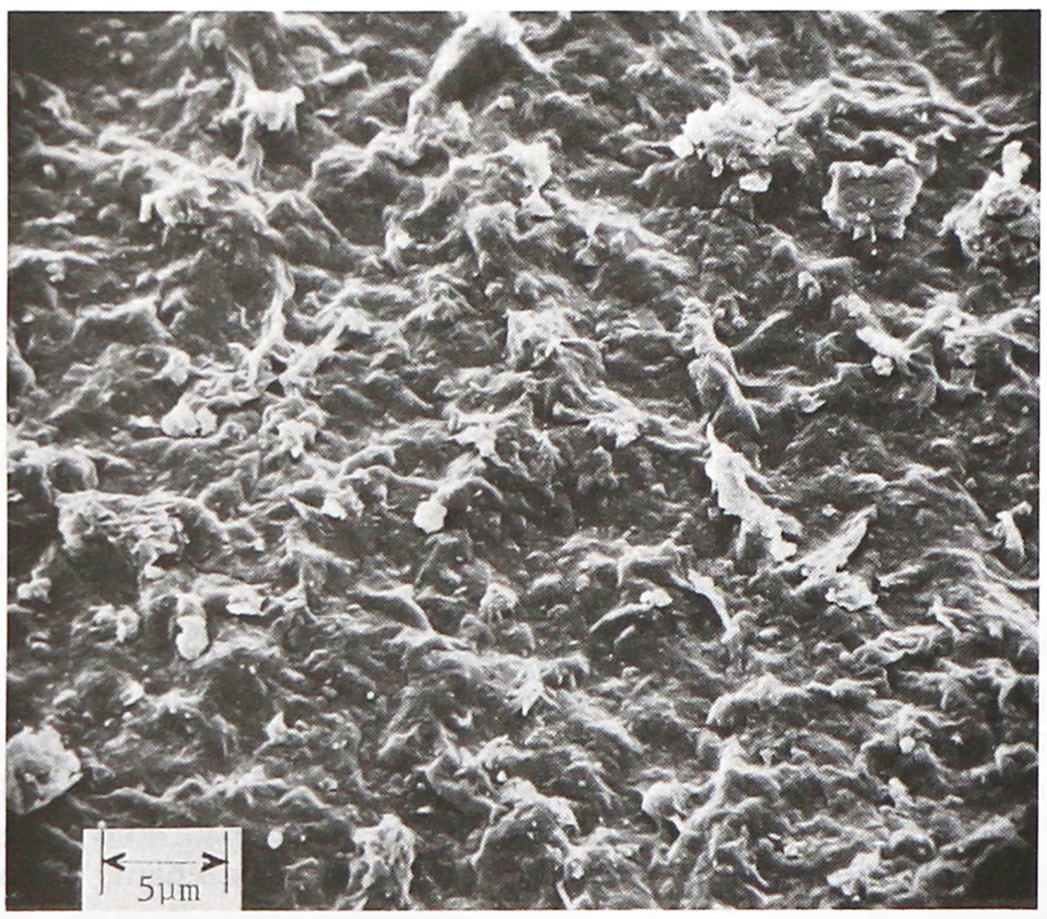
Owing to its inert nature, magnesium aluminum silicate has few incompatibilities but is generally unsuitable for acidic solutions below pH 3.5. Magnesium aluminum silicate, as with other clays, may adsorb some drugs.[10,11] This can result in low bioavailability if the drug is tightly bound or slowly desorbed, e.g. amfetamine sulfate,[4] tolbutamide,[12] warfarin sodium,[13] diazepam,[14] and diclofenac sodium.[15]

13 Method of Manufacture



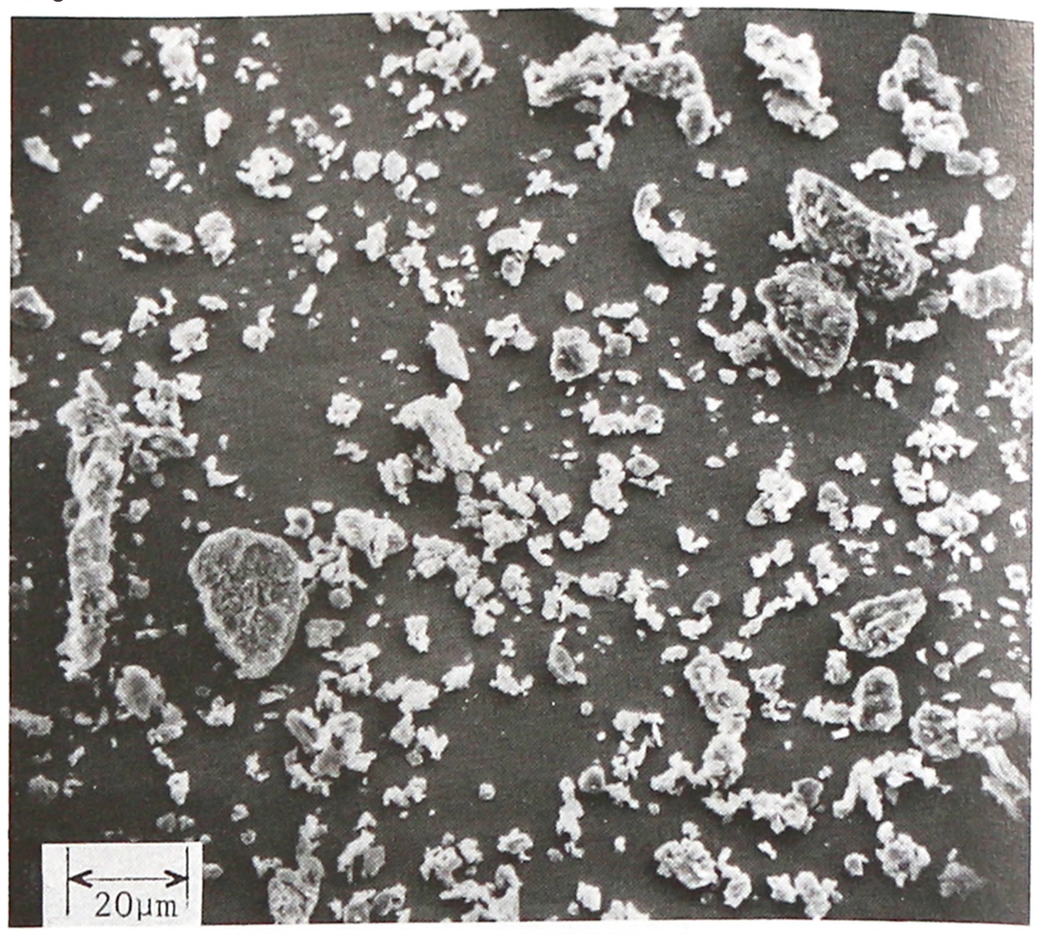
Magnesium aluminum silicate is obtained from silicate ores of the montmorillonite group, which show high magnesium content. The ore is blended with water to form a slurry to remove impurities and separate out the colloidal fraction. The refined colloidal dispersion is drum-dried to form a small flake, which is then micro-atomized to form various powder grades.

14 Safety

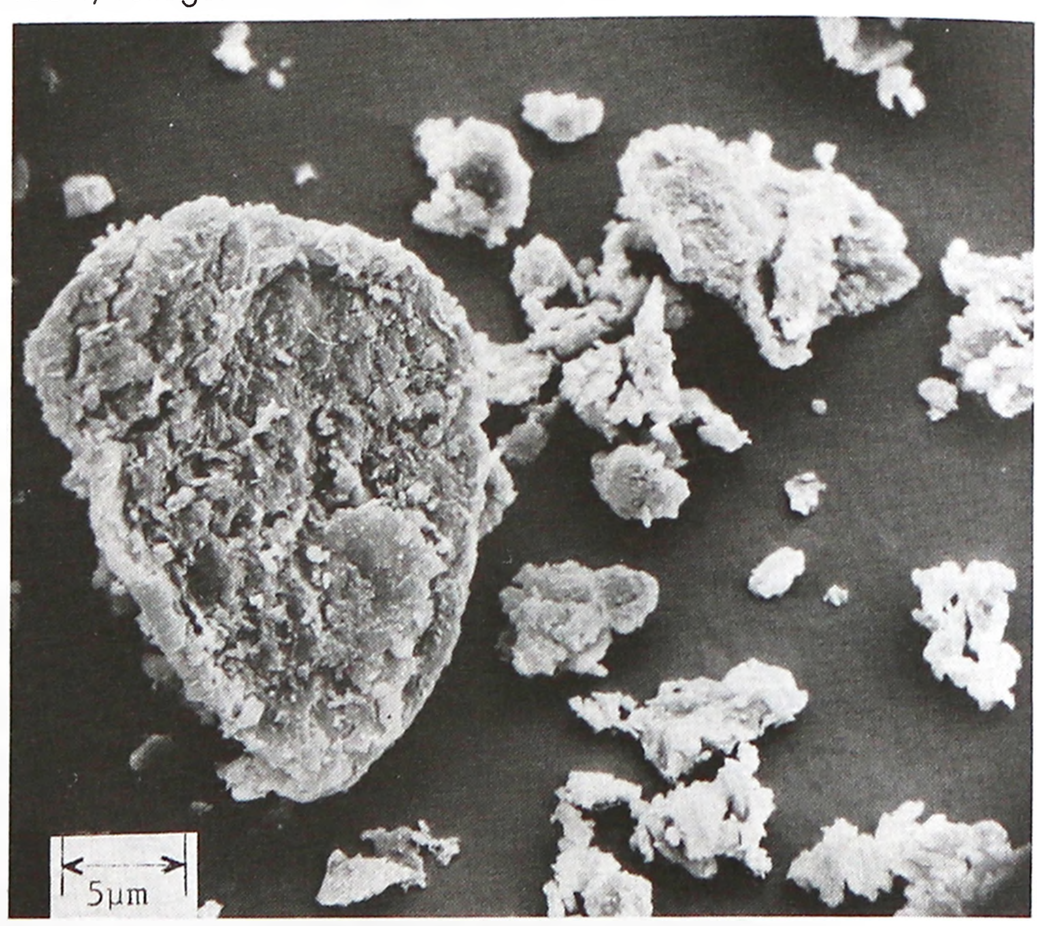


Magnesium aluminum silicate is generally regarded as nontoxic and nonirritating at the levels employed as a pharmaceutical excipient. Subacute animal feeding studies in rats and dogs fed magnesium aluminum silicate at 10% of the diet, for 90 days, were negative, including autopsy and histopathological examinations.[16]

The Cosmetic Ingredient Review Expert Panel has assessed magnesium aluminum silicate and concluded that the material is



SEM 1: Excipient: magnesium aluminum silicate (*Veegum*); manufacturer: RT Vanderbilt Co., Inc.; lot no.: 61A-1; magnification: 600×; voltage: 10 kV.



SEM 2: Excipient: magnesium aluminum silicate (*Veegum*); manufacturer: RT Vanderbilt Co., Inc.; lot no.: 61A-1; magnification: 2400×; voltage: 10 kV.

SEM 3: Excipient: magnesium aluminum silicate (*Veegum F*); manufacturer: RT Vanderbilt Co., Inc.; lot no: 61A-2; magnification: 600×; voltage: 10 kV.

SEM 4: Excipient: magnesium aluminum silicate (*Veegum F*); manufacturer: RT Vanderbilt Co., Inc.; lot no.: 61A-2; magnification: 2400×; voltage: 10 kV.

safe as used in the present practices of use and concentration in cosmetic formulations.[17]

LD_{50} (rat, oral): > 16 g/kg[18]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Adequate ventilation should be provided and dust generation minimized.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, drops, granules, solutions, suspensions, syrups, and tablets; rectal, topical, and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Attapulgite; bentonite; kaolin; magnesium silicate; magnesium trisilicate; montmorillonite; saponite; talc.

Montmorillonite

Empirical formula $Al_2O_5 \cdot 4SiO_2 \cdot 4H_2O$
CAS number [1318-93-0]
Comments A naturally occurring silicate clay.

18 Comments

The EINECS number for magnesium aluminum silicate is 215-478-8. The PubChem Compound ID (CID) for magnesium aluminum silicate is 3084116.

Magnesium Carbonate

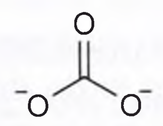
1 Nonproprietary Names

BP: Heavy Magnesium Carbonate
Light Magnesium Carbonate
JP: Magnesium Carbonate
PhEur: Magnesium Carbonate, Heavy
Magnesium Carbonate, Light
USP–NF: Magnesium Carbonate

2 Synonyms

Carbonic acid, magnesium salt (1:1); carbonate magnesium; *Destab*; E504; hydromagnesite; magnesii subcarbonas levis; magnesii subcarbonas ponderosus. *See* Sections 4 and 17.

3 Chemical Name and CAS Registry Number



Magnesium carbonate anhydrous [546-93-0]
See also Sections 4 and 17.

4 Empirical Formula and Molecular Weight

Magnesium carbonate is not a homogeneous material but may consist of the normal hydrate, the basic hydrate, and the anhydrous material $MgCO_3$, which is rarely encountered. Basic magnesium carbonate is probably the most common form, and may vary in formula between light magnesium carbonate, $(MgCO_3)_3 \cdot Mg(OH)_2 \cdot 3H_2O$, and magnesium carbonate hydroxide, $(MgCO_3)_4 \cdot Mg(OH)_2 \cdot 5H_2O$. Normal magnesium carbonate is a hydrous magnesium carbonate with a varying amount of water, $MgCO_3 \cdot xH_2O$.

See also Sections 8, 13, and 17.

5 Structural Formula

See Section 4.

6 Functional Category

Adsorbent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

As an excipient, magnesium carbonate is mainly used as a directly compressible tablet diluent in concentrations up to 45% w/w. Heavy magnesium carbonate produces tablets with high crushing strength, low friability, and good disintegration properties.[1–4] However, magnesium carbonate can have varying effects on dissolution and stability.[5,6] *See also* Section 12. Magnesium carbonate has been incorporated in microsphere formulations for the purpose of stabilizing encapsulated proteins.[7] It has also been coencapsulated in poly(lactide-*co*-glycolide) microsphere formulations to neutralize acidity and enhance the immunogenicity of a contraceptive peptide vaccine.[8] Magnesium carbonate has been incorporated as a pore-forming agent in injectable poly(DL-lactide-*co*-glycolide) implants to improve the release rate of a hydrophobic drug.[9] It is also used to absorb liquids, such as flavors, in tableting processes.

Magnesium carbonate is additionally used as a food additive. *See* Table I.

Table I: Uses of magnesium carbonate.

Use	Concentration (%)
Absorbent of liquid, in tableting	0.5–1.0
Tablet excipient (direct compression)	≤45

8 Description

Magnesium carbonate occurs as light, white-colored friable masses or as a bulky, white-colored powder. It has a slightly earthy taste and is odorless but, since it has a high absorptive ability, magnesium carbonate can absorb odors.

The USP 40–NF 35 S1 describes magnesium carbonate as either a basic hydrated magnesium carbonate or a normal hydrated magnesium carbonate. However, the PhEur 9.2 describes magnesium carbonate as being a hydrated basic magnesium carbonate in two separate monographs: heavy magnesium carbonate and light magnesium carbonate. The molecular formulas for heavy magnesium carbonate and light magnesium carbonate vary, but heavy magnesium carbonate may generally be regarded as the tetrahydrate $[(MgCO_3)_3{\cdot}Mg(OH)_2{\cdot}4H_2O]$, while light magnesium carbonate may be regarded as the trihydrate $[(MgCO_3)_3{\cdot}Mg(OH)_2{\cdot}3H_2O]$.

The molecular weights of the heavy and light forms of magnesium carbonate are 383.32 and 365.30, respectively.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Angle of repose

42–50° for granular heavy magnesium carbonate;

56–60° for spray-dried heavy magnesium carbonate.[3]

Density (bulk)

Heavy magnesium carbonate: 0.207–0.56 g/cm^3;[10]

Light magnesium carbonate: ≈0.12 g/cm^3.

Density (tapped)

Heavy magnesium carbonate: 0.314–0.783 g/cm^3;[10]

Light magnesium carbonate: ≈0.21 g/cm^3.

Density (true)

Heavy magnesium carbonate: 1.966–2.261 g/cm^3.[10]

Moisture content At relative humidities between 15% and 65% the equilibrium moisture content of heavy magnesium carbonate at 25°C is about 1% w/w; at relative humidities above 75% the equilibrium moisture content at 25°C is about 5% w/w.[3]

SEM 1: Excipient: magnesium carbonate USP; manufacturer: Mallinckrodt Chemicals Co.; lot no.: KJGJ; magnification: 60×; voltage: 20 kV.

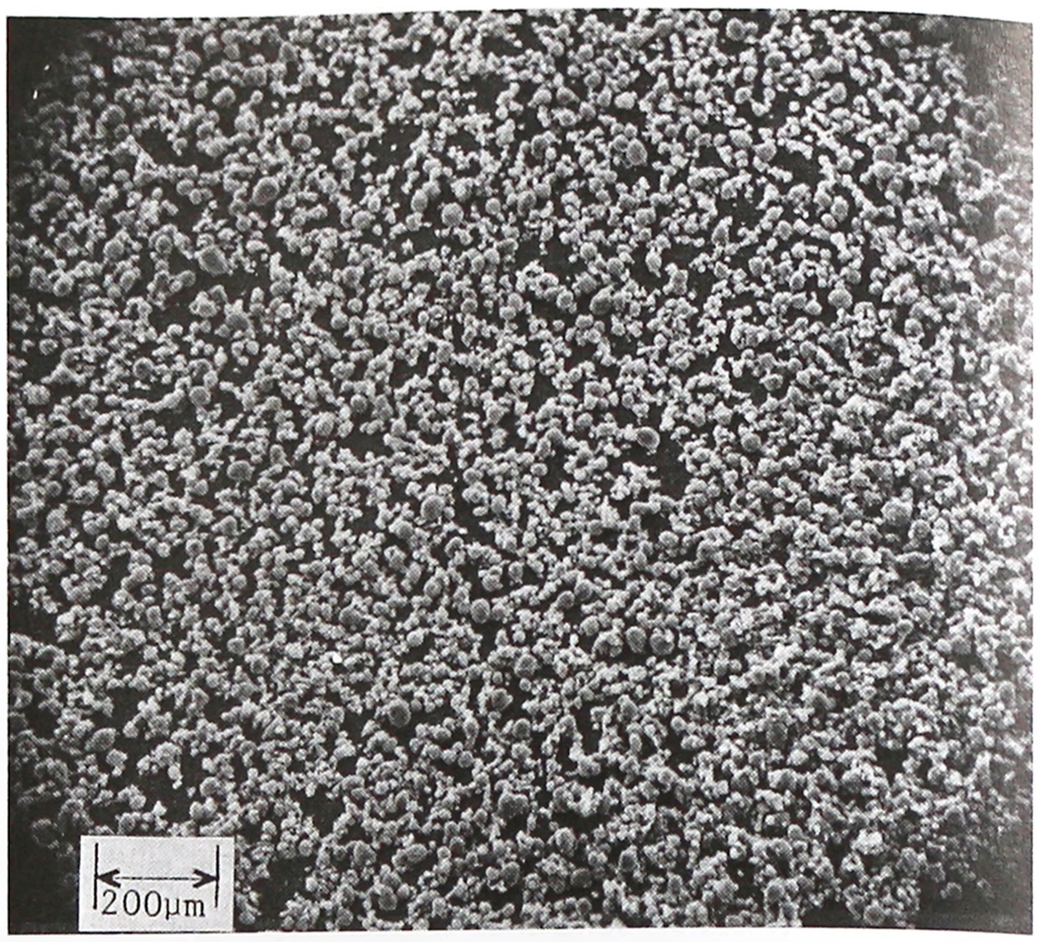


Table II: Pharmacopeial specifications for magnesium carbonate.

Test	JP XVII	PhEur 9.2[a]	USP 40–NF 35 S1

(a) Note that except where indicated all of the PhEur test limits apply to both the heavy and light forms of magnesium carbonate.

Particle size distribution

Heavy magnesium carbonate: 7–43 µm median particle size;[10]

Light magnesium carbonate: 99.95% through a 44.5 µm (#350 mesh) sieve for light magnesium carbonate.

Solubility Practically insoluble in water but soluble in water containing carbon dioxide. Insoluble in ethanol (95%) and other solvents. Magnesium carbonate dissolves and effervesces on contact with dilute acids.

Specific surface area

7.8–18.2 m^2/g for granular heavy magnesium carbonate;

4.4–15.5 m^2/g for spray-dried heavy magnesium carbonate;[3]

14.64–14.78 m^2/g for basic heavy magnesium carbonate.

Spectroscopy

NIR spectra *see* Figures 1 and 2.

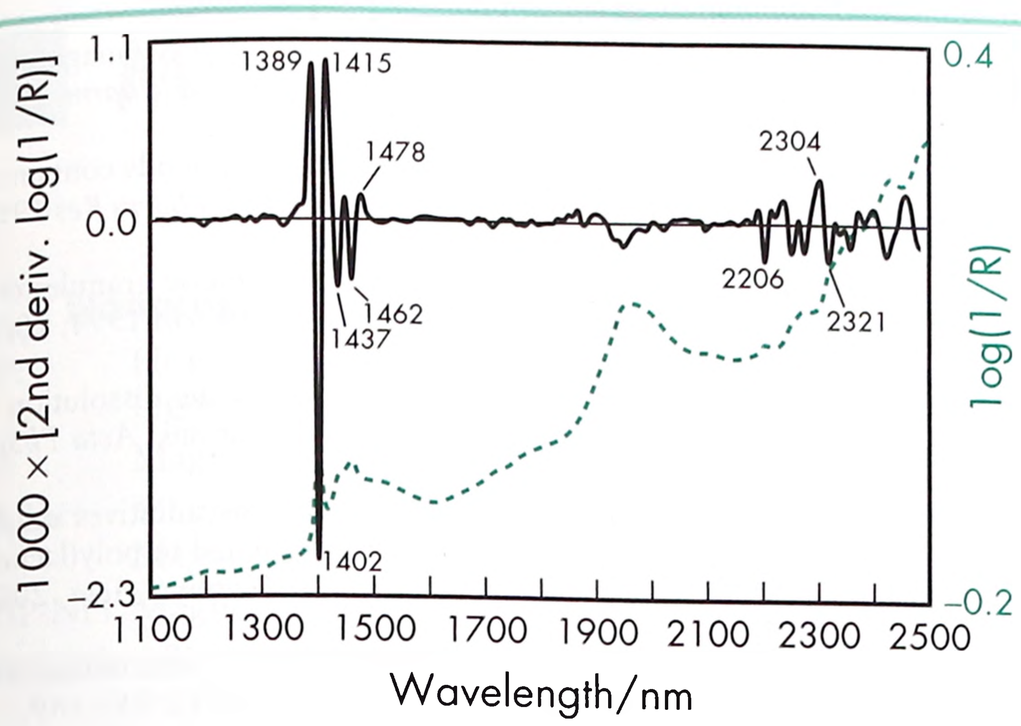

Figure 1: Near-infrared spectrum of heavy magnesium carbonate measured by reflectance.

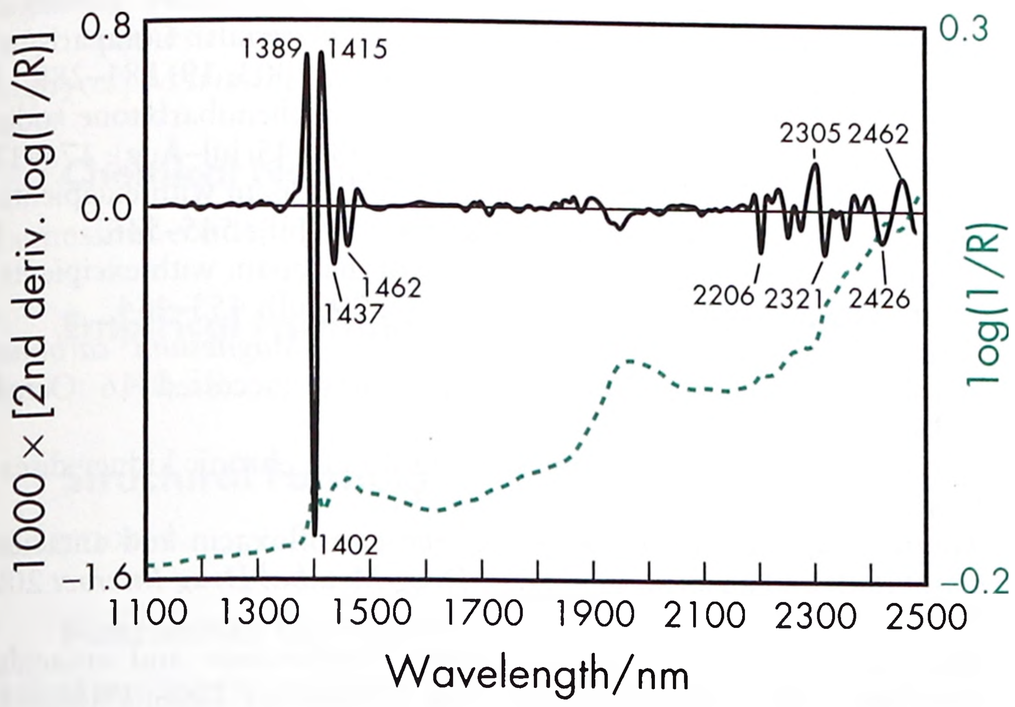

Figure 2: Near-infrared spectrum of light magnesium carbonate measured by reflectance.

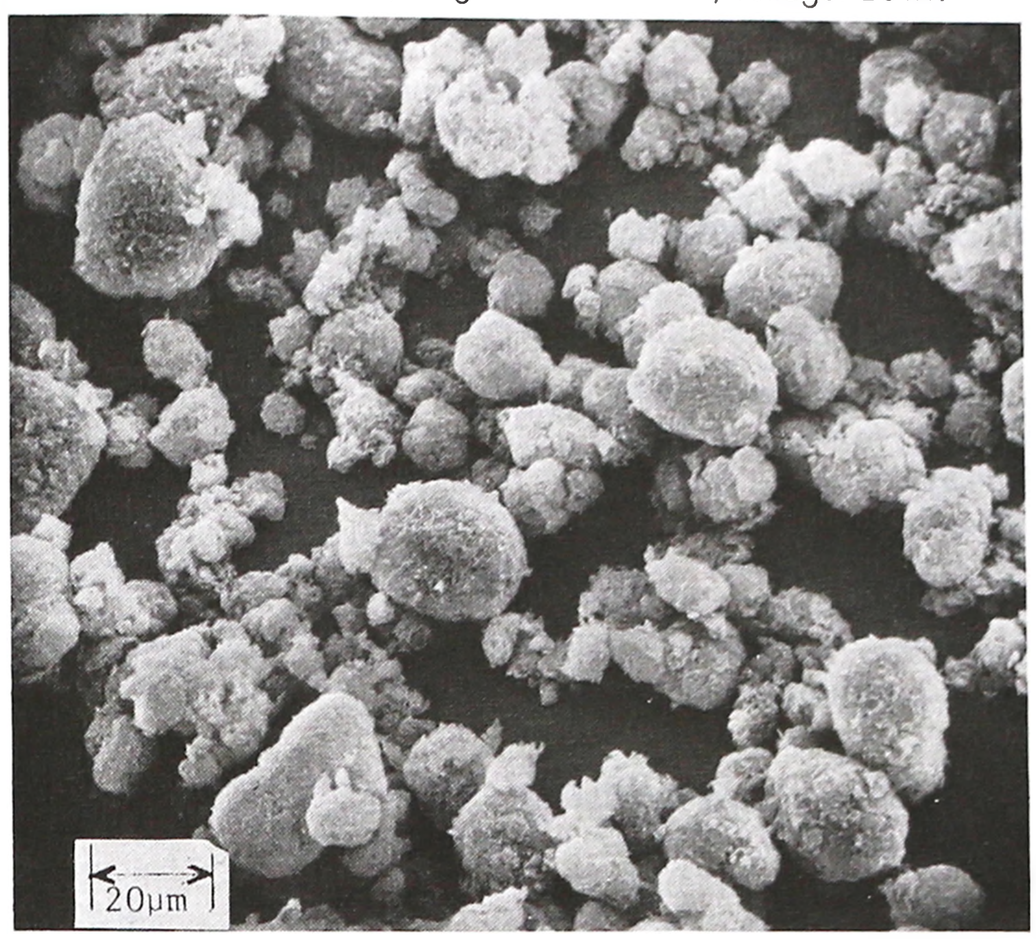
11 Stability and Storage Conditions

Magnesium carbonate is stable in dry air and on exposure to light. The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities



Incompatible with phenobarbital sodium,[4,11] diazepam solution at a pH ≥5,[12] some binary powder mixtures,[13] lansoprazole,[5] and formaldehyde.[14] Acids will dissolve magnesium carbonate, with the liberation of carbon dioxide. Slight alkalinity is imparted to water. Magnesium carbonate was also found to increase the dissolution of acetazolamide formulations at a pH of 1.12; however, dissolution was retarded at a pH of 7.4.[6]

13 Method of Manufacture

Depending upon the manufacturing process used, the composition of the magnesium carbonate obtained may vary from normal hydrated magnesium carbonate to basic hydrated magnesium carbonate.

Light magnesium carbonate may be manufactured by saturating an aqueous suspension of dolomite, $CaMg(CO_3)_2$, with carbon dioxide under pressure. On increase of the temperature, calcium carbonate precipitates almost entirely. The filtered solution is then heated to boiling; the magnesium bicarbonate in the solution loses carbon dioxide and water, and light magnesium carbonate precipitates.

SEM 2: Excipient: magnesium carbonate USP; manufacturer: Mallinckrodt Chemicals Co.; lot no.: KJGJ; magnification: 600×; voltage: 20 kV.

Heavy magnesium carbonate may be manufactured by mixing a hot concentrated solution of magnesium chloride or magnesium sulfate with a solution of sodium carbonate. The heavy magnesium carbonate may be either precipitated to produce a granular material or spray-dried. Varying the temperature of the reaction solutions produces heavy magnesium carbonate with differing physical properties: e.g. material with a higher specific surface area is produced at a lower reaction temperature. Low processing temperature provided the largest surface area, which produced optimum granules or spray-dried powder.[3] If dilute magnesium chloride or magnesium sulfate solutions are used for the reaction, a less dense material is produced.

Magnesium carbonates in varying states of hydration are also found as minerals in nature.

14 Safety

Magnesium carbonate is used as an excipient in oral solid-dosage pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material. However, the use of magnesium salts, such as magnesium carbonate, is contraindicated in patients with renal impairment. In certain studies, magnesium carbonate has been shown to be an effective phosphate binder in short-term use for patients with chronic kidney disease, but the effects of long-term use require further study.[15] The probable oral lethal dose in humans has been estimated at 0.5–5.0 g/kg bodyweight.[14]

On contact with gastric acid, magnesium carbonate reacts in the stomach to form soluble magnesium chloride and carbon dioxide. Magnesium carbonate should therefore not be used as an antacid by those individuals whose stomachs cannot tolerate the evolution of carbon dioxide. Some magnesium is absorbed but is usually excreted in the urine. As with other magnesium salts, magnesium carbonate has a laxative effect and may cause diarrhea.

Therapeutically, the usual dose of magnesium carbonate as an antacid is 250–500 mg, and 2.0–5.0 g as a laxative.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Magnesium carbonate may be irritant to the eyes; eye protection is recommended. OSHA standards state that IPA 8-hour time weighted airborne average is 10 mg/m^3.[14]

16 Regulatory Acceptance

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Magnesium carbonate anhydrous; magnesium carbonate hydroxide; normal magnesium carbonate.

Magnesium carbonate anhydrous

Empirical formula $MgCO_3$
Molecular weight 84.31
CAS number [546-93-0]
Synonyms Carbonic acid, magnesium salt anhydrous (1 : 1); E504; magnesite.
Appearance Odorless, white-colored bulky powder or light, friable masses.
Melting point Decomposes at 350°C.

Magnesium carbonate hydroxide

Empirical formula $(MgCO_3)_4 \cdot Mg(OH)_2 \cdot 5H_2O$
Molecular weight 485.65
CAS number [39409-82-0]
Synonyms Carbonic acid, magnesium salt (1 : 1), mixture with magnesium hydroxide and magnesium hydrate; dypingite; E504.
Appearance Odorless, white-colored bulky powder or light, friable masses.
Melting point On heating at 700°C it is converted into magnesium oxide.
Specific gravity 1.45
Comments The EINECS number for magnesium carbonate hydroxide is 235-192-7.

Normal magnesium carbonate

Empirical formula $MgCO_3 \cdot xH_2O$
CAS number [23389-33-5]
Synonyms Carbonic acid, magnesium salt (1 : 1), hydrate; magnesium carbonate, normal hydrate; E504.
Appearance Odorless, white-colored bulky powder or light, friable masses.

18 Comments

Therapeutically, magnesium carbonate is used as an antacid.

Magnesium carbonate has been found to increase the dissolution of acetazolamide formulations at a pH of 1.12; however, dissolution was retarded at a pH of 7.4.[6] It has also been found to retard the dissolution of ciprofloxacin, sparfloxacin, and cephradine.[16–18] In addition, magnesium carbonate has been shown to alter the pharmacokinetics of halofantrine, increasing the time to reach maximum plasma concentration and reducing maximum plasma concentrations.[19] Because drug interactions can occur with a variety of antacids,[16–20] the potential for these effects should be considered when designing pharmaceutical formulations containing magnesium carbonate.

A specification for magnesium carbonate is contained in the *Food Chemicals Codex* (FCC).[21]

The EINECS number for magnesium carbonate is 208-915-9.

3 Chemical Name and CAS Registry Number

Magnesium oxide [1309-48-4]

4 Empirical Formula and Molecular Weight

MgO 40.30

5 Structural Formula

See Section 4.

6 Functional Category

Anticaking agent; emulsifying agent; glidant; tablet and capsule diluent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium oxide is used as an alkaline diluent in solid dosage forms to modify the pH of tablets.[1] It can be added to solid-dosage forms to bind excess water and keep the granulation dry. In combination with silica, magnesium oxide can be used as an auxiliary glidant.[2]

8 Description

Two forms of magnesium oxide exist: a bulky form termed light magnesium oxide and a dense form termed heavy magnesium oxide. The USP 40–NF 35 S1 and JP XVII define both forms in a single monograph, while the BP 2017 and PhEur 9.2 have separate monographs for each form. The JP XVII states that when 5 g of magnesium oxide has a volume not more than 30 mL, it may be labeled heavy magnesium oxide. For the heavy variety, 15 g has an apparent volume before settling of not more than 60 mL; for the light variety, 15 g has an apparent volume before settling of not more than 100 mL as defined by the BP 2017 and PhEur 9.2.

Both forms of magnesium oxide occur as fine, white, odorless powders. Magnesium oxide possesses a cubic crystal structure, though the BP 2017 and PhEur 9.2 describe the appearance of light magnesium oxide as an amorphous powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for magnesium oxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Loss on ignition	≤10.0%	≤8.0%	≤10.0%
Color of solution	–	+	–
Free alkali and soluble salts	≤0.5%	--	≤2.0%
Soluble substances	–	≤2.0%	–
Acid-insoluble substances	≤0.1%	≤0.1%	≤0.1%
Arsenic	≤10 ppm	≤4 ppm	–
Calcium	–	≤1.5%	≤1.1%
Calcium oxide	≤1.5%	–	–
Carbonate	+	–	–
Heavy metals	≤40 ppm	–	≤20 ppm
Iron	≤500 ppm	+	≤0.05%
Heavy magnesium oxide	–	≤0.07%	–
Light magnesium oxide	–	≤0.1%	–
Chloride	–	+	–
Heavy magnesium oxide	–	≤0.1%	–
Light magnesium oxide	–	≤0.15%	–
Fluoride	≤0.08%	–	–
Sulfate	–	≤1.0%	–
Bulk density	–	+	+
Heavy magnesium oxide	–	≥0.25g/ml	–
Light magnesium oxide	–	≤0.15g/ml	–
Assay	≥96.0%	98.0–100.5%	96.0–100.5%

10 Typical Properties

Acidity/alkalinity pH = 10.3 (saturated aqueous solution)

Boiling point 3600°C

Melting point 2800°C

Particle size distribution 99.98% less than 45 μm in size (light magnesium oxide).

Refractive index 1.735

Solubility Soluble in dilute acids and ammonium salt solutions; very slightly soluble in pure water (≈0.0086 g/100 mL at 30°C; solubility is increased by carbon dioxide); practically insoluble in ethanol (95%).

Specific gravity 3.58 g/cm^3 at 25°C (heavy magnesium oxide).

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Magnesium oxide is stable at normal temperatures and pressures; however, it is hygroscopic, rapidly absorbing water and carbon dioxide on exposure to the air. Absorption occurs more readily with the light form than the heavy form. Magnesium hydroxide is formed in the presence of water.

The bulk material should be stored in an airtight container in a cool, dry place.

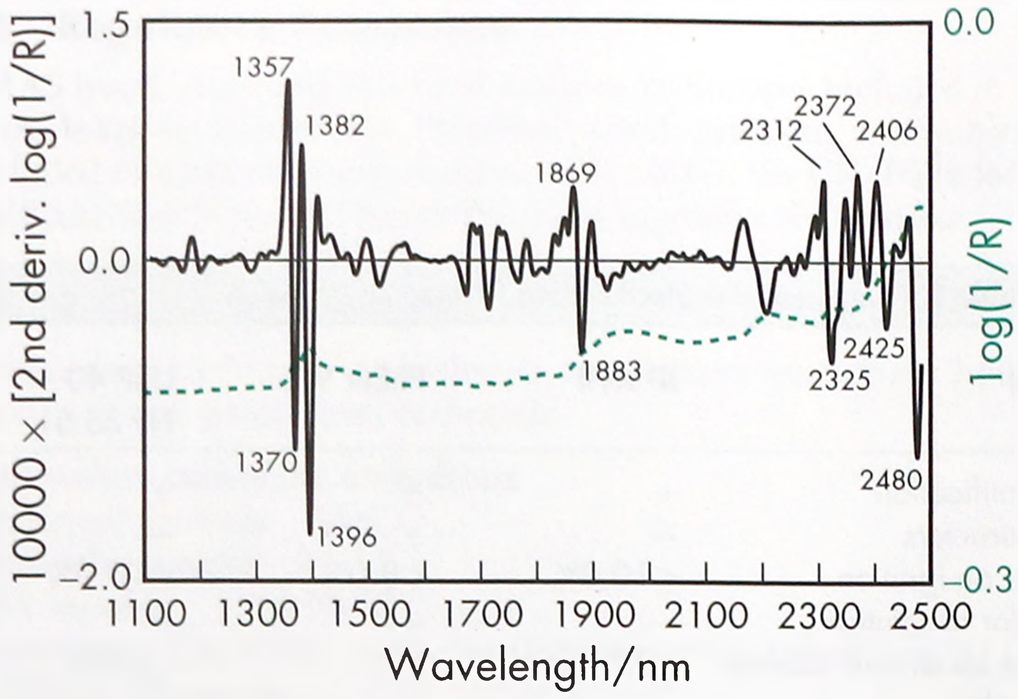

Figure 1: Near-infrared spectrum of magnesium oxide measured by reflectance.

12 Incompatibilities

Magnesium oxide is a basic compound and as such can react with acidic compounds in the solid state to form salts such as $Mg(ibuprofen)_2$ or degrade alkaline-labile drugs.[3]

Adsorption of various drugs onto magnesium oxide has been reported, such as antihistamines,[4] antibiotics (especially tetracyclines),[5] salicylates,[6] atropine sulfate,[7] hyoscyamine hydrobromide,[7] acetaminophen, chloroquine;[8] and anthranilic acid derivatives have been reported to adsorb onto the surface of magnesium oxide.[9]

Magnesium oxide can also complex with polymers to retard drug release[10–12] and can interact in the solid state with phenobarbital sodium.[13] Magnesium oxide can also reduce the bioavailability of phenytoin,[14] trichlormethiazide,[15] and antiarrhythmics.[16] The presence of magnesium oxide can also have a negative impact on the solid-state chemical stability of drugs, such as diazepam.[17] Magnesium oxide has been used as a stabilizer for omeprazole due to its strong waterproofing effect.[18]

13 Method of Manufacture

Magnesium oxide occurs naturally as the mineral periclase. It can be manufactured by many processes. Limestone containing the mineral dolomite is calcinated at high temperatures to produce dolime, which then reacts with magnesium chloride-rich sea water to produce magnesium hydroxide and calcium chloride.[19] The magnesium hydroxide is then calcinated to produce magnesium oxide and water. In another process, mined magnesite ($MgCO_3$) is calcinated to produce magnesium oxide and carbon dioxide.[19] Purification methods include crushing and size separation, heavy-media separation, and froth flotation.

Producing magnesium oxide from sea water is a process that involves heating magnesium chloride concentrated brine from the Dead Sea. The magnesium chloride decomposes into magnesium oxide and hydrochloric acid.[19]

Magnesium oxide may also be produced by the thermal decomposition of magnesium chloride, magnesium sulfate, magnesium sulfite, nesquehonite, and the basic carbonate $5MgO{\cdot}4CO_2{\cdot}5H_2O$. Purification of the magnesium oxide produced through thermal degradation is carried out by filtration or sedimentation.

14 Safety

Magnesium oxide is widely used in oral formulations and is generally regarded as a nontoxic material when employed as an excipient. However, due to its laxative action, adverse effects may occur if high doses are ingested orally. It may also cause skin irritation.[20]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Magnesium oxide may be harmful if inhaled, ingested, or absorbed through the skin in quantity, and is irritating to the eyes and respiratory system. Gloves, eye protection, and a dust mask or respirator are recommended. In the US and UK, the long-term (8-hour TWA) workplace exposure limits for magnesium oxide, calculated as magnesium, are 10 mg/m^3 for inhalable dust fume and 4 mg/m^3 for respirable dust.[19,21] The short-term (15-minute) limit for respirable dust is 10 mg/m^3.[19]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral capsules, tablets, and buccal). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Magnesium oxide is used therapeutically in oral treatments as an osmotic laxative, as a magnesium supplement to treat deficiency states, and as an antacid, either alone or in conjunction with aluminum hydroxide. Studies have indicated better bioavailability of magnesium from effervescent tablets than from capsules.[22] It is also used as a food additive.

A specification for magnesium oxide is contained in the *Food Chemicals Codex* (FCC).[23]

The EINECS number for magnesium oxide is 215-171-9. The PubChem Compound ID (CID) for magnesium oxide is 14792.

Magnesium Silicate

M

1 Nonproprietary Names

JP: Magnesium Silicate
USP–NF: Magnesium Silicate

2 Synonyms

E553a; synthetic magnesium silicate.

3 Chemical Name and CAS Registry Number

Silicic acid, magnesium salt [1343-88-0]

4 Empirical Formula and Molecular Weight

$MgO{\cdot}SiO_2{\cdot}xH_2O$
See also Sections 5 and 17.

5 Structural Formula

Magnesium silicate is a compound of magnesium oxide and silicon dioxide. *See also* Section 17.

The JP XVII states that magnesium silicate contains not less than 45.0% of silicon dioxide (SiO_2: molecular weight 60.08) and not less than 20.0% of magnesium oxide (MgO: 40.30), and the ratio of percentage (%) of magnesium oxide to silicon dioxide is not less than 2.2 and not more than 2.5.

The USP 40–NF 35 S1 describes magnesium silicate as a compound of magnesium oxide (MgO) and silicon dioxide (SiO_2) that contains not less than 15.0% of MgO and not less than 67.0% of SiO_2 calculated on the ignited basis.

6 Functional Category

Anticaking agent; glidant; lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium silicate is used in oral pharmaceutical formulations as a glidant, lubricant and an anticaking agent.[1]

8 Description

Magnesium silicate occurs as an odorless and tasteless, fine, white-colored powder that is free from grittiness.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for magnesium silicate.

Test	JP XVII	USP 40–NF 35 S1
Identification	+	+
pH (10% aqueous suspension)	—	7.0–10.8
Loss on drying	—	≤15%
Soluble salts	≤0.02 g	≤3.0%
Chloride	≤0.053%	—
Free alkali	+	+
Heavy metals	≤30 ppm	≤20 µg/g
Arsenic	≤5 ppm	—
Sulfate	≤0.48%	—
Loss on ignition	≤34%	≤15%
Fluoride	—	≤10 µg/g
Lead	—	≤10 µg/g
Acid-consuming capacity	+	—
Ratio of SiO_2 to MgO	2.2–2.5	2.5–4.5
Assay for MgO	≥20.0%	≥15%
Assay for SiO_2	≥45.0%	≥67%

10 Typical Properties

Density (relative) 2.5 (H_2O = 1)[2]
Moisture content Magnesium silicate is slightly hygroscopic.
Solubility Practically insoluble in ethanol (95%), ether, and water.

11 Stability and Storage Conditions

Magnesium silicate should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Magnesium silicate is incompatible with strong oxidizing agents and is readily decomposed by mineral acids.

Magnesium silicate may decrease the oral bioavailability of drugs such as mebeverine hydrochloride,[3] sucralfate, and tetracycline, via chelation or binding, when they are taken together. The dissolution rate of folic acid,[4] erythromycin stearate,[5] paracetamol,[6] and chloroquine phosphate[6] may be retarded by adsorption onto magnesium silicate. Antimicrobial preservatives, such as parabens, may be inactivated by the addition of magnesium silicate.[7]

13 Method of Manufacture

Magnesium silicate may be prepared from sodium silicate and magnesium sulfate. The silicate also occurs in nature as the minerals meerschaum, parasepiolite, and sepiolite.

14 Safety

Magnesium silicate is used in oral pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material.

Orally administered magnesium silicate is neutralized in the stomach to form magnesium chloride and silicon dioxide; some magnesium is absorbed. Caution should be used when greater than 50 mEq of magnesium is given daily to persons with impaired renal function, owing to the risk of hypermagnesemia.

Reported adverse effects include the formation of bladder and renal calculi following the regular use, for many years, of magnesium silicate as an antacid.[8,9]

The Cosmetic Ingredient Review Expert Panel has assessed magnesium silicate and concluded that the material is safe as used in cosmetic formulations.[10]

LD_{50} (rat, oral): 2.0 g/kg[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Avoid contact with skin and eyes, and avoid dust formation. Ensure adequate ventilation and wear suitable protective equipment.

16 Regulatory Acceptance

GRAS listed. Included in the FDA Inactive Ingredients Database (oral capsules; oral and sublingual tablets). Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Magnesium aluminum silicate; magnesium trisilicate; talc.

18 Comments

Magnesium silicate is also used as a glidant and anticaking agent in food products.

Magnesium silicate has been used to modify the permeability of starch to create a directly compressible coprocessed excipient that provides formulations with high mechanical strength, a short disintegration time, and low lubricant sensitivity.[11]

A specification for magnesium silicate is contained in the *Food Chemicals Codex* (FCC).[12]

The EINECS number for magnesium silicate is 215-681-1. The PubChem Compound ID (CID) for magnesium silicate includes 518821 and 14936.

Magnesium Stearate

1 Nonproprietary Names

BP: Magnesium Stearate
JP: Magnesium Stearate
PhEur: Magnesium Stearate
USP–NF: Magnesium Stearate

2 Synonyms

Cecavon MG 51; Dibasic magnesium stearate; *Kemilub EM-F*; magnesium distearate; magnesii stearas; magnesium octadecanoate; octadecanoic acid, magnesium salt; stearic acid, magnesium salt; *Synpro 90*.

3 Chemical Name and CAS Registry Number

Octadecanoic acid magnesium salt [557-04-0]

4 Empirical Formula and Molecular Weight

$C_{36}H_{70}MgO_4$ 591.24

The USP 40–NF 35 S1 describes magnesium stearate as a compound of magnesium with a mixture of solid organic acids that consists chiefly of variable proportions of magnesium stearate and magnesium palmitate ($C_{32}H_{62}MgO_4$). The fatty acids are derived from edible sources. It contains not less than 4.0% and not more than 5.0% of Mg, calculated on the dried basis.

The PhEur 9.2 describes magnesium stearate as a mixture of magnesium salts of different fatty acids consisting mainly of stearic (octadecanoic) acid [$(C_{17}H_{35}COO)_2Mg$; M_r 591.3] and palmitic (hexadecanoic) acid [$C_{15}H_{31}COO)_2Mg$; M_r 535.1] with minor proportions of other fatty acids. It contains not less than 4.0% and not more than 5.0% of Mg (A_r 24.30), calculated with reference to the dried substance. The fatty acid fraction contains not less than 40.0% of stearic acid and the sum of stearic and palmitic acid is not less than 90.0%.

5 Structural Formula

$[CH_3(CH_2)_{16}COO]_2Mg$

6 Functional Category

Tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium stearate is widely used in cosmetics, foods, and pharmaceutical formulations. It is primarily used as a lubricant in capsule and tablet manufacture at concentrations between 0.25% and 5.0% w/w. It is also used in barrier creams.

See also Section 18.

8 Description

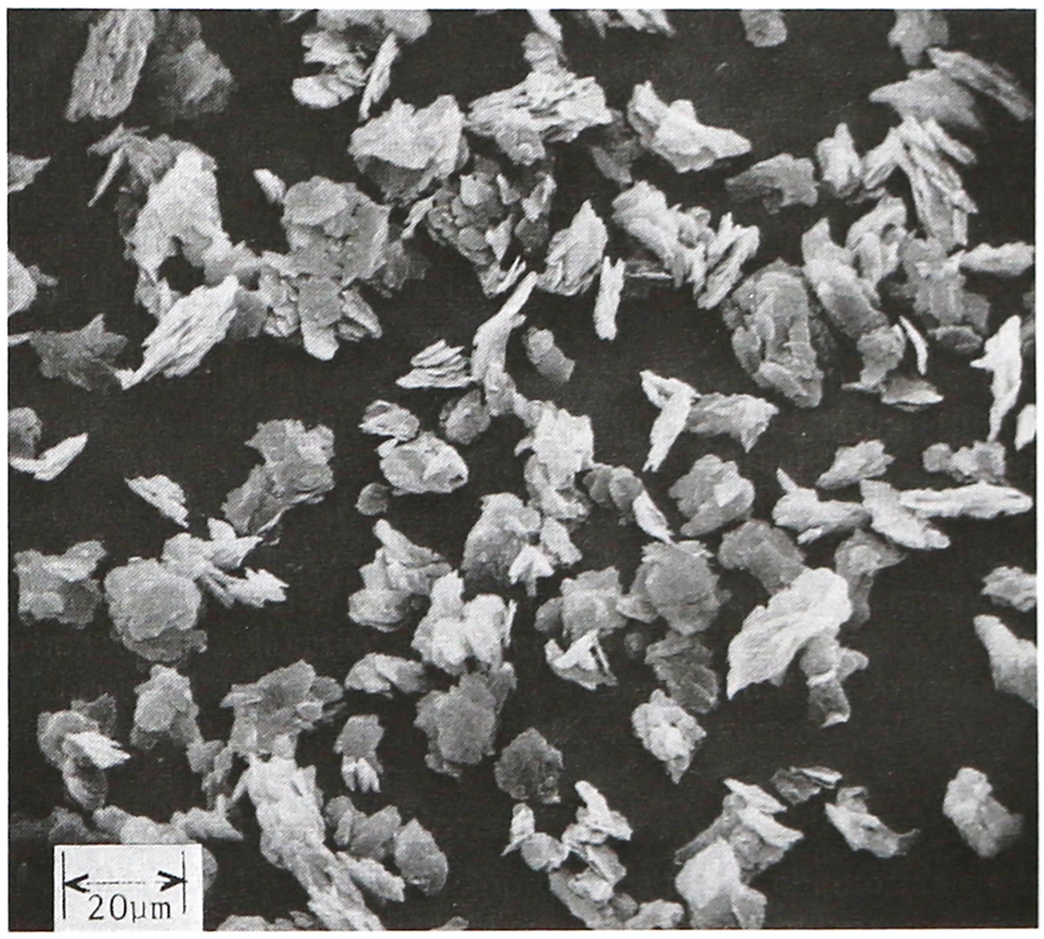
Magnesium stearate is a very fine, light white, precipitated or milled, impalpable powder of low bulk density, having a faint odor of stearic acid and a characteristic taste. The powder is greasy to the touch and readily adheres to the skin.

9 Pharmacopeial Specifications

The pharmacopeial specifications for magnesium stearate have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I. *See also* Section 18.

10 Typical Properties



Crystalline forms High-purity magnesium stearate has been isolated as a trihydrate, a dihydrate, and an anhydrate.
Density (bulk) 0.159 g/cm^3
Density (tapped) 0.286 g/cm^3
Density (true) 1.092 g/cm^3
Flash point 250°C
Flowability Poorly flowing, cohesive powder.
Melting range

117–150°C (commercial samples);

126–130°C (high purity magnesium stearate).

Solubility Practically insoluble in ethanol, ethanol (95%), ether and water; slightly soluble in warm benzene and warm ethanol (95%).

SEM 1: Excipient: magnesium stearate; magnification: 600×.

SEM 2: Excipient: magnesium stearate; magnification: 2400×.

(a) These tests have not been fully harmonized at the time of publication.

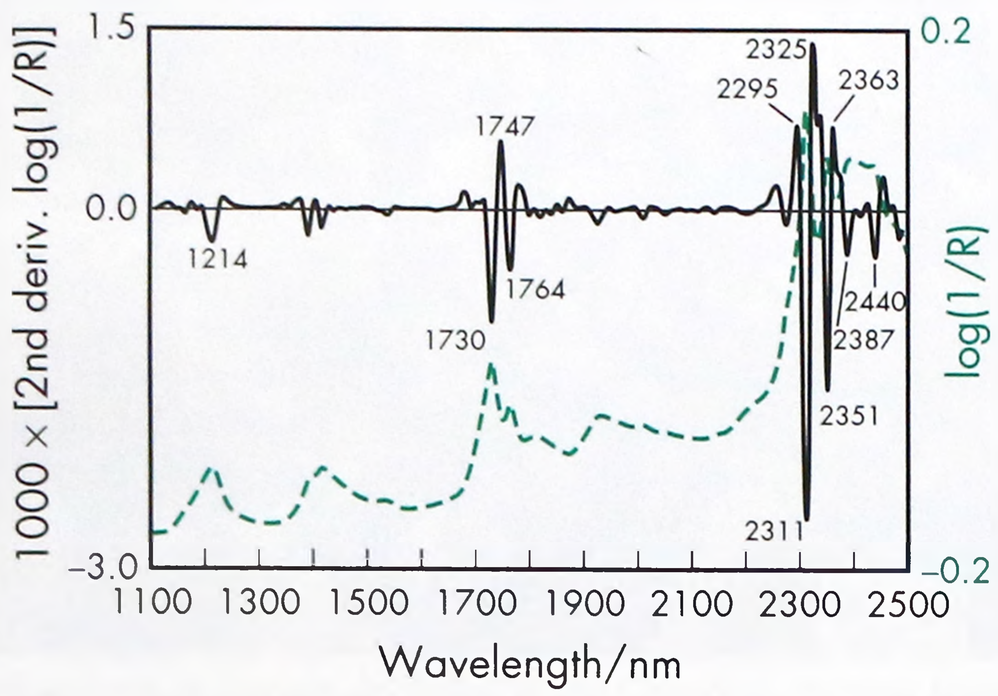

Figure 1: Near-infrared spectrum of magnesium stearate measured by reflectance.

Specific surface area 1.6–14.8 m^2/g

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Magnesium stearate is stable and should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Incompatible with strong acids, alkalis, and iron salts. Avoid mixing with strong oxidizing materials. Magnesium stearate cannot be used in products containing aspirin, some vitamins, and most alkaloidal salts.

13 Method of Manufacture

Magnesium stearate is prepared either by the interaction of aqueous solutions of magnesium chloride with sodium stearate or by the interaction of magnesium oxide, hydroxide, or carbonate with stearic acid at elevated temperatures.

14 Safety

Magnesium stearate is widely used as a pharmaceutical excipient and is generally regarded as being nontoxic following oral administration. However, oral consumption of large quantities may produce a laxative effect or mucosal irritation.

No toxicity information is available relating to normal routes of occupational exposure. Limits for heavy metals in magnesium stearate have been evaluated in terms of magnesium stearate worst-case daily intake and heavy metal composition.[1]

Toxicity assessments of magnesium stearate in rats have indicated that it is not irritating to the skin, and is nontoxic when administered orally or inhaled.[2,3]

Magnesium stearate has not been shown to be carcinogenic when implanted into the bladder of mice.[4]

LD_{50} (rat, inhalation): >2 mg/L[2]

LD_{50} (rat, oral): >10 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Excessive inhalation of magnesium stearate dust may cause upper respiratory tract discomfort, coughing, and choking. Finely dispersed particles can form explosive mixtures in air. Magnesium stearate should be handled in a well-ventilated environment; a respirator is recommended. In the US, the OSHA limit is 10 mg/m^3 TWA for magnesium stearate.

16 Regulatory Acceptance

GRAS listed. Accepted as a food additive in the US and UK. Included in the FDA Inactive Ingredients Database (oral capsules, powders, and tablets; buccal and vaginal tablets; topical preparations; intravitreal implants and injections; suspensions; powder for inhalation). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Listed on the US TSCA inventory.

17 Related Substances

Calcium stearate; stearic acid; zinc stearate.

18 Comments

Magnesium stearate has undergone harmonization for many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Crystalline form

The existence of various crystalline forms of magnesium stearate has been established.[5–9] A trihydrate, a dihydrate, and an anhydrate have been isolated,[7,8,10,11] and an amorphous form has been observed.[12] While the hydrated forms are stable in the presence of moisture, the anhydrous form adsorbs moisture at relative humidity up to 50%, and at higher humidities rehydrates to form the trihydrate. The anhydrate can be formed by drying either of the hydrates at 105°C.[8] Spectroscopic methods have been utilized to assess the polymorphic composition of mixtures of various forms of magnesium stearate.[13]

General physical properties

Physical properties of magnesium stearate can vary among batches from different manufacturers[14] because the solid-state characteristics of the powder are influenced by manufacturing variables.[6] Variations in the physical properties of different lots

of magnesium stearate from the same vendor have also been observed.[14] Presumably because of these variations, it has not been possible to conclusively correlate the dissolution rate retardation with observed lubricity.[15]

However, various physical properties of different batches of magnesium stearate, such as specific surface area, particle size, crystalline structure, moisture content, and fatty acid composition, have been correlated with lubricant efficacy.[7,12,14,16–22] Due to variations in the specific surface area, the labeling states that specific surface area and the method specified for its determination should be listed on the label. Reduction in dissolution caused by the effects of magnesium stearate in some cases can be overcome by including a highly swelling disintegrant in the formulation.[23]

The functionality of a vegetable and bovine grade of magnesium stearate was compared. The dry granulated formulation containing vegetable-based magnesium stearate showed a lower ejection force than the formulation containing bovine-based magnesium stearate. There was no difference between the dissolution profiles of the tablets using the different sources of magnesium stearate.[24]

Hydrophobicity

Magnesium stearate is hydrophobic and may retard the dissolution of a drug from a solid dosage form; the lowest possible concentration is therefore used in such formulations.[10,25–29] Capsule dissolution is also sensitive to both the amount of magnesium stearate in the formulation and the mixing time; higher levels of magnesium stearate and long mixing times can result in the formation of hydrophobic powder beds that do not disperse after the capsule shell dissolves.[30,31]

There is evidence to suggest that the hydrophobic nature of magnesium stearate can vary from batch to batch owing to the presence of water-soluble, surface-active impurities such as sodium stearate. Batches containing very low concentrations of these impurities have been shown to retard the dissolution of a drug to a greater extent than when using batches that contain higher levels of impurities.[15] One study related lubricity to the fatty acid composition (stearate : palmitate) of lubricant lots for tablet formulations based on compaction data and tablet material properties.[21] However, other studies have indicated that fatty acid composition has no influence on lubricant activity[7] and high-purity magnesium stearate was as effective a lubricant as the commercial material.[28] Moisture sorption at different relative humidities can result in morphological changes in the magnesium stearate.[32,33]

Lubricant properties

It has not been conclusively established which form of pure magnesium stearate possesses the best lubricating properties.[6,7,12,34,35] Commercial lots of magnesium stearate generally consist of mixtures of crystalline forms.[7,9,12,14,16,34,36] Because of the possibility of conversion of crystalline forms during heating, consideration should be given to the pretreatment conditions employed when determining physical properties of magnesium stearate powders such as surface area.[37,38]

The effects of the concentration of magnesium stearate and the time of lubrication of mixtures with magnesium stearate on the content uniformity of the active ingredient in mixtures have been studied in a model mixture containing lactose and aspirin. This model indicated the presence of an interaction between magnesium stearate concentration and lubrication time. For a given magnesium stearate concentration, there was a significant reduction in the content uniformity of aspirin as the time of lubrication of the mixture with magnesium stearate was increased.[39] The extent to which magnesium stearate improves blend flowability shows a dependency on the specific grade of the filler excipient used[40] and lubrication sensitivity as assessed by tablet tensile strength was dependent on excipient particle size.[41] Magnesium stearate has been shown to be effective for alleviating formulation sticking to rolls during dry granulation by roller compaction but its presence can affect ribbon mass output compared to unlubricated blends for certain roll types[42] as well as affecting the density distribution of the ribbons.[43] In multi-component systems, mixing order has been shown to have an impact blend and tablet performance characteristics.[44] The mechanistics of magnesium stearate lubrication during tablet ejection have been examined using atomic force microscopy.[45]

Other

An increase in the coefficient of variation of mixing and a decrease in the dissolution rate have been observed following blending of magnesium stearate with a tablet granulation. Tablet dissolution rate and crushing strength decreased as the time of blending increased; and magnesium stearate may also increase tablet friability. Blending times with magnesium stearate should therefore be carefully controlled[46–62] and lubrication kinetics and sensitivity have been shown to vary depending on the filler composition.[63] A variety of online analytical techniques have been investigated to monitor magnesium stearate in powder blends and tablets.[64–66] Inverse gas chromatography has been used to examine the surface coverage of magnesium stearate on powder blends[67] and also to correlate surface energy distribution of magnesium stearate treated powders with flow and cohesive properties.[68,69] Additionally, other advanced surface characterization techniques (XPS, ToF-SIMS) have been used to assess the coating of excipient substrates by magnesium stearate.[70] Magnesium stearate also affects the flow properties of blends.[71]

The impact of magnesium stearate levels on tablet compaction properties and performance of roller compacted granulations has been examined.[72–74] Variation in magnesium stearate physical properties can have a small but observable impact on tablet performance properties in dry granulation processing.[75] In other compaction studies performed with granules, magnesium stearate has been shown to exert an influence on granule relaxation and may help to prevent capping.[76]

Magnesium stearate has been investigated for use in inhalation powders to control their performance.[77]

A specification for magnesium stearate is included in the *Food Chemicals Codex* (FCC).[78]

The EINECS number for magnesium stearate is 209-150-3.

M

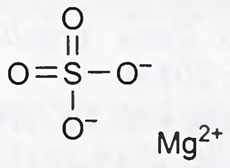
Magnesium Sulfate

1 Nonproprietary Names

BP: Dried Magnesium Sulfate
USP–NF: Magnesium Sulfate

2 Synonyms

Epsom salts; E518; magnesii sulphas; magnesium sulphate; sulphuric acid, magnesium salt.



3 Chemical Name and CAS Registry Number

Anhydrous magnesium sulfate [7487-88-9]

4 Empirical Formula and Molecular Weight

$MgSO_4$ 120.37

5 Structural Formula

6 Functional Category

Vaccine adjuvant.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium sulfate is used in solid oral dosage forms. It has also been used as an adjuvant during general anaesthesia.[1,2]

8 Description

Magnesium sulfate occurs as a colorless crystal or a granular crystalline powder and has a saline bitter taste. It effloresces in warm dry air.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Density 2.65 g/cm^3
Bulk density 600 kg/m^3

Table I: Pharmacopeial specifications for magnesium sulfate.

Test	BP 2017	USP 40–NF 35 S1
Identification	+	+
Character	+	+
Chloride	≤400 ppm	≤0.014%
Iron	≤30 ppm	≤20 μg/g[a]
Selenium	–	≤30 μg/g
Heavy metals	≤15 ppm	≤10 ppm
Arsenic	≤3 ppm	–
Insoluble matter	+	–
pH	+	5.0–9.2
Loss on drying	–	≤2%
Loss on ignition	–	22.0–28.0%
Assay (anhydrous basis)	62.0%–70.0%	99.0%–100.5%

(a) ≤0.5 μg/g for parenteral dosage forms.

Table II: Solubility of magnesium sulfate.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol	Sparingly soluble
Glycerol	1 in 1
Water	1 in 0.8
	1 in 0.5 at 100°C

Solubility *See* Table II.
Specific gravity 2.66

11 Stability and Storage Conditions

Store in well-closed containers.

12 Incompatibilities

Magnesium sulfate is incompatible with ethoxy ethyl alcohols, arsenates, phosphates, tartrates, lead, barium, strontium and calcium.

13 Method of Manufacture

Magnesium sulfate is prepared by the dehydration of a hydrate or the sulfation of magnesium oxide.

14 Safety

Parenteral use or use in presence of renal insufficiency may lead to magnesium intoxication.[3] Caution is also advised in pregnant women.

LD_{50} (mouse, SC): 645 mg/kg
LD_{50} (rat, SC): 1200 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye protection, gloves and dust mask are recommended. When heated to decomposition, toxic fumes of SO_x are released.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets including coated and extended release tablets) and the Canadian Natural Health Products Ingredients Database. Also included in parenteral (subcutaneous and intramuscular injections; suspensions for intravesical installation) and nonparenteral products (oral suspensions) licensed in the UK.

17 Related Substances

Magnesium sulfate monohydrate

Empirical formula $MgSO_4 \cdot H_2O$
Molecular Weight 138.36
CAS number [14168-73-1]
Synonyms Kieserite
Density 2.45 g/cm^3 at 20°C
Bulk density 500 kg/m^3
Solubility Soluble in water and ether, slightly soluble in alcohol and glycerol, insoluble in acetone.
Comments The names magnesium sulfate and magnesium sulfate monohydrate are used interchangeably in the literature, and also have the same EINECS number 231-298-2. Magnesium sulfate monohydrate is listed in the USP 40–NF 35 S1 magnesium sulfate monograph. Magnesium sulfate occurs naturally in sea water, mineral springs and in minerals such as kieserite. It is obtained from them directly or by neutralizing sulphuric acid with magnesium carbonate or magnesium oxide.

Magnesium sulfate heptahydrate

Empirical formula $MgSO_4 \cdot 7H_2O$
Molecular Weight 246.47
CAS number [10034-99-8]
Synonyms Bitter salts; Epsom salts; epsomite; magnesia sulfas heptahydricus.
Description A white or almost white, crystalline powder or brilliant, colourless crystals.
Density 1.68 g/cm^3 at 20°C
Bulk density 900 kg/m^3
Solubility Soluble in water and ether, slightly soluble in alcohol and glycerol, insoluble in acetone.
Comments The names magnesium sulfate and magnesium sulfate heptahydrate (sometimes listed as magnesium sulfate hydrate) are used interchangeably in the literature, and also have the same EINECS number 231-298-2. Magnesium sulfate heptahydrate is listed in the BP 2017, PhEur 9.2, USP 40–NF 35 S1 in the magnesium sulfate monograph and in the JP XVII as magnesium sulfate hydrate. Magnesium sulfate occurs naturally in sea water, mineral springs and in minerals such as epsomite. It is obtained from them directly or by neutralizing sulphuric acid with magnesium carbonate or oxide.

18 Comments

Therapeutically, magnesium sulfate is used in the treatment of magnesium deficiency and hypomagnesemia.[4,5] Magnesium salts, particularly magnesium sulfate, can also act as osmotic laxatives.[4] Magnesium sulfate is also used for bulking, hair conditioning and viscosity control in the cosmetics industry.[6]

A specification for magnesium sulfate is included in the Food Chemicals Codex.[7]

The EINECS number for magnesium sulfate is 231-298-2. The PubChem Compound ID (CID) number for magnesium sulfate is 24083.

3 Chemical Name and CAS Registry Number

Magnesium trisilicate anhydrous [14987-04-3]
Magnesium trisilicate hydrate [39365-87-2]

4 Empirical Formula and Molecular Weight

$Mg_2Si_3O_8 \cdot xH_2O$ 260.86 (anhydrous)

The USP 40–NF 35 S1 describes magnesium trisilicate as a compound of magnesium oxide (MgO) and silicon dioxide (SiO_2) with varying proportions of water. It contains not less than 20.0% of magnesium oxide and not less than 45.0% of silicon dioxide.

The PhEur 9.2 similarly describes magnesium trisilicate as having a variable composition corresponding to the approximate formula $Mg_2Si_3O_8 \cdot xH_2O$. It contains not less than 29.0% of magnesium oxide and not less than the equivalent of 65.0% of silicon dioxide, both calculated with reference to the ignited substance.

5 Structural Formula

See Section 4.

6 Functional Category

Glidant.

7 Applications in Pharmaceutical Formulation or Technology

Magnesium trisilicate is used in oral pharmaceutical formulations and food products as a glidant.

8 Description

Magnesium trisilicate occurs as an odorless and tasteless, fine, white-colored powder that is free from grittiness.

M

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for magnesium trisilicate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Ratio of SiO_2 to MgO	–	2.10–2.37
Loss on ignition	17.0–34.0%	17.0–34.0%
Water-soluble salts	≤1.5%	≤1.5%
Chloride	≤500 ppm	≤0.055%
Sulfates	<0.5%	<0.5%
Alkalinity	+	+
Arsenic	≤4 ppm	≤8 ppm
Heavy metals	–	≤0.003%
Acid-absorbing capacity	≥100.0 mL[a]	140–160 mL[a]
Assay of MgO	≥29.0%[b]	≥20.0%
Assay of SiO_2	≥65.0%[b]	≥45.0%

(a) Of 0.1 N hydrochloric acid per gram.
(b) With reference to the ignited substance.

10 Typical Properties

Moisture content Magnesium trisilicate is slightly hygroscopic. At relative humidities of 15–65%, the equilibrium moisture content at 25°C is 17–23% w/w; at relative humidities of 75–95%, the equilibrium moisture content is 24–30% w/w.

Solubility Practically insoluble in diethyl ether, ethanol (95%), and water.

Spectroscopy

NIR spectrum *see* Figure 1.

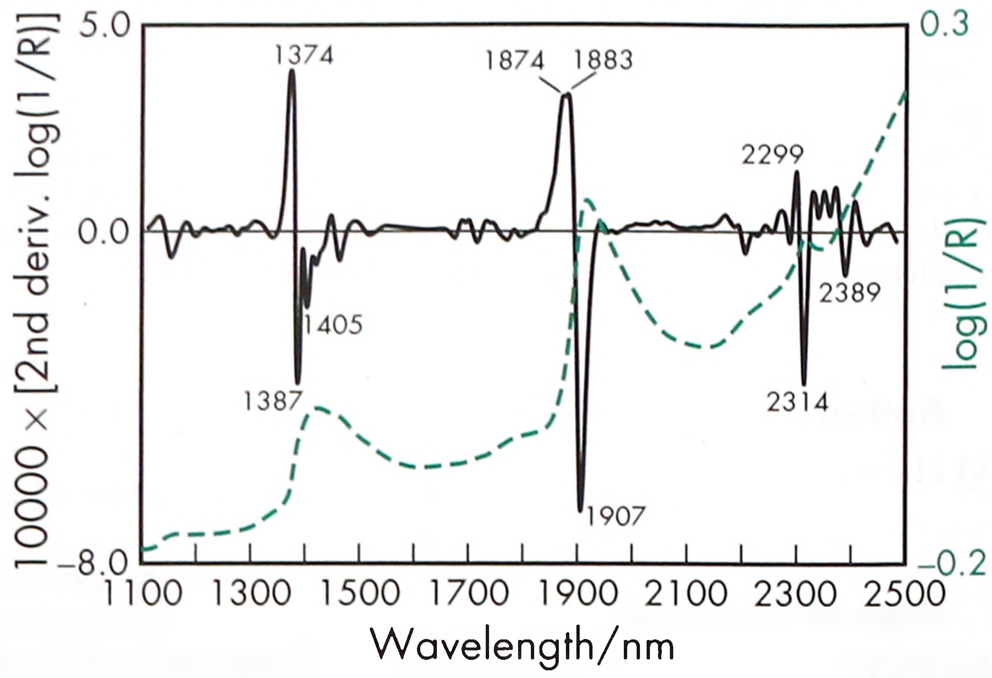

Figure 1: Near-infrared spectrum of magnesium trisilicate measured by reflectance.

11 Stability and Storage Conditions

Magnesium trisilicate is stable if stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Magnesium trisilicate, when taken with drugs such as mebeverine hydrochloride,[1] proguanil,[2] norfloxacin,[3] sucralfate, and tetracycline, may cause a reduction in bioavailability via binding or chelation. The dissolution rate of folic acid,[4] erythromycin stearate,[5] acetaminophen (paracetamol), and chloroquine phosphate[6] may be retarded by adsorption onto magnesium trisilicate. Antimicrobial preservatives, such as the parabens, may be inactivated by the addition of magnesium trisilicate.[7]

Magnesium trisilicate is also readily decomposed by mineral acids.

13 Method of Manufacture

Magnesium trisilicate may be prepared from sodium silicate and magnesium sulfate. It also occurs in nature as the minerals meerschaum, parasepiolite, and sepiolite.

14 Safety

Magnesium trisilicate is used in oral pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material.

When administered orally, magnesium trisilicate is neutralized in the stomach to form magnesium chloride and silicon dioxide; some magnesium may be absorbed. Caution should be used when concentrations greater than 50 mEq of magnesium are given daily to persons with impaired renal function, owing to the risk of hypermagnesemia.

Reported adverse effects include the potential for osmotic diarrhea in the elderly using antacids containing magnesium trisilicate;[8] and the potential for the formation of bladder and renal calculi following the long-term use of magnesium trisilicate as an antacid.[9,10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium silicate; magnesium aluminum silicate; magnesium silicate; magnesium trisilicate anhydrous; talc.

Magnesium trisilicate anhydrous

Empirical formula $Mg_2Si_3O_8$
Molecular weight 260.86
CAS number [14987-04-3]

18 Comments

Magnesium trisilicate is regarded as a type of magnesium silicate. The European food additive code E553a has been applied to both.

Therapeutically, up to about 2 g of magnesium trisilicate may be taken daily as an antacid and it has also been studied for the treatment of ciprofloxacin overdose or toxicity.[11]

The EINECS number for magnesium trisilicate is 239-076-7. The PubChem Compound ID (CID) for magnesium trisilicate is 5311266.

Maleic Acid

1 Nonproprietary Names

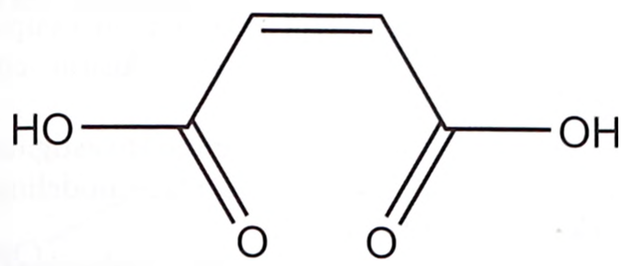
BP: Maleic Acid

PhEur: Maleic Acid

USP–NF: Maleic Acid

2 Synonyms

Acidum maleicum; *cis*-butenedioic acid; *cis*-2-butenedioic acid; (*Z*)-2-butenedioic acid; *cis*-ethene-1,2-dicarboxylic acid; *cis*-1,2-ethylenedicarboxylic acid; *cis*-maleic acid; maleinic acid; toxilic acid.



3 Chemical Name and CAS Registry Number

Z-But-2-enedioic acid [110-16-7]

4 Empirical Formula and Molecular Weight

$C_4H_4O_4$ 116.07

5 Structural Formula

6 Functional Category

Acidulant; buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Maleic acid is used in the pharmaceutical industry as a pH modifier and a buffering agent.[1–3] It is used in oral, topical, and parenteral pharmaceutical formulations in addition to food products. Maleic acid is also used to prevent rancidity of oils and fats; a ratio of 1:10 000 is usually sufficient to retard rancidity. *See also* Section 18.

8 Description

Maleic acid occurs as a white crystalline (monoclinic) powder and possesses a faint acidulous odor and an astringent taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for maleic acid.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	+
Heavy metals	–	≤10 ppm
Fumaric acid	≤1.5%	≤1.5%
Iron	≤5 ppm	≤5 ppm
Residue on ignition	≤0.1%	≤0.1%
Water	≤2.0%	≤2.0%
Assay (anhydrous basis)	99.0–101.0%	99.0–101.0%

10 Typical Properties

Acidity/alkalinity pH 2 (5% w/v aqueous solution at 25°C)
Boiling point 135°C (with decomposition)
Dissociation constants

$pK_{a1} = 1.91$;

$pK_{a2} = 6.33$.

Heat of combustion 1356.3 kJ/mol (324.2 kcal/mol)
Melting point 130–134°C
Partition coefficient $\log K_{ow} = -0.48$ (octanol/water)
Solubility *see* Table II.[4]
Specific gravity 1.590 (20°C)

Table II: Solubility of maleic acid.

Solvent	Solubility at 20°C
Benzene	1 in 4167
Carbon tetrachloride	1 in 50 000
Chloroform	1 in 909
Diethyl ether	1 in 13.2
Water	1 in 2.05

11 Stability and Storage Conditions

Maleic acid converts into the much higher-melting fumaric acid (mp: 287°C) when heated to a temperature slightly above its melting point.[5]

Maleic acid is combustible when exposed to heat or flame. The bulk material should be stored in airtight glass containers and protected from light. It is recommended not to store it above 25°C.

12 Incompatibilities

Maleic acid can react with oxidizing materials. Aqueous solutions are corrosive to carbon steels.

13 Method of Manufacture

Maleic anhydride is the main source of maleic acid produced by hydration. Maleic anhydride is prepared commercially by the oxidation of benzene or by the reaction of butane with oxygen in the presence of a vanadium catalyst.

14 Safety

Maleic acid is generally regarded as a nontoxic and nonirritant material when used at low levels as an excipient. However, in pure form it is considered very hazardous in the case of eye contact, which can result in corneal damage. It is also hazardous with respect to skin contact and inhalation. Skin contact can produce inflammation and blistering, with the amount of tissue damage dependent on the length of contact.

LD_{50} (mouse, oral): 2.40 g/kg[6]
LD_{50} (rabbit, skin): 1.56 g/kg
LD_{50} (rat, oral): 0.708 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Gloves, eye protection, and approved or certified respirators should be employed.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM and IV injections; oral syrups, tablets and capsules; topical applications). Included in nonparenteral and parenteral medicines licensed in the UK.

17 Related Substances

Fumaric acid.

18 Comments

Maleic acid and fumaric acid are the simplest unsaturated carboxylic diacids. These acids experience two-step dissociation in aqueous solutions.[7] They have the same structural formula but different spatial configurations. Fumaric acid is the *trans* and maleic acid the *cis* isomer. The physical properties of maleic acid and fumaric acid are very different. The *cis* isomer is less stable. Maleic acid is used in the preparation of fumaric acid by catalytic isomerization.

The antimicrobial activity of maleic acid has been evaluated for use in dental irrigants.[8,9] Novel applications of maleic acid include its use as an intranasal delivery system[10] and the use of styrene-maleic acid copolymer micelles for tumor targeting.[11,12] Copolymers of maleic acid (butyl monoester of poly[methylvinyl ether/maleic acid]) have found topical applications in medicated nail lacquer, mosquito repellent as film-forming agents, and in a dissolving microneedle platform for the transdermal delivery of cardiovascular drugs.[13] Compositions of certain maleic acid copolymers have been employed for preventing the attachment of dental plaque to the surface of teeth.

Maleic acid is commonly used as a pharmaceutical intermediate to form the maleate salts of several categories of therapeutic agents, such as salts of antihistamines and other drug substances.

The EINECS number for maleic acid is 203-742-5. The PubChem Compound ID (CID) for maleic acid is 444266.

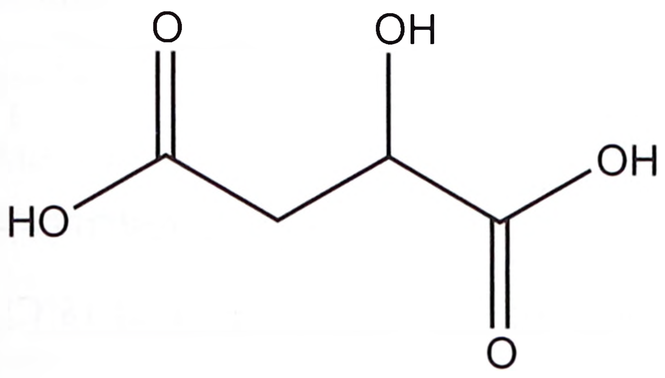
Malic Acid

1 Nonproprietary Names

BP: Malic Acid
PhEur: Malic Acid
USP–NF: Malic Acid

2 Synonyms

Acidum malicum; apple acid; E296; 2-hydroxy-1,4-butanedioic acid; hydroxybutanedioic acid; 1-hydroxy-1,2-ethanedicarboxylic acid; hydroxysuccinic acid; 2-hydroxysuccinic acid; DL-malic acid.



3 Chemical Name and CAS Registry Number

Hydroxybutanedioic acid [6915-15-7]
(*RS*)-(±)-Hydroxybutanedioic acid [617-48-1]

4 Empirical Formula and Molecular Weight

$C_4H_6O_5$ 134.09

5 Structural Formula

6 Functional Category

Acidulant; antioxidant; buffering agent; complexing agent; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Malic acid is used in pharmaceutical formulations as a general-purpose acidulant. It possesses a slight apple flavor and is used as a flavoring agent to mask bitter tastes and provide tartness. Malic acid is also used as an alternative to citric acid in effervescent powders, mouthwashes, and tooth-cleaning tablets.

In addition, malic acid has chelating and antioxidant properties.[1] It may be used with butylated hydroxytoluene as a synergist in order to retard oxidation in vegetable oils.

8 Description

White or nearly white, crystalline powder or granules having a slight odor and a strongly acidic taste. It is hygroscopic. The synthetic material produced commercially in Europe and the US is a racemic mixture, whereas the naturally occurring material found in apples and many other fruits and plants is levorotatory.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Data shown below are for the racemate. *See* Section 17 for other data for the D and L forms.

Acidity/alkalinity pH = 2.35 (1% w/v aqueous solution at 25°C)
Boiling point 150°C (with decomposition)

Table I: Pharmacopeial specifications for malic acid.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Melting point	128–132°C	–
Residue on ignition	≤0.1%	≤0.1%
Appearance of solution	+	–
Water-insoluble substances	≤0.1%	≤0.1%
Heavy metals	–	≤20 ppm
Fumaric acid	–	≤1.0%
Maleic acid	–	≤0.05%
Optical rotation	–0.10° to +0.10°	–
Related substances	+	–
Water	<2.0%	–
Assay	99.0–101.0%	99.0–100.5%

Table II: Solubility of malic acid.

Solvent	Solubility at 20°C
Acetone	1 in 5.6
Diethyl ether	1 in 119
Ethanol (95%)	1 in 2.6
Methanol	1 in 1.2
Propylene glycol	1 in 1.9
Water	1 in 1.5–2.0

Density (bulk) 0.81 g/cm^3
Density (tapped) 0.92 g/cm^3
Dissociation constant

pK_{a1} = 3.40 at 25°C;
pK_{a2} = 5.05 at 25°C.

Melting point 131–132°C
Solubility Freely soluble in ethanol (95%) and water but practically insoluble in benzene. A saturated aqueous solution contains about 56% malic acid at 20°C. *See* Table II.
Specific gravity

1.601 at 20°C;
1.250 (saturated aqueous solution at 25°C).

Spectroscopy

IR spectrum *see* Figure 1.
NIR spectrum *see* Figure 2.
Raman spectrum *see* Figure 3.

Viscosity (dynamic) 6.5 mPa s (6.5 cP) for a 50% w/v aqueous solution at 25°C.

11 Stability and Storage Conditions

Malic acid is stable at temperatures up to 150°C. At temperatures above 150°C it begins to lose water very slowly to yield fumaric acid; complete decomposition occurs at about 180°C to give fumaric acid and maleic anhydride. Conditions of high humidity and elevated temperatures should be avoided to prevent caking. The effects of grinding and humidity on malic acid have been investigated.[2] Malic acid is readily degraded by many aerobic and anaerobic microorganisms.

The bulk material should be stored in a well-closed container in a cool, dry place.

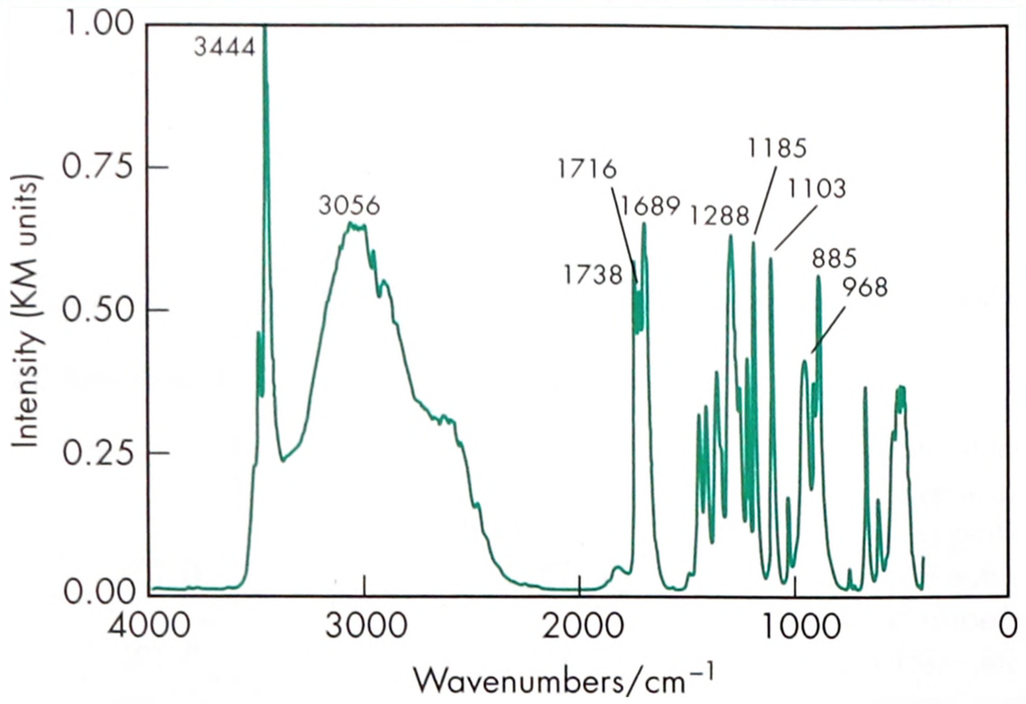


Figure 1: Infrared spectrum of malic acid measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

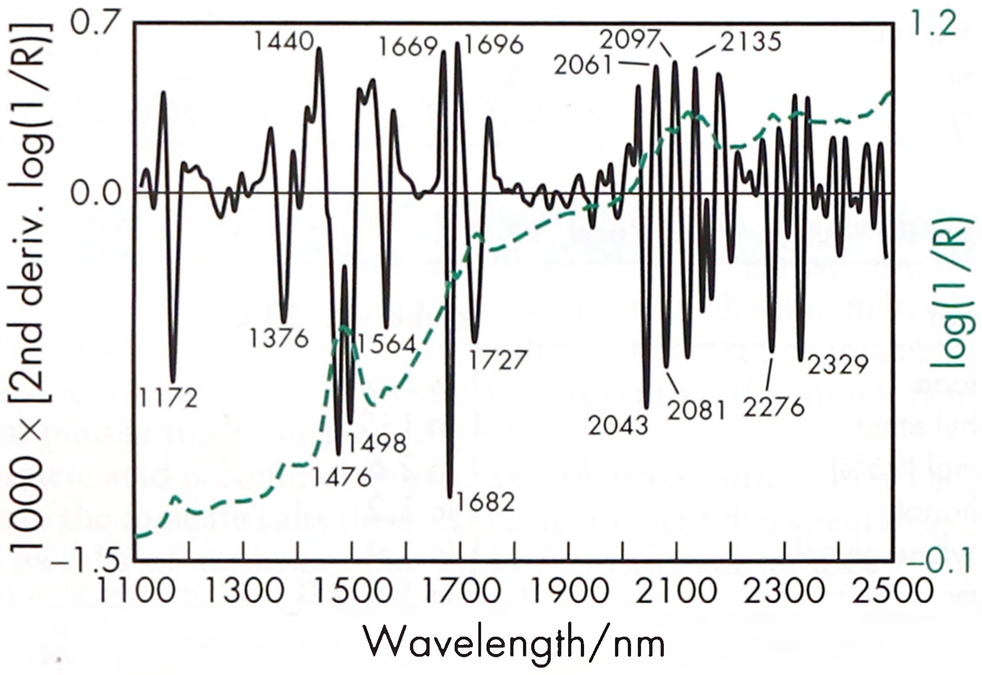

Figure 2: Near-infrared spectrum of malic acid measured by reflectance.

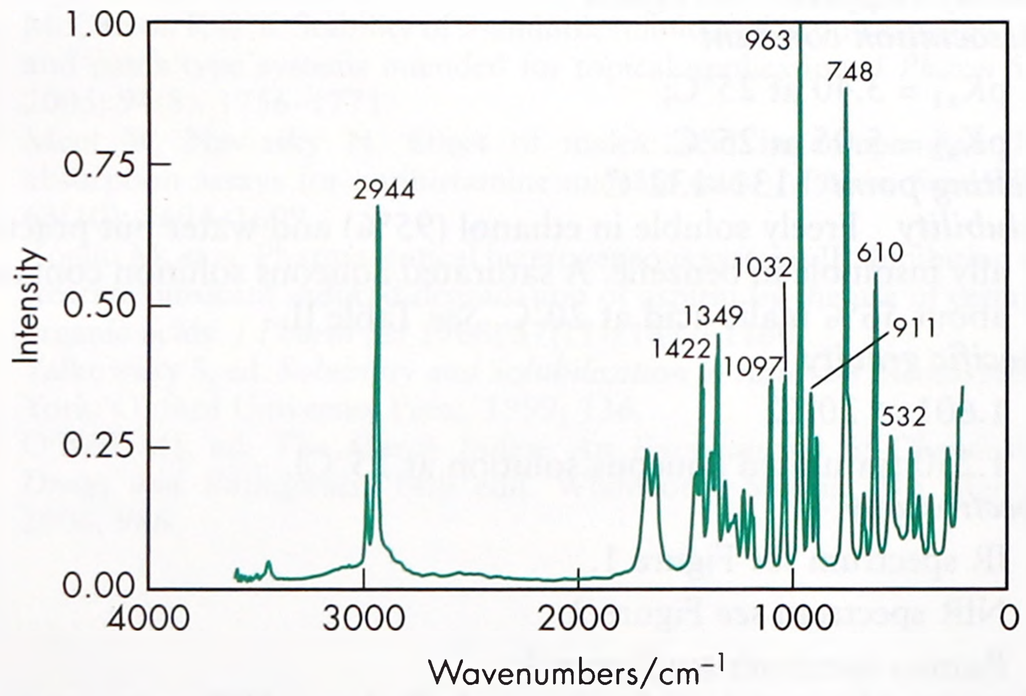

Figure 3: Raman spectrum of malic acid measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Malic acid can react with oxidizing materials. Aqueous solutions are mildly corrosive to carbon steels.

13 Method of Manufacture

Malic acid is manufactured by hydrating maleic and fumaric acids in the presence of suitable catalysts. The malic acid formed is then separated from the equilibrium product mixture. Malic acid can also be produced by fermentation following an enzymatic conversion of fumaric acid.[3–6]

14 Safety

Malic acid is used in oral, topical, and parenteral pharmaceutical formulations in addition to food products, and is generally regarded as a relatively nontoxic and nonirritant material. However, concentrated solutions may be irritant.

LD_{Lo} (rat, oral): 1.6 g/kg[7]
LD_{50} (rat, IP): 0.1 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Malic acid, and concentrated malic acid solutions may be irritant to the skin, eyes, and mucous membranes. Gloves and eye protection are recommended.

16 Regulatory Status

GRAS listed. Both the racemic mixture and the levorotatory isomer are accepted as food additives in Europe. The DL and L forms are included in the FDA Inactive Ingredients Database (oral preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Citric acid; fumaric acid; D-malic acid; L-malic acid; tartaric acid.

D-Malic acid

Empirical formula $C_4H_6O_5$
Molecular weight 134.09
CAS number [636-61-3]
Synonyms (*R*)-(+)-Hydroxybutanedioic acid; D-(+)-malic acid.
Melting point 99–101°C
Specific rotation $[\alpha]_D^{20}$ = +5.2° (in acetone at 18°C).

L-Malic acid

Empirical formula $C_4H_6O_5$
Molecular weight 134.09
CAS number [97-67-6]
Synonyms Apple acid; (*S*)-(−)-hydroxybutanedioic acid; L-(−)-malic acid.
Boiling point ≈140°C (with decomposition)
Melting point 99–100°C
Solubility Practically insoluble in benzene. *See also* Table III.

Table III: Solubility of L-malic acid.

Solvent	Solubility at 20°C
Acetone	1 in 1.6
Diethyl ether	1 in 37
Dioxane	1 in 1.3
Ethanol (95%)	1 in 1.2
Methanol	1 in 0.51
Water	1 in 2.8

Specific gravity 1.595 at 20°C
Specific rotation $[\alpha]_D^{20}$ = −5.7° (in acetone at 18°C)

18 Comments

Therapeutically, malic acid is well-known for its positive effect on skin[8,9] and has been used topically in combination with benzoic acid and salicylic acid to treat burns, ulcers, and wounds. It has also been used orally and parenterally, either intravenously or intramuscularly, in the treatment of liver disorders, and as a sialagogue.[10]

Malic acid can be mineralized by photocatalytic degradation when in the presence of an illuminated source, and therefore has

been investigated in order to understand the degradation steps of organic pollutants contained in water.[11–13]

In food products, malic acid may be used in concentrations up to 420 ppm.

A specification for malic acid is contained in the *Food Chemical Codex* (FCC)[14] and the *Japanese Pharmaceutical Excipients* (JPE).[15]

The EINECS number for malic acid is 202-601-5. The PubChem Compound ID (CID) for malic acid is 525.

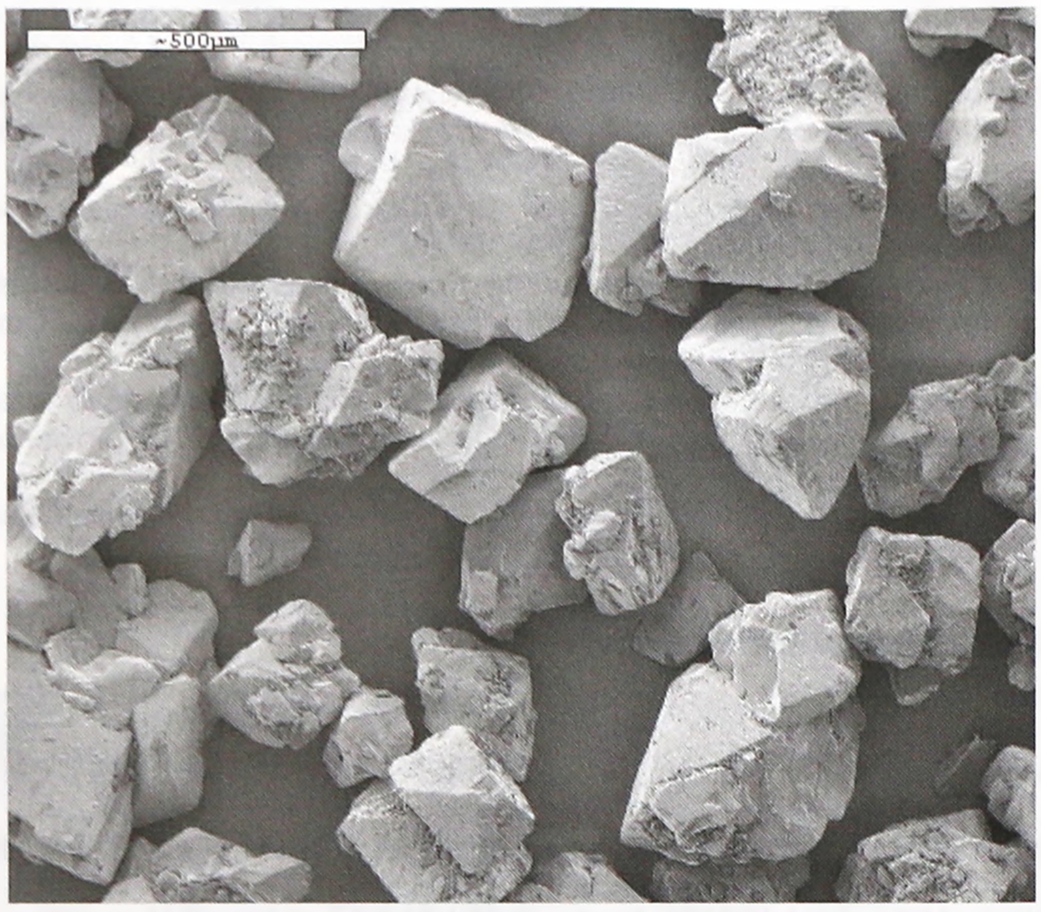
$C_{12}H_{24}O_{11}$ 344.32



5 Structural Formula

6 Functional Category

Coating agent; tablet and capsule binder; tablet and capsule diluent; sweetening agent.

SEM 1: Excipient: *SweetPearl P200*; manufacturer: Roquette Frères.

7 Applications in Pharmaceutical Formulation or Technology

Maltitol is widely used in the pharmaceutical industry in the formulation of oral dosage forms. It is a noncariogenic bulk sweetener, approximately as sweet as sucrose, well adapted as a diluent for different oral dosage forms, wet granulation, and sugar-free hard coating.

8 Description

Maltitol occurs as a white, odorless, sweet, anhydrous crystalline powder. It is a disaccharide consisting of one glucose unit linked with one sorbitol unit via an α-(1→4) bond. The crystal structure is orthorhombic.

9 Pharmacopeial Specifications

See Table I.

20	10
30	11
40	15
50	24
60	70

Viscosity (dynamic) *see* Table III.

11 Stability and Storage Conditions

Maltitol has good thermal and chemical stability. When it is heated at temperatures above 200°C, decomposition begins (depending on time, temperature, and other prevailing conditions). Maltitol does not undergo browning reactions with amino acids, and absorbs atmospheric moisture only at relative humidities of 89% and above, at 20°C.

12 Incompatibilities

—

13 Method of Manufacture

Maltitol is obtained from hydrogenated maltose syrup. Starch is hydrolyzed to yield a high-concentration maltose syrup, which is hydrogenated with a catalyst. After purification and concentration, the syrup is crystallized.

14 Safety

Maltitol is used in oral pharmaceutical formulations, confectionery, and food products, and is considered to be noncariogenic. It is generally regarded as a nontoxic, nonallergenic, and nonirritant material.

Digestion of maltitol follows two different metabolic pathways: absorption in the small intestine and fermentation in the large intestine (colon). These two metabolic pathways must thus be considered when evaluating the energy value.

The hydrolysis of maltitol in the small intestine releases sorbitol and glucose. Glucose is actively transported and rapidly absorbed, whereas sorbitol absorption is passive. The nonabsorbed sorbitol and nonhydrolyzed maltitol are fermented by the microflora in the colon. The relative importance of the two absorption pathways depends on numerous individual factors and is related to the quantity of maltitol ingested. Excessive oral consumption (>50 g daily) may cause flatulence and diarrhea.

Maltitol exhibits a low glycemic index and can therefore, under medical supervision, have a place in the diet of diabetic patients. The intake of maltitol must be taken into account for the calculation of the daily glucidic allowance.

The WHO, in considering the safety of maltitol, did not set a value for the acceptable daily intake since the levels used in food to achieve a desired effect were not considered a hazard to health.[3,4]

15 Handling Precautions

Observe normal precautions appropriate to circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in oral pharmaceutical formulations. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sorbitol.

18 Comments

Maltitol is not fermented by oral bacteria and is neither acidogenic nor cariogenic. A specification for maltitol syrup is contained in the *Food Chemicals Codex* (FCC).[5]

The EINECS number for maltitol is 209-567-0. The PubChem Compound ID (CID) for maltitol includes 3871 and 493591.

Maltitol Solution

1 Nonproprietary Names

BP: Liquid Maltitol
PhEur: Maltitol, Liquid
USP–NF: Maltitol Solution

2 Synonyms

E965; hydrogenated glucose syrup; *Finmalt L*; *Lycasin HBC*; *Lycasin 75/75*; *Lycasin 80/55*; *Lycasin 85/55*; *Maltilite*; *Maltisorb 75/75*; *Maltisweet 3145*; maltitol syrup; maltitolum liquidum.

3 Chemical Name and CAS Registry Number

Maltitol solution [9053-46-7]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 describes liquid maltitol as an aqueous solution of a hydrogenated, partly hydrolyzed starch, with not less than 68% w/w of solid matter and not more than 85% w/w. This is composed of a mixture of mainly D-maltitol (≥50% w/w), D-sorbitol (≤8% w/w), and hydrogenated oligo- and polysaccharides, all quoted on an anhydrous basis.

The USP 40–NF 35 S1 describes maltitol solution as a water solution containing, on the anhydrous basis, not less than 50% w/w of D-maltitol ($C_{12}H_{24}O_{11}$) and not more than 8.0% w/w of D-sorbitol ($C_6H_{14}O_6$). *See also* Section 18.

5 Structural Formula

See Section 4.

6 Functional Category

Suspending agent; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Maltitol solution is used in oral pharmaceutical formulations as a bulk sweetening agent, either alone or in combination with other excipients, such as sorbitol. Maltitol solution is also used as a suspending agent in oral suspensions as an alternative to sucrose syrup since it is viscous, noncariogenic, and has a low calorific value. It is also noncrystallizing and therefore prevents 'cap-locking' in syrups and elixirs.

Maltitol solution is additionally used in the preparation of pharmaceutical lozenges,[1] and is also used in confectionery and food products.

8 Description

Maltitol solution is a colorless and odorless, clear viscous liquid. It is sweet-tasting (approximately 75% the sweetness of sucrose).

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for maltitol solution.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Conductivity	≤10 µS·cm^{-1}	–
pH	–	5.0–7.5
Reducing sugars	≤0.2%	≤0.3%
Lead	≤0.5 ppm	–
Nickel	≤1 ppm	≤1 ppm
Water	15.0–32.0%	≤31.5%
Residue on ignition	–	≤0.1%
Maltitol (dried basis)	≥50.0%	≥50.0%
Sorbitol (dried basis)	≤8.0%	≤8.0%
Microbial contamination		
Aerobic bacteria	–	≤1000 cfu/g
Fungi	–	≤100 cfu/g

10 Typical Properties

Boiling point 105°C
Flash point >150°C
Density 1.36 g/cm^3 at 20°C
Heat of combustion 10.0 kJ/g (2.4 kcal/g)
Osmolarity The osmolarity of an aqueous maltitol solution is similar to that of a sucrose solution of the same concentration. A 10% v/v aqueous solution of *Lycasin 80/55* (Roquette) is isoosmotic with serum.
Refractive index n_D^{20} = 1.478
Solubility Miscible with ethanol (provided the ethanol concentration is less than 55%), glycerin, propylene glycol, and water. Insoluble in mineral and vegetable oils.
Viscosity (dynamic) Maltitol solution is a viscous, syrupy, liquid. At 20°C, a solution of *Lycasin 80/55* (Roquette) containing 75% of dry substances has a viscosity of approximately 2000 mPa s (2000 cP). With increasing temperature, the viscosity of a maltitol solution is reduced; *see* Figure 1. The viscosity of maltitol solutions also decreases with decreasing concentration of dry solids, at a constant temperature. Maltitol solution may also be mixed with sorbitol solution to obtain blends of a desired viscosity.

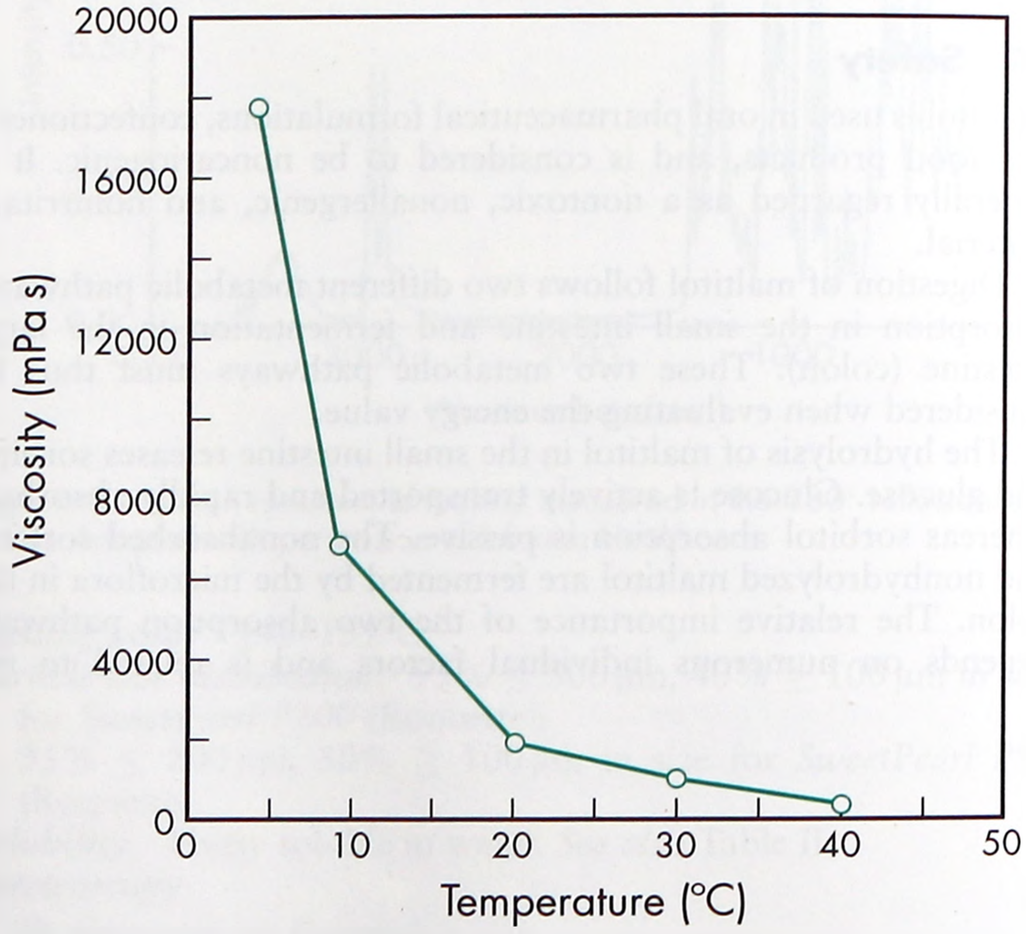

Figure 1: Viscosity of maltitol solution (*Lycasin 80/55*, Roquette Frères), containing 75% of dry substances, at different temperatures.

11 Stability and Storage Conditions

Maltitol solution is stable for at least 2 years at room temperature and pH 3–9. Following storage for 3 months at 50°C, maltitol solution at pH 2 underwent slight hydrolysis (1.2%) and became yellow colored. At pH 3, and the same storage conditions, no color change was apparent although very slight hydrolysis occurred (0.2%). At pH 4–9, no hydrolysis occurred although a very slight yellow color was formed under alkaline conditions.[2]

Formulations containing maltitol solution should be preserved with an antimicrobial preservative such as sodium benzoate or a mixture of parabens. Maltitol solution is noncrystallizing.

Maltitol solution should be stored in a well-closed container, in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Maltitol solution is prepared by the hydrogenation of a high-maltose syrup that is obtained from starch by enzymatic hydrolysis. The maltitol solution produced from this process consists of the hydrogenated homologs of the oligosaccharides contained in the original syrup.

14 Safety

Maltitol solution is used in oral pharmaceutical formulations, confectionery, and food products, and is considered to be less cariogenic than sucrose.[3–6] It is generally regarded as a nontoxic, nonallergenic, and nonirritant material. However, excessive oral consumption (more than 50 g daily) may cause flatulence and diarrhea.

The WHO, in considering the safety of maltitol solution, did not set a value for the acceptable daily intake since the levels used in food to achieve a desired effect were not considered a hazard to health.[7,8]

LD_{50} (rat, IP): 20 g/kg[9]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral solutions). Accepted for use in confectionery, foods, and nonparenteral pharmaceutical formulations in Europe and the USA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Maltitol; sorbitol.

18 Comments

Hydrogenated glucose syrup is a generic term used to describe aqueous mixtures containing mainly D-maltitol, along with D-sorbitol and hydrogenated oligosaccharides and polysaccharides. Such mixtures can vary widely in their composition and hence physical and chemical properties. Products containing up to 90% of maltitol are usually known as maltitol syrup or maltitol solution. Preparations containing a minimum of 98% of maltitol are designated maltitol.

Maltodextrin

1 Nonproprietary Names

BP: Maltodextrin

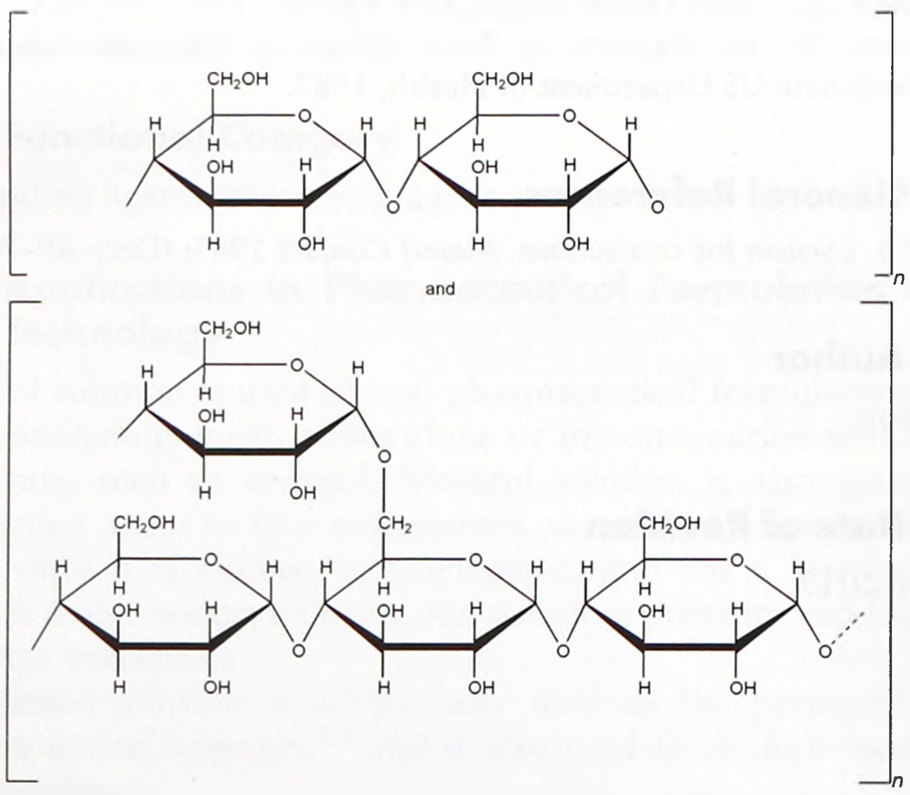
PhEur: Maltodextrin

USP–NF: Maltodextrin

2 Synonyms

Amidex; *Cargill Dry MD*; *Caloreen*; *C*Dry A*;*C*Dry MD*; *C*PharmDry*; *Clintose*; *Globe*; *Globe Plus*; *Glucidex*; *Insta*Potato*; *Insta*Rice*Trin*; *Lycatab DSH*; *Maldex*; *Maldex G*; *Malta*Gran*; maltodextrinum; *Maltosweet*; *Maltrin*; *Maltrin QD*; *Paselli MD*; *Pinedex*; *Star-Dri*.

3 Chemical Name and CAS Registry Number



Maltodextrin [9050-36-6]

4 Empirical Formula and Molecular Weight

$(C_6H_{10}O_5)_n \cdot H_2O$ 900–9 000

The USP 40–NF 35 S1 describes maltodextrin as a nonsweet, nutritive saccharide mixture of polymers that consist of D-glucose units, with a dextrose equivalent (DE) less than 20; *see also* Section 18. The D-glucose units are linked primarily by α-(1→4) bonds but there are branched segments linked by α-(1→6) bonds. It is prepared by the partial hydrolysis of a food-grade starch with suitable acids and/or enzymes.

5 Structural Formula

6 Functional Category

Anticaking agent; biodegradable material; coating agent; direct compression excipient; tablet and capsule binder; tablet and capsule diluent; tonicity agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Maltodextrin is used in tablet formulations as a binder and diluent in both direct-compression and wet-granulation or agglomeration processes.[1–7] Maltodextrin appears to have no adverse effect on the rate of dissolution of tablet and capsule formulations; magnesium stearate 0.5–1.0% may be used as a lubricant. It has been used as a carrier in a spray-dried redispersible oil-in-water emulsion to improve the bioavailability of poorly soluble drugs.[8] Maltodextrin may also be used as a tablet film former in aqueous film-coating processes. Maltodextrin grades with a high DE value are particularly useful in chewable tablet formulations.

Maltodextrin may also be used in pharmaceutical formulations to increase the viscosity of solutions and to prevent the crystallization of syrups.

Maltodextrin is also widely used in confectionery and food products, as well as personal care applications. *See* Table I.

Table I: Uses of maltodextrin.

Use	Concentration (%)
Aqueous film-coating	2–10
Carrier	10–99
Crystallization inhibitor for lozenges and syrups	5–20
Osmolarity regulator for solutions	10–50
Spray-drying aid	20–80
Tablet binder (direct compression)	2–40
Tablet binder (wet granulation)	3–10

8 Description

Maltodextrin occurs as a nonsweet, odorless, white powder or granules. The solubility, hygroscopicity, sweetness, and compressibility of maltodextrin increase as the DE increases. The USP 40–NF 35 S1 states that it may be physically modified to improve its physical and functional characteristics.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for maltodextrin.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	—
Characters	+	—
Microbial limits	+	+
pH (20% w/v solution)	4.0–7.0	4.0–7.0
Loss on drying	≤6.0%	≤6.0%
Residue on ignition	≤0.5%	≤0.5%
Heavy metals	—	≤5 ppm
Protein	—	≤0.1%
Sulfur dioxide	≤20 ppm	≤40 ppm
Dextrose equivalent	+	<20

10 Typical Properties

Angle of repose

35.2° for *Maltrin QD M500*;[5]

28.4° for *Maltrin M510*.[5]

Density (bulk)

0.43 g/cm^3 for *Lycatab DSH*;

0.26 g/cm^3 for *Maltrin QD M500*;

0.51 g/cm^3 for *Maltrin M040*;

0.54 g/cm^3 for *Maltrin M100*;

0.57 g/cm^3 for *Maltrin M150*;

0.61 g/cm^3 for *Maltrin M180*;
0.30 g/cm^3 for *Maltrin QD M440*;
0.56 g/cm^3 for *Maltrin M510*;
0.37 g/cm^3 for *Maltrin QD M550*;
0.40 g/cm^3 for *Maltrin QD M580*;
0.13 g/cm^3 for *Maltrin M700*.

Density (tapped)

0.63 g/cm^3 for *Lycatab DSH*;
0.32 g/cm^3 for *Maltrin QD M500*;
0.54 g/cm^3 for *Maltrin M510*.[5]

Density (true)

1.419 g/cm^3;
1.334 g/cm^3 for Maltodextrin FCC;
1.410 g/cm^3 for *Maltrin M500*;
1.425 g/cm^3 for *Maltrin M510*.

Moisture content Hygroscopicity increases as DE increases. Maltodextrin is slightly hygroscopic at relative humidities less than 50%. At relative humidities greater than 50%, the hygroscopicity of maltodextrin increases nonlinearly.

Particle size distribution

Maltrin is available in various grades with different particle size distributions.

For *Lycatab DSH*: maximum of 15% greater than 200 µm, and minimum of 80% greater than 50 µm in size.

Solubility Freely soluble in water; slightly soluble in ethanol (95%). Solubility increases as DE increases.

Specific surface area

0.54 m^2/g for *Maltrin QD M500*;
0.31 m^2/g for *Maltrin M510*.[5]

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Viscosity (dynamic)

Less than 20 mPa s (20 cP) for a 20% w/v aqueous solution of *Lycatab DSH*. The viscosity of maltodextrin solutions decreases as the DE increases.

Viscosity is 3.45 mPa s for a 20% w/v aqueous dispersion of *Star-Dri* (Tate & Lyle).

11 Stability and Storage Conditions

Maltodextrin is stable for at least 1 year when stored at a cool temperature (<30°C) and less than 50% relative humidity. Maltodextrin solutions may require the addition of an antimicrobial preservative.

Maltodextrin should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Under certain pH and temperature conditions maltodextrin may undergo Maillard reactions with amino acids to produce yellowing or browning. Incompatible with strong oxidizing agents.

13 Method of Manufacture

Maltodextrin is prepared by heating and treating starch with acid and/or enzymes in the presence of water. This process partially hydrolyzes the starch, to produce a solution of glucose polymers of varying chain length. This solution is then filtered, concentrated, and dried to obtain maltodextrin.

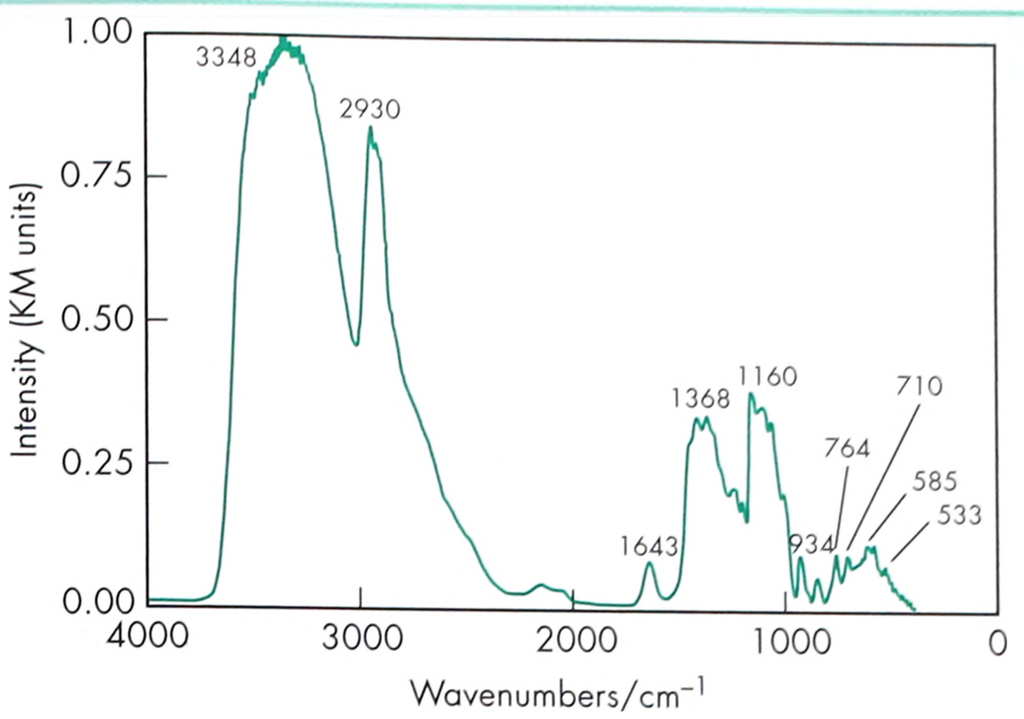


Figure 1: Infrared spectrum of maltodextrin M050 measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

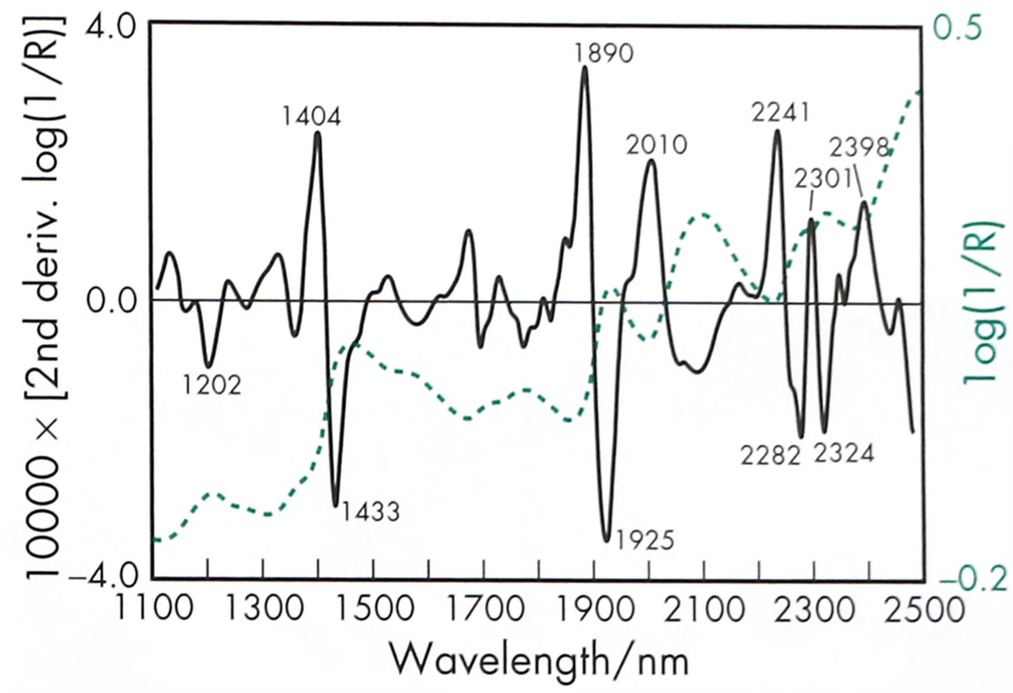

Figure 2: Near-infrared spectrum of maltodextrin measured by reflectance.

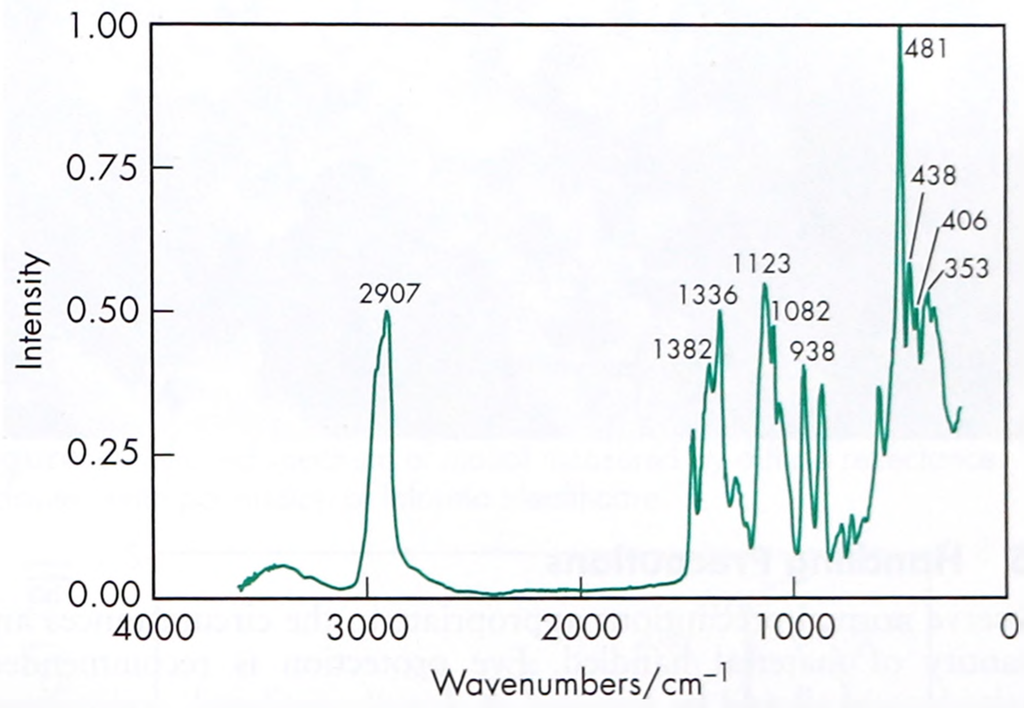

Figure 3: Raman spectrum of maltodextrin M050 measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

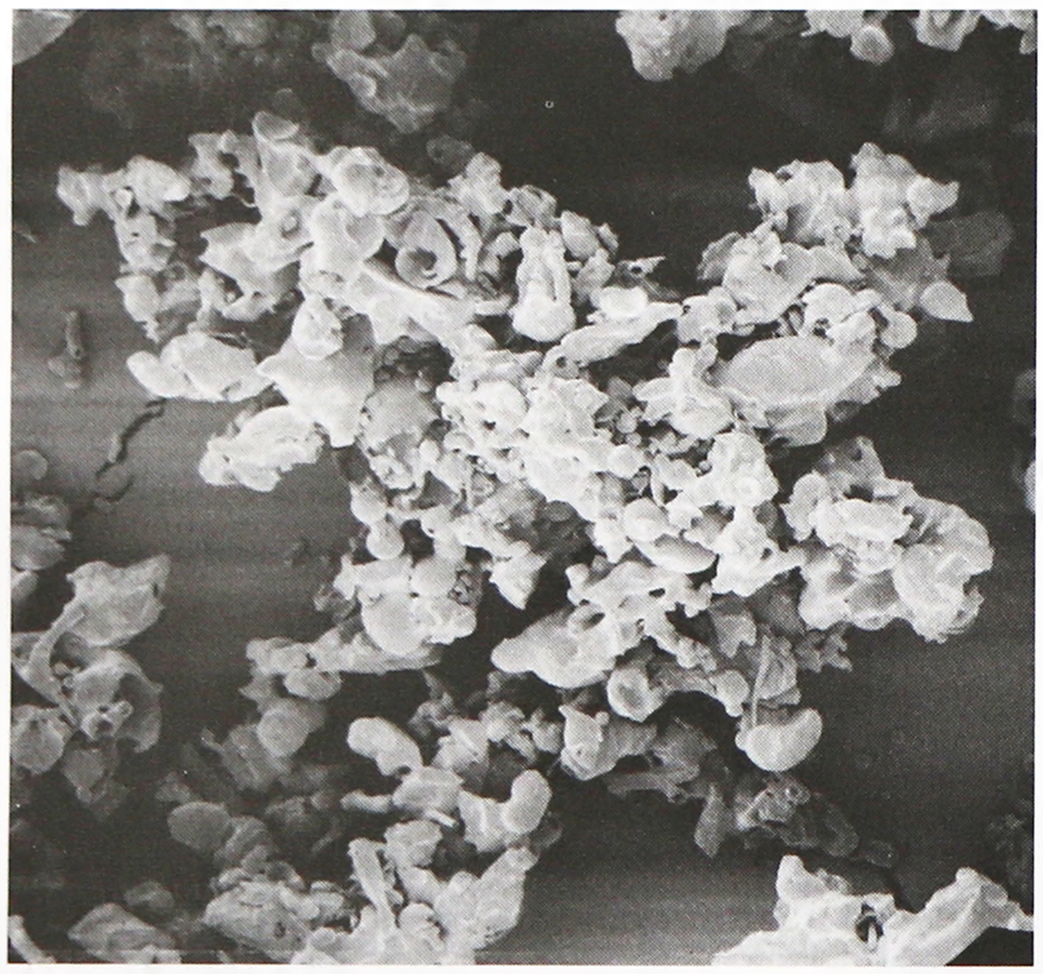
14 Safety



Maltodextrin is a readily digestible carbohydrate with a nutritional value of approximately 17 kJ/g (4 kcal/g). In the US, it is generally recognized as safe (GRAS) as a direct human food ingredient at levels consistent with current good manufacturing practices. As an excipient, maltodextrin is generally regarded as a nonirritant and nontoxic material.

M

SEM 1: Excipient: maltodextrin (*Maltrin M100*); manufacturer: Grain Processing Corp.; magnification: 100×.

SEM 2: Excipient: maltodextrin (*Maltrin QD M500*); manufacturer: Grain Processing Corp.; magnification: 100×.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended. Maltodextrin should be handled in a well-ventilated environment and excessive dust generation should be avoided.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral tablets and granules). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Corn syrup solids; dextrates; dextrin; starch.

18 Comments

Various different grades of maltodextrin are commercially available for food and pharmaceutical applications from a number of suppliers: e.g. *Lycatab DS* (Roquette Frères), *Maltrin* (Grain Processing Corp.) and *Star-Dri* (Tate & Lyle). The grades have different physical properties such as solubility and viscosity, depending upon their DE value. The dextrose equivalent (DE) value is a measure of the extent of starch-polymer hydrolysis and is defined as the reducing power of a substance expressed in grams of D-glucose per 100 g of the dry substance.

Therapeutically, maltodextrin is often used as a carbohydrate source in oral nutritional supplements because solutions with a lower osmolarity than isocaloric dextrose solutions can be prepared. At body osmolarity, maltodextrin solutions provide a higher caloric density than glucose or other sugars.

A specification for maltodextrin is contained in the *Food Chemicals Codex* (FCC).[9] The EINECS number for maltodextrin is 232-940-4. The PubChem Compound ID (CID) for maltodextrin is 107526.

3 Chemical Name and CAS Registry Number

3-Hydroxy-2-methyl-4 *H* -pyran-4-one [118-71-8]

4 Empirical Formula and Molecular Weight

$C_6H_6O_3$ 126.11

5 Structural Formula

6 Functional Category

Flavor enhancer; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Maltol is used in pharmaceutical formulations and food products as a flavoring agent or flavor enhancer. In foods, it is used at concentrations up to 30 ppm, particularly with fruit flavorings, although it is also used to impart a freshly baked odor and flavor to bread and cakes. When used at concentrations of 5–75 ppm, maltol potentiates the sweetness of a food product, permitting a reduction in sugar content of up to 15% while maintaining the same level of sweetness. Maltol is also used at low levels in perfumery.

8 Description

White crystalline solid with a characteristic, caramel-like odor and taste. In dilute solution it possesses a sweet, strawberry-like or pineapple-like flavor and odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for maltol.

Test	USP 40–NF 35 S1
Identification	+
Melting range	160–164°C
Water	≤0.5%
Residue on ignition	≤0.2%
Lead	≤10 ppm
Heavy metals	≤20 ppm
Assay (anhydrous basis)	≥99.0%

10 Typical Properties

Acidity/alkalinity pH = 5.3 (0.5% w/v aqueous solution)
Melting point 162–164°C (begins to sublime at 93°C)
Solubility *see* Table II.

Table II: Solubility of maltol.

Solvent	Solubility at 20°C
Chloroform	Freely soluble
Diethyl ether	Sparingly soluble
Ethanol (95%)	1 in 21
Glycerin	1 in 80
Propan-2-ol	1 in 53
Propylene glycol	1 in 28
Water	1 in 82

Spectroscopy

11 Stability and Storage Conditions

Maltol solutions may be stored in glass or plastic containers. The bulk material should be stored in a well-closed container, protected from light, in a cool, dry place. *See also* Section 12.

12 Incompatibilities

Concentrated solutions in metal containers, including some grades of stainless steel, may discolor on storage.

M

13 Method of Manufacture

Maltol is mainly isolated from naturally occurring sources such as beechwood and other wood tars; pine needles; chicory; and the bark of young larch trees. It may also be synthesized by the alkaline hydrolysis of streptomycin salts or by a number of other synthetic methods.

14 Safety

Maltol is generally regarded as an essentially nontoxic and nonirritant material. In animal feeding studies, it has been shown to be well tolerated with no adverse toxic, reproductive, or embryogenic effects observed in rats and dogs fed daily intakes of up to 200 mg/kg body-weight of maltol, for 2 years.[1] The WHO has set an acceptable daily intake for maltol at up to 1 mg/kg body-weight.[2,3] A case of allergic contact dermatitis, attributed to the use of maltol in a lip ointment, has been reported.[4]

LD_{50} (chicken, oral): 3.72 g/kg[5]
LD_{50} (guinea pig, oral): 1.41 g/kg
LD_{50} (mouse, oral): 0.85 g/kg
LD_{50} (mouse, SC): 0.82 g/kg
LD_{50} (rabbit, oral): 1.62 g/kg
LD_{50} (rat, oral): 1.41 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Maltol should be used in a well-ventilated environment. Eye protection is recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral solutions and syrups). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ethyl maltol.

18 Comments

Maltol is a good chelating agent and various metal complexes, e.g. aluminum maltol and ferric maltol, have been investigated as potentially useful therapeutic or experimental agents.[6–9]

Maltol is a constituent of Korean red ginseng.[10]

A specification for maltol is included in the *Food Chemicals Codex*.[11]

The EINECS number for maltol is 204-271-8. The PubChem Compound ID (CID) for maltol is 8369.

Maltose

1 Nonproprietary Names

JP: Maltose Hydrate

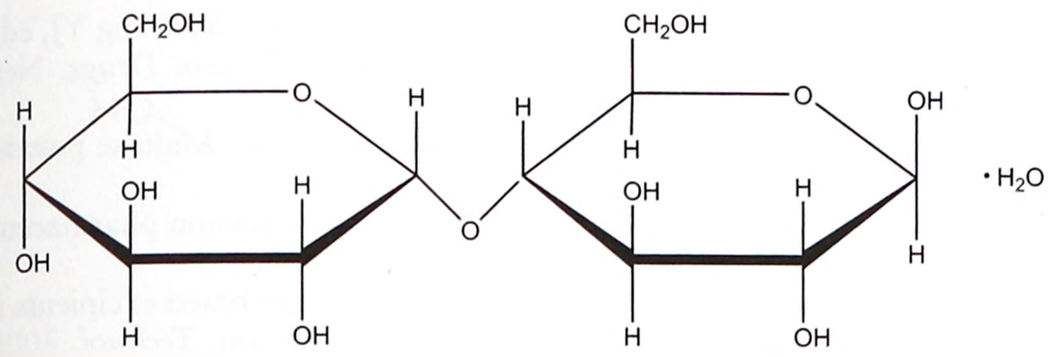
USP–NF: Maltose

2 Synonyms

Advantose 100; cextromaltose; *Finetose*; *Finetose F*; 4-O-α-D-glucopyranosyl-β-D-glucose; 4-(α-D-glucosido)-D-glucose; malt sugar; maltobiose; *Maltodiose*; *Sunmalt*; *Sunmalt S*.

3 Chemical Name and CAS Registry Number

4-*O*-α-D-Glucopyranosyl-β-D-glucopyranose anhydrous [69-79-4]



4-*O*-α-D-Glucopyranosyl-β-D-glucopyranose monohydrate [6363-53-7]

4 Empirical Formula and Molecular Weight

$C_{12}H_{22}O_{11}$ 342.30 (anhydrous)

$C_{12}H_{22}O_{11}·H_2O$ 360.31 (monohydrate)

5 Structural Formula

6 Functional Category

Sweetening agent; tablet and capsule binder; tablet and capsule diluent; tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology

Maltose is a disaccharide carbohydrate widely used in foods and pharmaceuticals. It is used as a diluent, wet binder and disintegrant for tablets and capsules, and as a sweetening agent for oral liquids.

In parenteral products, maltose may be used as a protein stabilizer,[1] a bulking agent,[2] and as a source of sugar, particularly for diabetic patients.

Crystalline maltose is used as a direct-compression tablet excipient in chewable and nonchewable tablets.[3–5]

8 Description

Maltose occurs as white crystals or as a crystalline powder. It is odorless and has a sweet taste approximately 30% that of sucrose.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for maltose.

Test	JP XVII	USP 40–NF 35 S1
Identification	+	+
Specific rotation	+126° to +131°	—
pH	—	—
for anhydrous	—	3.7–4.7
for monohydrate	4.5–6.5	4.0–5.5

10 Typical Properties

Angle of repose 25° for *Advantose 100*.[3]

Density (bulk) 0.67–0.72 g/cm^3 for *Advantose 100*.[3]

Density (tapped) 0.73–0.81 g/cm^3 for *Advantose 100*.[3]

Dissociation constant pK_a = 12.05 at 21°C

Flowability 18% (Carr compressibility index) for *Advantose 100*.[5]

Melting point 102–125°C.[3–6]

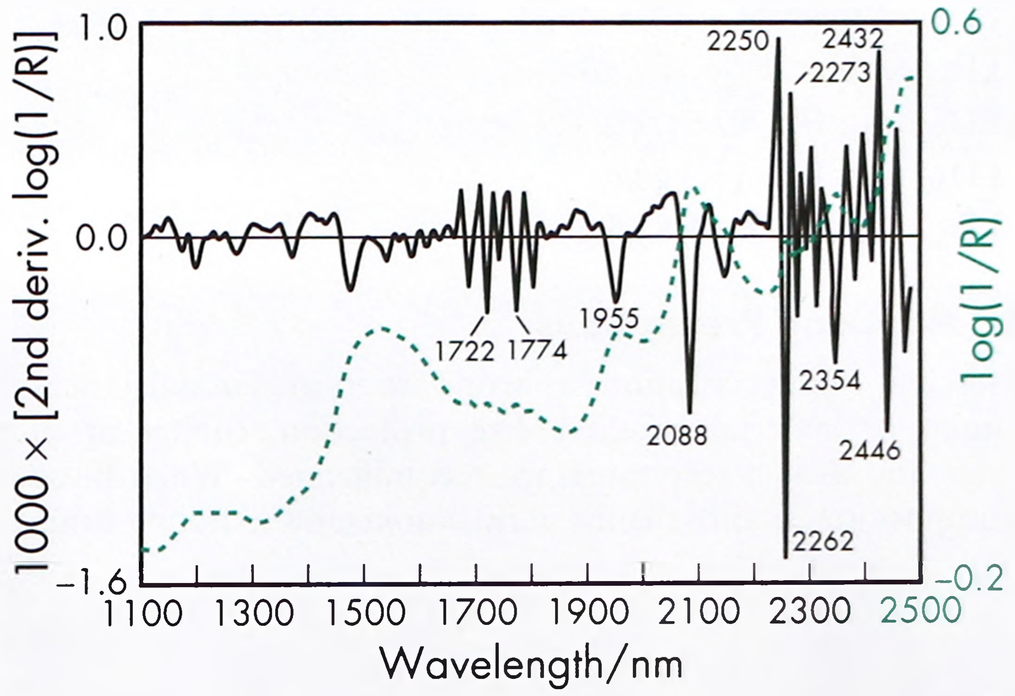
Particle size distribution Not more than 15% greater than 210 μm, and not more than 15% smaller than 74 μm in size for *Advantose 100*.[3]

Solubility Freely soluble in water; very slightly soluble in cold ethanol (95%); practically insoluble in diethyl ether.

Specific surface area 0.08 m^2/g for *Advantose 100*.[3]

Spectroscopy

NIR spectrum *see* Figure 1.



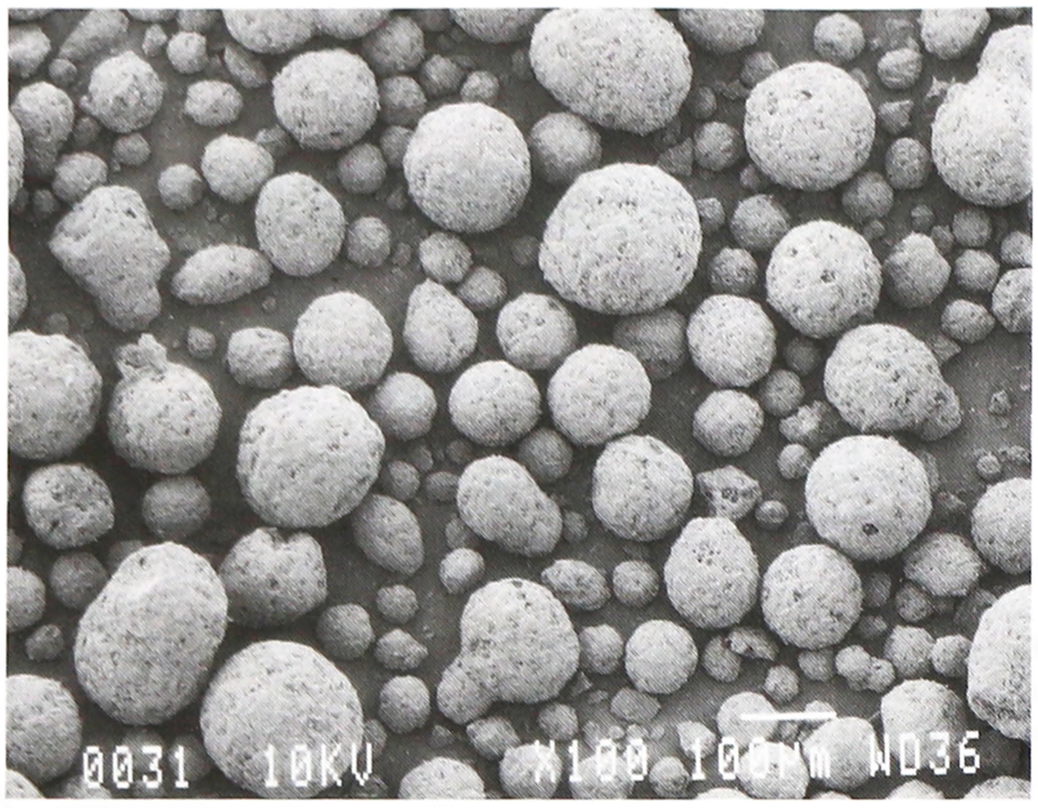


Figure 1: Near-infrared spectrum of maltose monohydrate measured by reflectance.

11 Stability and Storage Conditions

Maltose should be stored in a well-closed container in a cool, dry place.

SEM 1: Excipient: crystalline maltose; manufacturer: SPI Pharma Group; lot no.: 8K110947; magnification: 100×; voltage 10 kV.

12 Incompatibilities

Maltose may react with oxidizing agents. A Maillard-type reaction may occur between maltose and compounds with a primary amine group, e.g. glycine, to form brown-colored products.[7]

13 Method of Manufacture

Maltose monohydrate is prepared by the enzymatic degradation of starch.

14 Safety

Maltose is used in oral and parenteral pharmaceutical formulations and is generally regarded as an essentially nontoxic and nonirritant material. However, there has been a single report of a liver transplantation patient with renal failure who developed hyponatremia following intravenous infusion of normal immunoglobulin in 10% maltose. The effect, which recurred on each of four successive infusions, resembled that of hyperglycemia and was thought to be due to accumulation of maltose and other osmotically active metabolites in the extracellular fluid.[8]

LD_{50} (mouse, IV): 26.8 g/kg[9]
LD_{50} (mouse, SC): 38.6 g/kg
LD_{50} (rabbit, IV): 25.2 g/kg
LD_{50} (rat, IP): 30.6 g/kg
LD_{50} (rat, IV): 15.3 g/kg
LD_{50} (rat, oral): 34.8 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, rubber or plastic gloves, and a dust respirator are recommended. When heated to decomposition, maltose emits acrid smoke and irritating fumes.

16 Regulatory Status

In the US, maltose is considered as a food by the FDA and is therefore not subject to food additive and GRAS regulations. Included in the FDA Inactive Ingredients Database (oral solutions). Included in the Canadian Natural Health Products Ingredients Database. Included in parenteral products available in a number of countries worldwide.

17 Related Substances

Glucose, liquid.

18 Comments

Crystalline maltose, e.g. *Advantose 100* (SPI Pharma, Inc.), is spray-dried to produce spherical particles with good flow properties. The material is also nonhygroscopic and is highly compressible.

A genetic condition known as congenital sucrase-isomaltase deficiency can cause an individual to be maltose and sucrose intolerant.

A specification for maltose syrup powder is contained in the *Japanese Pharmaceutical Excipients* (JPE).[10]

The EINECS number for maltose is 200-716-5. The PubChem Compound ID (CID) for maltose includes 6255 and 23724983.

Mannitol

1 Nonproprietary Names

BP: Mannitol

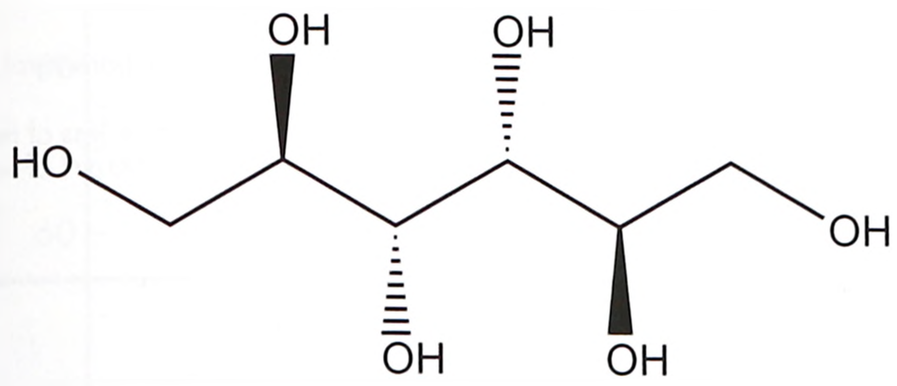
JP: D-Mannitol

PhEur: Mannitol

USP–NF: Mannitol

2 Synonyms

Cordycepic acid; *C*PharmMannidex*; E421; manita; manitol; manna sugar; mannit; D-mannite; mannite; mannitolum; *Mannogem*; *Parteck*; *Pearlitol*.



3 Chemical Name and CAS Registry Number

D-Mannitol [69-65-8]

4 Empirical Formula and Molecular Weight

$C_6H_{14}O_6$ 182.17

5 Structural Formula

6 Functional Category

Lyophilization aid; plasticizing agent; sweetening agent; tablet and capsule diluent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Mannitol is widely used in pharmaceutical formulations and food products. In pharmaceutical preparations it is primarily used as a diluent (10–90% w/w) in tablet formulations, where it is of particular value since it is not hygroscopic and may thus be used with moisture-sensitive active ingredients.[1,2]

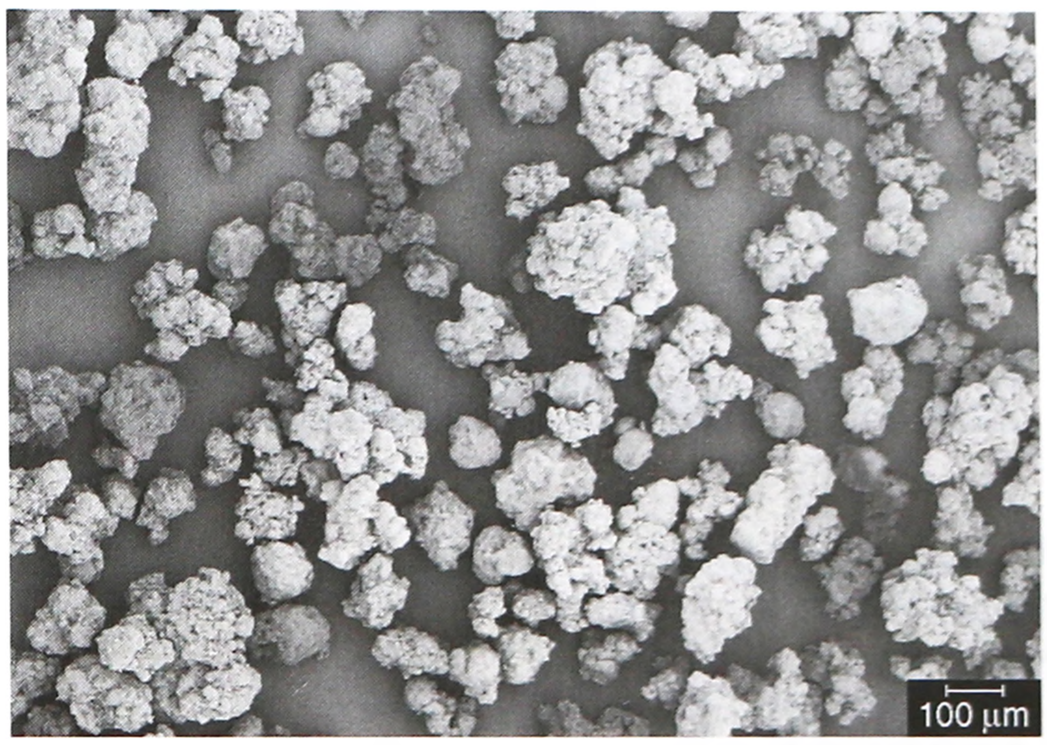
Mannitol may be used in direct-compression tablet applications,[3,4] for which the granular and spray-dried forms are available,[5] or in wet granulations.[6,7] Granulations containing mannitol have the advantage of being easily dried. Specific tablet applications include antacid preparations, glyceryl trinitrate tablets, and vitamin preparations. Mannitol is commonly used as an excipient in the manufacture of chewable tablet formulations because of its negative heat of solution, sweetness, and 'mouth feel'.[7–9] It is also used as a diluent in rapidly dispersing oral dosage forms.[10]

Mannitol has been used to prevent thickening in aqueous antacid suspensions of aluminum hydroxide (<7% w/v). It has also been used as a plasticizer in soft-gelatin capsules, as a component of sustained-release tablet formulations,[11] as a carrier in dry powder inhalers,[12–14] and in the formulation of pellets for colon drug delivery.[15] Mannitol has also been studied as a promising hydrophilic carrier for solid dispersion preparation to improve the solubility and dissolution of poorly soluble drugs.[16]

In lyophilized preparations, mannitol (20–90% w/w) has been used as a carrier to produce a stiff, homogeneous cake that improves the appearance of the lyophilized plug in a vial.[17,18] A pyrogen-free form is available specifically for this use.

8 Description

Mannitol is D-mannitol. It is a hexahydric alcohol related to mannose and is isomeric with sorbitol.



Mannitol occurs as a white, odorless, crystalline powder, or free-flowing granules. It has a sweet taste, approximately as sweet as glucose and half as sweet as sucrose, and imparts a cooling sensation in the mouth. Microscopically, it appears as orthorhombic needles when crystallized from alcohol. Mannitol shows polymorphism.[19]

9 Pharmacopeial Specifications

The pharmacopeial specifications for mannitol have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table I. *See also* Section 18.

SEM 1: Excipient: mannitol; manufacturer: Merck; magnification: 50×; voltage: 3.5 kV.

SEM 2: Excipient: mannitol; manufacturer: Merck; magnification: 500×; voltage: 3.5 kV.

SEM 3: Excipient: mannitol powder; manufacturer: SPI Polyols Inc.; lot no: 3140G8; magnification: 100×.

SEM 4: Excipient: mannitol granular; manufacturer: SPI Polyols Inc.; lot no: 2034F8; magnification: 100×.

10 Typical Properties

Compressibility *see* Figure 1.

Density (bulk)

0.430 g/cm^3 for powder;

0.7 g/cm^3 for granules.

Density (tapped)

0.734 g/cm^3 for powder;

0.8 g/cm^3 for granules.

Density (true) 1.514 g/cm^3

Dissociation constant pK_a = 13.5 at 18°C

Flash point <150°C

Flowability Powder is cohesive, granules are free flowing.

Heat of combustion 16.57 kJ/g (3.96 kcal/g)

Heat of solution −120.9 J/g (−28.9 cal/g) at 25°C

Melting point 166–168°C

Moisture content *see* Figure 2.

Osmolarity A 5.07% w/v aqueous solution is isoosmotic with serum.

Particle size distribution

Pearlitol 300 DC: maximum of 0.1% greater than 500 µm and minimum of 90% greater than 200 µm in size;

Pearlitol 400 DC: maximum of 20% greater than 500 µm and minimum of 85% greater than 100 µm in size;

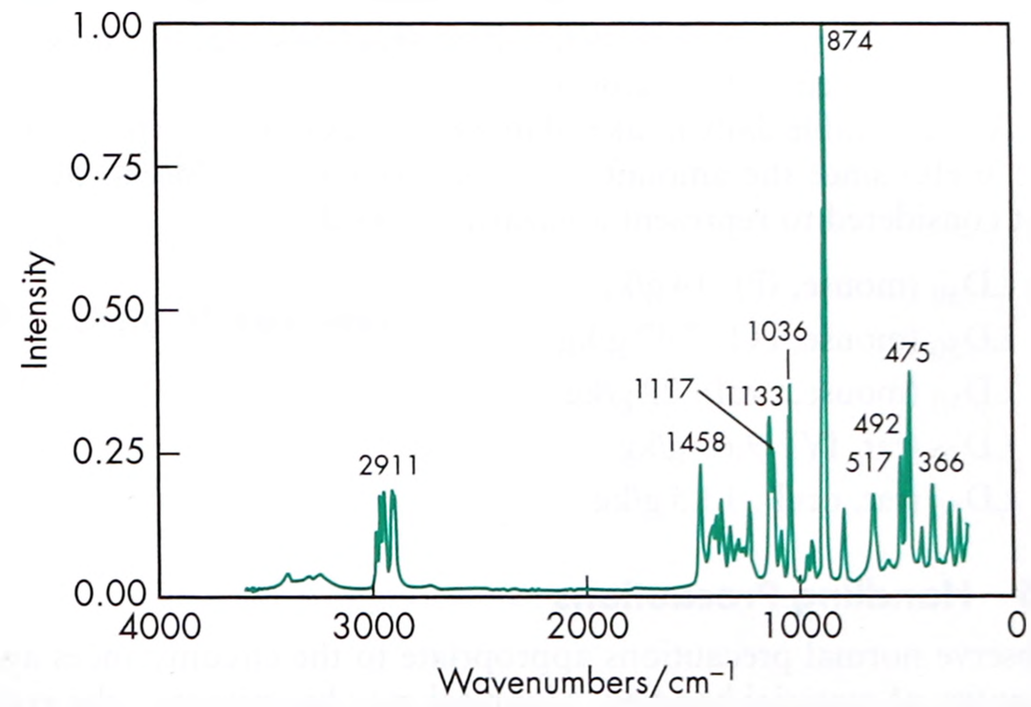

Figure 6: Raman spectrum of mannitol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Mannitol is stable in the dry state and in aqueous solutions. Solutions may be sterilized by filtration or by autoclaving and if necessary may be autoclaved repeatedly with no adverse physical or chemical effects.[22] In solution, mannitol is not attacked by cold, dilute acids or alkalis, nor by atmospheric oxygen in the absence of catalysts. Mannitol does not undergo Maillard reactions.

The bulk material should be stored in a well-closed container in a cool, dry place.

M

12 Incompatibilities

Mannitol solutions, 20% w/v or stronger, may be salted out by potassium chloride or sodium chloride.[23] Precipitation has been reported to occur when a 25% w/v mannitol solution was allowed to contact plastic.[24] Sodium cephapirin at 2 mg/mL and 30 mg/mL concentration is incompatible with 20% w/v aqueous mannitol solution. Mannitol is incompatible with xylitol infusion and may form complexes with some metals such as aluminum, copper, and iron. Reducing sugar impurities in mannitol have been implicated in the oxidative degradation of a peptide in a lyophilized formation.[25] Mannitol was found to reduce the oral bioavailability of cimetidine compared to sucrose,[26] and exhibit incompatibility in formulations containing hydrochlorothiazide.[27]

13 Method of Manufacture

Mannitol may be extracted from the dried sap of manna and other natural sources by means of hot alcohol or other selective solvents. It is commercially produced by the catalytic or electrolytic reduction of monosaccharides such as mannose and glucose.

14 Safety

Mannitol is a naturally-occurring sugar alcohol found in animals and plants; it is present in small quantities in almost all vegetables. Laxative effects may occur if mannitol is consumed orally in large quantities.[28] If it is used in foods as a bodying agent and daily ingestion of over 20 g is foreseeable, the product label should bear the statement 'excessive consumption may have a laxative effect'. After intravenous injection, mannitol is not metabolized to any appreciable extent and is minimally reabsorbed by the renal tubule, about 80% of a dose being excreted in the urine in 3 hours.[29]

A number of adverse reactions to mannitol have been reported, primarily following the therapeutic use of 20% w/v aqueous intravenous infusions.[30] The quantity of mannitol used as an excipient is considerably less than that used therapeutically and is consequently associated with a lower incidence of adverse reactions. However, allergic, hypersensitive-type reactions may occur when mannitol is used as an excipient.

An acceptable daily intake of mannitol has not been specified by the WHO since the amount consumed as a sweetening agent was not considered to represent a hazard to health.[31]

LD_{50} (mouse, IP): 14 g/kg[32]
LD_{50} (mouse, IV): 7.47 g/kg
LD_{50} (mouse, oral): 22 g/kg
LD_{50} (rat, IV): 9.69 g/kg
LD_{50} (rat, oral): 13.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Mannitol may be irritant to the eyes; eye protection is recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IP, IM, IV, and SC injections; infusions; buccal, oral and sublingual tablets, powders and capsules; ophthalmic preparations; topical solutions; nasal sprays; transdermal patches). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sorbitol.

18 Comments

Mannitol has undergone harmonization of many attributes for the JP, PhEur and USP-NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Mannitol is an isomer of sorbitol, the difference between the two polyols occurring in the planar orientation of the OH group on the second carbon atom. Each isomer is characterized by its own individual set of properties, the most important difference being the response to moisture. Sorbitol is hygroscopic, while mannitol resists moisture sorption, even at high relative humidities.

Granular mannitol flows well and imparts improved flow properties to other materials. However, it usually cannot be used with concentrations of other materials exceeding 25% by weight. Recommended levels of lubricant are 1% w/w calcium stearate or 1–2% w/w magnesium stearate. Suitable binders for preparing granulations of powdered mannitol are gelatin, methylcellulose 400, starch paste, povidone, and sorbitol. Usually, 3–6 times as much magnesium stearate or 1.5–3 times as much calcium stearate is needed for lubrication of mannitol granulations than is needed for other excipients.

Ludiflash (BASF) is a coprocessed excipient used as a tablet filler, binder, and disintegrant, and contains mainly mannitol with povidone, crospovidone and polyvinyl acetate. It is used for direct compression, and especially for tablets that disintegrate in the mouth.[33] *Compressol* SM (SPI Pharma) is another directly compressible coprocessed excipient used in tablet formulations consisting of mannitol and sorbitol; *see* Mannitol and Sorbitol, Coprocessed.

Mannitol is used in food applications as a bulking agent. Therapeutically, mannitol administered parenterally is used as an osmotic diuretic, as a diagnostic agent for kidney function, as an adjunct in the treatment of acute renal failure, and as an agent to reduce intracranial pressure, treat cerebral edema, and reduce intraocular pressure. Given orally, mannitol is not absorbed significantly from the gastrointestinal tract, but in large doses it can cause osmotic diarrhea; *see* Section 14.

A specification for mannitol is contained in the *Food Chemicals Codex* (FCC).[34]

The EINECS number for mannitol is 200-711-8. The PubChem Compound ID (CID) for mannitol includes 6251 and 453.

Mannitol and Sorbitol, Coprocessed

1 Nonproprietary Names

None adopted.

2 Synonyms

Compressol S; *Compressol SM*.

3 Chemical Name and CAS Registry Number

See Section 8.

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

See Section 8.

6 Functional Category

Direct compression excipient.

7 Applications in Pharmaceutical Formulation or Technology

Coprocessed mannitol and sorbitol is used in direct compression of tablets with high active loading and/or with actives that are difficult to compress as it has good flow and compressibility properties.[1,2] The coprocessed mixture with its improved functionality has been used in tableting of moisture-sensitive active substances as it has a lower hygroscopicity than standard sorbitol.[1–7]

Mannitol and sorbitol coprocessed mixture has a pleasant taste and favorable mouthfeel, making it especially suitable for chewable tablets.[1,2]

8 Description

Coprocessed mannitol and sorbitol occurs as a white to off-white fine powder with a smooth mouthfeel.

9 Pharmacopeial Specifications

Both mannitol and sorbitol are listed as separate monographs in the BP, JP, PhEur, and USP–NF, but the combination is not listed. *See* Mannitol, and Sorbitol.

10 Typical Properties

Density (tapped) 0.5–0.65 g/cm^3 for *Compressol SM* [8]
Loss on drying ≤1% for *Compressol SM* [8]
Particle size distribution

≤10% of the powder is retained on the 60-mesh screen

≤18% goes through the 325-mesh screen (for *Compressol SM*)[8]

Solubility Soluble in water (for *Compressol SM*)[9]
Total polyols 96–101% (for *Compressol SM*)[8]

11 Stability and Storage Conditions

Protect from excessive temperatures and humidity. Store in a tightly closed container.

12 Incompatibilities

See Mannitol, and Sorbitol. The coprocessed mixture may react with strong acids or oxidizing agents.[4] Upon decomposition, this product emits carbon monoxide, carbon dioxide, and/or low-molecular-weight hydrocarbons.

13 Method of Manufacture

Mannitol and sorbitol coprocessed mixture is manufactured by a proprietary process.

14 Safety

Coprocessed mannitol and sorbitol is a nonflammable white powder.[4] Eye contact may produce slight irritation. No skin irritation can be expected from single short-term exposure to this product. Prolonged or repeated contact may produce some irritation. Ingestion of large amounts may produce gastrointestinal disturbances including a laxative action. Overexposure to dusts may produce irritation of the respiratory system.

See also Mannitol, and Sorbitol.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Accumulation of airborne dust may present an explosion hazard in the presence of an ignition source. Avoid breathing dusts from this material.[4] Avoid contact with the eyes, and wash thoroughly after handling.

16 Regulatory Status

Mannitol and sorbitol is a coprocessed mixture of two materials both of which are GRAS listed and accepted for use as a food additive in Europe. *See* Mannitol, and Sorbitol.

Mannitol GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IP, IM, IV, and SC injections; infusions; buccal, oral and sublingual tablets, powders and capsules; ophthalmic preparations; topical solutions). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Sorbitol GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (intra-articular and IM injections; nasal; oral capsules, solutions, suspensions, syrups and tablets; rectal, topical, and vaginal preparations). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Mannitol; sorbitol.

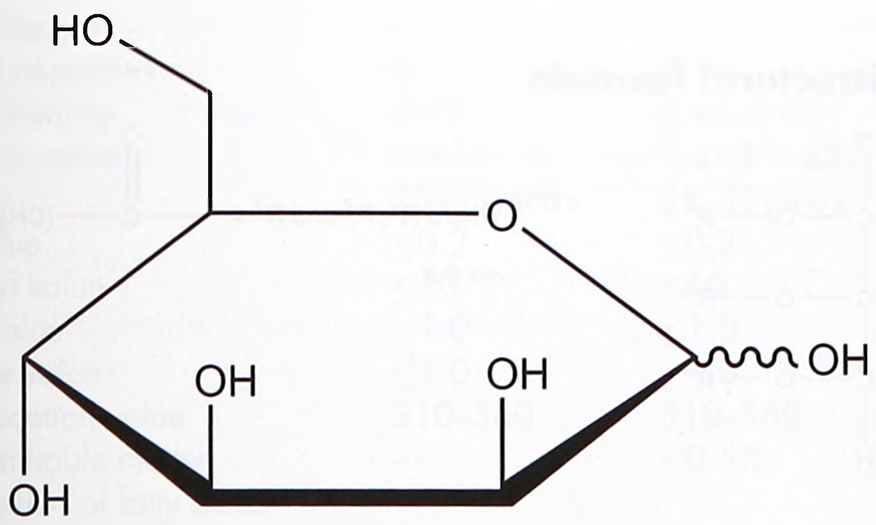
D-Mannose

1 Nonproprietary Names

None adopted.

2 Synonyms

Carubinose; dextra mannose; D-mannopyranose; *MannoTab*; seminose.



3 Chemical Name and CAS Registry Number

(3*S*,4*S*,5*S*,6*R*)-6-(Hydroxymethyl)oxane-2,3,4,5-tetrol [3458-28-4]

4 Empirical Formula and Molecular Weight

$C_6H_{12}O_6$ 180.16

5 Structural Formula

6 Functional Category

Antioxidant; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

D-Mannose is used as a sweetening agent in oral pharmaceutical products. A directly compressible grade of D-mannose is used as an antioxidant in dietary applications.[1]

8 Description

D-Mannose is a colorless or white crystalline powder with a sweet taste but bitter aftertaste. The ambiguity of taste perception of D-mannose has been traced to actual differences in taste between the α and β forms.[2]

9 Pharmacopeial Specifications

—

10 Typical Properties

Density 1.54 g/cm^3
Dissociation constant $pK_a = 11.98$
Melting point 132–140°C (with decomposition); 133°C (α-form)
Solubility *see* Table I.

Table I: Solubility of D-mannose.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol	1 in 250
Methanol	1 in 120
Pyridine	1 in 3.5
Water	1 in 0.4

Specific rotation $[\alpha]_D^{20}$ +13.7 to +14.2° (20% w/v in water containing approx. 0.05% w/v NH_3).

11 Stability and Storage Conditions

D-Mannose is stable in the dry state and in aqueous solutions. It can be fermented by yeast. Store in tightly closed containers in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

D-Mannose is prepared from glucose in the Lobry-de Bruyn-van Ekenstein transformation. It can also be prepared by the oxidation of mannitol.

D-Mannose can also be manufactured from wood-based or other biomass hydrolysates using an aqueous chromatographic separation process.[1]

14 Safety

D-Mannose is used in oral preparations. The majority of ingested D-mannose is excreted unconverted into the urine within 30–60

minutes, with no significant increase in blood-glucose levels during this time.[3]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral, tablet). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dextrose; mannitol.

18 Comments

Included in the BP 2017 as a general reagent. D-Mannose is a naturopathic remedy for urinary tract infections.

D-Mannose has recently been investigated as a surface modifier for nanoparticles and liposomes to enhance oral and alveolar delivery by macrophage targeting.[4–7] Research has also shown that D-mannose is useful in freeze-dried suspensions to prevent aggregation.[8]

The EINECS number for D-mannose is 222-392-4. The PubChem Compound ID (CID) for D-mannose is 18950.

Medium-chain Triglycerides

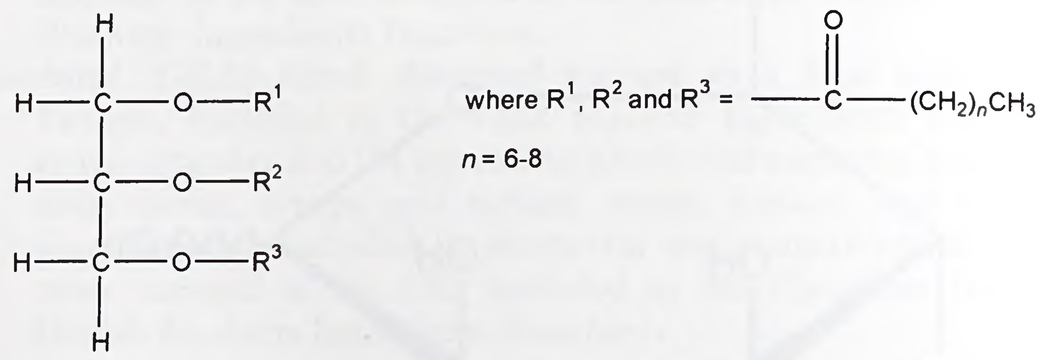
1 Nonproprietary Names

BP: Medium-chain Triglycerides
PhEur: Triglycerides, Medium-Chain
USP–NF: Medium-Chain Triglycerides

2 Synonyms

Bergabest; caprylic/capric triglyceride; *Captex 300*; *Captex 355*; *Coconad*; *Crodamol GTCC*; *Delios*; glyceryl tricaprylate/caprate; *Kollisolv MCT*; *Labrafac CC*; *Labrafac Lipo*; *Labrafac WL1349*; MCT oil; *Miglyol 810*; *Miglyol 812*; *Myritol*; *Neobee M5*; *Nesatol*; oleum neutrale; oleum vegetable tenue; *ProKote 2855*; *Stelliesters MCT*; thin vegetable oil; triglycerida saturata media; *Waglinol 3/9280*.

3 Chemical Name and CAS Registry Number



Medium-chain triglycerides [438544-49-1]

4 Empirical Formula and Molecular Weight

≈500 (average)

The PhEur 9.2 describes medium-chain triglycerides as the fixed oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineenis* Jacq. They consist of a mixture of triglycerides of saturated fatty acids, mainly of caprylic acid and of capric acid. They contain not less than 95% of saturated fatty acids.

5 Structural Formula

See also Section 4.

6 Functional Category

Emulsifying agent; solvent; suppository base; suspending agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Medium-chain triglycerides have been used in a variety of pharmaceutical formulations including oral, parenteral, and topical preparations.

In oral formulations, medium-chain triglycerides are used as the base for the preparation of oral emulsions, microemulsions, self-emulsifying systems, solutions, or suspensions of drugs that are unstable or insoluble in aqueous media, e.g. calciferol. Medium-

chain triglycerides have also been investigated as intestinal absorption enhancers[1,2] and have additionally been used as a filler in capsules and sugar-coated tablets, and as a lubricant or antiadhesion agent in tablets.

In parenteral formulations, medium-chain triglycerides have similarly been used in the production of emulsions, solutions, or suspensions intended for intravenous administration.[3–9] In rectal formulations, medium-chain triglycerides have been used in the preparation of suppositories containing labile materials. In cosmetics and topical pharmaceutical preparations, medium-chain triglycerides are used as a component of ointments, creams, and liquid emulsions.[5]

An emulsion of medium-chain triglycerides has shown significant potential as an effective antimicrobial alternative to chlorhexidine- and xylitol- based products for use against animal pathogens.[10]

Although similar to long-chain triglycerides, medium-chain triglycerides have a number of advantages in pharmaceutical formulations, which include better spreading properties on the skin; no impedance of skin respiration; good penetration properties; good emollient and cosmetic properties; no visible film on the skin surface; good compatibility; good solvent properties; and good stability against oxidation.

8 Description

A colorless to slightly yellowish oily liquid that is practically odorless and tasteless. It solidifies at about 0°C. The oil is free from catalytic residues or the products of cracking.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for medium-chain triglycerides.

(a) For medium-chain triglycerides intended for use in parenteral nutrition.

10 Typical Properties

Acid value
≤0.1 for *Crodamol GTCC*;
≤0.1 for *Miglyol 810*;
≤0.1 for *Miglyol 812*;
≤0.05 for *Neobee M5*.

Cloud point
≤5°C for *Crodamol GTCC*;
≈10°C for *Miglyol 810*;
≈10°C for *Miglyol 812*.

Color
≤60 (Hazen color index) for *Crodamol GTCC*;
≤90 (Hazen color index) for *Miglyol 810*;
≤60 (Hazen color index) for *Miglyol 812*;
≤100 (Hazen color index) for *Neobee M5*.

Density
0.94–0.96 g/cm^3 for *Crodamol GTCC* at 20°C;
0.94–0.95 g/cm^3 for *Miglyol 810* at 20°C;
0.94–0.95 g/cm^3 for *Miglyol 812* at 20°C;
0.94 g/cm^3 for *Neobee M5* at 20°C.

Freezing point −5°C for *Neobee M5*

Hydroxyl value ≤8 for *Neobee M5*

Iodine number
≤1.0 for *Crodamol GTCC*;
≤0.5 for *Miglyol 810*;
≤0.5 for *Miglyol 812*;
≤0.5 for *Neobee M5*.

Moisture content
≤0.15% w/w for *Crodamol GTCC*;
≤0.10% w/w for *Miglyol 810*;
≤0.10% w/w for *Miglyol 812*;
≤0.15% w/w for *Neobee M5*.

Peroxide value
≤1.0 for *Miglyol 810*;
≤1.0 for *Miglyol 812*;
≤0.5 for *Neobee M5*.

Refractive index
1.4485–1.4500 for *Crodamol GTCC* at 20°C;
1.4485–1.4505 for *Miglyol 810* at 20°C;
1.4490–1.4510 for *Miglyol 812* at 20°C;
1.4480–1.4510 for *Neobee M5* at 20°C.

Saponification value
325–345 for *Crodamol GTCC*;
335–355 for *Miglyol 810*;
325–345 for *Miglyol 812*;
335–360 for *Neobee M5*.

Solubility Soluble in all proportions at 20°C in acetone, benzene, 2-butanone, carbon tetrachloride, chloroform, dichloromethane, ethanol, ethanol (95%), ether, ethyl acetate, petroleum ether, special petroleum spirit (boiling range 80–110°C), propan-2-ol, toluene, and xylene. Miscible with long-chain hydrocarbons and triglycerides; practically insoluble in water.

Surface tension
32.2 mN/m for *Crodamol GTCC* at 25°C;
31.0 mN/m for *Miglyol 810* at 20°C;
31.1 mN/m for *Miglyol 812* at 20°C;
32.3 mN/m for *Neobee M5* at 25°C.

Viscosity (dynamic)
27–30 mPa s (27–30 cP) for *Miglyol 810* at 20°C;

28–32 mPa s (28–32 cP) for *Miglyol 812* at 20°C;
23 mPa s (23 cP) for *Neobee M5* at 25°C.

11 Stability and Storage Conditions

Medium-chain triglycerides are stable over the wide range of storage temperatures that can be experienced in tropical and temperate climates. Ideally, however, they should be stored at temperatures not exceeding 25°C and not exposed to temperatures above 40°C for long periods. At low temperatures, samples of medium-chain triglycerides may become viscous or solidify. Samples should therefore be well melted and mixed before use, although overheating should be avoided.

In the preparation of microemulsions and self-emulsifying systems, emulsions, or aqueous suspensions of medium-chain triglycerides, care should be taken to avoid microbiological contamination of the preparation, since lipase-producing microorganisms, which become active in the presence of moisture, can cause hydrolysis of the triglycerides. Hydrolysis of the triglycerides is revealed by the characteristic unpleasant odor of free medium-chain fatty acids.

Medium-chain triglycerides may be sterilized by maintaining at 170°C for 1 hour.

Medium-chain triglycerides should be stored protected from light in a well-filled and well-closed container. When stored dry, in sealed containers, medium-chain triglycerides remain stable for many years.

12 Incompatibilities

Preparations containing medium-chain triglycerides should not come into contact with polystyrene containers or packaging components since the plastic rapidly becomes brittle upon contact. Low-density polyethylene should also not be used as a packaging material as the medium-chain triglycerides readily penetrate the plastic, especially at high temperatures, forming an oily film on the outside. High-density polyethylene is a suitable packaging material. Closures based on phenol resins should be tested before use for compatibility with medium-chain triglycerides. Polyvinyl chloride packaging should also be tested for compatibility since medium-chain triglycerides can dissolve some plasticizers, such as phthalates, out of the plastic.

Materials recommended as safe for packaging medium-chain triglycerides are low-density polyethylene, polypropylene, glass, and metal.

13 Method of Manufacture

Medium-chain triglycerides are obtained from the fixed oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. Hydrolysis of the fixed oil followed by distillation yields the required fatty acids, which are then re-esterified to produce the medium-chain triglycerides.

Although the PhEur 9.2 specifies that medium-chain fatty acids are obtained from coconut oil, medium-chain triglycerides are also to be found in substantial amounts in the kernel oils of certain other types of palm-tree, e.g. palm kernel oil and babassu oil. Some animal products, such as milk-fat, also contain small amounts (up to 4%) of the medium-chain fatty acid esters.

14 Safety

Medium-chain triglycerides are used in a variety of pharmaceutical formulations including oral, parenteral, and topical products, and are generally regarded as essentially nontoxic and nonirritant materials.

In acute toxicology studies in animals and humans, no irritant or other adverse reactions have been observed; for example, when they were patch-tested on more than 100 individuals, no irritation was produced on either healthy or eczematous skin. Medium-chain triglycerides are not irritating to the eyes.

Similarly, chronic toxicology studies in animals have shown no harmful adverse effects associated with medium-chain triglycerides following inhalation or intraperitoneal, oral, and parenteral administration.

In humans, administration of 0.5 g/kg body-weight medium-chain triglycerides to healthy individuals produced no change in blood or serum triglycerides compared to subjects receiving the same dose of the long-chain triglyceride triolein.

In patients consuming diets based on medium-chain triglycerides, adverse effects reported include abdominal pain and diarrhea.

LD_{50} (mouse, IV): 3.7 g/kg
LD_{50} (mouse, oral): 29.6 g/kg
LD_{50} (rat, oral): 33.3 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral, sublingual, topical and transdermal preparations). Included in nonparenteral and parenteral medicines licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Coconut oil; suppository bases, hard fat; vegetable oil, hydrogenated.

18 Comments

Medium-chain triglycerides may also be known as fractionated coconut oil, which contains three saturated lipid chains bound to a glycerin backbone, and are distinguished from other triglycerides by the length of the carbon chains, normally between 6 and 10.

Therapeutically, medium-chain triglycerides have been used as nutritional agents.[11] Diets containing medium-chain triglycerides are used in conditions associated with the malabsorption of fat, such as cystic fibrosis, since medium-chain triglycerides are more readily digested than long-chain triglycerides. Medium-chain triglycerides have been investigated particularly for their use in total parenteral nutrition regimens in combination with long-chain triglycerides.[4,12]

A specification for medium-chain fatty acid triglycerides is included in the *Japanese Pharmaceutical Excipients* (JPE).[13]

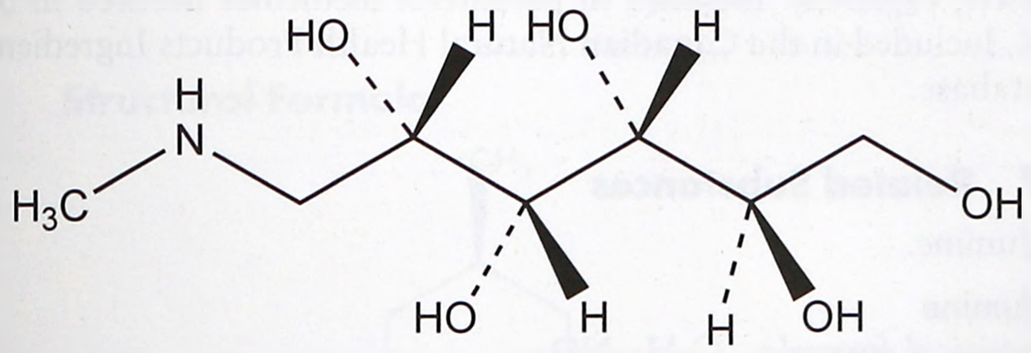
Meglumine

1 Nonproprietary Names

BP: Meglumine
JP: Meglumine
PhEur: Meglumine
USP–NF: Meglumine

2 Synonyms

Meglumin; meglumina; megluminum; 1-methylamino-1-deoxy-D-glucitol; *N*-methylglucamine; *N*-methyl-D-glucamine.



3 Chemical Name and CAS Registry Number

1-Deoxy-1-(methylamino)-D-glucitol [6284-40-8]

4 Empirical Formula and Molecular Weight

$C_7H_{17}NO_5$ 195.21

5 Structural Formula

6 Functional Category

Buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Meglumine is an organic base used as a pH-adjusting agent and solubilizing agent, primarily in the preparation of soluble salts of iodinated organic acids used as X-ray contrast media.

8 Description

Meglumine occurs as a white to slightly yellow-colored crystalline powder; it is odorless or with a slight odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for meglumine.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Appearance of solution	+	+	+
Melting range	128–131°C	128°C	128–132°C
Specific optical rotation	−16.0° to −17.0°	−16.0° to −17.0°	−15.7° to −17.3°
Reducing substances	—	≤0.2%	—
Loss on drying	≤0.5%	≤0.5%	≤1.0%
Residue on ignition	≤0.1%	≤0.1%	≤0.1%
Absence of reducing substances	+	—	+
Bacterial endotoxins	—	≤1.5 IU/g	—
Heavy metals	≤10 ppm	≤10 ppm	≤0.002%
Iron	—	≤10 ppm	—
Arsenic	≤1 ppm	—	—
Chloride	≤0.009%	≤100 ppm	—
Sulfate	≤0.019%	≤150 ppm	—
Nickel	—	≤5 ppm	—
Aluminum	—	≤5 ppm	—
Assay (dried basis)	≥99.0%	99.0–101.0%	99.0–100.5%

10 Typical Properties

Acidity/alkalinity pH = 10.5 (1% w/v aqueous solution).
Dissociation constant pK_a = 9.5 at 20°C
Melting point 128–132°C
Osmolarity A 5.02% w/v aqueous solution is iso-osmotic with serum.
Solubility *see* Table II.
Specific rotation $[\alpha]_D^{20}$ = −16.5° (10% w/v aqueous solution)

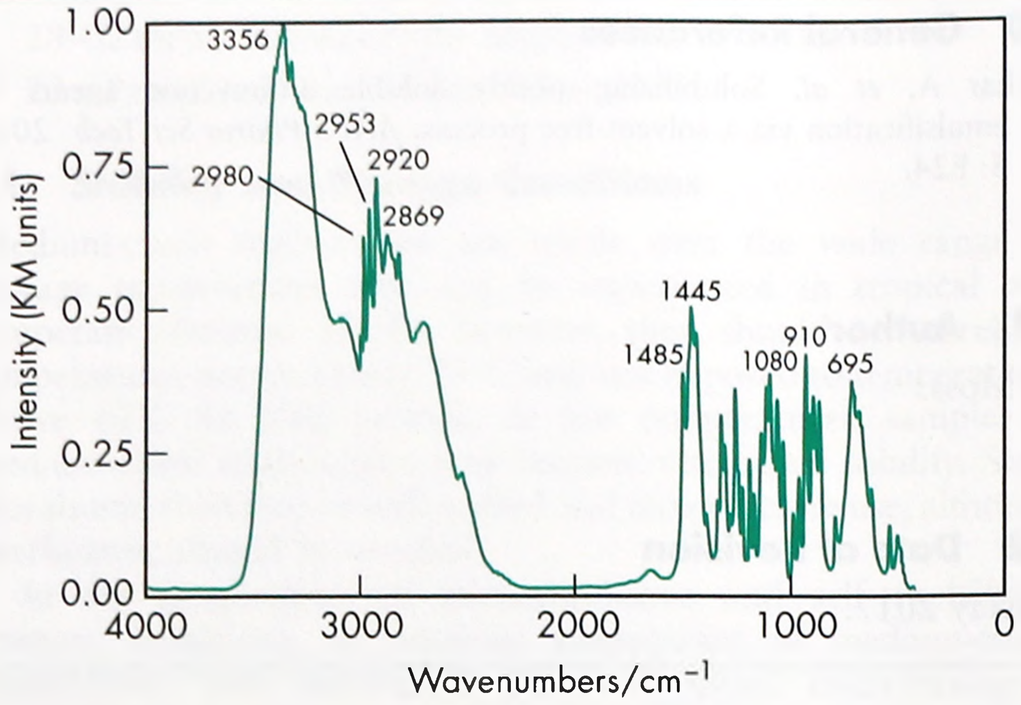


Figure 1: Infrared spectrum of meglumine measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

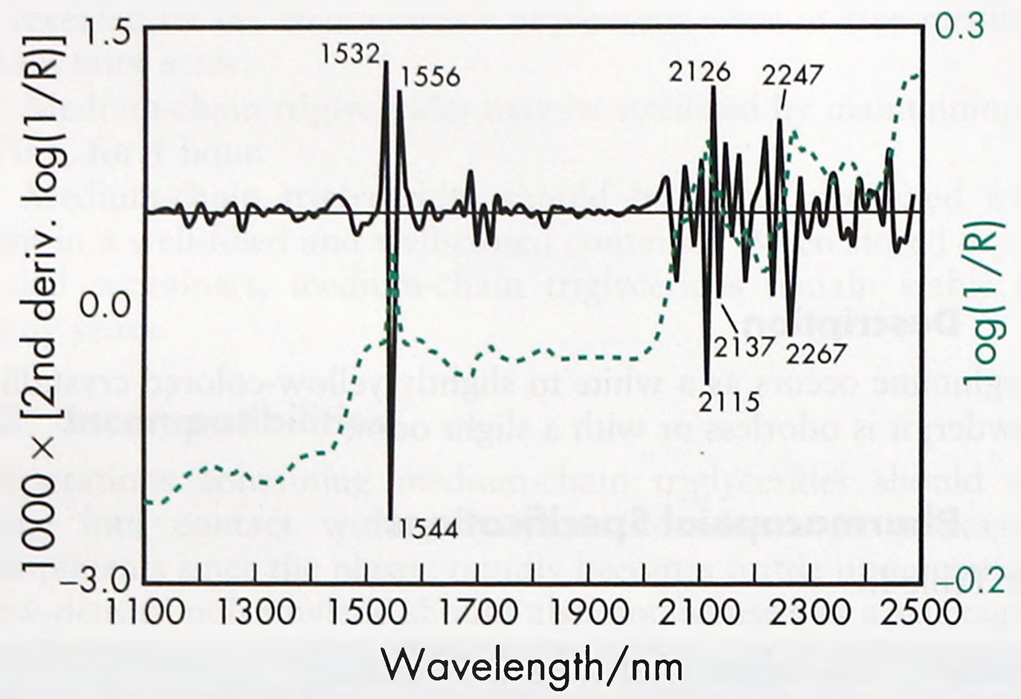

Figure 2: Near-infrared spectrum of meglumine measured by reflectance.

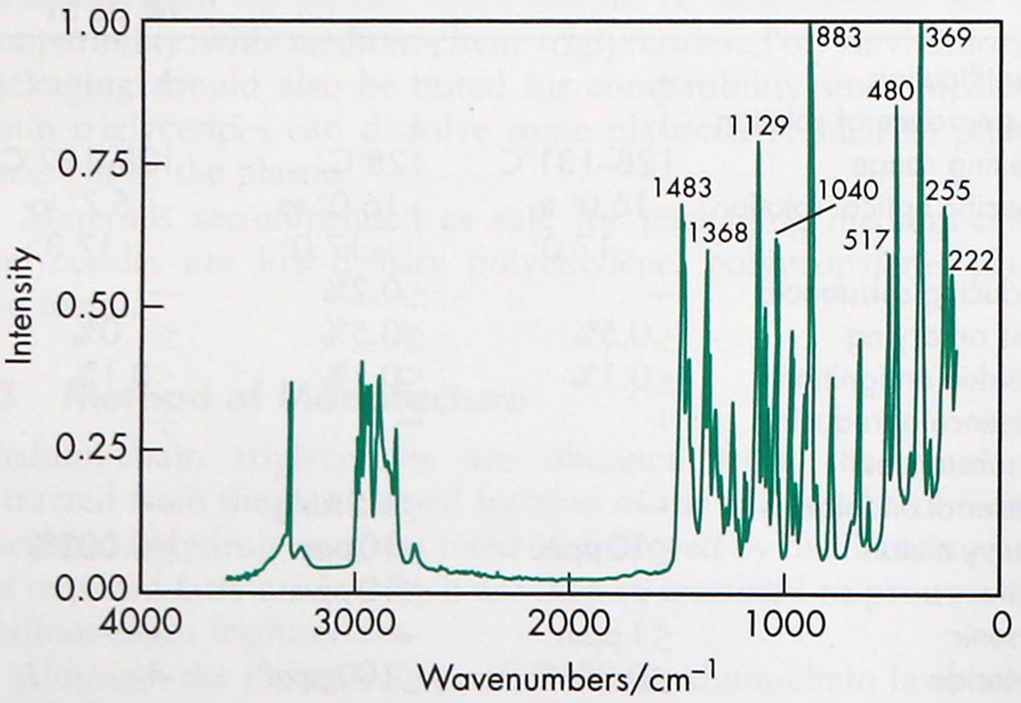

Figure 3: Raman spectrum of meglumine measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Meglumine does not polymerize or dehydrate unless heated above 150°C for prolonged periods.

Table II: Solubility of meglumine.

Solvent	Solubility at 20°C unless otherwise stated
Chloroform	Practically insoluble
Ethanol (95%)	1 in 80
	1 in 4.8 at 70°C
Ether	Practically insoluble
Water	1 in 1

The bulk material should be stored in a well-closed container in a cool, dry place. Meglumine should not be stored in aluminum containers since it reacts to evolve hydrogen gas; it discolors if stored in containers made from copper or copper alloys. Stainless steel containers are recommended.

12 Incompatibilities

Incompatible with aluminum, copper, mineral acids, and oxidizing materials. Differential scanning calorimetry studies suggest meglumine is incompatible with glipizide.[1]

13 Method of Manufacture

Meglumine is prepared by the imination of glucose and monomethylamine, in an alcoholic solution, followed by catalytic hydrogenation.

14 Safety

Meglumine is widely used in parenteral pharmaceutical formulations and is generally regarded as a nontoxic material at the levels usually employed as an excipient.

LD_{50} (mouse, IP): 1.68 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Meglumine should be handled in a well-ventilated environment, and eye protection, gloves, and a respirator are recommended. Exposure to meglumine dust should be kept below 10 mg/m^3 for total inhalable dust (8-hour TWA) or 5 mg/m^3 for respirable dust (8-hour TWA). There is a risk of explosion when meglumine dust is mixed with air.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (injections; oral tablets, capsules). Included in parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Eglumine.

Eglumine

Empirical formula $C_8H_{19}NO_5$
Molecular weight 209.24
CAS number [14216-22-9]
Synonyms 1-Deoxy-1-(ethylamino)-D-glucitol; *N*-ethylglucamine.
Melting point ≈138°C
Comments Eglumine is prepared similarly to meglumine except that monoethylamine is used as the precursor, instead of monomethylamine.

18 Comments

The EINECS number for meglumine is 228-506-9. The PubChem Compound ID (CID) for meglumine is 8567.

Menthol

1 Nonproprietary Names

BP: Racementhol

JP: *dl*-Menthol

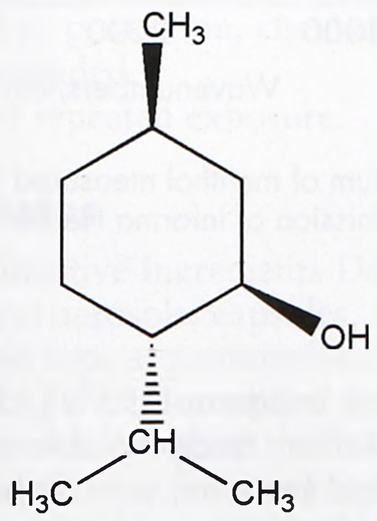
PhEur: Menthol, Racemic

USP–NF: Menthol

2 Synonyms

Hexahydrothymol; 2-isopropyl-5-methylcyclohexanol; 4-isopropyl-1-methylcyclohexan-3-ol; 3-*p*-menthanol; *p*-menthan-3-ol; *dl*-menthol; mentholum racemicum; menthomenthol; mentoli; mentolis; peppermint camphor; racemic menthol.

3 Chemical Name and CAS Registry Number



(1*RS*,2*RS*,5*RS*)-(±)-5-Methyl-2-(1-methylethyl)cyclohexanol [15356-70-4]

Note that the following CAS numbers have also been used: [1490-04-6] and [89-78-1].

4 Empirical Formula and Molecular Weight

$C_{10}H_{20}O$ 156.27

5 Structural Formula

6 Functional Category

Flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Menthol is widely used in pharmaceuticals, confectionery, and toiletry products as a flavoring agent or odor enhancer. In addition to its characteristic peppermint flavor, *l*-menthol, which occurs naturally, also exerts a cooling or refreshing sensation that is exploited in many topical preparations; *see* Section 18. Unlike mannitol, which exerts a similar effect due to a negative heat of solution, *l*-menthol interacts directly with the body's coldness receptors. *d*-Menthol has no cooling effect, while racemic menthol exerts an effect approximately half that of *l*-menthol. The propensity of menthol to sublime has been exploited to prepare formulated granules with increased porosity, which can increase dissolution and disintegration rate.[1]

When used to flavor tablets, menthol is generally dissolved in ethanol (95%) and sprayed onto tablet granules and not used as a solid excipient.

Menthol has been investigated as a skin-penetration enhancer and is also used in perfumery, tobacco products and chewing gum.

See Table I.

Table I: Uses of menthol.

Use	Concentration (%)
Pharmaceutical products	
Inhalation	0.02–0.05
Oral liquids	0.001–0.05
Tablets	0.2–0.4
Topical formulations	0.05–10.0
Cosmetic products	
Toothpaste	0.4
Mouthwash	0.1–2.0
Oral spray	0.3

8 Description

Racemic menthol is a mixture of equal parts of the (1*R*,2*S*,5*R*)- and (1*S*,2*R*,5*S*)-isomers of menthol. It is a free-flowing or agglomerated crystalline powder, or colorless, prismatic, or acicular shiny crystals, or hexagonal or fused masses with a strong characteristic odor and taste. The crystalline form may change with time owing to sublimation within a closed vessel. The USP 40–NF 35 S1 specifies that menthol may be either naturally occurring *l*-menthol or

Figure 1: Photomicrograph of large DL-menthol crystals; magnification 7×. Manufacturer: Charkit Chemical Corp., USA.

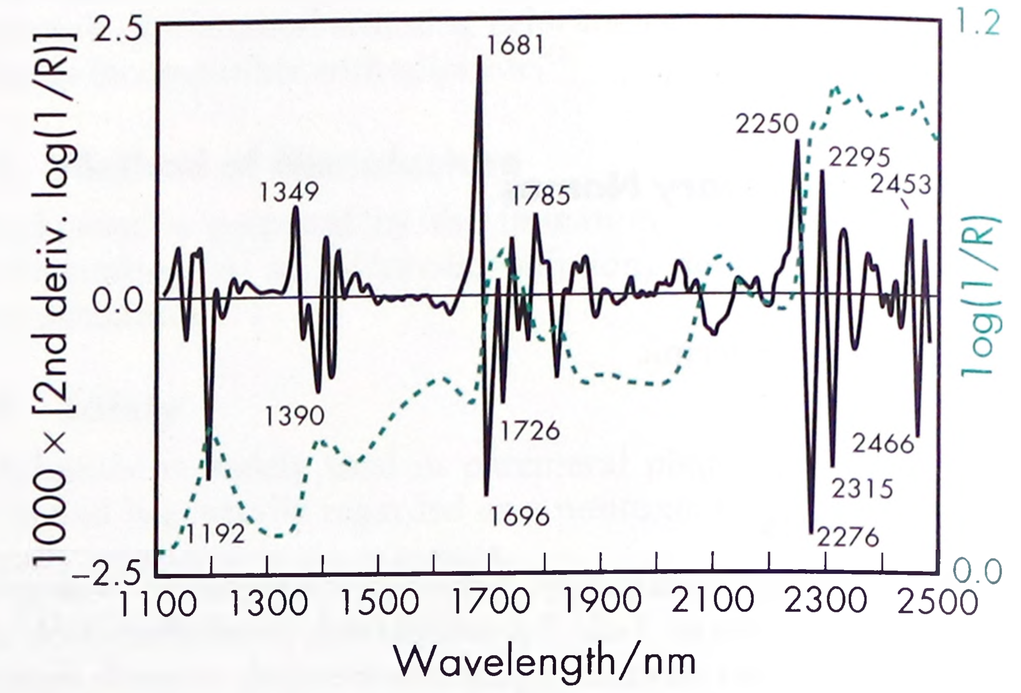

Figure 3: Near-infrared spectrum of menthol measured by reflectance.

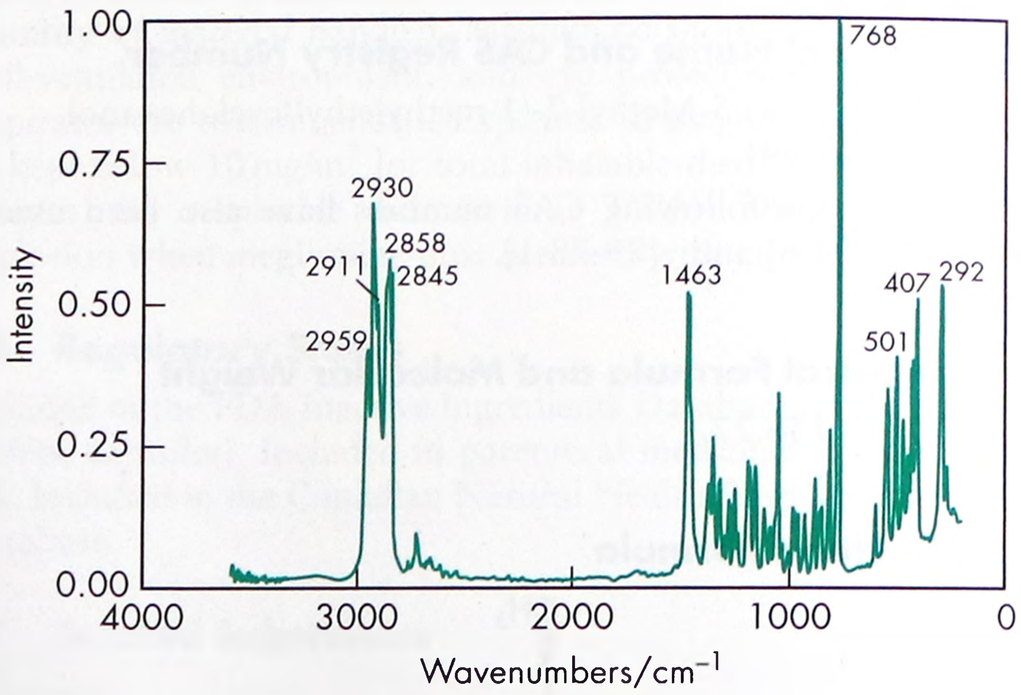

Figure 4: Raman spectrum of menthol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Solubility Very soluble in ethanol (95%), chloroform, ether, fatty oils and liquid paraffin; freely soluble in glacial acetic acid; soluble in acetone and benzene; very slightly soluble in glycerin; practically insoluble in water.
Specific gravity 0.890
Specific rotation

$[\alpha]_D^{20}$ = −2° to +2° (10% w/v alcoholic solution)

See also Section 17.

Spectroscopy

IR spectrum *see* Figure 2.

NIR spectrum *see* Figure 3.

Raman spectrum *see* Figure 4.

11 Stability and Storage Conditions

Menthol should be stored in a well-closed container at a temperature not exceeding 25°C, since it sublimes readily.

A formulation containing menthol 1% w/w in aqueous cream has been reported to be stable for up to 18 months when stored at room temperature.[2]

12 Incompatibilities

Incompatible with: butylchloral hydrate; camphor; chloral hydrate; chromium trioxide; β-naphthol; phenol; potassium permanganate; pyrogallol; resorcinol; and thymol.

13 Method of Manufacture

Menthol occurs widely in nature as *l*-menthol and is the principal component of peppermint and cornmint oils obtained from the *Mentha piperita* and *Mentha arvensis* species. Commercially, *l*-menthol is mainly produced by extraction from these volatile oils. It may also be prepared by partial or total synthetic methods.

Racemic menthol is prepared synthetically via a number of routes, e.g. by hydrogenation of thymol.

14 Safety

Almost all toxicological data for menthol relate to its use as a therapeutic agent rather than as an excipient. Inhalation or ingestion of large quantities can result in serious adverse reactions such as ataxia[3] and CNS depression,[4] hypersensitivity reactions, severe abdominal pain, nausea, vomiting, vertigo, drowsiness, and coma.[5] Although menthol is essentially nonirritant there have been some reports of hypersensitivity following topical application.[6,7] In a Polish study approximately 1% of individuals were determined as being sensitive to menthol.[8] There have been reports of apnea and instant collapse in infants after the local application of menthol to their nostrils.[5]

The WHO has set an acceptable daily intake of menthol at up to 0.4 mg/kg body-weight.[9]

LD_{50} (rat, IM): 10.0 g/kg[10]

LD_{50} (rat, oral): 3.18 g/kg

15 Handling Precautions

May be harmful by inhalation or ingestion in large quantities; may be irritant to the skin, eyes, and mucous membranes. Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, chemical resistant gloves, and respirators are recommended.

Avoid prolonged or repeated exposure.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (dental preparations, inhalations, oral aerosols, capsules, solutions, suspensions, syrups, and tablets; also topical preparations). Menthol is listed as a food additive in the EAFUS list compiled by the FDA. Included in nonparenteral medicines licensed in the UK. Accepted for use in foods and confectionery as a flavoring agent of natural origin. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

d-Menthol; *l*-menthol; thymol.

d-Menthol

Empirical formula $C_{10}H_{20}O$

Molecular weight 156.27

CAS number [15356-60-2]

Synonyms (1*S*,2*R*,5*S*)-(+)-5-Methyl-2-(1-methylethyl)cyclohexanol; (1*S*,2*R*,5*S*)-2-isopropyl-5-methylcyclohexanol; (+) menthol.

Appearance Colorless, prismatic or acicular, shiny crystals, without the characteristic odor, taste, and cooling effect of *l*-menthol. The crystalline form may change with time owing to sublimation within a closed vessel.

Flash point >91°C

Melting point 43–44°C

Specific rotation $[\alpha]_D^{23}$ = +48° (10% w/v alcoholic solution)

l-Menthol

Empirical formula $C_{10}H_{20}O$

Molecular weight 156.27

CAS number [2216-51-5]

Synonyms Levomenthol; levomentholum; (−)menthol; (1*R*,2*S*,5*R*)-(−)-5-methyl-2-(1-methylethyl)cyclohexanol.

Appearance Colorless, prismatic, or acicular, shiny crystals, with a strong, characteristic odor, taste, and cooling effect. The crystalline form may change with time owing to sublimation within a closed vessel.

Flash point >100°C

Melting point 41–44°C

Refractive index n_D^{20} = 1.4600

Specific rotation $[\alpha]_D^{20}$ = −45° to −51° (10% w/v alcoholic solution)

Safety

LD_{50} (mouse, IP): 6.6 g/kg[10]

LD_{50} (mouse, oral): 3.4 g/kg

LD_{50} (rat, IP): 0.7 g/kg

LD_{50} (rat, oral): 3.3 g/kg

18 Comments

Therapeutically, when applied to the skin, menthol dilates the blood vessels, causing a sensation of coldness followed by an analgesic effect. It relieves itching and is used in creams, lotions, and ointments. When administered orally in small doses menthol has a carminative action.

It should be noted that considerable variation in the chemical composition of natural menthol oils can occur depending upon their country of origin.

A specification for menthol is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for menthol is 201-939-0. The PubChem Compound ID (CID) for menthol is 1254.

Methionine

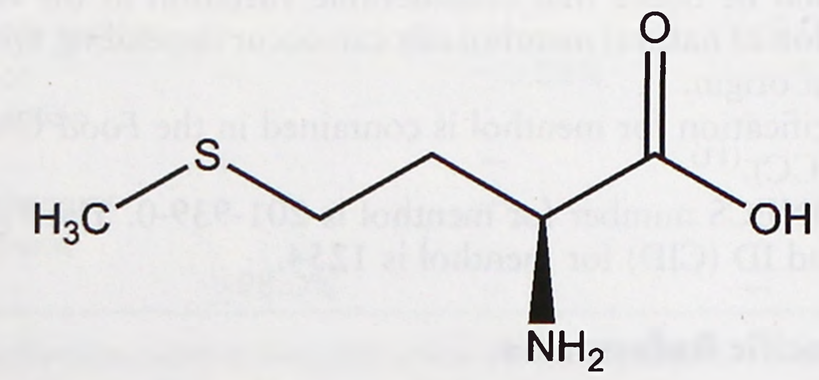
M

1 Nonproprietary Names

BP: Methionine
JP: L-Methionine
PhEur: Methionine
USP–NF: Methionine

2 Synonyms

α-Amino-γ-methylmercaptobutyric acid; (*S*)-2-amino-4-(methylthio)butanoic acid; 2-amino-4-(methylthio)butyric acid; L-methionine; methioninum; γ-methylthio-α-aminobutyric acid.



3 Chemical Name and CAS Registry Number

(2*S*)-2-Amino-4-methylsulfanylbutanoic acid [63-68-3]

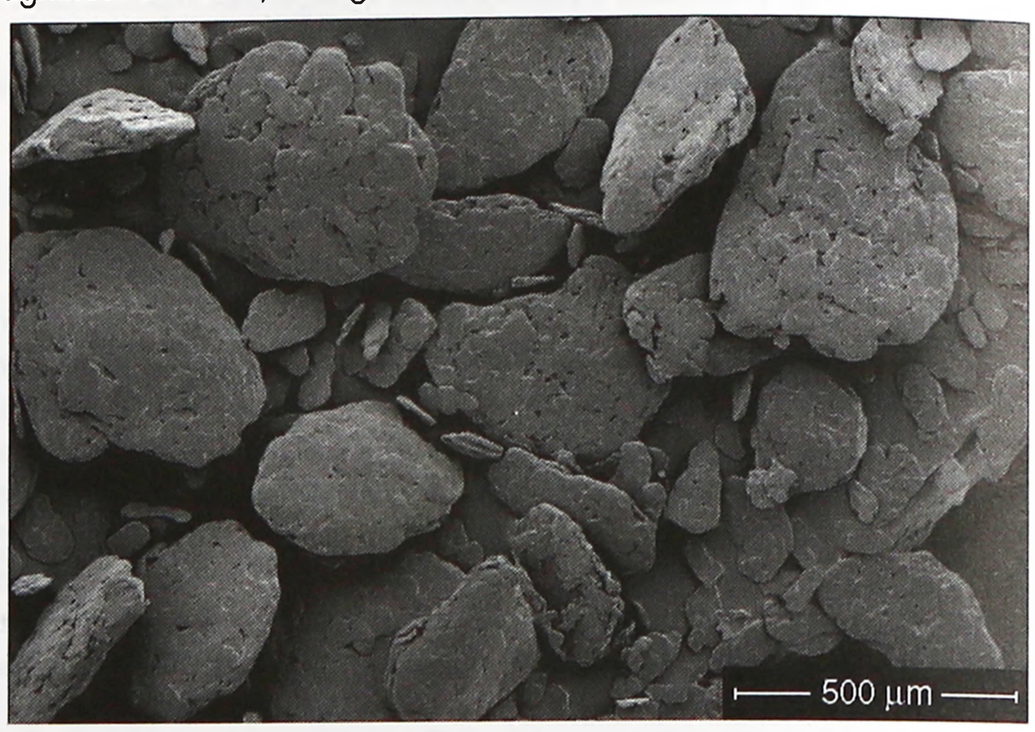
4 Empirical Formula and Molecular Weight

$C_5H_{11}NO_2S$ 149.21

5 Structural Formula

6 Functional Category

Buffering agent; flavoring agent.



7 Applications in Pharmaceutical Formulation or Technology

Methionine is used in oral pharmaceutical formulations as a flavoring agent.[1] It has been included in parenteral formulations as a pH controlling agent.[2,3]

8 Description

Methionine occurs as a white or almost white, crystalline powder or colorless crystals.

SEM 1: Excipient: methionine; manufacturer: Sigma-Aldrich; magnification: 60×; voltage: 10 kV.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 5.6–6.1 (1% w/v aqueous solution)[1]
Density 1.34 g/cm^3[1]
Melting point 280–282°C[4]
Solubility Soluble in water, dilute acids, and alkalis. Insoluble in absolute ethanol, ethanol (95%), benzene, acetone, and ether.

11 Stability and Storage Conditions

Methionine is sensitive to light and should be stored in a cool, dark place.

12 Incompatibilities

Methionine is incompatible with strong oxidizing agents.

13 Method of Manufacture

Numerous methods have been described for manufacture of methionine, including hydrolysis of methionine amide[5] and 5-(β-methylmercaptoethyl)-hydantoin.[6]

Table I: Pharmacopeial specifications for methionine.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	—
Specific rotation	+21.0° to 25.0°	+22.5° to 24.0°	+22.4° to 24.7°
pH	5.2–6.2	5.5–6.5	5.6–6.1

Iron	—	≤10 ppm	≤30 ppm
Sulfated ash	—	≤0.1%	—
Assay (dried basis)	≥98.5%	99.0–101.0%	98.5–101.5%

14 Safety

Methionine is used in oral pharmaceutical formulations. The pure form of methionine is mildly toxic by ingestion and by the IP route. Chronic administration of L-methionine has been shown to lead to memory impairment in animals.[7]

LD_{50} (rat, IP): 4.328 g/kg[8]

LD_{50} (rat, oral): 36 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets). Included in parenteral preparations (injection solutions; powders for reconstitution) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

D-Methionine; DL-methionine.

D-Methionine

Molecular weight 149.21
CAS number [348-67-4]
Specific rotation

$[\alpha]^{25}_{D}$ = +8.12° (c = 0.8);

$[\alpha]^{25}_{D}$ = −21.18° (c = 0.8 in 0.2*N* HCl)[4]

Comments D-Methionine has been investigated for use in spray-dried formulations for respiratory drug delivery.[9] Therapeutically, it has been studied for use as an antioxidant to improve noise-induced hearing loss.[10]

The EINECS number for D-methionine is 206-483-6.

DL-Methionine

Empirical formula $C_5H_{11}NO_2S$
Molecular Weight 149.21
CAS number [59-51-8]
Synonyms DL-2-Amino-4-(methylthio)butyric acid; racemethionine.
Acidity/alkalinity pH = 5.6–6.1 (1% w/v aqueous solution)
Density 1.34 g/cm^3
Dissociation constant

pK_{a1} = 2.28 at 25°C;

pK_{a2} = 9.21 at 25°C

Melting point 281°C
Solubility Soluble in dilute acids and alkalis. *See also* Table II.
Comments DL-Methionine is listed in BP 2017 and PhEur 9.2. A specification for DL-methionine is contained in the FCC.[11] The EINECS number for DL-methionine is 200-432-1.

Table II: Solubility of DL-methionine.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	Very slightly soluble
Ether	Insoluble
Water	1 in 55 at 0°C 1 in 30 at 25°C 1 in 16.5 at 50°C 1 in 9.5 at 75°C 1 in 5.7 at 100°C

18 Comments

Methionine has been used experimentally as an antioxidant for antibodies,[12] and in lyophilized lipid/DNA complexes.[13] It has also been studied in a topical protein formulation to prevent viscosity loss,[14] and in dextran microspheres to increase the efficiency of human growth hormone encapsulation.[15]

Methionine is used in paracetamol poisoning to prevent hepatotoxicity, and is frequently included in paracetamol formulations for this purpose.[16,17] L-Methionine is an essential amino acid and is included in amino acid solutions for parenteral nutrition.[16] It has been used to treat liver disorders and also to lower urinary pH.[16]

A specification for L-methionine is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for L-methionine is 200-562-9. The PubChem Compound ID (CID) for L-methionine is 6137.

3 Chemical Name and CAS Registry Number

Cellulose methyl ether [9004-67-5]

4 Empirical Formula and Molecular Weight

Methylcellulose is a long-chain substituted cellulose in which approximately 27–32% of the hydroxyl groups are in the form of the methyl ether. The various grades of methylcellulose have degrees of polymerization in the range 50–1000, with molecular weights (number average) in the range 10 000–220 000 Da. The degree of substitution of methylcellulose is defined as the average number of methoxyl (CH_3O) groups attached to each of the anhydroglucose units along the chain. The degree of substitution also affects the physical properties of methylcellulose, such as its solubility.

5 Structural Formula

The structure shown is with complete substitution of the available hydroxyl units of methoxyl substitution. Note that methoxyl substitution can occur at any combination of the hydroxyl groups of the anhydroglucose ring of cellulose at positions 2, 3, and 6.

See Section 4.

6 Functional Category

Coating agent; emulsifying agent; modified-release agent; suspending agent; tablet and capsule binder; tablet and capsule disintegrant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Methylcellulose is widely used in oral and topical pharmaceutical formulations; *see* Table I.

In tablet formulations, low- or medium-viscosity grades of methylcellulose are used as binding agents, the methylcellulose being added either as a dry powder or in solution.[1–3] High-viscosity grades of methylcellulose may also be incorporated in tablet formulations as a disintegrant.[4] Methylcellulose may be added to a tablet formulation to produce sustained-release preparations.[5]

Tablet cores may also be spray-coated with either aqueous or organic solutions of highly substituted low-viscosity grades of

methylcellulose to mask an unpleasant taste or to modify the release of a drug by controlling the physical nature of the granules.[6] Methylcellulose coats are also used for sealing tablet cores prior to sugar coating.

Low-viscosity grades of methylcellulose are used to emulsify olive, peanut, and mineral oils.[7] They are also used as suspending or thickening agents for orally administered liquids, methylcellulose commonly being used in place of sugar-based syrups or other suspension bases.[8] Methylcellulose delays the settling of suspensions and increases the contact time of drugs, such as antacids, in the stomach.

High-viscosity grades of methylcellulose are used to thicken topically applied products such as creams and gels.

In ophthalmic preparations, a 0.5–1.0% w/v solution of a highly substituted, high-viscosity grade of methylcellulose has been used as a vehicle for eye drops.[9] However, hypromellose-based formulations are now preferred for ophthalmic preparations. Methylcellulose is also used in injectable formulations.

Table I: Uses of methylcellulose.

Use	Concentration (%)
Bulk laxative	5.0–30.0
Creams, gels, and ointments	1.0–5.0
Emulsifying agent	1.0–5.0
Ophthalmic preparations	0.5–1.0
Suspensions	1.0–2.0
Sustained-release tablet matrix	5.0–75.0
Tablet binder	1.0–5.0
Tablet coating	0.5–5.0
Tablet disintegrant	2.0–10.0

8 Description

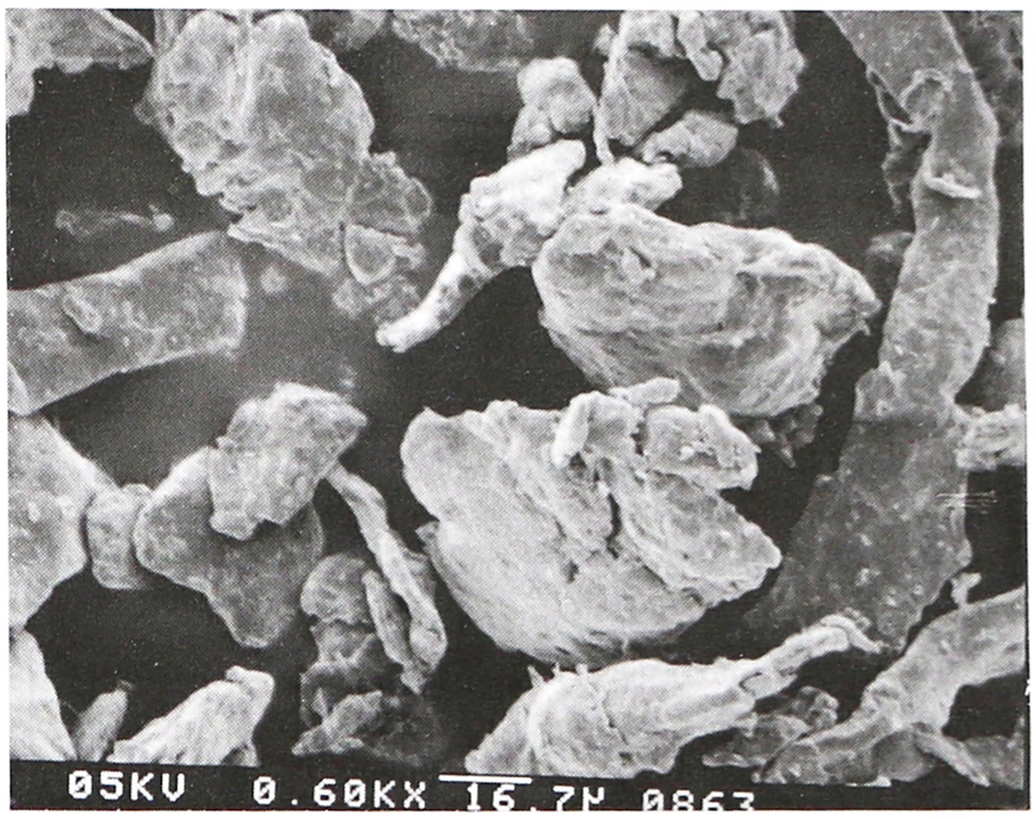
Methylcellulose occurs as a white, fibrous powder or granules, hygroscopic when dry. It is practically odorless and tasteless. It should be labeled to indicate its viscosity type (viscosity of a 1 in 50 solution).

9 Pharmacopeial Specifications

The pharmacopeial specifications for methylcellulose have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for methylcellulose.



Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters[a]	–	+	–
Appearance of solution	–	+	–
pH	5.0–8.0	5.0–8.0	5.0–8.0
Viscosity			
<600 mPa s	80.0–120.0%[b]	80.0–120.0%[b]	80.0–120.0%[b]
≥600 mPa s	75.0–140.0%[b]	75.0–140.0%[b]	75.0–140.0%[b]
Loss on drying	≤5.0%	≤5.0%	≤5.0%

(a) These tests have not been fully harmonized at the time of publication.
(b) Of that stated for its nominal viscosity.

SEM 1: Excipient: methylcellulose; manufacturer: Dow Chemical Co.; lot no.: KC16012N21; magnification: 60×; voltage: 5 kV.

SEM 2: Excipient: methylcellulose; manufacturer: Dow Chemical Co.; lot no.: KC16012N21; magnification: 600×; voltage: 5 kV.

10 Typical Properties

Acidity/alkalinity pH = 5.0–8.0 for a 1% w/v aqueous suspension.

Autoignition temperature >350°C for *Methocel A4M*.

Degree of substitution 1.64–1.92

Density (bulk) 0.276 g/cm^3

Density (tapped) 0.464 g/cm^3

Density (true) 1.341 g/cm^3

Glass transition temperature (T_g) 196°C for *Methocel A4M*.

Melting point Begins to brown at 190–200°C; begins to char at 225–230°C.

Refractive index of solution n_D^{20} = 1.336 (2% aqueous solution).

Solubility Practically insoluble in acetone, methanol, chloroform, ethanol (95%), ether, saturated salt solutions, toluene, and hot water. Soluble in glacial acetic acid and in a mixture of equal volumes of ethanol and chloroform. In cold water, methylcellulose swells and disperses slowly to form a clear to opalescent, viscous, colloidal dispersion.

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

M

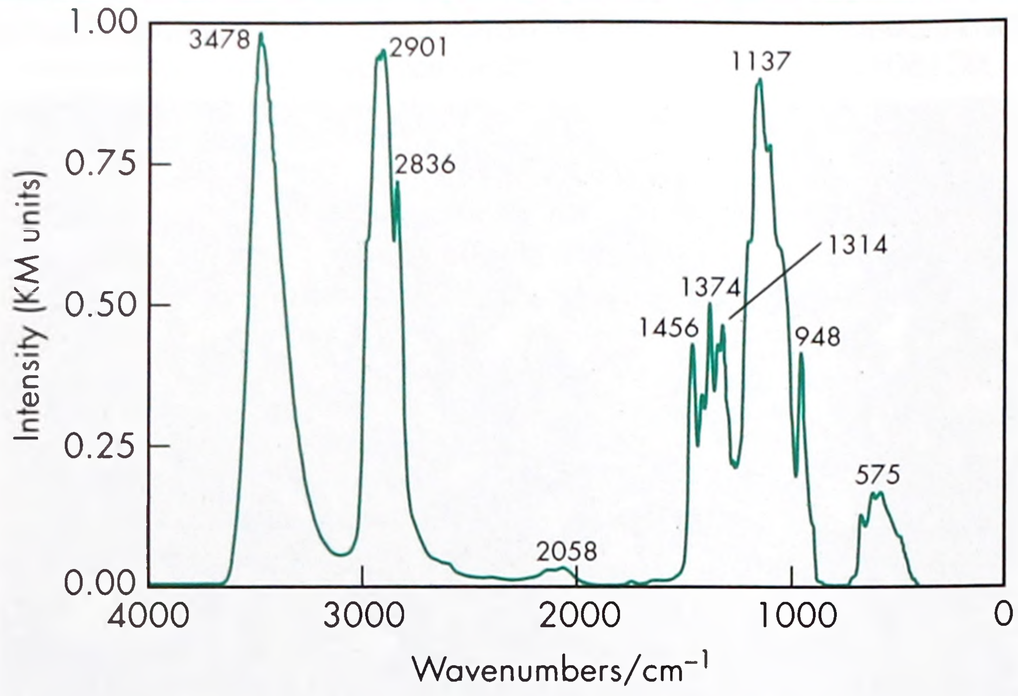

Figure 1: Infrared spectrum of methylcellulose measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

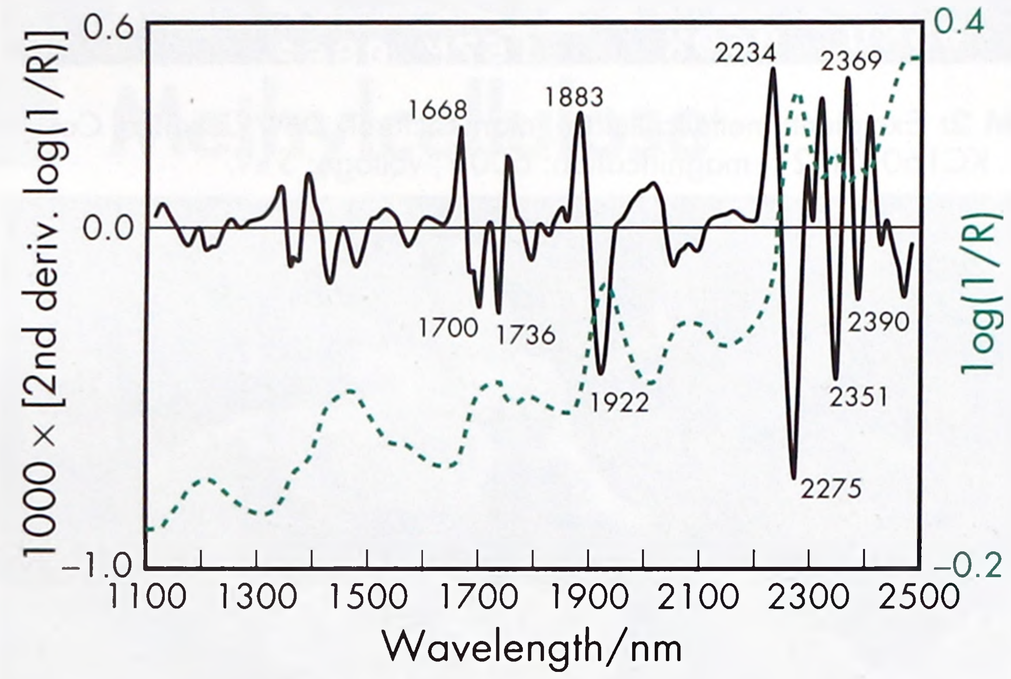

Figure 2: Near-infrared spectrum of methylcellulose measured by reflectance.

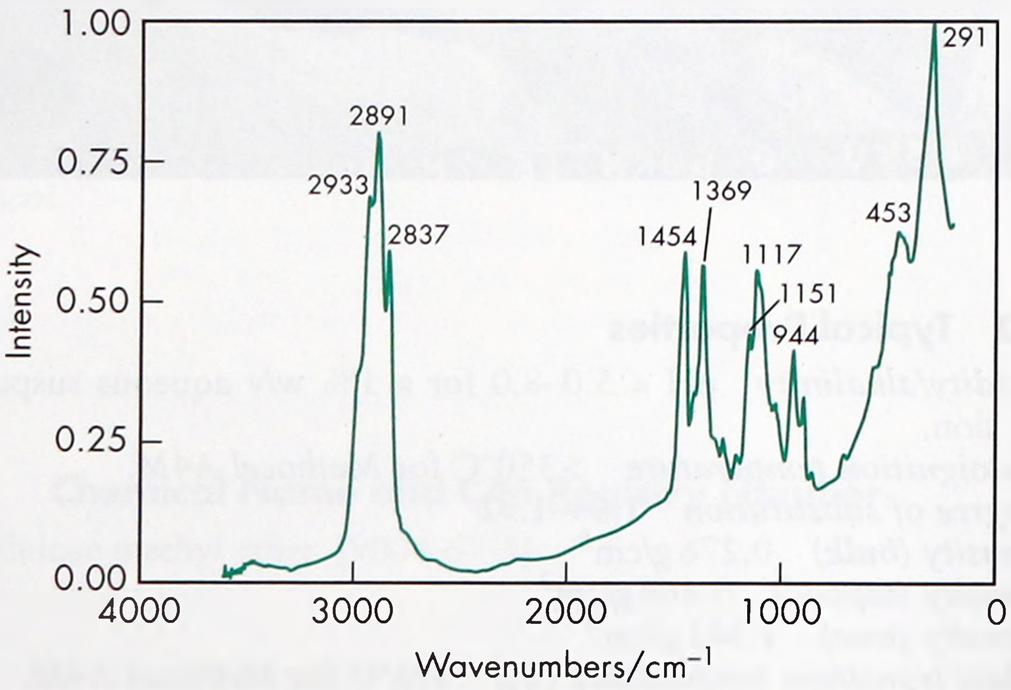

Figure 3: Raman spectrum of methylcellulose measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Surface tension

53–59 mN/m (53–59 dynes/cm) for a 0.05% w/v solution at 25°C;

45–55 mN/m for 0.1% at 20°C.

Interfacial tension of solution versus paraffin oil is 19–23 mN/m for 0.1% w/v solution at 20°C.

Viscosity (dynamic) Various grades of methylcellulose are commercially available that vary in their degree of polymerization. Aqueous solutions at concentrations of 2% w/v will produce viscosities between 5 and 75 000 mPa s. Individual grades of methylcellulose have a stated, narrowly defined viscosity range measured for a 2% w/v solution. The viscosity of solutions may be increased by increasing the concentration of methylcellulose. Increased temperatures reduce the viscosity of solutions until gel formation occurs at 50–60°C. The process of thermogelation is reversible, with a viscous solution being reformed on cooling.

See also Table III.

Table III: Typical viscosity values for 2% w/v aqueous solutions of *Methocel* (Dow Chemical Co.) at 20°C.

Methocel grade	Viscosity (mPa s)
A4MP	4000
A15-LV	15
A15CP	1500
A4CP	400

11 Stability and Storage Conditions

Methylcellulose powder is stable, although slightly hygroscopic. The bulk material should be stored in an airtight container in a cool, dry place.

Solutions of methylcellulose are stable to alkalis and dilute acids at pH 3–11, at room temperature. At pH less than 3, acid-catalyzed hydrolysis of the glucose–glucose linkages occurs and the viscosity of methylcellulose solutions is reduced.[10] On heating, solution viscosity is reduced until gel formation occurs at approximately 50°C; *see* Section 10.

Methylcellulose solutions are liable to microbial spoilage and antimicrobial preservatives should therefore be used. Solutions may also be sterilized by autoclaving, although this process can decrease the viscosity of a solution.[11,12] The change in viscosity after autoclaving is related to solution pH. Solutions at pH less than 4 had viscosities reduced by more than 20% subsequent to autoclaving.[11]

12 Incompatibilities

Methylcellulose is incompatible with aminacrine hydrochloride; chlorocresol; mercuric chloride; phenol; resorcinol; tannic acid; silver nitrate; cetylpyridinium chloride; *p*-hydroxybenzoic acid; *p*-aminobenzoic acid; methylparaben; propylparaben; and butylparaben.

Salts of mineral acids (particularly polybasic acids), phenols, and tannins will coagulate solutions of methylcellulose, although this can be prevented by the addition of ethanol (95%) or glycol diacetate. Complexation of methylcellulose occurs with highly surface-active compounds such as tetracaine and dibutoline sulfate.

High concentrations of electrolytes increase the viscosity of methylcellulose mucilages owing to the 'salting out' of methylcellulose. With very high concentrations of electrolytes, the methylcellulose may be completely precipitated in the form of a discrete or continuous gel. Methylcellulose is incompatible with strong oxidizing agents such as bleach, perchloric acid, nitric acid, perchlorates, alkali nitrates, alkali nitrites, and calcium oxide.

13 Method of Manufacture

Methylcellulose is prepared from wood pulp (cellulose) by treatment with alkali followed by methylation of the alkali cellulose with methyl chloride. The product is then purified and ground to powder form.

14 Safety

Methylcellulose is widely used in a variety of oral and topical pharmaceutical formulations. It is also extensively used in cosmetics

and food products, and is generally regarded as a nontoxic, nonallergenic, and nonirritant material.[13]

Following oral consumption, methylcellulose is not digested or absorbed and is therefore a noncaloric material. Ingestion of excessive amounts of methylcellulose may temporarily increase flatulence and gastrointestinal distention.

In the normal individual, oral consumption of large amounts of methylcellulose has a laxative action and medium- or high-viscosity grades are therefore used as bulk laxatives.

Esophageal obstruction may occur if methylcellulose is swallowed with an insufficient quantity of liquid. Consumption of large quantities of methylcellulose may additionally interfere with the normal absorption of some minerals. However, this and the other adverse effects discussed above relate mainly to the use of methylcellulose as a bulk laxative and are not significant factors when methylcellulose is used as an excipient in oral preparations.

Methylcellulose is not commonly used in parenteral products, although it has been used in intra-articular and intramuscular injections. Studies in rats have suggested that parenterally administered methylcellulose may cause glomerulonephritis and hypertension.[13] Methylcellulose is considered to be toxic by the intraperitoneal route of administration.

The WHO has not specified an acceptable daily intake of methylcellulose since the level of use in foods was not considered to be a hazard to health.[14]

LD_{50} (mouse, IP): 275 g/kg[15]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Dust may be irritant to the eyes and eye protection should be worn. Use in a well-ventilated area. Excessive dust generation should be avoided to minimize the risk of explosion. Methylcellulose is combustible. Spills of the dry powder or solution should be cleaned up immediately, as the slippery film that forms can be dangerous.

16 Regulatory Status

GRAS listed. Accepted as a food additive in the US, Europe and Japan. Included in the FDA Inactive Ingredients Database (sublingual tablets; IM injections; intrasynovial injections; nasal preparations; ophthalmic preparations; oral capsules, suspensions, and tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. Reported in the EPA TSCA inventory.

17 Related Substances

Ethylcellulose; hydroxyethyl cellulose; hydroxyethylmethyl cellulose; hypromellose.

18 Comments

Methylcellulose has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The thermal gelation temperature for methylcellulose decreases as a function of concentration. The presence of additives can increase or decrease the thermal gelation temperature. The presence of drugs can influence the properties of methylcellulose gels.[16] In addition, the viscosity of methylcellulose solutions can be modified by the presence of drugs or other additives.[17] Aqueous solutions of methylcellulose can be frozen and do not undergo phase separation upon freezing.

Methylcellulose is best dissolved in water by one of three methods, the most suitable being chosen for a particular application.

The most commonly used method is to add methylcellulose initially to hot water. The appropriate quantity of methylcellulose required to produce a solution of specified viscosity is mixed with water at 70°C; about half the desired final volume of water is used. Cold water or ice is then added to the hot methylcellulose slurry in order to reduce the temperature to below 20°C. A clear, aqueous methylcellulose solution is obtained.[18]

Alternatively, either methylcellulose powder may be dry-blended with another powder prior to mixing with cold water, or methylcellulose powder may be moistened with an organic solvent such as ethanol (95%) prior to the addition of water.

In general, methylcellulose solutions exhibit pseudoplastic flow and there is no yield point. Nonthixotropic flow properties are observed below the gelation temperature.

Note that some cellulose ether products possess hydroxypropyl substitutions in addition to methyl substitutions but are designated with the same trade name in a product line, differing only by a unique identifier code. These products should not be confused with the products that contain only methyl substitutions. Methylcellulose has been investigated as a stabilizer for liposome dispersions.[19]

Therapeutically, methylcellulose is used as a bulk laxative. It has also been used to aid appetite control in the management of obesity, but there is little evidence supporting its efficacy.

A specification for methylcellulose is contained in the *Food Chemicals Codex* (FCC).[20]

4 Empirical Formula and Molecular Weight

$C_8H_8O_3$ 152.15

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Methylparaben is widely used as an antimicrobial preservative in cosmetics, food products, and pharmaceutical formulations; *see* Table I. It may be used either alone or in combination with other parabens or with other antimicrobial agents. In cosmetics, methylparaben is the most frequently used antimicrobial preservative.[1]

The parabens are effective over a wide pH range and have a broad spectrum of antimicrobial activity, although they are most effective against yeasts and molds. Antimicrobial activity increases as the chain length of the alkyl moiety is increased, but aqueous solubility decreases; therefore a mixture of parabens is frequently

used to provide effective preservation. Preservative efficacy is also improved by the addition of propylene glycol (2–5%), or by using parabens in combination with other antimicrobial agents such as imidurea; *see* Section 10.

Owing to the poor solubility of the parabens, paraben salts (particularly the sodium salt) are more frequently used in formulations. However, this raises the pH of poorly buffered formulations.

Methylparaben (0.18%) together with propylparaben (0.02%) has been used for the preservation of various parenteral pharmaceutical formulations; *see* Section 14.

Table I: Uses of methylparaben.

Use	Concentration (%)
IM, IV, SC injections[a]	0.065–0.25
Inhalation solutions	0.025–0.07
Intradermal injections	0.10
Nasal solutions	0.033
Ophthalmic preparations[a]	0.015–0.2
Oral solutions and suspensions	0.015–0.2
Rectal preparations	0.1–0.18
Topical preparations	0.02–0.3
Vaginal preparations	0.1–0.18

(a) *See* Section 14.

8 Description

Methylparaben occurs as colorless crystals or a white crystalline powder. It is odorless or almost odorless and has a slight burning taste.

9 Pharmacopeial Specifications

The pharmacopeial specifications for methylparaben have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

10 Typical Properties

Antimicrobial activity

See Table III. Methylparaben exhibits antimicrobial activity of pH 4–8. Preservative efficacy decreases with increasing pH owing to the formation of the phenolate anion. Parabens are more active against yeasts and molds than against bacteria. They are also more active against Gram-positive bacteria than against Gram-negative bacteria.

Methylparaben is the least active of the parabens; antimicrobial activity increases with increasing chain length of the alkyl moiety. Activity may be improved by using combinations of parabens as synergistic effects occur. Therefore, combinations of methyl-, ethyl-, propyl-, and butylparaben are often used together. Activity has also been reported to be enhanced by the addition of other excipients such as: propylene glycol (2–5%);[2] phenylethyl alcohol;[3] and edetic acid.[4] Activity may also be enhanced owing to synergistic effects by using combinations of parabens with other antimicrobial preservatives such as imidurea.[5]

The hydrolysis product *p*-hydroxybenzoic acid has practically no antimicrobial activity.

See also Section 12.

Dissociation constant pK_a = 8.4 at 22°C
Melting point 125–128°C
Partition coefficients Values for different vegetable oils vary considerably and are affected by the purity of the oil; *see* Table IV.
Solubility *see* Table V.

Table IV: Partition coefficients of methylparaben in vegetable oil and water.[6,7]

Solvent	Partition coefficient oil : water
Almond oil	7.5
Castor oil	6.0
Corn oil	4.1
Diethyl adipate	200
Isopropyl myristate	18.0
Lanolin	7.0
Mineral oil	0.1
Peanut oil	4.2
Soybean oil	6.1

Table V: Solubility of methylparaben in various solvents.[4]

Solvent	Solubility at 25°C unless otherwise stated
Ethanol	1 in 2
Ethanol (95%)	1 in 3
Ethanol (50%)	1 in 6
Ether	1 in 10
Glycerin	1 in 60
Mineral oil	Practically insoluble
Peanut oil	1 in 200
Propylene glycol	1 in 5
Water	1 in 400
	1 in 50 at 50°C
	1 in 30 at 80°C

Spectroscopy

IR spectrum *see* Figure 1.
NIR spectrum *see* Figure 2.
Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Aqueous solutions of methylparaben at pH 3–6 may be sterilized by autoclaving at 120°C for 20 minutes, without decomposition.[8] Aqueous solutions at pH 3–6 are stable (less than 10% decomposition) for up to about 4 years at room temperature, while aqueous solutions at pH 8 or above are subject to rapid hydrolysis (10% or more after about 60 days storage at room temperature); *see* Tables VI and VII.[9]

Methylparaben should be stored in a well-closed container in a cool, dry place.

Table VI: Predicted rate constants and half-lives for methylparaben dissolved in dilute hydrochloric acid solution, at 25°C.

Initial pH of solution	Rate constant $k \pm \sigma$[a] (hour^{-1})	Half-life $t_{1/2} \pm \sigma$[a] (day)
1	$(1.086 \pm 0.005) \times 10^{-4}$	266 ± 13
2	$(1.16 \pm 0.12) \times 10^{-5}$	2490 ± 260
3	$(6.1 \pm 1.5) \times 10^{-7}$	47000 ± 12000
4	$(3.27 \pm 0.64) \times 10^{-7}$	88000 ± 17000

(a) Indicates the standard error.

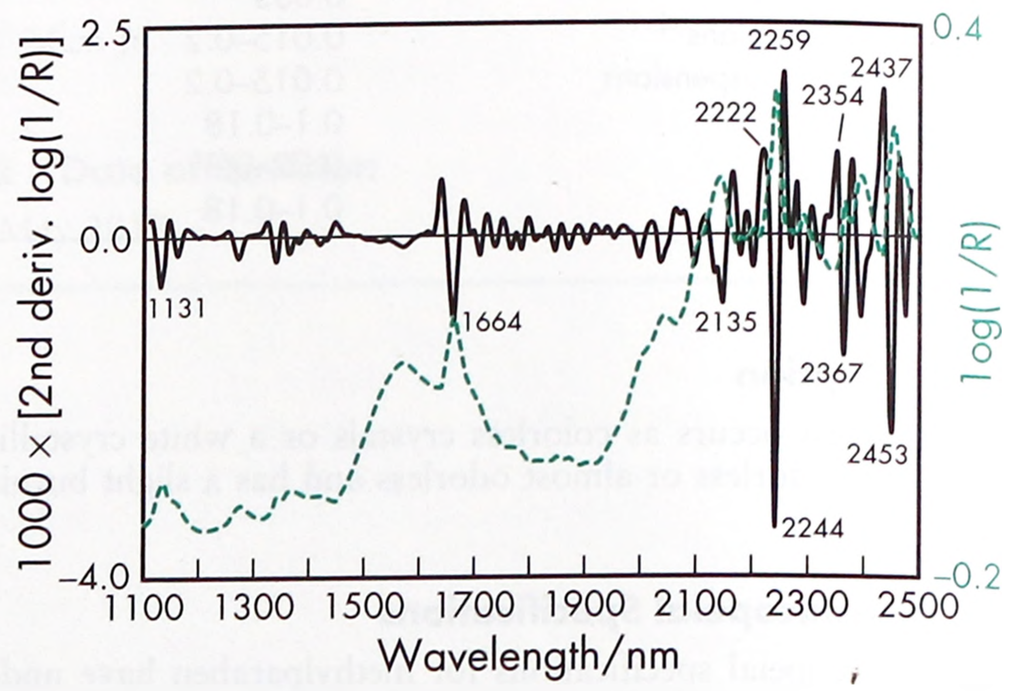

Figure 2: Near-infrared spectrum of methylparaben measured by reflectance.

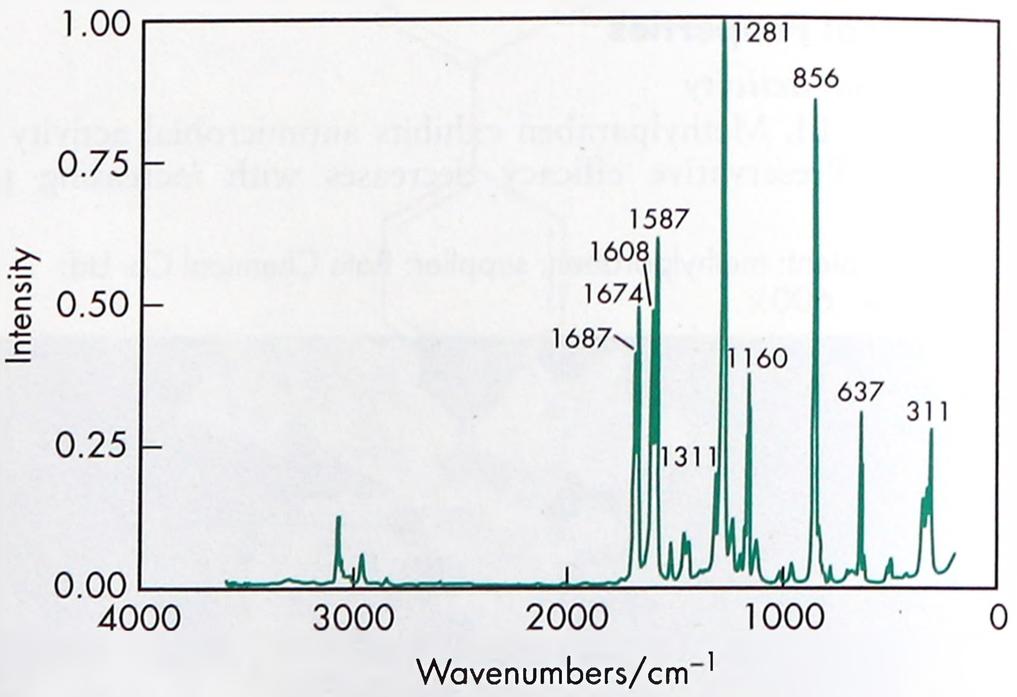

Figure 3: Raman spectrum of methylparaben measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

The antimicrobial activity of methylparaben and other parabens is considerably reduced in the presence of nonionic surfactants, such as polysorbate 80, as a result of micellization.[10,11] However, propylene glycol (10%) has been shown to potentiate the antimicrobial activity of the parabens in the presence of nonionic surfactants and prevents the interaction between methylparaben and polysorbate 80.[12]

Table VII: Predicted remaining amount of methylparaben dissolved in dilute hydrochloric acid solution, after autoclaving.

Initial pH of solution	Rate constant $k \pm \sigma$[a] ($hour^{-1}$)	Predicted residual amount after autoclaving (%)
1	$(4.96 \pm 0.16) \times 10^{-1}$	84.77 ± 0.46
2	$(4.49 \pm 0.37) \times 10^{-2}$	98.51 ± 0.12
3	$(2.79 \pm 0.57) \times 10^{-3}$	99.91 ± 0.02
4	$(1.49 \pm 0.22) \times 10^{-3}$	99.95 ± 0.01

(a) Indicates the standard error.

Incompatibilities with other substances, such as bentonite,[13] magnesium trisilicate,[14] talc, tragacanth,[15] sodium alginate,[16] essential oils,[17] sorbitol,[18] and atropine,[19] have been reported. It also reacts with various sugars and related sugar alcohols.[20]

Absorption of methylparaben by plastics has also been reported; the amount absorbed is dependent upon the type of plastic and the vehicle. It has been claimed that low-density and high-density polyethylene bottles do not absorb methylparaben.[21]

Methylparaben is discolored in the presence of iron and is subject to hydrolysis by weak alkalis and strong acids.

13 Method of Manufacture

Methylparaben is prepared by the esterification of *p*-hydroxybenzoic acid with methanol.

14 Safety

Methylparaben and other parabens are widely used as antimicrobial preservatives in cosmetics and oral and topical pharmaceutical formulations. Although parabens have also been used as preservatives in injections and ophthalmic preparations, they are now generally regarded as being unsuitable for these types of formulations owing to the irritant potential of the parabens. These experiences may depend on immune responses to enzymatically formed metabolites of the parabens in the skin. A comprehensive review of the evaluation of the health aspects of methylparaben based on existing literature has been published.[22]

Parabens are nonmutagenic, nonteratogenic, and noncarcinogenic. Sensitization to the parabens is rare, and these compounds do not exhibit significant levels of photocontact sensitization or phototoxicity.

Hypersensitivity reactions to parabens, generally of the delayed type and appearing as contact dermatitis, have been reported. However, given the widespread use of parabens as preservatives, such reactions are relatively uncommon; the classification of parabens in some sources as high-rate sensitizers may be overstated.[23]

Immediate hypersensitivity reactions following injection of preparations containing parabens have also been reported.[24–26] Delayed-contact dermatitis occurs more frequently when parabens are used topically, but has also been reported to occur after oral administration.[27–29]

Unexpectedly, preparations containing parabens may be used by patients who have reacted previously with contact dermatitis provided they are applied to another, unaffected, site. This has been termed the paraben paradox.[30]

Concern has been expressed over the use of methylparaben in infant parenteral products because bilirubin binding may be affected, which is potentially hazardous in hyperbilirubinemic neonates.[31]

Although methylparaben has been considered a safe preservative in cosmetics, a report has indicated that it may have harmful effects on human skin when exposed to sunlight.[32] Another study has concluded that methylparaben may cause skin damage involving carcinogenesis through the combined activation of sunlight irradiation and skin esterases.[33]

Estrogenic effects have been reported *in vitro*[34] and parabens, particularly methylparaben, have been detected in human breast tumours.[35] However the estrogenic effects of the parabens are much less than the effects of naturally occurring estrogen.[34]

The WHO has set an estimated total acceptable daily intake for methyl- and ethylparabens at up to 10 mg/kg body-weight.[36,37]

LD_{50} (dog, oral): 3.0 g/kg[38]

LD_{50} (mouse, IP): 0.96 g/kg

LD_{50} (mouse, SC): 1.20 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Methylparaben may be irritant to the skin, eyes, and mucous membranes, and should be handled in a well-ventilated environment. Eye protection, gloves, and a dust mask or respirator are recommended.

16 Regulatory Status

Methylparaben and propylparaben are affirmed GRAS Direct Food Substances in the US at levels up to 0.1%. All esters except the benzyl ester are allowed for injection in Japan. In cosmetics, the EU and Brazil allow use of each paraben at 0.4%, but the total of all parabens may not exceed 0.8%. The upper limit in Japan is 1.0%.

Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM, IV, and SC injections; inhalation preparations; ophthalmic preparations; oral capsules, tablets, solutions and suspensions; otic, rectal, topical, and vaginal preparations). Included in medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

M

17 Related Substances

Butylparaben; ethylparaben; methylparaben potassium; methylparaben sodium; propylparaben.

Methylparaben potassium

Empirical formula $C_8H_7KO_3$
Molecular weight 190.25
CAS number [26112-07-2]
Synonyms Methyl 4-hydroxybenzoate potassium salt; potassium methyl hydroxybenzoate.
Comments Methylparaben potassium may be used instead of methylparaben because of its greater aqueous solubility.

Methylparaben sodium

Empirical formula $C_8H_7NaO_3$
Molecular weight 174.14
CAS number [5026-62-0]
Synonyms E219; methyl 4-hydroxybenzoate sodium salt; sodium methyl hydroxybenzoate; soluble methyl hydroxybenzoate.
Appearance A white, odorless or almost odorless, hygroscopic crystalline powder.
Acidity/alkalinity pH = 9.5–10.5 (0.1% w/v aqueous solution)
Solubility 1 in 50 of ethanol (95%); 1 in 2 of water; practically insoluble in fixed oils.
Comments Methylparaben sodium may be used instead of methylparaben because of its greater aqueous solubility. However, it may cause the pH of a formulation to become more alkaline.

18 Comments

Methylparaben has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur

EDQM website, and also the General Information Chapter G10 in the JP.

The BP 2017, PhEur 9.2 and USP 40–NF 35 S1 also list Methylparaben Sodium as a separate monograph.

In addition to the most commonly used paraben esters, some other less-common esters have also been used; *see* Table VIII. A specification for methylparaben is contained in the *Food Chemicals Codex* (FCC).[39]

The EINECS number for methylparaben is 202-785-7.

The PubChem Compound ID (CID) for methylparaben is 7456.

Table VIII: CAS numbers of less common paraben esters.

Name	CAS Number
Benzylparaben	94-18-8
Isobutylparaben	4247-02-3
Isopropylparaben	4191-73-5

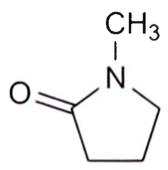
Methylpyrrolidone

1 Nonproprietary Names

BP: Methylpyrrolidone
PhEur: *N*-Methylpyrrolidone
USP–NF: Methylpyrrolidone

2 Synonyms

1-Methyl-2-one pyrrolidin; 1-methyl-2-oxopyrrolidine; 1-methyl-2-pyrrolidinone; 1-methyl-2-pyrrolidone; 1-methylazacyclopentan-2-one; 1-methylpyrrolidin-2-one; 2-methyl-2-azacyclopentanone; MP; *M-Pyrol*; *N*-methyl tetrahydropyrrolone; *N*-methyl-1-oxotetramethyleneamine; *N*-methyl-2-pyrrolidinone; *N*-methyl-2-pyrrolidone; *N*-methylpyrrolidone; *N*-methylpyrrolidonum; *N*-methyl-α-pyrrolidinone; *N*-methyl-γ-butyrolactam; *N*-methyl-γ-butyrolactone; NMP; *Pharmasolve*.



3 Chemical Name and CAS Registry Number

1–Methylpyrrolidin–2–one [872–50–4]

4 Empirical Formula and Molecular Weight

C_5H_9NO 99.1

5 Chemical Structure

6 Functional Category

Penetration enhancer; solubilizing agent; solvent

7 Applications in Pharmaceutical Formulation or Technology

Methylpyrrolidone is used as an aprotic cosolvent to dissolve active pharmaceutical ingredients in oral, injectable, and topical formulations. It has been investigated for use as a topical penetration enhancer.[1,2]

8 Description

Methylpyrrolidone occurs as a clear, hygroscopic liquid with a mild amine odor.

9 Pharmacopeia Specifications

See Table I.

Table I: Pharmacopeial specifications for methylpyrrolidone.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Heavy metals	–	≤10 ppm
Organic impurities	–	+
Related substances	+	–
Alkalinity	+	+
Clarity and color of solution	–	+
Appearance	+	–
Water	≤0.1%	≤0.1%

10 Typical Properties

Boiling point 204°C
Dielectric constant 32.2 at 25°C
Dipole moment 4.09 Debye at 25°C
Enthalpy of evaporation 43.82 ± 3.0 kJ/mol
Flash point (closed cup) 93°C
Flash point (open cup) 95°C[3]
Freezing point/melting point –24.4°C
Heat of combustion 3008.3 kJ/mol (719 kcal/mol)
Heat of vaporization 532.9 kJ/kg (127.3 kcal/kg)
Relative density 1.034
Refractive index 1.469
Solubility Miscible with ethanol (95%), water, and most other organic solvents. *See also* Table II.[4]

Table II: Hansen solubility parameters for methylpyrrolidone.[4]

Parameter	δ ($MPa^{1/2}$)
Total	11.2
Polar	6.0
Dispersion	8.8
Hydrogen bonding	3.5

Specific heat 1.675 kJ/kg at 20°C
Surface tension 40.7 mN/m (40.7 dyne/cm) at 25°C
Vapor pressure 0.33 mmHg at 23.2°C; 5.00 mmHg at 65°C
Viscosity 1.65 mPa s (1.65 cP) at 25°C

11 Stability and Storage Conditions

Methylpyrrolidone is stable at temperatures up to 800°C in the absence of air.[3] Store protected from light and moisture.[3]

12 Incompatibilities

Methylpyrrolidone is unreactive except in the presence of strong acids or bases. It may form complexes with metals, metal alkali salts, and some active pharmaceutical ingredients, including benzocaine, phenol, and iodine.[3] It is noncorrosive and biodegradable.[3]

13 Method of Manufacture

Methylpyrrolidone is produced by the condensation of butyrolactone with methylamine.[3]

14 Safety

Methylpyrrolidone is considered a poison when injected via the intravenous route. It is moderately toxic by ingestion, skin contact, and intraperitoneal routes. It is an experimental teratogen; mutagenicity data have been reported.[5]

LD_{50} (mouse, IP): 3.05 g/kg[5]
LD_{50} (mouse, IV): 0.0545 g/kg
LD_{50} (mouse, oral): 5.13 g/kg
LD_{50} (rabbit, SC): 8.0 g/kg
LD_{50} (rat, IP): 2.472 g/kg
LD_{50} (rat, IV): 0.0805 g/kg
LD_{50} (rat, oral): 3.914 g/kg

M

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, methylpyrrolidone emits toxic fumes of nitrogen oxides (NO_x).

In the UK, the workplace exposure limits for methylpyrrolidone are 40 mg/m^3 (10 ppm) long-term (8-hour TWA) and 80 mg/m^3 (20 ppm) short-term (15 minutes).[6]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (periodontal drug delivery system; subcutaneous injection).

17 Related Substances

Pyrrolidone.

18 Comments

The FDA Inactive Ingredients Database gives a maximum potency of 25.85% for methylpyrrolidone when used in subcutaneous injections. A specification for methylpyrrolidone is included in the *Japanese Pharmaceutical Excipients* (JPE).[7]

The EINECS number for methylpyrrolidone is 212-828-1. The PubChem compound ID for methylpyrrolidone is 8454.

Mineral Oil

1 Nonproprietary Names

BP: Liquid Paraffin
JP: Liquid Paraffin
PhEur: Paraffin, Liquid
USP-NF: Mineral Oil

2 Synonyms

Avatech; *Drakeol*; heavy liquid petrolatum; heavy mineral oil; liquid petrolatum; paraffin oil; paraffinum liquidum; *Sirius*; white mineral oil.

3 Chemical Name and CAS Registry Number

Mineral oil [8012-95-1] and [8042-47-5]

4 Empirical Formula and Molecular Weight

Mineral oil is a mixture of refined liquid saturated aliphatic (C_{14}–C_{18}) and cyclic hydrocarbons obtained from petroleum. The USP 39–NF 34 specifies that mineral oil may contain a suitable stabilizer.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; lubricant; oleaginous vehicle; solvent; vaccine adjuvant.

7 Applications in Pharmaceutical Formulation or Technology

Mineral oil is used primarily as an excipient in topical pharmaceutical formulations, where its emollient properties are exploited as an ingredient in ointment bases;[1] *see* Table I. It is additionally used in oil-in-water emulsions[2–6] as a solvent, as a lubricant in oral and ophthalmic formulations, and to a limited extent as a mold-release agent for cocoa butter suppositories. It has also been used in the preparation of microspheres[7–9] and as a vaccine adjuvant.[10,11]

Mineral oil has been investigated in the formulation of transdermal contraceptive patches.[12]

Table I: Uses of mineral oil.

Use	Concentration (%)
Ophthalmic ointments	3.0–60.0
Otic preparations	0.5–3.0
Topical emulsions	1.0–32.0
Topical lotions	1.0–20.0
Topical ointments	0.1–95.0

8 Description

Mineral oil is a transparent, colorless, viscous oily liquid, without fluorescence in daylight. It is practically tasteless and odorless when cold, and has a faint odor of petroleum when heated.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for mineral oil.

Readily carbonizable substances	+	+	+

(a) At 37.8°C.
(b) At 40.0 ± 0.1°C.

10 Typical Properties

Boiling point >360°C
Flash point 210–224°C
Pour point −12.2 to −9.4°C
Refractive index n_D^{20} = 1.4756–1.4800
Surface tension ≈35 mN/m at 25°C
Solubility Practically insoluble in ethanol (95%), glycerin, and water; soluble in acetone, benzene, chloroform, carbon disulfide, ether, and petroleum ether. Miscible with volatile oils and fixed oils, with the exception of castor oil.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (dynamic) 110–230 mPa s (110–230 cP) at 20°C

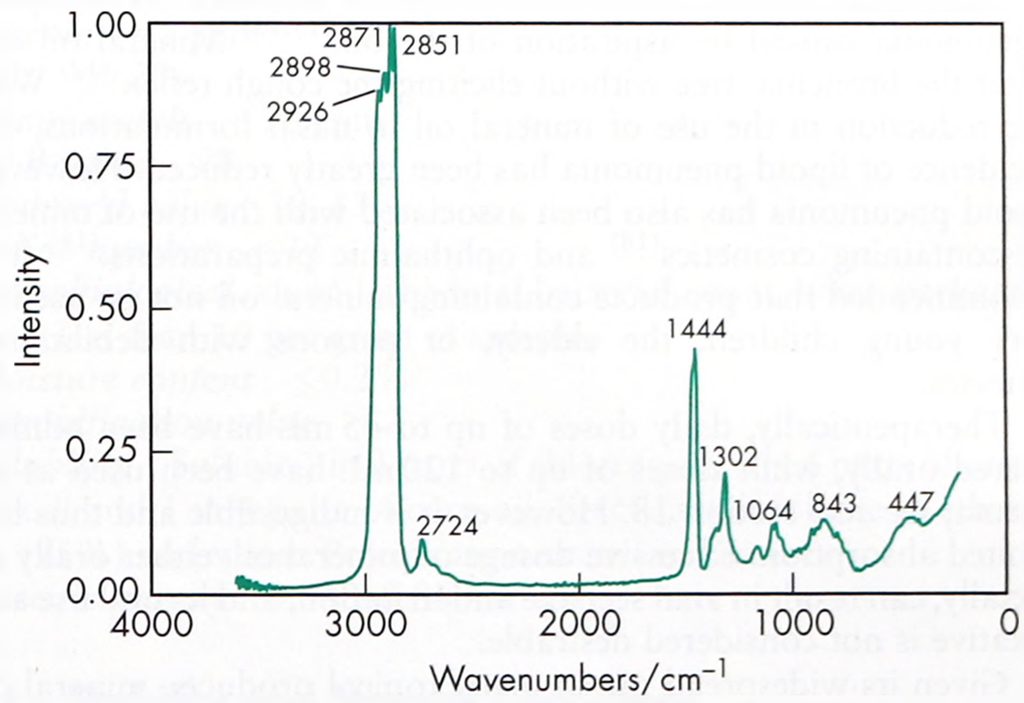

Figure 2: Raman spectrum of mineral oil measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Mineral oil undergoes oxidation when exposed to heat and light. Oxidation begins with the formation of peroxides, exhibiting an 'induction period'. Under ordinary conditions, the induction period may take months or years. However, once a trace of peroxide is formed, further oxidation is autocatalytic and proceeds very rapidly. Oxidation results in the formation of aldehydes and organic acids, which impart taste and odor. Stabilizers may be added to retard oxidation; butylated hydroxyanisole, butylated hydroxytoluene, and alpha tocopherol are the most commonly used antioxidants.

Sterilization of petrolatum eye ointment base (containing mineral oil) by gamma irradiation exposures of 15–50 kGy has been shown to produce radiolytic volatile degradation products in proportion to the radiation dose. The principal radiolysis products from mineral oil were reported to be short-chain hydrocarbons, and as such was shown to be a suitable sterilization method.[13]

Mineral oil may be sterilized by dry heat.

Mineral oil should be stored in an airtight container, protected from light, in a cool, dry place.

12 Incompatibilities

Mineral oil is incompatible with strong oxidizing agents.

13 Method of Manufacture

Mineral oil is obtained by distillation of petroleum. The lighter hydrocarbons are first removed by distillation and the residue is then redistilled between 330–390°C. The distillate is chilled and the solid fractions are removed by filtration. The filtrate is then further purified and decolorized by high-pressure hydrogenation or sulfuric acid treatment; the purified filtrate is then filtered through adsorbents. The liquid portion obtained is distilled and the portion boiling below 360°C is discarded. A suitable stabilizer may be added to the mineral oil; *see* Section 11.

14 Safety

Mineral oil is used as an excipient in a wide variety of pharmaceutical formulations; *see* Section 16. It is also used in cosmetics and in some food products.

Chronic oral consumption of mineral oil may impair the appetite and interfere with the absorption of fat-soluble vitamins. Prolonged use should be avoided. Mineral oil is absorbed to some extent when emulsified and can lead to granulomatous reactions. Similar reactions also occur upon injection of the oil;[14] injection may also cause vasospasm.

The most serious adverse reaction to mineral oil is lipoid pneumonia caused by aspiration of the oil.[15,16] Mineral oil can enter the bronchial tree without eliciting the cough reflex.[17] With the reduction in the use of mineral oil in nasal formulations, the incidence of lipoid pneumonia has been greatly reduced. However, lipoid pneumonia has also been associated with the use of mineral oil-containing cosmetics[18] and ophthalmic preparations.[19] It is recommended that products containing mineral oil not be used in very young children, the elderly, or persons with debilitating illnesses.

Therapeutically, daily doses of up to 45 mL have been administered orally, while doses of up to 120 mL have been used as an enema; *see also* section 18. However, it is indigestible and thus has limited absorption. Excessive dosage of mineral oil, either orally or rectally, can result in anal seepage and irritation, and its oral use as a laxative is not considered desirable.

Given its widespread use in many topical products, mineral oil has been associated with few instances of allergic reactions.

The WHO has not specified an acceptable daily intake of mineral oil given the low concentration consumed in foods.[20]

LD_{50} (mouse, oral): 22 g/kg[21]

15 Handling Precautions

Observe precautions appropriate to the circumstances and quantity of material handled. Avoid inhalation of vapors and wear protective clothing to prevent skin contact. Mineral oil is combustible.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (dental preparations; IV injections; ophthalmic preparations; oral capsules and tablets; otic, topical, transdermal, and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Accepted in the UK for use in certain food applications. Included in the Canadian List of Natural Health Products Ingredients Database.

17 Related Substances

Mineral oil and lanolin alcohols; light mineral oil; paraffin; petrolatum.

18 Comments

Mineral oil has been used as a non-solvent in a reversed phase separation technique to formulate polylactide-co-glycolide-based implants for the controlled release of ciprofloxacin hydrochloride.[22]

Therapeutically, mineral oil has been used in the treatment of constipation as it acts as a lubricant and stool softener when taken orally.

It is also used in cosmetics, and was historically used in some food products.[23]

A specification for mineral oil is contained in the *Food Chemicals Codex* (FCC).[24]

The EINECS number for mineral oil is 232-384-2.

Mineral Oil and Lanolin Alcohols

1 Nonproprietary Names

None adopted.

2 Synonyms

Amerchol L-101; liquid paraffin and lanolin alcohols; *Protalan M-16*; *Protalan M-26*; *Vilvanolin*.

3 Chemical Name and CAS Registry Number

Mineral oil [8012-95-1]

Lanolin alcohols [8027-33-6]

4 Empirical Formula and Molecular Weight

A mixture of mineral oil and lanolin alcohols.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; emulsifying agent.

7 Applications in Pharmaceutical Formulation or Technology

Mineral oil and lanolin alcohols is an oily liquid used in topical pharmaceutical formulations and cosmetics as an emulsifying agent with emollient properties; *see* Table I. It is used as a primary emulsifier in the preparation of water-in-oil creams and lotions and as an auxiliary emulsifier and stabilizing agent in oil-in-water creams and lotions.

Table I: Uses of mineral oil and lanolin alcohols.

Use	Concentration (%)
Emollient	3.0–6.0
Emulsifier in w/o creams and lotions	5.0–15.0
Emulsifier in o/w creams and lotions	0.5–6.0

8 Description

Mineral oil and lanolin alcohols occurs as a pale yellow-colored, oily liquid with a faint characteristic sterol odor.

9 Pharmacopeial Specifications

Lanolin alcohols and mineral oil are listed as separate monographs in BP, JP, PhEur and USP–NF and the combination is not listed; *see* Lanolin Alcohols and Mineral Oil.

10 Typical Properties

Acid value ≤1
Arsenic ≤2 ppm
Ash ≤0.2%
Heavy metals ≤20 ppm
HLB value ≈8
Hydroxyl value 10–15
Iodine number ≤12
Microbiological count The total bacterial count, when packaged, is less than 10 per gram of sample.
Moisture content ≤0.2%
Saponification value ≤2
Solubility Soluble 1 in 2 parts of chloroform, 1 in 4 parts of castor oil, and 1 in 4 parts of corn oil. Practically insoluble in ethanol (95%) and water. Precipitation occurs in hexane.
Specific gravity 0.840–0.860 at 25°C

11 Stability and Storage Conditions

Mineral oil and lanolin alcohols is a stable blend and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Lanolin alcohols are incompatible with coal tar, ichthammol, phenol, and resorcinol.

13 Method of Manufacture

Lanolin alcohols are dissolved in mineral oil.

14 Safety

Mineral oil and lanolin alcohols is generally regarded as an essentially nontoxic and nonirritant material. However, lanolin alcohols may be irritant to the skin and cause hypersensitivity in some individuals.[1,2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical creams, emulsions and lotions). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lanolin alcohols; mineral oil; petrolatum and lanolin alcohols.

18 Comments

See Lanolin Alcohols and Mineral Oil for further information.

Studies have been carried out on the use of synthetic blends containing lanolin alcohols and mineral oils that may avoid an allergic response whilst still producing an ointment base with the appropriate physical characteristics.[3]

Mineral Oil, Light

M

1 Nonproprietary Names

BP: Light Liquid Paraffin

JP: Light Liquid Paraffin

PhEur: Paraffin, Light Liquid

USP–NF: Light Mineral Oil

2 Synonyms

905 (mineral hydrocarbons); *Citation*; light liquid petrolatum; light white mineral oil; paraffinum perliquidum.

3 Chemical Name and CAS Registry Number

Light mineral oil [8012-95-1] and [8042-47-5]

4 Empirical Formula and Molecular Weight

Light mineral oil is a mixture of refined liquid saturated hydrocarbons obtained from petroleum. It is less viscous and has a lower specific gravity than mineral oil. The USP 40–NF 35 S1 specifies that light mineral oil may contain a suitable stabilizer.

5 Structural Formula

A mixture of refined liquid hydrocarbons, essentially paraffins and naphthenic in nature, obtained from petroleum.

6 Functional Category

Emollient; oleaginous vehicle; solvent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Light mineral oil is used in applications similar to those of mineral oil. It is used primarily as an excipient in topical pharmaceutical formulations where its emollient properties are exploited in ointment bases;[1–3] *see* Table I. It is also used in ophthalmic formulations.[4,5] Light mineral oil is additionally used in oil-in-water and polyethlylene glycol/glycerol emulsions;[6–9] as a solvent and lubricant in capsules and tablets; as a solvent and penetration enhancer in transdermal preparations;[10] and as the oily medium used in the microencapsulation of many drugs.[11–17]

Table I: Uses of light mineral oil.

Use	Concentration (%)
Ophthalmic ointments	≤15.0
Otic preparations	≤50.0
Topical emulsions	1.0–20.0
Topical lotions	7.0–16.0
Topical ointments	0.2–23.0

8 Description

Light mineral oil occurs as a transparent, colorless liquid, without fluorescence in daylight. It is practically tasteless and odorless when cold, and has a faint odor when heated.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Solubility Soluble in chloroform, ether, and hydrocarbons; sparingly soluble in ethanol (95%); practically insoluble in water.

11 Stability and Storage Conditions

Light mineral oil undergoes oxidation when exposed to heat and light. Oxidation begins with the formation of peroxides, exhibiting an 'induction period'. Under typical storage conditions, the induction period may take months or years. However, once a trace of peroxide is formed, further oxidation is autocatalytic and proceeds very rapidly. Oxidation results in the formation of aldehydes and

organic acids, which impart taste and odor. The USP 40–NF 35 S1 permits the addition of suitable stabilizers to retard oxidation, butylated hydroxyanisole, butylated hydroxytoluene, and alpha tocopherol being the most commonly used antioxidants.

Light mineral oil may be sterilized by dry heat.

Light mineral oil should be stored in an airtight container in a cool, dry place and protected from light.

12 Incompatibilities

Light mineral oil is incompatible with strong oxidizing agents.

13 Method of Manufacture

Light mineral oil is obtained by the distillation of petroleum. A suitable stabilizer may be added to the oil; *see* Section 11.

See also Mineral Oil for further information.

14 Safety

Light mineral oil is used in applications similar to those of mineral oil. Mineral oil is considered safe by the FDA for direct use in foods. However, oral ingestion of large doses of light mineral oil or chronic consumption may be harmful. Chronic use may impair appetite and interfere with the absorption of fat-soluble vitamins. It is absorbed to some extent when emulsified, leading to granulomatous reactions. Oral and intranasal use of mineral oil or products containing mineral oil by infants or children is not recommended because of the possible danger of causing lipoid pneumonia.

See Mineral Oil for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Since light mineral oil is combustible, it should not be handled or stored near heat, sparks, or flame. Light mineral oil should not be mixed with or stored with strong oxidants. Inhalation of mineral oil vapors may be harmful.

16 Regulatory Status

Light mineral oil is included in the FDA Inactive Ingredients Database (dental and ophthalmic preparations; oral capsules and tablets; otic, rectal, topical, transdermal and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Accepted in the UK for use in certain food applications. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Mineral oil; mineral oil and lanolin alcohols; paraffin; petrolatum.

18 Comments

Light mineral oil is also used in cosmetics and certain food products.

A specification for light mineral oil is contained in the *Food Chemicals Codex* (FCC).[18]

The EINECS number for light mineral oil is 232-384-2.

Monoethanolamine

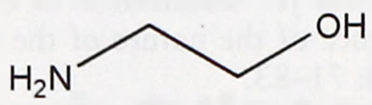
1 Nonproprietary Names

BP: Ethanolamine

USP–NF: Monoethanolamine

2 Synonyms

β-Aminoethyl alcohol; colamine; ethylolamine; β-hydroxyethylamine; 2-hydroxyethylamine.



3 Chemical Name and CAS Registry Number

2-Aminoethanol [141-43-5]

4 Empirical Formula and Molecular Weight

C_2H_7NO 61.08

5 Structural Formula

6 Functional Category

Alkalizing agent; emulsifying agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Monoethanolamine is used primarily in pharmaceutical formulations for pH adjustment and in the preparation of emulsions. Other uses include as a solvent for fats and oils and as a stabilizing agent in an injectable dextrose solution of phenytoin sodium.

8 Description

Monoethanolamine occurs as a clear, colorless or pale yellow-colored, moderately viscous liquid with a mild, ammoniacal odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for monoethanolamine.

Viscosity (dynamic)

18.95 mPa s (18.95 cP) at 25°C;
5.03 mPa s (5.03 cP) at 60°C.

11 Stability and Storage Conditions

Monoethanolamine is very hygroscopic and is unstable when exposed to light. Aqueous monoethanolamine solutions may be sterilized by autoclaving.

When monoethanolamine is stored in large quantities, stainless steel is preferable for long-term storage. Copper, copper alloys, zinc, and galvanized iron are corroded by amines and should not be used for construction of storage containers. Ethanolamines readily absorb moisture and carbon dioxide from the air; they also react with carbon dioxide. This can be prevented by sealing the monoethanolamine under an inert gas. Smaller quantities of monoethanolamine should be stored in an airtight container, protected from light, in a cool, dry place.

12 Incompatibilities

Monoethanolamine contains both a hydroxy group and a primary amine group and will thus undergo reactions characteristic of both alcohols and amines. Ethanolamines will react with acids to form salts and esters. Discoloration and precipitation will take place in the presence of salts of heavy metals. Monoethanolamine reacts with acids, acid anhydrides, acid chlorides, and esters to form amide derivatives, and with propylene carbonate or other cyclic carbonates to give the corresponding carbonates.

As a primary amine, monoethanolamine will react with aldehydes and ketones to yield aldimines and ketimines. Additionally, monoethanolamine will react with aluminum, copper, and copper alloys to form complex salts. A violent reaction will occur with acrolein, acrylonitrile, epichlorohydrin, propiolactone, and vinyl acetate.

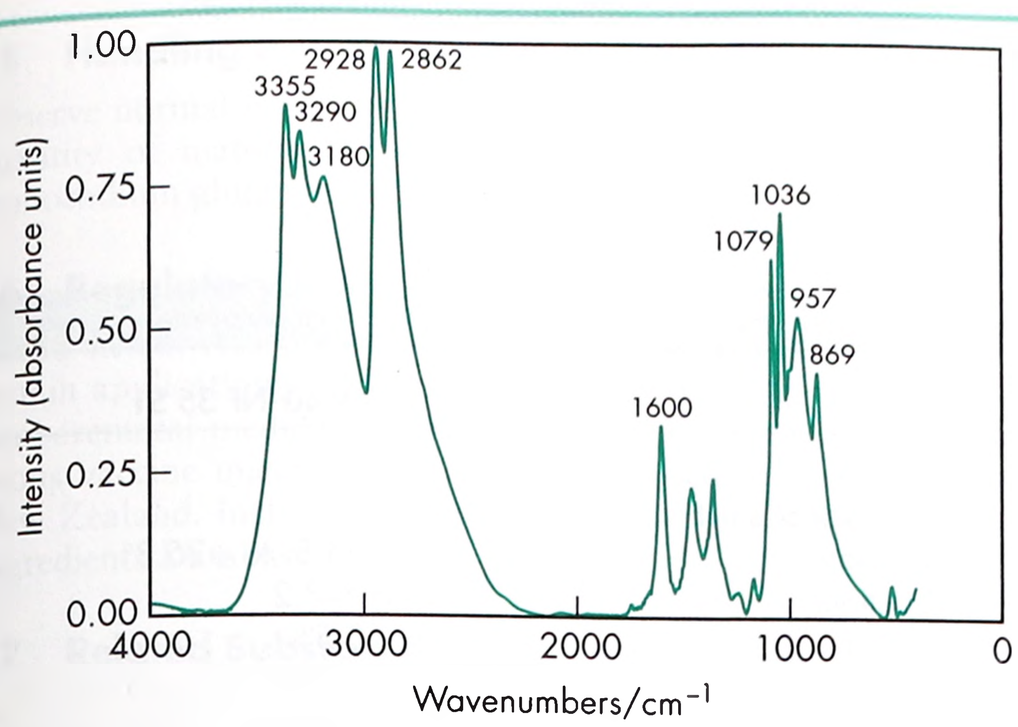

Figure 1: Infrared spectrum of monoethanolamine measured by transmission. Adapted with permission of Informa Healthcare.

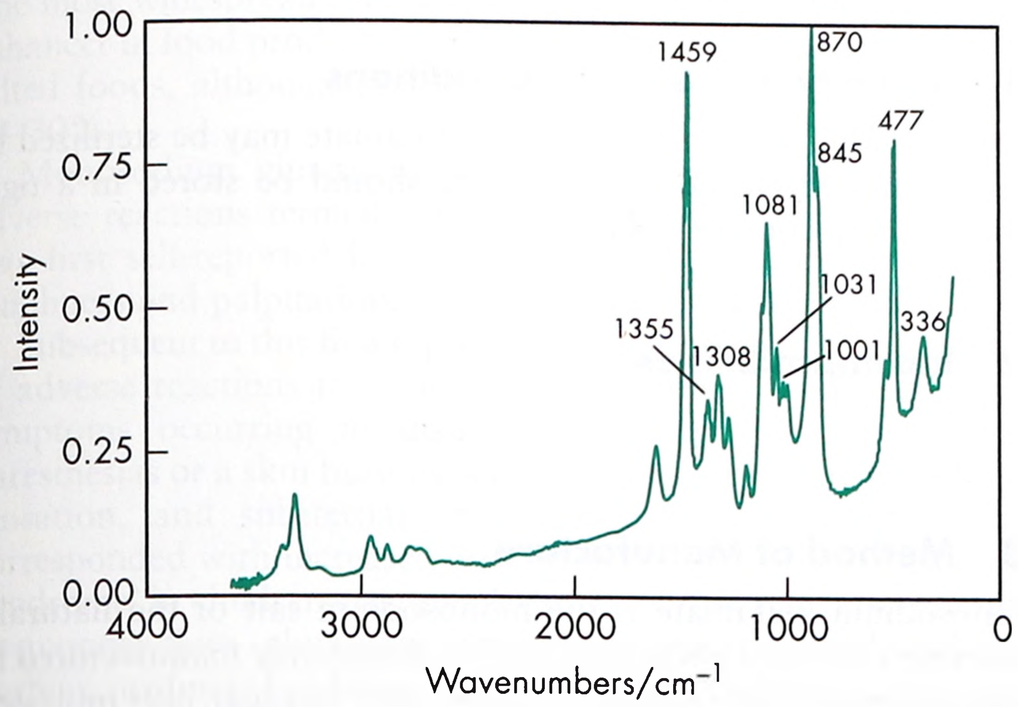

Figure 2: Raman spectrum of monoethanolamine measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Monoethanolamine is prepared commercially by the ammonolysis of ethylene oxide. The reaction yields a mixture of monoethanolamine, diethanolamine, and triethanolamine, which is separated to obtain the pure products. Monoethanolamine is also produced from the reaction between nitromethane and formaldehyde.

14 Safety

Monoethanolamine is an irritant, caustic material, but when it is used in neutralized parenteral and topical pharmaceutical formulations it is not usually associated with adverse effects, although hypersensitivity reactions have been reported. Monoethanolamine salts are generally regarded as being less toxic than monoethanolamine.

LD_{50} (rat, IV): 0.23 g/kg
LD_{50} (rat, oral): 1.72 g/kg
LD_{50} (rat, SC): 1.5 g/kg

15 Handling Precautions

When handling concentrated solutions of monoethanolamine, personal protective equipment such as an appropriate respirator, chemically resistant gloves, safety goggles, and other protective clothing should be worn. Transfer or prepare monoethanolamine solutions only in a chemical fume hood.

Vapors may flow along surfaces to distant ignition sources and flash back. Closed containers exposed to heat may explode. Contact with strong oxidizers may cause fire.

In the UK, the short-term (15-minute) workplace exposure limit for monoethanolamine is 7.6 mg/m^3 (3 ppm) and the long-term exposure limit (8-hour TWA) is 2.5 mg/m^3 (1 ppm).[2]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets; delayed action). Included in parenteral and nonparenteral medicines licensed in the UK and US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Diethanolamine; triethanolamine.

18 Comments

Monoethanolamine is used to produce a variety of salts with therapeutic uses. For example, a salt of monoethanolamine with vitamin C is used for intramuscular injection, while the salicylate and undecenoate monoethanolamine salts are utilized respectively in the treatment of rheumatism and as an antifungal agent. However, the most common therapeutic use of monoethanolamine is in the production of ethanolamine oleate injection, which is used as a sclerosing agent.[3]

A specification for monoethanolamine is included in the *Japanese Pharmaceutical Excipients* (JPE).[4]

The EINECS number for monoethanolamine is 205-483-3.

Monosodium Glutamate

1 Nonproprietary Names

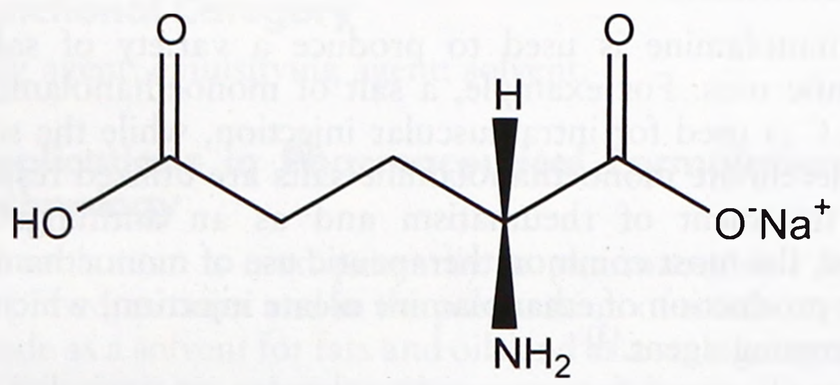
USP–NF: Monosodium Glutamate

2 Synonyms

Aji-No-Moto; chinese seasoning; E621; glutamic acid monosodium salt; glutamic acid, sodium salt; MSG; monosodium L-glutamate monohydrate; natrii glutamas; sodium L-glutamate; sodium glutamate monohydrate; sodium hydrogen L-(+)-2-aminoglutarate monohydrate.

3 Chemical Name and CAS Registry Number

Glutamic acid monosodium salt anhydrous [142-47-2]



Glutamic acid monosodium salt monohydrate [6106-04-3]

4 Empirical Formula and Molecular Weight

$C_5H_8NO_4Na$ 169.13 (anhydrous)

$C_5H_8NO_4Na \cdot H_2O$ 187.13 (monohydrate)

5 Structural Formula

6 Functional Category

Buffering agent; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Monosodium glutamate is used in oral pharmaceutical formulations as a buffer and a flavor enhancer. For example, it is used with sugar to improve the palatability of bitter-tasting drugs and can reduce the metallic taste of iron-containing liquids. It has also been used in subcutaneous live vaccine injections such as measles, mumps, rubella and varicella-zoster live vaccine.

8 Description

Monosodium glutamate occurs as white free-flowing crystals or a crystalline powder. It is practically odorless and has a meat-like taste.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 7.0 (0.2% w/v aqueous solution)
Melting point 232°C
Solubility Soluble in water; sparingly soluble in ethanol (95%).
Specific rotation $[\alpha]_D^{25}$ = +24.2° to +25.5° at 25°C (8.0% w/v in 1.0 N HCl).

Table I: Pharmacopeial specifications for monosodium glutamate.

Test	USP 40–NF 35 S1
Identification	+
Clarity and color of solution	+
Specific rotation	+24.8° to +25.3°
pH (5% solution)	6.7–7.2
Loss on drying	≤0.5%
Chloride	≤0.25%
Lead	≤10 ppm
Assay	99.0–100.5%

11 Stability and Storage Conditions

Aqueous solutions of monosodium glutamate may be sterilized by autoclaving. Monosodium glutamate should be stored in a tight container in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Monosodium glutamate is the monosodium salt of the naturally occurring L-form of glutamic acid. It is commonly manufactured by fermentation of carbohydrate sources such as sugar beet molasses. In general, sugar beet products are used in Europe and the USA. Other carbohydrate sources such as sugar cane and tapioca are used in Asia.

14 Safety

Monosodium glutamate is widely used in foods and oral pharmaceutical formulations. It is generally regarded as moderately toxic on ingestion or intravenous administration. Adverse effects include somnolence, hallucinations and distorted perceptions, headache, dyspnea, nausea or vomiting, and dermatitis. The lowest lethal oral dose in humans is reported to be 43 mg/kg.[1] The use of monosodium glutamate in foods has been controversial due to the so-called 'Chinese Restaurant Syndrome' (*see* Section 18), although it is generally regarded as safe at intake levels of up to 6 mg/kg bodyweight.[2] In Europe, total glutamate intake from food ranges from 5–12 g/day.[2]

There has been a report of a foreign body granuloma caused by monosodium glutamate after a BCG vaccination.[3]

LD_{50} (cat, SC): 8 g/kg[4]
LD_{50} (guinea pig, IP): 15 g/kg[4]
LD_{50} (mouse, IP): 3.8 g/kg[4]
LD_{50} (mouse, IV): 30 g/kg[4]
LD_{50} (mouse, oral): 11.4 g/kg[4]
LD_{50} (mouse, SC): 8.2 g/kg[4]
LD_{50} (rat, IP): 4.253 g/kg[4]
LD_{50} (rat, IV): 3.3 g/kg[4]
LD_{50} (rat, oral): 16.6 g/kg[4]
LD_{50} (rat, SC): 5.58 g/kg[4]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, monosodium glutamate emits toxic fumes of NO_x and Na_2O.

16 Regulatory Status

GRAS listed. Accepted in Europe for use as a food additive in certain applications. Included in the EAFUS database. Included in nonparenteral medicines licensed in the UK. Included in subcutaneous vaccine injections (*ProQuad*) liscensed in Europe, US and New Zealand. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

The most widespread use of monosodium glutamate is as a flavor enhancer in food products. Typically, 0.2–0.9% is used in normally salted foods, although products such as soy protein can contain 10–30%.

Monosodium glutamate has been associated with reports of adverse reactions termed 'Chinese Restaurant Syndrome' after it was first self-reported by a physician who regularly experienced numbness and palpitations after consuming Chinese food.[5]

Subsequent to this first report, numerous other anecdotal reports of adverse reactions to monosodium glutamate were made, with symptoms occurring at doses of 1.5–12 g. Reactions include paresthesias or a skin burning sensation, facial pressure or tightness sensation, and substernal chest pressure. Severity of reaction corresponded with increased dose. Reports of 'Chinese Restaurant Syndrome' in children are rare. A variety of other adverse reactions to monosodium glutamate have also been reported including flushing, asthma, headache, behavioral abnormalities, and ventricular tachycardia.[6–8]

Placebo-controlled, blinded, trials of monosodium glutamate consumption have, however, largely failed to reproduce the full effects of 'Chinese Restaurant Syndrome' as it was originally described, and symptoms may be simply due to dyspepsia.[9] Other trials have resulted in reactions to monosodium glutamate in fewer than 1% of patients with chronic idiopathic urticaria.[10] Some dose-dependent adverse reactions may be attributed to monosodium glutamate, with doses of 5 g producing reactions in 30% of individuals tested.[11] In the US, the FDA has stated that monosodium glutamate and related substances are safe food ingredients for most people when used at 'customary' levels.[12–14]

Monosodium glutamate monohydrate 32 g is approximately equivalent to anhydrous monosodium glutamate 29 g or glutamic acid 25 g. Each gram of monosodium glutamate monohydrate represents 5.3 mmol (5.3 mEq) of sodium.

A specification for monosodium glutamate is contained in the *Food Chemicals Codex* (FCC).[15]

The EINECS number for monosodium glutamate is 205-538-1. The PubChem Compound ID (CID) for monosodium glutamate is 23689119.

4 Empirical Formula and Molecular Weight

$C_3H_8O_2S$ 108.16

5 Structural Formula

M

6 Functional Category

Antimicrobial preservative; antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Monothioglycerol is used as an antioxidant in pharmaceutical formulations, mainly in parenteral preparations.[1] Monothioglycerol is reported to have some antimicrobial activity.[2–4] It is also widely used in cosmetic formulations such as depilating agents.

8 Description

Monothioglycerol occurs as a colorless or pale-yellow colored, viscous, hygroscopic liquid with a slight odor of sulfide.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for monothioglycerol.

Test	USP 40–NF 35 S1
Specific gravity	1.241–1.250
Refractive index	1.521–1.526
pH (10% aqueous solution)	3.5–7.0
Water	≤5.0%
Residue on ignition	≤0.1%
Selenium	≤0.003%
Heavy metals	≤0.002%
Assay (anhydrous basis)	97.0–101.0%

10 Typical Properties

Acidity/alkalinity pH = 3.5–7.0 (10% w/v aqueous solution)
Boiling point 118°C
Flash point 110°C
Refractive index n_D^{25} = 1.521–1.526
Solubility Miscible with ethanol (95%); freely soluble in water; practically insoluble in ether.
Specific gravity 1.241–1.250
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

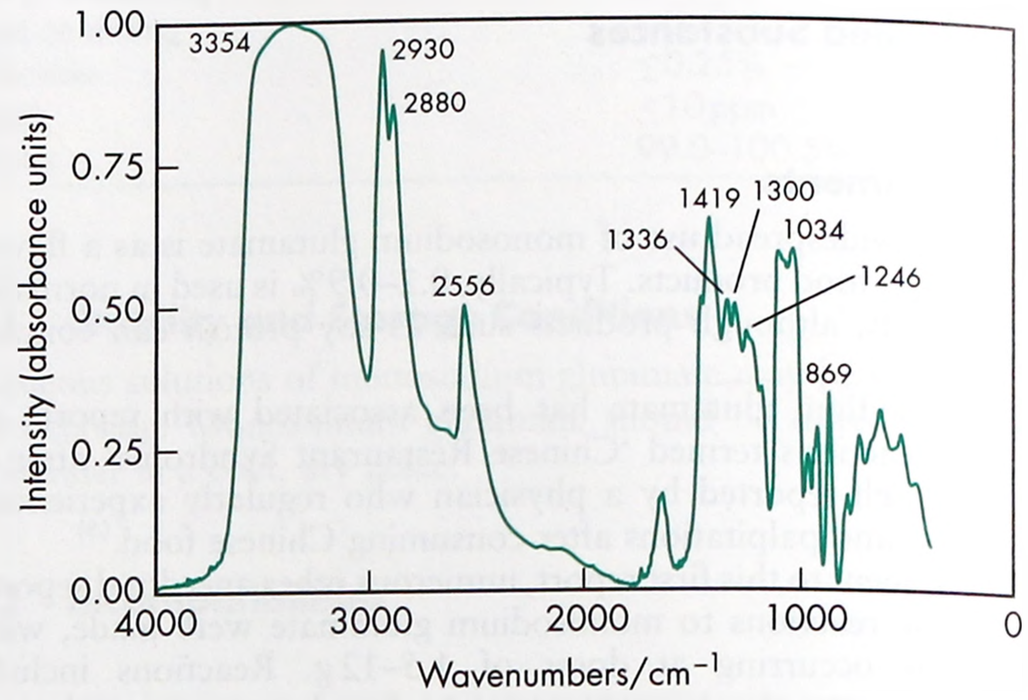

Figure 1: Infrared spectrum of monothioglycerol measured by transmission. Adapted with permission of Informa Healthcare.

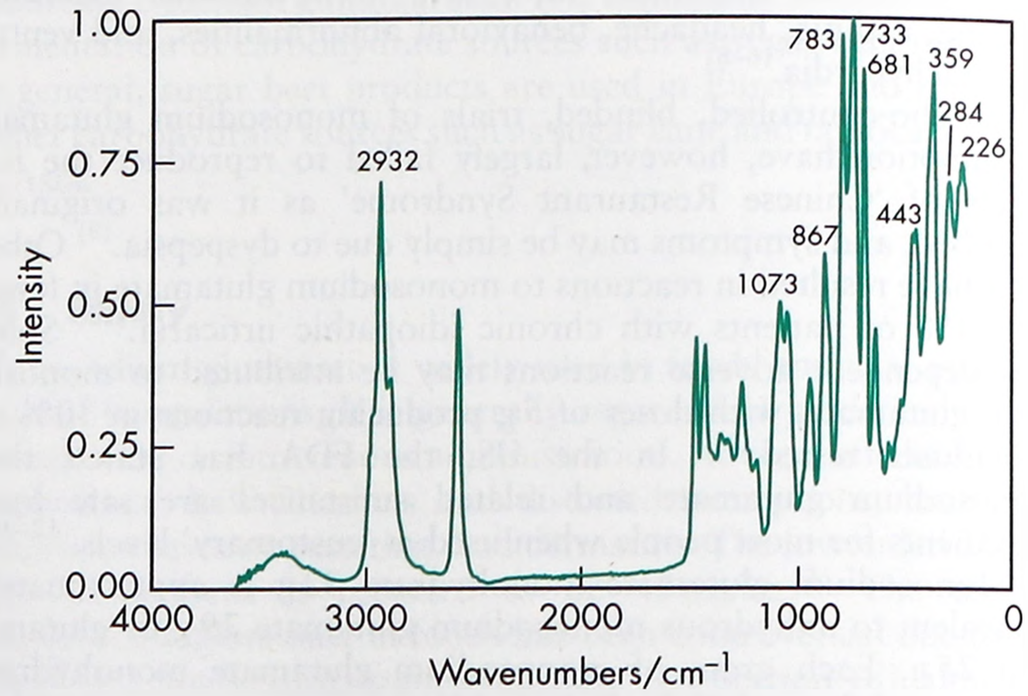

Figure 2: Raman spectrum of monothioglycerol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Monothioglycerol is unstable in alkaline solutions. Monothioglycerol should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Monothioglycerol can react with oxidizing materials.

13 Method of Manufacture

Monothioglycerol is prepared by heating an ethanolic solution of 3-chloro-1,2-propanediol with potassium bisulfide.

14 Safety

Monothioglycerol is generally regarded as a relatively nontoxic and nonirritant material at the concentrations used as a pharmaceutical excipient. It is used in topical and injectable preparations.

Undiluted monothioglycerol is considered a poison by the IP and IV routes; it has also been reported to be mutagenic.[5]

LD_{50} (cat, IV): 0.22 g/kg[5]
LD_{50} (mouse, IP): 0.34 g/kg
LD_{50} (rabbit, IV): 0.25 g/kg
LD_{50} (rat, IP): 0.39 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Monothioglycerol is flammable when exposed to heat or flame; when heated to decomposition it emits toxic fumes of SO_x.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM, IV and other injections). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Therapeutically, monothioglycerol has been used in a 0.02% w/w aqueous solution to stimulate wound healing, and as a 0.1% w/w jelly in atrophic rhinitis.

The EINECS number for monothioglycerol is 202-495-0. The PubChem Compound ID (CID) for monothioglycerol includes 7291 and 447638.

3 Chemical Name and CAS Registry Number

Tetradecanoic acid [544-63-8]

4 Empirical Formula and Molecular Weight

$C_{14}H_{28}O_2$ 228.37

5 Structural Formula

6 Functional Category

Emulsifying agent; penetration enhancer; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Myristic acid is used in oral and topical pharmaceutical formulations as an emulsifying agent, penetration enhancer, and tablet and capsule lubricant.

Myristic acid has been evaluated as a penetration enhancer in melatonin transdermal patches in rats[1] and bupropion formulations on human cadaver skin.[2] Further studies have assessed the suitability of myristic acid in oxymorphone formulations,[3] clobetasol 17-propionate topical applications,[4] and diltiazem hydrochloride hydroxypropyl methylcellulose gel formulations.[5] Furthermore, polyvinyl alcohol substituted with myristic acid (as well as other fatty acids) at different substitution degrees has been studied for the preparation of biodegradable microspheres containing progesterone or indomethacin.[6] Myristic acid has also been investigated for use in solid lipid nanoparticles for enhanced oral bioavailability of low molecular weight heparins,[7] and for colon-specific delivery of peptide drugs.[8]

8 Description

Myristic acid occurs as an oily white crystalline solid with a faint odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for myristic acid.

Test	USP 40–NF 35 S1
Identification	+
Residue on ignition	≤0.1%
Lead	≤2ppm
Mineral acids	+
Congealing temperature	48–55.5°C
Acid value	242–249
Iodine value	≤1.0
Peroxide value	≤10.0
Unsaponifiable matter	≤1%
Water	≤0.2%
Assay	≥97.0%

10 Typical Properties

Boiling point 326.2°C
Flash point >110°C
Melting point 54.5°C
Solubility Soluble in acetone, benzene, chloroform, ethanol (95%), ether, and aromatic and chlorinated solvents; practically insoluble in water.
Specific gravity 0.860–0.870

M

11 Stability and Storage Conditions

The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Myristic acid is incompatible with strong oxidizing agents and bases.

13 Method of Manufacture

Myristic acid occurs naturally in nutmeg butter and in most animal and vegetables fats. Synthetically, it may be prepared by electrolysis of methyl hydrogen adipate and decanoic acid or by Maurer oxidation of myristyl alcohol.

14 Safety

Myristic acid is used in oral and topical pharmaceutical formulations and is generally regarded as nontoxic and nonirritant at the levels employed as an excipient. However, myristic acid is reported to be an eye and skin irritant at high levels and is poisonous by intravenous administration. Mutation data have also been reported.[9]

LD_{50} (mouse, IV): 0.043 g/kg[9]
LD_{50} (rat, oral): >10 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Acrid smoke and irritating fumes are emitted when myristic acid is heated to decomposition. Protective clothing, gloves, and safety goggles are recommended. Wear suitable respiratory equipment.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral capsules). Included in nonparenteral medicines licensed in the UK.

17 Related Substances

Lauric acid; myristyl alcohol; palmitic acid; potassium myristate; sodium myristate; stearic acid.

Potassium myristate

Empirical formula $C_{14}H_{28}O_2K$
Molecular weight 267.52
CAS number [13429-27-1]
Comments Potassium myristate is used as a surfactant and emulsifying agent in pharmaceutical formulations. The EINECS number for potassium myristate is 236-550-5.

Sodium myristate

Empirical formula $C_{14}H_{28}O_2Na$
Molecular weight 251.41
CAS number [822-12-8]
Comments Sodium myristate is used as an emulsifying agent in pharmaceutical formulations. The EINECS number for sodium myristate is 212-487-9.

18 Comments

Therapeutically, myristic acid has been investigated for use in gene therapy[10,11] and chemotherapy.[12]

A specification for myristic acid is contained in the *Food Chemicals Codex* (FCC)[13] and in the *Japanese Pharmaceutical Excipients* (JPE).[14]

The EINECS number for myristic acid is 208-875-2. The PubChem Compound ID (CID) for myristic acid is 11005.

3 Chemical Name and CAS Registry Number

Tetradecan-1-ol [112-72-1]

4 Empirical Formula and Molecular Weight

$C_{14}H_{30}O$ 214.4

5 Structural Formula

6 Functional Category

Emollient; emulsion stabilizing agent; nonionic surfactant; oleaginous vehicle; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Myristyl alcohol is used in oral, parenteral, and topical pharmaceutical formulations.

Myristyl alcohol has been evaluated as a penetration enhancer in melatonin transdermal patches in rats.[1] The steady-state flux value of melatonin across human skin using myristyl alcohol as a permeation enhancer was reported as 18.2 μg/(cm^3 h).[2] It has also been investigated for use in microemulsions as transdermal drug delivery vehicles.[3]

Myristyl alcohol has been studied in controlled-release lipid particle systems.[4–6] It has also been tested as a bilayer stabilizer in niosome formulations containing ketorolac tromethamine,[7] and zidovudine.[8] Niosomes containing myristyl alcohol showed a considerably slower release rate of ketorolac tromethamine than those containing cholesterol.[7] This was also observed with the zidovudine formulation.[8]

8 Description

Myristyl alcohol occurs as a white crystalline solid with a waxy odor. Also reported as opaque leaflets or crystals from ethanol.[9]

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for myristyl alcohol.

Test	USP 40–NF 35 S1
Identification	+
Acid value	≤2
Iodine value	≤1
Hydroxyl value	250–267
Water	≤0.5%
Residue of ignition	≤0.1%
Limit of related fatty acids and unspecified impurities	≤10.0%
Assay	90.0–102.0%

10 Typical Properties

Boiling point 167°C at 1.5 mPa (15 atm)
Density 0.8355 g/cm^3 at 20°C for solid; 0.8236 g/cm^3 at 38°C for liquid[9]
Flash point 140°C (open cup)[9]
Melting point 38°C; also reported as 37.6°C[9]
Solubility Practically insoluble in water; soluble in ether, slightly soluble in ethanol (95%).
Specific gravity 0.824
Vapor pressure 1.33 Pa (0.01 mmHg) at 20°C[9]

11 Stability and Storage Conditions

The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Myristyl alcohol is combustible when exposed to heat or flame. It can react with oxidizing materials. When heated to decomposition, it emits acrid smoke and irritating fumes.[9]

13 Method of Manufacture

Myristyl alcohol is found in spermaceti wax and sperm oil, and may be synthesized by sodium reduction of fatty acid esters or the reduction of fatty acids by lithium aluminum hydride. It can also be formed from acetaldehyde and dimethylamine.[10]

14 Safety

Myristyl alcohol is used in oral, parenteral, and topical pharmaceutical formulations. The pure form of myristyl alcohol is mildly

toxic by ingestion and may be carcinogenic; experimental tumorigenic data are available.[11] It is also a human skin irritant.[9] In animal studies of the skin permeation enhancement effect of saturated fatty alcohols, myristyl alcohol exhibited a lower effect when compared with decanol, undecanol, or lauryl alcohol but caused greater skin irritation.[12] A study investigating contact sensitization to myristyl alcohol revealed that patch testing of myristyl alcohol 10% petrolatum should not be carried out owing to observed irritant effects; thus the use of a lower concentration of myristyl alcohol for such tests (5% petrolatum) was recommended.[11] Myristyl alcohol has been associated with some reports of contact allergy.[13,14] A moderate-to-severe erythema and moderate edema are seen when 75 mg is applied to human skin intermittently in three doses over 72 hours.[9]

The Cosmetic Ingredient Review (CIR) Expert Panel have assessed myristyl alcohol and concluded that the material is safe for use in cosmetic formulations in present practices of use and concentration.[15] *See* section 18.

LD_{50} (rabbit, skin): >5 g/kg; 7.13 ml/kg[16]
LD_{50} (rat, oral): 5 g/kg; 32.5 ml/kg[16]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. The use of gloves is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablet: sustained-release; and topical formulations: cream, lotion, suspension). Included in nonparenteral (topical cream) formulations licensed in the UK.

17 Related Substances

Lauric acid; myristic acid; palmitic acid; potassium myristate; sodium myristate; stearic acid.

18 Comments

Myristyl alcohol is used as a flavouring agent in foods,[17] and in cosmetic products at concentrations between ≤0.01–5%.[15]

A specification for myristyl alcohol is contained in the *Food Chemicals Codex* (FCC).[18]

The EINECS number for myristyl alcohol is 204-000-3. The PubChem Compound ID (CID) for myristyl alcohol is 8209.

Neohesperidin Dihydrochalcone

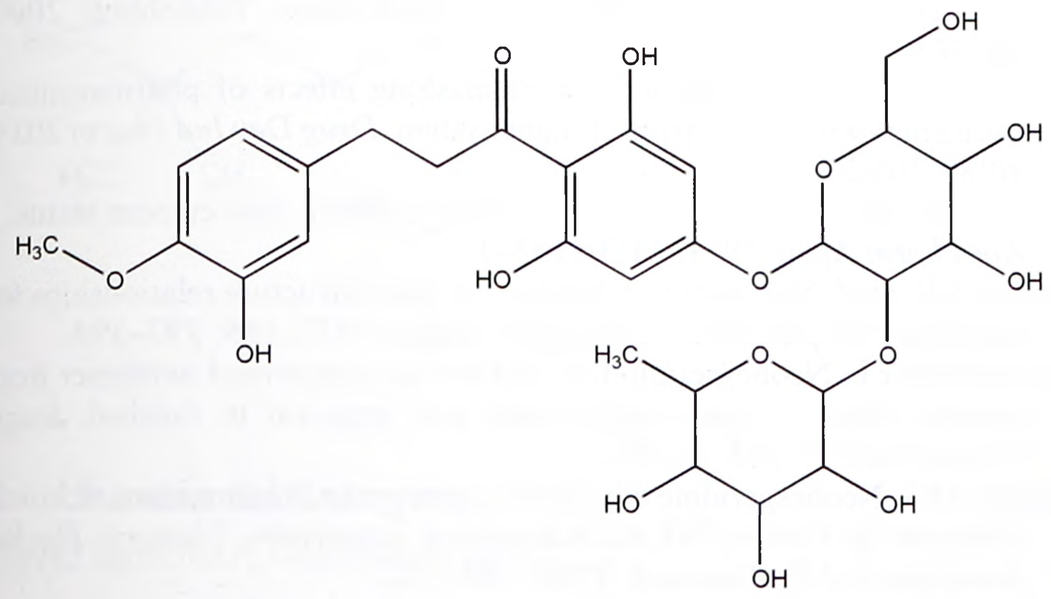
1 Nonproprietary Names

BP: Neohesperidin Dihydrochalcone

PhEur: Neohesperidin Dihydrochalcone

2 Synonyms

Citrosa; 1-[4-[[2-*O*-6-deoxy-α-L-mannopyranosyl)-β-D-glycopyranosyl]oxy]-2,6-dihydroxyphenyl]-3-(3-hydroxy-4-methoxyphenyl); 3,5-dihydroxy-4-(3-hydroxy-4-methoxyhydrocinnamoyl)phenyl-2-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranoside; 3,5-dihydroxy-4-[3-(3-hydroxy-4-methoxyphenyl)propionyl]phenyl-2-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranoside; E959; neohesperidin DC; neohesperidin DHC; neohesperidin dihydrochalconum; neohesperidine dihydrochalcone; NHDC; 1-propanone; *Sukor*.



3 Chemical Name and CAS Registry Number

1-[4-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-2,6-dihydroxyphenyl]-3-(3-hydroxy-4-methoxyphenyl)propan-1-one [20702-77-6]

4 Empirical Formula and Molecular Weight

$C_{28}H_{36}O_{15}$ 612.58

5 Structural Formula

6 Functional Category

Flavor enhancer; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Neohesperidin dihydrochalcone is a synthetic intense sweetening agent approximately 1000–1500 times sweeter than sucrose and 20 times sweeter than saccharin. Structurally it is an analogue of neohesperidin, a flavanone that occurs naturally in Seville oranges (*Citrus aurantium*).

Neohesperidin dihydrochalcone is used in pharmaceutical and food applications as a sweetening agent and flavor enhancer. The sweetness profile is characterized by a lingering sweet/menthol-like aftertaste.[1] The typical level used in foods is 1–5 ppm although much higher levels may be used in certain applications such as chewing gum. Synergistic effects occur with other intense and bulk sweeteners such as acesulfame K, aspartame, polyols, and saccharin.[2]

In pharmaceutical applications, neohesperidin dihydrochalcone is useful in masking the unpleasant bitter taste of a number of drugs such as antacids, antibiotics, and vitamins. In antacid preparations, levels of 10–30 ppm result in improved palatability.

8 Description

Neohesperidin dihydrochalcone occurs as a white or yellowish-white powder with an intensely sweet taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for neohesperidin dihydrochalcone.

Test	PhEur 9.2
Identification	+
Characters	+
Appearance of solution	+
Related substances	+
Water	≤12.0%
Sulfated ash	≤0.2%
Assay (anhydrous substance)	96.0–101.0%

10 Typical Properties

Hygroscopicity Slightly hygroscopic; absorbs up to 15% of water.
Melting point 156–158°C
Solubility *see* Table II.

Table II: Solubility of neohesperidin dihydrochalcone.

Solvent	Solubility at 25°C unless otherwise stated
Dichloromethane	Practically insoluble
Dimethyl sulfoxide	Freely soluble
Methanol	Soluble
Water	1 in 2000 at 22°C 1 in 1.54 at 80°C

11 Stability and Storage Conditions

Neohesperidin dihydrochalcone is stable for over three years when stored at room temperature.[1]

Accelerated stability studies on aqueous solutions stored at 30–60°C and pH 1–7 for 140 days indicate that neohesperidin dihydrochalcone solutions are likely to be stable for 12 months at room temperature and pH 2–6.[3] Solutions formulated with some or all of the water replaced by solvents with a lower dielectric constant are reported to have longer shelf-lives.[4]

The bulk material should be stored in a cool, dry place protected from light.

12 Incompatibilities

—

13 Method of Manufacture

Neohesperidin dihydrochalcone is synthesized commercially from either of the bitter-flavanones neohesperidin or naringin by catalytic

hydrogenation under alkaline conditions in a process first described in the 1960s, in which neohesperidin is purified by recrystallization from water solutions.[5,6]

14 Safety

Neohesperidin dihydrochalcone is accepted for use in food products either as a sweetener or flavor modifier in a number of areas including Europe, US, Australia, New Zealand, and several countries in Africa and Asia. It is also used in a number of oral pharmaceutical formulations.

Animal toxicity studies suggest that neohesperidin dihydrochalcone is a nontoxic, nonteratogenic, and noncarcinogenic material at the levels used in foods and pharmaceuticals.[7,8] In Europe, an acceptable daily intake of 0–5 mg/kg body-weight has been established.[9,10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the EAFUS database. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Hesperidin.

Hesperidin
Empirical formula $C_{28}H_{34}O_{15}$
Molecular weight 610.56
CAS number [520-26-3]
Synonyms (2*S*)-7-[[6-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-2,3-dihydro-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4*H*-1-benzopyran-4-one; hesperitin 7-rhamnoglucoside; hesperetin-7-rutinoside.
Melting point 258–262°C
Solubility Freely soluble in diluted alkalis and pyridines; soluble in formamide; slightly soluble in methanol and hot glacial acetic acid.
Comments Hesperedin is the predominant flavonoid in lemons and sweet oranges (*Citrus sinensis*).

18 Comments

Neohesperidin dihydrochalcone is sufficiently soluble in aqueous solutions for most pharmaceutical and food applications; however, solubility may be improved by dissolving in ethanol, glycerin, propylene glycol, or aqueous mixtures of these solvents.[10] Solubility may also be improved by mixing with other intense or bulk sweeteners.[2]

Neohesperidin dihydrochalcone in weak concentrations has been shown not to enhance the taste of aqueous sucrose solutions.[6]

A specification for neohesperidin dihydrochalcone is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for neohesperidin dihydrochalcone is 243-978-6. The PubChem Compound ID (CID) for neohesperidin dihydrochalcone is 30231.

(3*R*)-3-(3,3-Dimethylbutylamino)-4-[[(2*R*)-1-methoxy-1-oxo-3-phenylpropan-2-yl]amino]-4-oxobutanoic acid [165450-17-9]

4 Empirical Formula and Molecular Weight

$C_{20}H_{30}N_2O_5$ 378.47

5 Structural Formula

6 Functional Category

Flavor enhancer; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Neotame is a water-soluble, nonnutritive, intense sweetening agent used in beverages and foods. It is structurally related to aspartame and is about 7000–13 000 times sweeter than sucrose, and about 30–60 times sweeter than aspartame, making it the sweetest artificial sweetener available. Neotame is said to have a 'clean' sweet taste in contrast to the bitter, metallic aftertaste associated with saccharin. Although neotame has approximately the same caloric value as sucrose (1.2 kJ/g) the small quantities used to achieve a desired level of sweetness in a formulation mean that it is essentially nonnutritive.

Neotame may be used in sub-sweetening quantities as a flavor enhancer, e.g. with mint or strawberry flavor.

8 Description

Neotame occurs as an odorless, white to off-white powder. It has an intense sweet taste 7000–13 000 times sweeter than sucrose depending on the matrix.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for neotame.

Test	USP 40–NF 35 S1
Identification	+
Specific optical rotation	−40.0° to −43.4°
Water	≤5.0%
Residue on ignition	≤0.2%
Lead	≤2 µg/g
Related compounds	+
Assay (anhydrous basis)	97.0–102.0%

10 Typical Properties

Acidity/alkalinity pH = 5.0–7.0 (0.5% w/v aqueous solution)
Dissociation constant

pK_{a1} = 3.01;

pK_{a2} = 8.02.

Melting point 80–83°C
Solubility *see* Table II.

Table II: Solubility of neotame.

Solvent	Solubility at 25°C unless otherwise stated
Ethanol	1 in 1.05
Ethyl acetate	1 in 23 at 15°C
	1 in 13
	1 in 1 at 60°C
Water	1 in 94 at 15°C
	1 in 79
	1 in 21 at 60°C

11 Stability and Storage Conditions

Neotame stability is affected by moisture, pH, and temperature. Neotame is stable in bakery products and pasteurized dairy products.

The bulk material should be stored in a well-closed container, in a cool, dry place; it is stable for up to 5 years at room temperature.

12 Incompatibilities

—

13 Method of Manufacture

Neotame is manufactured by the reaction of aspartame and 3,3-dimethylbutyraldehyde, followed by purification, drying, and milling.[1–3]

14 Safety

Studies in animals and humans have shown that neotame is a relatively nontoxic, nonteratogenic, and noncarcinogenic substance. It is reported as safe for use during pregnancy and lactation, and by children and persons with diabetes.

Human studies in healthy and diabetic patients suggest that neotame is well-tolerated at doses up to 1.5 mg/kg body-weight daily (the highest dose studied). Following reviews of over 100

animal and human toxicity studies the European Food Safety Authority and WHO have established an acceptable daily intake for neotame at up to 2 mg/kg body-weight.[4,5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye protection is recommended.

16 Regulatory Status

Accepted for use as a food additive in several countries including the US, UK, Mexico, Australia, and New Zealand. Included in the FDA Inactive Ingredients Database (oral spray). Approved for use in India in pharmaceutical preparations.[6] Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Aspartame.

18 Comments

Neotame does not degrade to diketopiperazine and does not require special labeling for phenylketonuria.

Neotame is metabolized to de-esterified neotame and methanol, with practically all neotame being eliminated from the body in the urine and feces. At least 30% of ingested neotame is rapidly absorbed. Peak plasma concentrations of neotame are observed at approximately 30–60 minutes after ingestion.

A specification for neotame is contained in the *Food Chemicals Codex* (FCC).[7]

The PubChem Compound ID (CID) for neotame is 3081923.

3 Chemical Name and CAS Registry Number

3-Pyridinecarboxamide [98-92-0]

4 Empirical Formula and Molecular Weight

$C_6H_6N_2O$ 122.13

5 Structural Formula

6 Functional Catergory

Antioxidant; solubilzing agent.

7 Applications in Pharmaceutical Formulation of Technology

As a pharmaceutical excipient, niacinamide is used in parenteral and topical formulations at concentrations of 1.25% to 2.5% as a solubilizing agent and/or an antioxidant. The solubilizing effect of niacinamide has been investigated for a number of poorly soluble

drugs, and has been compared to the efficiency of hydroxypropyl-β-cyclodextrin and sulfobutylether-β-cyclodextrin.[1]

Niacinamide is used in the formulation of tissue glue (lyophilized human fibrinogen-human thrombin sealant solutions) to lower the viscosity of the sealer protein solution and to facilitate the reconstitution of the sealer protein concentrate.[2] It has also been investigated to induce crystallization during lyophilisation increasing drug stability.[3]

8 Description

Niacinamide occurs as a hygroscopic white, crystalline powder, or colorless crystals.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for niacinamide.

Test	JP XVII	PhEur 9.2	USP 40 –NF 35 S1

Related substances	—	≤0.2%[a]	—

[a] ≤0.1% for each impurity.

10 Typical Properties

Dissociation constant pK (20°C) = 3.3
Solubility Soluble in water (1 g/mL) at 20°C, ethanol (100 mM), glycerol (1 g/10 mL), DMSO (100 mM), methanol, butanol, and chloroform. Slightly soluble in ether.
Flash point 150°C (closed cup); 182°C (open cup).
Vapor pressure 2.64×10^{-5} kPa at 25°C
Partition coefficient (n-octanol/water) -0.37
Specific gravity 1.4 at 25°C

11 Stability and Storage Conditions

Niacinamide is generally stable at room temperature. Do not heat to more than 85°C. In strong acidic and alkaline solutions niacinamide is hydrolysed to nicotinic acid. Niacinamide should be protected from light and stored in a dry place.

12 Incompatibilities

Niacinamide is incompatible with strong oxidising agents, strong acids and alkaline solutions.

13 Method of Manufacture

Niacinamide is usually prepared by esterifying nicotinic acid with methanol followed by ammonolysis. It can also be alternately prepared by passing ammonia gas into molten nicotinic acid or hydrolysis of 3-cyanopyridine.

14 Safety

Niacinamide is nontoxic and the Cosmetic Ingredient Review Expert Panel has concluded that the material is safe as used in cosmetics and personal care products.[4,5] Side effects of oral doses have been reported (headache, dizziness, nausea, vomiting, sweating and fatigue).[5] A tolerable upper intake level for adults of 900 mg/day has been proposed.[6]

LD_{50} (rat, oral): 3.5 g/kg[7]
LD_{50} (rat, SC): 1.68 g/kg[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Niacinamide causes serious eye irritation, skin irritation and may cause respiratory irritation. When heated to decomposition, Niacinamide emits toxic fumes. Suitable protective clothing, eye protection, gloves, and a respirator are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (topical gel preparations, and IM, IV, intra-articular, intrasynovial, and intralesional injections). Included in epilesional preparations licensed in the UK. Included as a food additive in the EAFUS list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ascorbic acid.

18 Comments

Niacinamide is a form of vitamin B3. It is also used in cosmetic formulations, foods and to prevent/treat niacin deficiency.[4,5] Structurally related niacin (nicotinic acid; *see* figure 1) is also a form of vitamin B3, however the term niacin has been used to describe both niacinamide and nicotinic acid forms of vitamin B3. Similarly, niacin is also referred to as vitamin PP which has been used as a synonym of vitamin B3.

The EINECS number for niacinamide is 202-713-4. The PubChem Compound ID (CID) for niacinamide is 936.

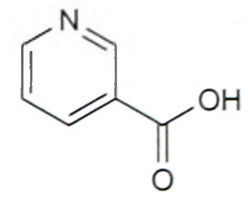

Figure 1: Chemical structure of nicotinoic acid (niacin).

Nitrogen

1 Nonproprietary Names

BP: Nitrogen
JP: Nitrogen
PhEur: Nitrogen
USP–NF: Nitrogen

2 Synonyms

Azote; E941; nitrogenium.

3 Chemical Name and CAS Registry Number

Nitrogen [7727-37-9]

4 Empirical Formula and Molecular Weight

N_2 28.01

5 Structural Formula

See Section 4.

6 Functional Category

Aerosol propellant; air displacement.

7 Applications in Pharmaceutical Formulation or Technology

Nitrogen and other compressed gases such as carbon dioxide and nitrous oxide are used as propellants for topical pharmaceutical aerosols. They are also used in other aerosol products that work satisfactorily with the coarse aerosol spray produced with compressed gases, e.g. furniture polish and window cleaner. Nitrogen is insoluble in water and other solvents, and therefore remains separated from the actual pharmaceutical formulation.

Advantages of compressed gases as aerosol propellants are that they are less expensive; of low toxicity; and practically odorless and tasteless. In contrast to liquefied gases, their pressures change relatively little with temperature. However, there is no reservoir of propellant in the aerosol and as a result the pressure decreases as the product is used, changing the spray characteristics.

Misuse of a product by the consumer, such as using a product inverted, results in the discharge of the vapor phase instead of the liquid phase. Most of the propellant is contained in the vapor phase and therefore some of the propellant will be lost and the spray characteristics will be altered. Additionally, the sprays produced using compressed gases are very wet. However, developments in valve technology have reduced the risk of misuse by making available valves which will spray only the product (not propellant) regardless of the position of the container. Additionally, barrier systems will also prevent loss of propellant, and have been used for pharmaceuticals and cosmetic aerosol sprays and foams utilizing nitrogen as the propellant.

Nitrogen is also used to displace air from solutions subject to oxidation, by sparging, and to replace air in the headspace above products in their final packaging, e.g. in parenteral products packaged in glass ampoules. Nitrogen is also used for the same purpose in many food products.

8 Description

Nitrogen occurs naturally as approximately 78% v/v of the atmosphere. It is a nonreactive, noncombustible, colorless, tasteless, and odorless gas. It is usually handled as a compressed gas, stored in metal cylinders.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for nitrogen.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Production	–	+	–
Odor	–	–	+
Carbon monoxide	–	≤5 ppm	≤0.001%
Carbon dioxide	+	≤300 ppm	–
Water	–	≤67 ppm	–
Oxygen	–	≤50 ppm	≤1.0%
Assay	≥99.5%	≥99.5%	≥99.0%

10 Typical Properties

Density 0.967 g/cm^3 for vapor at 21°C.
Flammability Nonflammable
Solubility Practically insoluble in water and most solvents; soluble in water under pressure.
Vapor density (absolute) 1.25 g/cm^3 at standard temperature and pressure.
Vapor density (relative) 0.97 (air = 1)

11 Stability and Storage Conditions

Nitrogen is stable and chemically unreactive. It should be stored in tightly sealed metal cylinders in a cool, dry place.

12 Incompatibilities

Generally compatible with most materials encountered in pharmaceutical formulations and food products.

13 Method of Manufacture

Nitrogen is obtained commercially, in large quantities, by the fractional distillation of liquefied air.

14 Safety

Nitrogen is generally regarded as a nontoxic and nonirritant material. However, it is an asphyxiant and inhalation of large quantities is therefore hazardous. *See also* Section 18.

15 Handling Precautions

Handle in accordance with procedures for handling metal cylinders containing liquefied or compressed gases. Eye protection, gloves, and protective clothing are recommended. Nitrogen is an asphyxiant and should be handled in a well-ventilated environment.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (injections; dental preparations; nasal sprays; oral solutions; rectal gels). Accepted for use as a food additive in Europe. Included in parenteral and nonparenteral medicines licensed in the UK and US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Carbon dioxide; nitrous oxide.

18 Comments

Different grades of nitrogen are commercially available that have, for example, especially low moisture levels.

Nitrogen is commonly used as a component of the gas mixtures breathed by divers. Under high pressure, such as when diving at great depths, nitrogen will dissolve in blood and lipid. If decompression is too rapid, decompression sickness may occur when the nitrogen effervesces from body stores to form gas emboli.

A specification for nitrogen is contained in the *Food Chemicals Codex* (FCC).[1]

The EINECS number for nitrogen is 231-783-9. The PubChem Compound ID (CID) for nitrogen is 947.

5 Structural Formula

See Section 4.

6 Functional Category

Aerosol propellant.

7 Applications in Pharmaceutical Formulation or Technology

Nitrous oxide and other compressed gases such as carbon dioxide and nitrogen are used as propellants for topical pharmaceutical aerosols. They are also used in other aerosol products that work satisfactorily with the coarse aerosol spray that is produced with compressed gases, e.g. furniture polish and window cleaner.

The advantages of compressed gases as aerosol propellants are that they are less expensive, of low toxicity, and practically odorless and tasteless. In contrast to liquefied gases, their pressures change relatively little with temperature. However, there is no reservoir of propellant in the aerosol, and as a result the pressure decreases as the product is used, changing the spray characteristics.

Misuse of a product by the consumer, such as using a product inverted, results in the discharge of the vapor phase instead of the liquid phase. Since most of the propellant is contained in the vapor phase, some of the propellant will be lost and the spray characteristics will be altered. Additionally, the sprays produced using compressed gases are very wet. However, recent developments in valve technology have reduced the risk of misuse by making available valves which will spray only the product (not propellant) regardless of the position of the container. Additionally, barrier systems will also prevent loss of propellant, and have found increased use with this propellant.

8 Description

Nitrous oxide is a nonflammable, colorless and odorless, sweet-tasting gas. It is usually handled as a compressed gas, stored in metal cylinders.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for nitrous oxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—
Production	—	+	—
Acidity or alkalinity	+	—	—
Carbon dioxide	+	≤300 ppm	≤0.03%
Carbon monoxide	+	≤5 ppm	≤0.001%

Nitrogen dioxide	—	—	≤1 ppm
Nitric monoxide and nitrogen dioxide	—	≤2 ppm	—
Halogens	—	—	≤1 ppm
Oxidizing substances	+	—	—
Potassium permanganate-reducing substances	+	—	—
Ammonia	—	—	≤0.0025%
Chloride	+	—	—
Air	—	—	≤1.0%
Water	—	≤67 ppm	≤150 mg/m^3
Assay	≥97.0%	≥98.0%	≥99.0%

10 Typical Properties

Density 1.53 g/cm^3

Flammability Nonflammable, but supports combustion.

Solubility Freely soluble in chloroform, ethanol (95%), ether, and oils; soluble 1 in 1.5 volumes of water at 20°C and 101.3 kPa pressure.

Vapor density (absolute) 1.97 g/cm^3 at standard temperature and pressure.

Vapor density (relative) 1.52 (air = 1)

11 Stability and Storage Conditions

Nitrous oxide is essentially nonreactive and stable except at high temperatures; at a temperature greater than 500°C nitrous oxide decomposes to nitrogen and oxygen. Explosive mixtures may be formed with other gases such as ammonia, hydrogen, and other fuels. Nitrous oxide should be stored in a tightly sealed metal cylinder in a cool, dry place.

12 Incompatibilities

Nitrous oxide is generally compatible with most materials encountered in pharmaceutical formulations, although it may react as a mild oxidizing agent.

13 Method of Manufacture

Nitrous oxide is prepared by heating ammonium nitrate to about 170°C. This reaction also forms water.

14 Safety

Nitrous oxide is most commonly used therapeutically as an anesthetic and analgesic. Reports of adverse reactions to nitrous oxide therefore generally concern its therapeutic use, where relatively large quantities of the gas may be inhaled, rather than its use as an excipient.

The main complications associated with nitrous oxide inhalation occur as a result of hypoxia. Prolonged administration may also be harmful. Nitrous oxide is rapidly absorbed on inhalation.

15 Handling Precautions

Handle in accordance with procedures for handling metal cylinders containing liquefied or compressed gases. Eye protection, gloves, and protective clothing are recommended. Nitrous oxide is an anesthetic gas and should be handled in a well-ventilated environment. In the UK, the recommended long-term (8-hour TWA) workplace exposure limit for nitrous oxide is 183 mg/m^3 (100 ppm).[1]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in nonparenteral medicines licensed in the UK and US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Carbon dioxide; nitrogen.

18 Comments

A mixture of 50% nitrous oxide and 50% oxygen (*Entonox*, BOC) is commonly used as an analgesic administered by inhalation.

Therapeutically, nitrous oxide is best known as an anesthetic administered by inhalation. When used as an anesthetic it has strong analgesic properties but produces little muscle relaxation. Nitrous oxide is always administered in conjunction with oxygen since on its own it is hypoxic.

A specification for nitrous oxide is contained in the *Food Chemicals Codex* (FCC).[2]

The EINECS number for nitrous oxide is 233-032-0. The PubChem Compound ID (CID) for nitrous oxide is 948.

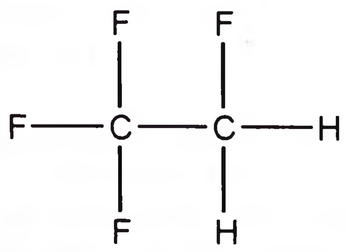
Norflurane (HFC)

1 Nonproprietary Names

BP: Norflurane
PhEur: Norflurane

2 Synonyms

Dymel 134a/P; fluorocarbon 134a; *Frigen 134a*; *Genetron 134a*; HFA 134a; HFC 134a; *Isceon 134a*; *Klea 134a*; propellant 134a; refrigerant 134a; *Solkane 134a*; *Suva 134a*; tetrafluoroethane; *Zephex 134a*.



3 Chemical Name and CAS Registry Number

1,1,1,2-Tetrafluoroethane [811-97-2]

4 Empirical Formula and Molecular Weight

$C_2H_2F_4$ 102.0

5 Structural Formula

6 Functional Category

Aerosol propellant.

7 Applications in Pharmaceutical Formulation or Technology

Norflurane is a hydrofluorocarbon (HFC) or hydrofluoroalkane (HFA) aerosol propellant that contains hydrogen, fluorine, and carbon, as opposed to chlorofluorocarbons (CFCs), which contain chlorine, fluorine, and carbon. The lack of chlorine in the molecule and the presence of hydrogen reduce the ozone depletion activity to practically zero. Hence norflurane is an alternative to CFCs in the formulation of metered-dose inhalers (MDIs).[1–9] It has replaced CFC-12 as a refrigerant and propellant since it has essentially the same vapor pressure. Very low Kauri-butanol value and solubility parameters indicate that it is not a good solvent for the commonly used surfactants for MDIs. Sorbitan trioleate, sorbitan sesquioleate, oleic acid, and soya lecithin show limited solubility in norflurane and the amount of surfactant that actually dissolves may not be sufficient to keep a drug readily dispersed. Up to 10% ethanol may be used to increase its solubility.

When norflurane (P-134a) is used for pharmaceutical aerosols and MDIs, the pharmaceutical grade must be specified. Industrial grades may not be satisfactory due to their impurity profiles.

8 Description

Norflurane is a liquefied gas and exists as a liquid at room temperature when contained under its own vapor pressure, or as a gas when exposed to room temperature and atmospheric pressure. The liquid is practically odorless and colorless. The gas in high concentrations has a slight etherlike odor. Norflurane is noncorrosive, nonirritating, and nonflammable.

9 Pharmacopeial Specifications

Table I: Pharmacopeial specifications for norflurane.

Test	PhEur 9.2
Identification	+
Characters	+
Appearance	+
Acidity[a]	≤0.1 ppm
Non-volatile matter	≤50 ppm
Non-condensable gases	≤1.5% (v/v)

CFC 12	≤100 ppm
HCFC 124	≤100 ppm
HFC 134	≤1000 ppm
HFC 152a	≤500 ppm
HFC 143a	≤50 ppm
Limit of unsaturated impurities	
CFC 1112a	≤5 ppm
HCFC 1122	≤5 ppm
HFC 1225ye/c	≤5 ppm
HFC 1243zf	≤5 ppm
Other impurities	≤5 ppm
Total other	≤10 ppm
Total impurities	≤1000 ppm

(a) Expressed as HCl.

10 Typical Properties

Boiling point −26.5°C
Density 1.21 g/cm^3 for liquid at 25°C
Flammability Nonflammable
Freezing point −108°C
Kauri-butanol value 8
Solubility Soluble in ethanol (95%), ether, and 1 in 1294 parts of water at 20°C.

Specific gravity 1.208 at 25°C
Vapor density (absolute) 4.466 g/L at standard temperature and pressure.
Vapor density (relative) 3.6 (air = 1) at 25°C
Vapor pressure
662 kPa (96 psia) at 25°C
Viscosity (dynamic)
0.222 mPa s (0.222 cP) for liquid at 20°C;
0.210 mPa s (0.210 cP) for liquid at 25°C.

11 Stability and Storage Conditions

Norflurane is a nonreactive and stable material. The liquified gas is stable when used as a propellant and should be stored in a metal cylinder in a cool dry place.

12 Incompatibilities

The major incompatibility of norflurane is its lack of miscibility with water. Since it has a very low Kauri-butanol value, norflurane is considered to be a very poor solvent for most drugs used in MDI formulations. It also shows a low solubility for some of the commonly used MDI surfactants.

Norflurane is also incompatible with alkali metals, alkaline earth metals, powdered metals, and powdered metal salts.[10]

13 Method of Manufacture

Norflurane can be prepared by several different routes; however, the following routes of preparation illustrate the methods used:

Isomerization/hydrofluorination of 1,1,2-trichloro-1,2,2-trifluoroethane (CFC-113) to 1,1-dichloro-1,2,2,2-tetrafluoroethane (CFC-114a), followed by hydrodechlorination of the latter.

Hydrofluorination of trichloroethylene, via 1-chloro-1,1,1-trifluoroethane (HCFC-133a).

14 Safety

Norflurane is used as a refrigerant and as a non-CFC propellant in various aerosols including topical pharmaceuticals and MDIs. It is regarded as nontoxic and nonirritating when used as directed.

No acute or chronic hazard is present when exposures to the vapor are below the acceptable exposure limit (AEL) of 1000 ppm, 8-hour and 12-hour time weighed average (TWA).[11] In this regard it has the same value as the threshold limit value (TLV) for CFC-12. Inhaling a high concentration of norflurane vapors can be harmful and is similar to inhaling vapors of CFC-12. Intentional inhalation of vapors of norflurane can be dangerous and may cause death. The same labeling required on CFC aerosols would be required for those containing norflurane as a propellant (except for the EPA requirement). *See* Chlorofluorocarbons (CFC), Section 14.

15 Handling Precautions

Norflurane is usually encountered as a liquefied gas and appropriate precautions for handling should be taken. Eye protection, gloves, and protective clothing are recommended.

Norflurane should be handled in a well-ventilated environment. The vapors are heavier than air and do not support life; therefore, when cleaning large tanks that have contained the propellant, adequate provisions for oxygen supply in the tanks must be made in order to protect workers cleaning the tanks.

Although nonflammable, when heated to decomposition norflurane emits toxic fumes.

In the UK, the long-term workplace exposure limit (8-hour TWA) for norflurane is 4240 mg/m^3 (1000 ppm).[12]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (aerosol formulations for inhalation and nasal applications). Included in non-parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Difluoroethane; heptafluoropropane.

18 Comments

The use of norflurane as a propellant for MDIs has been the subject of numerous patents throughout the world. These patents cover the formulation of MDIs and use of specific surfactants, cosolvents, etc. A US patent claims a self-propelling aerosol formulation that may be free of CFCs and which comprises a medicament, 1,1,1,2-tetrafluoroethane, a surface-active agent, and at least one compound having a higher polarity than 1,1,1,2-tetrafluoroethane.[13] Another patent has been issued by the European Patent Office and has 14 claims, among them a claim that includes norflurane, an alcohol (such as ethanol), surfactant, and medicament.[14] The formulator is referred to the patent literature prior to formulating a MDI with norflurane as the propellant. The formulation of MDI with this non-CFC propellant is complicated since norflurane serves as a replacement for dichlorodifluoromethane or dichlorotetrafluoroethane. The use of an HFC as the propellant also requires a change in manufacturing procedure, which necessitates a redesign of the filling and packaging machinery for a MDI.[15] The EINECS number for norflurane is 212-377-0.

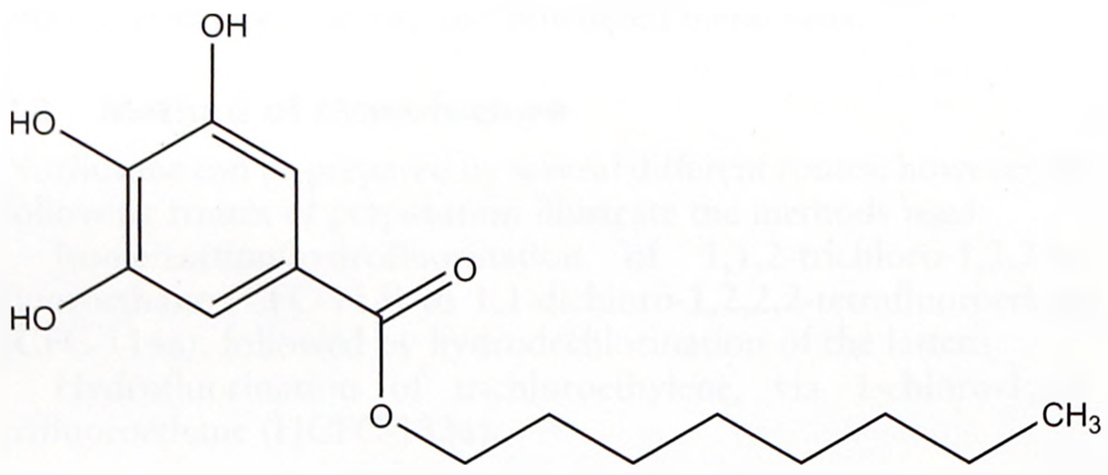
Octyl Gallate

1 Nonproprietary Names

BP: Octyl Gallate
PhEur: Octyl Gallate

2 Synonyms

Benzoic acid, 3,4,5-trihydroxy-octyl ester; E311; gallic acid, octyl ester; octil gallate; octylis gallas.



3 Chemical Name and CAS Registry Number

Octyl 3,4,5-trihydroxybenzoate [1034-01-1]

4 Empirical Formula and Molecular Weight

$C_{15}H_{22}O_5$ 282.3

5 Structural Formula

6 Functional Category

Antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Octyl gallate and other alkyl gallates have become widely used as antioxidant preservatives in cosmetics, perfumes, foods, and pharmaceuticals since the use of propyl gallate in preventing autoxidation of oils was first described in 1943.[1,2]

Octyl gallate and other alkyl gallates are used as antioxidants in foods, at concentrations of 0.001 to 0.1% w/v, to prevent deterioration and rancidity of fats and oils.[3] They are often used with other antioxidants such as butylated hydroxyanisole or butylated hydroxytoluene, and with sequestrants such as citric acid and zinc salts, to improve acceptability and efficacy.

Octyl gallate has been investigated as a means of increasing the bioavailability of orally administered veterinary pharmaceutical compounds.[4]

8 Description

Octyl gallate is a white or almost white, odorless or almost odorless, crystalline powder.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Flash point 93.3°C
Melting point 94–95°C; 100–102°C after 6 hours drying at 90°C.
Solubility *See* Table II.

Table I: Pharmacopeial specifications for octyl gallate.

Test	PhEur 9.2
Characters	+
Identification	+
Chlorides	≤100 ppm
Loss on drying	≤0.5%
Sulfated ash	≤0.1%
Impurities	+
Assay (dried substance)	97.0–103.0%

Table II: Solubility of octyl gallate.

Solvent	Solubility at 20°C
Acetone	1 in 1
Chloroform	1 in 30
Ethanol (95%)	1 in 2.5
Ether	1 in 3
Methanol	1 in 0.7
Peanut oil	1 in 33
Propylene glycol	1 in 7
Water	Practically insoluble

11 Stability and Storage Conditions

Store in non-metallic airtight containers. Protect from light.

12 Incompatibilities

The alkyl gallates are incompatible with metals, e.g. sodium, potassium, and iron, forming intensely colored complexes. Complex formation may be prevented, under some circumstances, by the addition of a sequestering agent, typically citric acid. Octyl gallate also reacts with strong oxidizing agents and strong bases.

13 Method of Manufacture

Octyl gallate is prepared by the esterification of gallic acid with octanol.[5]

14 Safety

Octyl gallate is widely used in food products and is generally regarded as a non-toxic and nonirritant material. It may cause sensitivity and skin reactions.[6,7]

The WHO has established a temporary estimated acceptable daily intake for octyl gallate at up to 0.1 mg/kg body weight.[9]

LD_{50} (IP, rat): 0.06 g/kg[8]
LD_{50} (oral, rat): 1.96 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, octyl gallate emits acrid and irritating fumes. Eye protection and gloves are recommended.

16 Regulatory Status

Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database, which has set a limit of up to 0.1 mg/kg body weight daily for octyl gallate.

17 Related Substances

Dodecyl gallate; propyl gallate.

18 Comments

Octyl gallate has been investigated for its antifungal activity,[10–12] and for its antiviral effect against influenza and other viruses.[13,14]

The EINECS number for octyl gallate is 213-853-0. The PubChem Compound ID (CID) for octyl gallate is 61253.

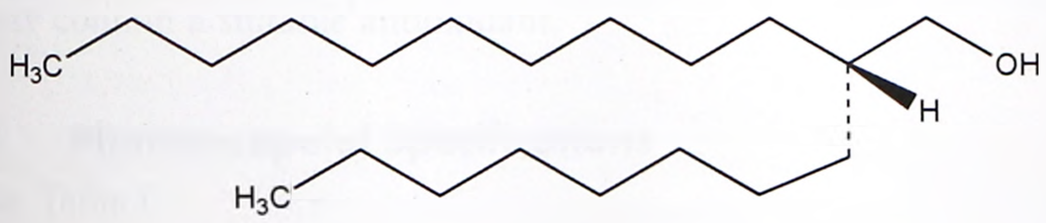
Octyldodecanol

1 Nonproprietary Names

BP: Octyldodecanol
PhEur: Octyldodecanol
USP–NF: Octyldodecanol

2 Synonyms

Eutanol G PH; isoarachidyl alcohol; *Jarcol 1-20*; *Jeecol ODD*; octildodecanol; octyldodecanolum; 2-octyl-1-dodecanol; 2-octyldodecanol; 2-octyldodecyl alcohol; *STELLIESTERS ODOL*.



3 Chemical Name and CAS Registry Number

Octyldodecanol [5333-42-6]

4 Empirical Formula and Molecular Weight

$C_{20}H_{42}O$ 298.62

5 Structural Formula

6 Functional Category

Emollient; emulsifying agent; lubricant; solvent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Octyldodecanol is widely used in cosmetics and pharmaceutical applications as an emulsifying and opacifying agent. It is primarily used in topical applications because of its lubricating and emollient properties.

Octyldodecanol has been used in the preparation of oil/water microemulsions and nanoemulsions investigated as vehicles for the dermal administration of drugs having no or low skin penetration.[1–3] Octyldodecanol has also been evaluated as a solvent for naproxen when applied topically.[4] Studies of estimated permeability coefficient suggest that octyldodecanol could be a potential dermal permeation enhancer.[5]

8 Description

Octyldodecanol occurs as a clear, colorless, or yellowish, oily liquid.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for octyldodecanol.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Acidity or alkalinity	+	—
Relative density	≈0.840	—
Refractive index	≈1.455	—
Optical rotation	−0.10° to +0.10°	—
Hydroxyl value	175–190	175–190
Iodine value	≤8.0	≤8.0
Saponification value	≤5.0	≤5.0
Acid value	—	≤0.5
Peroxide value	≤5.0	—
Water	≤0.5%	—
Sulfated ash	≤0.1%	—
Assay	≥90.0%	≥90.0%

10 Typical Properties

Boiling point 364–381°C
Flash point 180–200°C
Melting point <−20°C
Partition coefficient Log *P* (octanol : water) >8 at 23°C
Refractive index n_D^{20} = 1.45–1.46
Solubility Miscible with ether and ethanol (95%); practically insoluble in water.
Specific gravity 0.83–0.85 at 20°C
Viscosity (dynamic) 58–64 mPa s (58–64 cP) at 20°C

11 Stability and Storage Conditions

The bulk material should be stored in a well-closed container in a cool, dry place, protected from light. In the original unopened container, octyldodecanol can be stored for 2 years protected from moisture at below 30°C.

12 Incompatibilities

Octyldodecanol is generally compatible with most materials encountered in cosmetic and pharmaceutical formulations; however, it is incompatible with strong oxidizing agents.

13 Method of Manufacture

Octyldodecanol is produced by the condensation of two molecules of decyl alcohol. It also occurs naturally in small quantities in plants.

14 Safety

Octyldodecanol is widely used in cosmetics and topical pharmaceutical formulations, and is generally regarded as nontoxic and nonirritant at the levels employed as an excipient.

In acute oral toxicity studies in rats fed 5 g/kg of undiluted octyldodecanol, no deaths were observed.[6] In an acute dermal toxicity study, intact and abraded skin sites of guinea pigs were treated with 3 g/kg of undiluted octyldodecanol under occlusive patches; no deaths occurred and no gross skin lesions were observed.[6] Octyldodecanol caused either no ocular irritation or minimal, transient irritation in the eyes of rabbits.[6] However, some sources describe octyldodecanol as an eye and severe skin irritant.[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, octyldodecanol emits acrid smoke and irritating fumes.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical cream emulsions, gels, lotions, ointments and suspensions; transdermal films; vaginal tablets and creams). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

A specification for octyldodecanol is included in *Japanese Pharmaceutical Excipients* (JPE).[8]

The EINECS number for octyldodecanol is 226-242-9. The PubChem Compound ID (CID) for octyldodecanol includes 21414 and 11983377.

Oleic Acid

1 Nonproprietary Names

BP: Oleic Acid

PhEur: Oleic Acid

USP–NF: Oleic Acid

2 Synonyms

Acidum oleicum; *Crodolene*; *Crossential 094*; elaic acid; elaidic acid; *Emersol*; extraolein; *Glycon*; *Groco*; *Hy-Phi*; *Industrene*; *Metaupon*; *Neo-Fat*; *cis*-9-octadecenoic acid; 9,10-octadecenoic acid; oleinic acid; *Priolene*.

3 Chemical Name and CAS Registry Number

(*Z*)-9-Octadecenoic acid [112-80-1]

4 Empirical Formula and Molecular Weight

$C_{18}H_{34}O_2$ 282.47

5 Structural Formula

6 Functional Category

Emulsifying agent; penetration enhancer; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Oleic acid is used as an emulsifying agent in foods and topical pharmaceutical formulations. It has been investigated as a penetration enhancer in transdermal formulations,[1–21] to improve the bioavailability of poorly water-soluble drugs in tablet formulations,[22] and as part of a vehicle in soft gelatin capsules, in topical nanoemulsion,[23,24] lipid-emulsion[25] and microemulsion[26–35] formulations, in oral self-emulsifying drug delivery systems,[36,37] bioadhesive gels,[38] in oral mucoadhesive patches,[39] buccal delivery[40] and in a metered-dose inhaler.[41] It has also been used as a solubilizer[42,43] and as an iontophoresis pre-treatment.[44–46]

The phase behavior of sonicated dispersions of oleic acid has been described,[47] and mechanisms for the topical penetration-enhancing actions of oleic acid have been presented.[48,49] Oleic acid has also been studied as a plasticizer in drug-loaded casein beads,[50] as a phospholipid stabilizer[51] and viscosity enhancer.[52]

8 Description

A yellowish to pale brown, oily liquid with a characteristic lard-like odor and taste. Pure oleic acid is a colorless liquid (above 5-7°).

Oleic acid consists chiefly of (*Z*)-9-octadecenoic acid together with varying amounts of saturated and other unsaturated acids. It may contain a suitable antioxidant.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for oleic acid.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+

Linoleic acid	≤18.0%	≤18.0%
Linolenic acid	≤4.0%	≤4.0%
Fatty acids of chain length greater than C_{18}	≤4.0%	≤4.0%
Acid value	195–204	196–204
Iodine value	89–105	85–105
Peroxide value	≤10.0	≤10.0
Congealing temperature	—	+
From animal sources	—	3–10°C
From vegetable sources	—	10–16°C
Margaric acid	+	—
From animal sources	≤4.0%	—
From vegetable sources	≤0.2%	—
Color of solution	+	—
Assay	65–88%	≥65.0%
Water	—	≤0.4%

10 Typical Properties

Acidity/alkalinity pH = 4.4 (saturated aqueous solution)

Autoignition temperature 363°C

Boiling point 286°C at 13.3 kPa (100 mmHg) (decomposition at 80–100°C)

Density 0.895 g/cm^3

Flash point 189°C

Melting point 6–12°C; pure oleic acid solidifies at 4°C[53]

Refractive index n_D^{26} = 1.4585

Solubility Miscible with benzene, chloroform, ethanol (95%), ether, hexane, and fixed and volatile oils; practically insoluble in water.

Vapor pressure 133 Pa (1 mmHg) at 176.5°C

Viscosity (dynamic) 26 mPa s (26 cP) at 25°C

11 Stability and Storage Conditions

On exposure to air, oleic acid gradually absorbs oxygen, darkens in color, and develops a more pronounced odor. At atmospheric pressure, it decomposes when heated at 80–100°C.

Oleic acid should be stored in a well-filled, well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Incompatible with aluminum, calcium, heavy metals, iodine solutions, perchloric acid, and oxidizing agents. Oleic acid reacts with alkalis to form soaps.

13 Method of Manufacture

Oleic acid is obtained by the hydrolysis of various animal and vegetable fats or oils, such as olive oil, followed by separation of the liquid acids. It consists chiefly of (Z)-9-octadecenoic acid. Oleic acid that is to be used systemically should be prepared from edible sources.

14 Safety

Oleic acid is used in oral and topical pharmaceutical formulations.

In vitro tests have shown that oleic acid causes rupture of red blood cells (hemolysis), and intravenous injection or ingestion of a large quantity of oleic acid can therefore be harmful. The effects of oleic acid on alveolar[54] and buccal[55] epithelial cells *in vitro* have also been studied; the *in vitro* and *in vivo* effects of oleic acid on rat skin have been reported.[56] Oleic acid is a moderate skin irritant; it should not be used in eye preparations.

An acceptable daily intake for the calcium, sodium, and potassium salts of oleic acid was not specified by the WHO since the total daily intake of these materials in foods was such that they did not pose a hazard to health.[57]

LD_{50} (mouse, IV): 0.23 g/kg[58]

LD_{50} (rat, IV): 2.4 mg/kg

LD_{50} (rat, oral): 74 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Gloves and eye protection are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (inhalation, nasal and oral aerosols; oral tablets; topical emulsions and solutions; transdermal films and patches). Included in nonparenteral medicines (metered-dose inhalers; oral prolonged-release capsules; oral prolonged-release granules) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ethyl oleate.

18 Comments

The USP 40–NF 35 S1 requires the label for oleic acid to indicate if it is for external use only, whether it is derived from animal or vegetable sources, and the name and quantity of any added substances. The PhEur 9.2 requires the label to state whether the oleic acid is obtained from animal or vegetable sources.

Several grades of oleic acid are commercially available, ranging in color from pale yellow to reddish brown. Different grades become turbid at varying temperatures depending upon the amount of saturated acid present. Usually, oleic acid contains 7–12% saturated acids, such as stearic and palmitic acid, together with other unsaturated acids, such as linoleic acid.

Oleic acid has been shown to be an important factor in the hypoglycemic effect produced by multiple emulsions containing insulin intended for intestinal delivery of insulin.[59]

Oleic acid has been reported to act as an ileal 'brake' that slows down the transit of luminal contents through the distal portion of the small bowel.[60]

Oleic acid labeled with ^{131}I and ^{3}H is used in medical imaging.

A specification for oleic acid is contained in the *Food Chemicals Codex* (FCC)[61] and in the *Japanese Pharmaceutical Excipients* (JPE).[62]

The EINECS number for oleic acid is 204-007-1. The PubChem Compound ID (CID) for oleic acid includes 965 and 445639.

Oleyl Alcohol

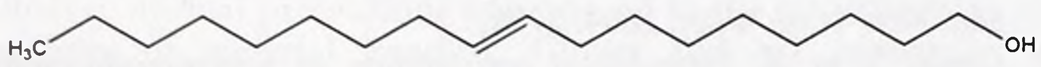
1 Nonproprietary Names

BP: Oleyl Alcohol
PhEur: Oleyl Alcohol
USP–NF: Oleyl Alcohol

2 Synonyms

Alcohol oleicus; *HD-Eutanol V PH*; *Novol*; *Ocenol*; *cis*-9-octadecen-1-ol; oleic alcohol; oleo alcohol; oleol.

3 Chemical Name and CAS Registry Number



(Z)-9-Octadecen-1-ol [143-28-2]

4 Empirical Formula and Molecular Weight

$C_{18}H_{36}O$ 268.48

The USP 40–NF 35 S1 describes oleyl alcohol as a mixture of unsaturated and saturated high molecular weight fatty alcohols consisting chiefly of oleyl alcohol.

5 Structural Formula

6 Functional Category

Emollient; emulsifying agent; penetration enhancer; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Oleyl alcohol is mainly used as an emollient, solubilizer, and emulsifying agent in topical pharmaceutical formulations, and it has also been used in transdermal delivery formulations.[1–8] It has been utilized in the development of biodegradable injectable thermoplastic oligomers,[9] pH-sensitive liposome formulations,[10,11] and in aerosol formulations of insulin[12] and albuterol.[13]

8 Description

Oleyl alcohol occurs as a colorless or light yellow oily liquid with a faint characteristic odor and bland taste.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

10 Typical Properties

Boiling point 330–360°C
Density 0.847–0.850 g/cm^3 at 40°C
Flash point 189–191°C
Melting point 13–19°C
Partition coefficient Log *P* (octanol : water) = 7.50.
Solubility Soluble in ethanol (95%), ether, isopropyl alcohol, and light mineral oil; insoluble in water.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

The bulk material should be stored in a well-closed container in a cool, dry, place.

Table I: Pharmacopeial specifications for oleyl alcohol.

Test	PhEur 9.2	USP 40–NF 35 S1
Appearance	+	–
Cloud point	<10°C	<10°C

12 Incompatibilities

—

13 Method of Manufacture

Oleyl alcohol is produced by catalytic, high-pressure hydrogenation of oleic acid followed by filtration and distillation. Synthetically, it can be prepared from butyl oleate by a Bouveault–Blanc reduction with sodium and butyl alcohol. An alternative method of manufacture is by the hydrogenation of triolein in the presence of zinc chromite.

14 Safety

Oleyl alcohol is mainly used in topical pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material at the levels employed as an excipient. However, contact dermatitis due to oleyl alcohol has been reported.[14–18]

The results of acute oral toxicity and percutaneous studies in animals with products containing 8% oleyl alcohol indicate a very low toxicity.[19] Formulations containing 8% or 20% oleyl alcohol administered by gastric intubation, at doses up to 10 g/kg bodyweight, caused no deaths and no toxic effects in rats.[19]

LD_{50} (rat, oral): >5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical emulsions, creams, and ointments; transdermal controlled-release films). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Oleic acid; oleyl oleate.

Oleyl oleate

Empirical formula $C_{36}H_{68}O_2$
Molecular weight 532.9
CAS number [3687-45-4]
Refractive index n_D^{25} = 1.464–1.466
Specific gravity 0.861–0.882
Solubility Miscible with chloroform and with diethyl ether; slightly soluble in ethanol.

18 Comments

Oleyl alcohol is a mixture of unsaturated and staturated long-chain fatty alcohols consisting mainly of octadec-9-enol (oleyl alcohol and elaidyl alcohol). It may be of animal or vegetable origin.

Oleyl alcohol occurs naturally in fish oils. Therapeutically, it has been suggested that oleyl alcohol may exhibit antitumor properties via transmembrane permeation.[20,21]

A specification for oleyl alcohol is included in the *Japanese Pharmaceutical Excipients* (JPE).[22]

The EINECS number for oleyl alcohol is 205-597-3. The PubChem Compound ID (CID) for oleyl alcohol is 5284499.

Olive Oil

1 Nonproprietary Names

BP: Refined Olive Oil
JP: Olive Oil
PhEur: Olive Oil, Refined
USP–NF: Olive Oil

2 Synonyms

Gomenoleo oil; olea europaea oil; oleum olivae; olivae oleum raffinatum; pure olive oil.

3 Chemical Name and CAS Registry Number

Olive oil [8001-25-00]

4 Empirical Formula and Molecular Weight

Olive oil is a mixture of fatty acid glycerides. Analysis of olive oil shows a high proportion of unsaturated fatty acids, and a typical analysis shows that the composition of the fatty acids is as follows:

Myristic acid (14 : 0), ≤0.5%
Palmitic acid (16 : 0), 7.5–20.0%
Palmitoleic acid (16 : 1), 0.3–5.0%
Hepatodecenoic acid (17 : 1), ≤0.3%
Stearic acid (18 : 0), 0.5–5.0%
Oleic acid (18 : 1), 55.0–83.0%
Linoleic acid (18 : 2), 3.5–21.0%
Linolenic acid (18 : 3), ≤0.9%
Arachidic acid (20 : 0), ≤0.6%
Eicosenoic acid (20 : 1), ≤0.4%
Behenic acid (22 : 0), ≤0.2%
Lignoceric acid (24 : 0), ≤1.0%
Sterols are also present.

5 Structural Formula

See Section 4.

6 Functional Category

Oleaginous vehicle.

7 Applications in Pharmaceutical Formulation or Technology

Olive oil has been used in enemas, liniments, ointments, plasters, and soap. It has also been used in oral capsules and solutions, and as a vehicle for oily injections including targeted delivery systems.[1] Olive oil has been investigated for use in self-emulsifying and self-microemulsifying formulations for a variety of drug molecules. It has been used in topically applied lipogels of methyl nicotinate.[2] Olive oil has been used in combination with soybean oil to prepare lipid emulsion for use in pre-term infants.[3]

8 Description

Olive oil is the fixed oil obtained by cold expression or other suitable mechanical means from the ripe drupes of *Olea europaea*. It occurs as a clear, colorless or yellow, transparent oily liquid. It may contain suitable antioxidants.

Refined olive oil is obtained by refining crude olive oil such that the glyceride content of the oil is unchanged. A suitable antioxidant may be added.

9 Pharmacopeial Specifications

The regulation of olive oil is different in different countries. The pharmacopeial specifications are also different, and may refer to different materials. In JP XVII the monograph covers either mixtures of refined olive oil and virgin olive oil or just refined olive oil. In the USP 40–NF 35 S1 and PhEur 9.2, the monographs are specific for refined olive oil.

See Table I.

10 Typical Properties

Flash point 225°C
Refractive index n_D^{25} = 1.4657–1.4893
Smoke point 160–188°C
Solubility Slightly soluble in ethanol (95%); miscible with ether, chloroform, light petroleum (50–70°C), and carbon disulfide.

11 Stability and Storage Conditions

When cooled, olive oil becomes cloudy at approximately 10°C, and becomes a butter-like mass at 0°C.

Olive oil should be stored in a cool, dry place in a tight, well-filled container, protected from light.

For refined oil intended for use in the manufacture of parenteral dosage forms, the PhEur 9.2 requires that the bulk oil be stored under an inert gas.

12 Incompatibilities

Olive oil may be saponified by alkali hydroxides. As it contains a high proportion of unsaturated fatty acids, olive oil is prone to oxidation and is incompatible with oxidizing agents.

13 Method of Manufacture

Virgin olive oil is produced by crushing olives (the fruit of *Olea europaea*), typically using an edge runner mill. The oil is then expressed from the crushed mass solely by mechanical or other physical methods under conditions that do not cause deterioration of the oil. Any further treatment that the oil undergoes is limited to washing, decantation, centrifugation, and filtration.

Refined olive oil is obtained from virgin olive oil by refining methods that do not alter the initial glyceride content of the oil.

14 Safety

Olive oil is used widely as an edible oil and in food preparations and products such as cooking oils and salad dressings. It is used in cosmetics and topical pharmaceutical formulations. Olive oil is generally regarded as a relatively nonirritant and nontoxic material when used as an excipient.

Olive oil is a demulcent and has mild laxative properties when taken orally. It has been used in topical formulations as an emollient and to sooth inflamed skin; to soften the skin and crusts in eczema; in massage oils; and to soften earwax.[4]

There have been isolated reports that olive oil may cause a reaction in hypersensitive individuals. However, this is relatively uncommon.[5–7] Olive oil is an infrequent sensitizer and does not appear to be a significant allergen in the US, possibly due to the development of oral tolerance.

Table I: Pharmacopeial specifications for olive oil.

Test	JP XVII	PhEur 9.2[a]	USP 40–NF 35 S1[b]
Identification	—	+	—
Characters	+	+	—

(a) The PhEur 9.2 monograph refers to refined olive oil.
(b) The USP 40–NF 35 S1 monograph refers to refined olive oil.
(c) If intended for use in the manufacture of parenteral preparations, the PhEur imposes a limit of <5.0

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Olive oil spills are slippery and an inert oil absorbent should be used to cover the oil, which can then be disposed of according to the appropriate legal regulations.

16 Regulatory Status

Olive oil is an edible oil. Included in the FDA Inactive Ingredients Database (oral capsules and solution; topical solutions). Included in nonparenteral medicines licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database. For nontopical uses, refined olive oil is generally preferred.

17 Related Substances

Crude olive-pomace oil; extra virgin olive oil; fine virgin olive oil; lampante virgin olive oil; olive-pomace oil; refined olive-pomace oil; virgin olive oil.

Crude olive-pomace oil

Comments Crude olive-pomace oil is olive-pomace oil that is intended for refining prior to its use in food for human consumption, or that is intended for technical purposes.

Extra virgin olive oil

Comments Extra virgin oil is a virgin oil that has an organoleptic rating of not less than 6.5, and a free acidity (as oleic acid) of not more than 1.0 g per 100 g.

Fine virgin olive oil

Comments Fine virgin oil has an organoleptic rating of not less than 5.5, and a free acidity (as oleic acid) of not more than 1.5 g per 100 g.

Lampante virgin olive oil

Comments Lampante virgin olive oil is virgin olive oil that is not fit for consumption unless it is further processed. This grade of oil is intended for refining or technical purposes.

Olive-pomace oil

Comments Olive-pomace oil is the oil obtained from the solvent extraction of olive pomace, but does not include oils obtained by reesterification processes or any mixture with oils of any kind. Olive-pomace oil of commerce is a blend of refined olive-pomace oil and virgin olive oil that is fit for human consumption. *See also* Section 18.

Refined olive-pomace oil

Comments Refined olive-pomace oil is obtained from crude olive-pomace oil by refining methods that do not alter the initial glyceride structure. It is intended for consumption, or blended with virgin olive oil.

Virgin olive oil

Comments Virgin olive oil has an organoleptic rating of not less than 3.5, and a free acidity (as oleic acid) of not more than 3.3 g per 100 g. The PhEur 9.2 contains a monograph on virgin olive oil as well as refined olive oil.

18 Comments

Olive oil is available in a variety of different grades; *see* Section 17. All olive oils are graded according to the degree of acidity.

Olive oil is used widely in the food industry as a cooking oil and for preparing salad dressings. The flavor, color, and fragrance of olive oils may vary, depending on the region where the olives are grown, the condition of the crops, and the type of olive used. Therapeutically, it has been used to soften ear wax.[4]

In cosmetics, olive oil is used as a solvent, and also as a skin and hair conditioner. Types of products containing olive oil include shampoos and hair conditioners, cleansing products, topical creams and lotions, and sun-tan products.

Olive-pomace oil is obtained from the olive pomace by solvent extraction. The use of solvent extraction causes small changes in the typical fatty acid composition of the oil, and changes in organoleptic properties and impurities. Other oils can be prepared by reesterification of the appropriate combination of fatty acids with glycerol. Olive-pomace oils or reesterified oils cannot be called olive oil.

Palmitic Acid

1 Nonproprietary Names

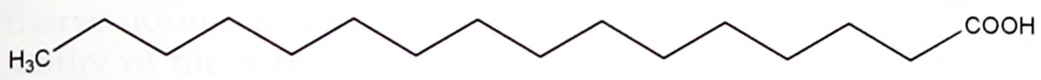
BP: Palmitic Acid

PhEur: Palmitic Acid

USP–NF: Palmitic Acid

2 Synonyms

Acidum palmiticum; cetylic acid; *Edenor C16 98-100*; *Emersol 140*; *Emersol 143*; *n*-hexadecoic acid; hexadecylic acid; *Hydrofol*; *Hystrene 9016*; *Industrene 4516*; *Lunac P-95*; *NAA-160*; 1-pentadecanecarboxylic acid.



3 Chemical Name and CAS Registry Number

Hexadecanoic acid [57-10-3]

4 Empirical Formula and Molecular Weight

$C_{16}H_{32}O_2$ 256.42

5 Structural Formula

6 Functional Category

Emulsifying agent; penetration enhancer; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Palmitic acid is used in oral and topical pharmaceutical formulations as an emulsifying agent, skin penetration enhancer, and tablet and capsule lubricant.

Palmitic acid has been investigated for use in implants for sustained release of insulin in rats.[1,2]

8 Description

Palmitic acid occurs as white crystalline scales with a slight characteristic odor and taste.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for palmitic acid.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance	+	—
Acidity	+	—
Acid value	216–220	216–220
Color	—	+

10 Typical Properties

Boiling point 351–352°C; 271.5°C at 100 mmHg
Flash point >110°C
Melting point 63–64°C
Solubility Soluble in ethanol (95%); practically insoluble in water.
Specific gravity 0.849–0.851

11 Stability and Storage Conditions

The bulk material should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Palmitic acid is incompatible with strong oxidizing agents, reducing agents, and bases.

13 Method of Manufacture

Palmitic acid occurs naturally in all animal fats as the glyceride, palmitin, and in palm oil partly as the glyceride and partly uncombined. Palmitic acid is most conveniently obtained from olive oil after removal of oleic acid, or from Japanese beeswax. Synthetically, palmitic acid may be prepared by heating cetyl alcohol with soda lime to 270°C or by fusing oleic acid with potassium hydrate.

14 Safety

Palmitic acid is used in oral and topical pharmaceutical formulations and is generally regarded as nontoxic and nonirritant at the levels employed as an excipient. However, palmitic acid is reported to be an eye and skin irritant at high levels and is poisonous by intravenous administration.

LD_{50} (mouse, IV): 57 mg/kg[3]
LD_{50} (rat, oral): >10000 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When palmitic acid is heated to decomposition, carbon dioxide and carbon monoxide are formed. Lab coat, gloves, dust respirator and safety glasses are recommended.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Ingredients Database.

17 Related Substances

Lauric acid; myristic acid; palmitin; sodium palmitate; stearic acid.

Palmitin

Empirical formula $C_{51}H_{98}O_6$
Molecular weight 807.29
CAS number [555-44-2]
Refractive index $n_D^{25} = 1.4381$
Specific gravity 0.886
Solubility Soluble in benzene, chloroform, and ether; practically insoluble in ethanol (95%) and in water.

Sodium palmitate

Synonyms Hexadecanoic acid sodium salt; palmitic acid sodium salt; sodium hexadecanoate.
Empirical formula $C_{16}H_{31}O_2Na$
Molecular weight 278.47
CAS number [408-35-5]
Melting point 283–290°C
Comments Sodium palmitate is used as a surfactant and emulsifying agent in pharmaceutical formulations. The EINECS number for sodium palmitate is 206-988-1.

18 Comments

Therapeutically, palmitic acid has been studied as an inhibitor of HIV infection.[4–6]

A specification for palmitic acid is included in the *Food Chemicals Codex*[7] and in the *Japanese Pharmaceutical Excipients* 2004 (JPE).[8]

The EINECS number for palmitic acid is 200-312-9. The PubChem Compound ID (CID) for palmitic acid is 985.

Palm Kernel Oil

P

1 Nonproprietary Names

BP: Fractionated Palm Kernel Oil
USP–NF: Palm Kernel Oil

2 Synonyms

Elaeis guineensis seed oil; oleum palmae nuclei; palm-nut oil.

3 Chemical Name and CAS Registry Number

Palm kernel oil [8023-79-8]

4 Empirical Formula and Molecular Weight

Palm kernel oil consists of glyceride esters of fatty acids, primarily lauric (48%), myristic (16%), and oleic (15%) acids.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; suppository base.

7 Applications in Pharmaceutical Formulation or Technology

Palm kernel oil is widely used in cosmetics, food products, and pharmaceuticals. Fractionated palm kernel oil is used as a basis for suppositories, whereas the unfractionated oil has been used as an emollient and ointment base.

8 Description

Palm kernel oil occurs as a white to yellowish, odorless or almost odorless, solid, brittle fat.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for palm kernel oil.[a]

Test	BP 2017	USP 40–NF 35 S1
Identification	–	+
Characters	+	–
Acid value	≤0.2	≤2.0
Iodine value	≤6.0	–
Melting point	31–36°C	27–29°C
Refractive index	1.445–1.447	–
Saponification value	246–250	–
Peroxide value	–	≤10.0
Peroxides	+	–
Unsaponifiable matter	–	≤1.5%
Water	–	≤0.1%
Limit of lead	–	≤0.1 µg/g
Fatty acid composition	–	+

(a) BP is fractionated palm kernel oil and USP–NF is palm kernel oil.

10 Typical Properties

Density 0.925–0.935
Refractive index $n_D^{40} = 1.449–1.452$
Solubility Practically insoluble in water; miscible with chloroform, ether, and petroleum spirit (boiling range, 40–60°C); practically insoluble in ethanol (96%).

11 Stability and Storage Conditions

Preserve in well-closed containers. Store at a temperature not exceeding 25°C.

12 Incompatibilities

—

13 Method of Manufacture

Palm kernel oil is obtained from the kernels of the oil palm *Elaeis guineensis* by either mechanical expression or solvent extraction.

14 Safety

Palm kernel oil is used in cosmetics and foods as well as topically in pharmaceutical formulations. It is considered safe to use in cosmetic formulations.[1]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, unhydrogenated palm kernel oil emits acrid smoke and irritating fumes.[2]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (rectal; suppository). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Palm oil.

18 Comments

Palm kernel oil is used in soap production and the oleochemical industry.

A specification for palm kernel oil (unhydrogenated) is contained in the *Food Chemicals Codex*.[3]

The EINECS number for palm kernel oil is 232-425-4.

19 Specific References

Palm Oil

1 Nonproprietary Names

USP–NF: Palm Oil

2 Synonyms

Cegesoft GPO; *Elaeis guineensis* oil; palm butter; palm fat; palm grease; palm tallow.

3 Chemical Name and CAS Registry Number

Palm oil [8002-75-3]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 states that palm oil is the refined fixed oil obtained from the pulp of the fruit of the oil palm *Elaeis guineensis* (Fam. Aracaceae). It may contain suitable antioxidants.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient.

7 Applications in Pharmaceutical Formulation or Technology

Palm oil is used as an emollient in pharmaceutical creams and ointments. It is also used as a constituent for suppositories.[1] Palm oil mixed with polysorbate 80 has been found to enhance the oral bioavailability of the antioxidant astaxanthin.[2]

8 Description

Palm oil occurs as a white to yellowish fatty solid with a faint odor of violets.

9 Pharmacopeial Specifications

See Table I.

Table 1: Pharmacopeial specifications for palm oil.

Test	USP 40–NF 35 S1
Identification	+
Melting range	30–40°C
Acid value	≤2.0
Peroxide value	≤5.0
Unsaponifiable matter	≤1.0%
Fatty acid composition	+
Residue on ignition	≤0.1%
Water	≤0.1%
Heavy metals	≤10 µg/g
Alkaline impurities	+

10 Typical Properties

Density 0.952 g/cm^3
Refractive index n_D^{20} = 1.453–1.459
Solubility Soluble in ethanol (96%), ether, chloroform, and carbon disulfide. Insoluble in water.

11 Stability and Storage Conditions

Store in well-closed containers. Do not store above 55°C.

12 Incompatibilities

—

13 Method of Manufacture

Palm oil is obtained by boiling, centrifugation, and mechanical expression. It is refined, bleached, and deodorized to substantially remove free fatty acids, phospholipids, color, odor and flavor components, and other miscellaneous non-oil materials.

14 Safety

Palm oil is widely used in foods as well as topically in pharmaceutical formulations. It is also considered safe for use in cosmetic formulations.[3]

TD_{LO} (oral, rat): 55 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, palm oil emits acrid smoke and irritating fumes.[4]

16 Regulatory Status

Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Palm oil, hydrogenated; palm kernel oil.

18 Comments

Palm oil is widely used in the food processing industry and in the manufacture of soaps, detergents, and other surfactants. Unrefined palm oil is rich in carotenoids, which are largely or wholly removed during standard refinement and processing.[5] The crude oil is deep orange-red with a characteristic odor, and is semisolid at 21–27°C.[5,6]

Therapeutically, palm oil is used for liver disorders in the Philippines (*Livermin*, Korea Ginseng Research).[5] Tocotrienol-rich palm oil has also been used in a nano-emulsified system for topical application against skin carcinomas.[7]

A specification for palm oil (unhydrogenated) is contained in the *Food Chemicals Codex*.[6]

The EINECS number for palm oil is 232-316-1.

Palm Oil, Hydrogenated

1 Nonproprietary Names

USP–NF: Hydrogenated Palm Oil

2 Synonyms

Cegesoft; *Dynasan P60*; *Softisan 154*.

3 Chemical Name and CAS Registry Number

Hydrogenated palm oil [68514-74-9] and [8033-29-2]

4 Empirical Formula and Molecular Weight

Hydrogenated palm oil consists mainly of triglycerides of palmitic and stearic acids.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; tablet and capsule lubricant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Hydrogenated palm oil is used in pharmaceutical formulations as a constituent of bases for suppositories, as an emulsifying agent and viscosity-increasing agent for creams, gels, and ointments, and as a lubricant and binder in tablet and capsule formulation.[1,2] It has also been used in the preparation of nanostructured lipid carriers as a vehicle for oral drug delivery.[3]

8 Description

Hydrogenated palm oil occurs as a white to yellowish, fatty solid to semisolid.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for hydrogenated palm oil.

Test	USP 40–NF 35 S1
Identification	+
Melting range	58–62°C
Acid value	≤2.0
Peroxide value	≤5.0
Unsaponifiable matter	≤0.8%
Fatty acid composition	+
Loss on drying	≤0.1%
Residue on ignition	≤0.1%
Heavy metals	≤0.001%
Alkaline impurities	+
Nickel	≤1.0 µg/g

10 Typical Properties

Solubility Practically insoluble in water; very slightly soluble in alcohol; freely soluble in ether.

11 Stability and Storage Conditions

Store in airtight containers. Protect from light.

12 Incompatibilities

—

13 Method of Manufacture

Hydrogenated palm oil is obtained by refining and hydrogenating the oil obtained from the pulp of the fruit of the oil palm *Elaeis guineensis*, and consists mainly of triglycerides of palmitic and stearic acids.

14 Safety

Hydrogenated palm oil is used in oral pharmaceutical formulations and is regarded as a safe material.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredient Database (rectal suppositories; vaginal gels). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Palm oil; palm kernel oil.

18 Comments

Hydrogenated palm oil is also widely used in the cosmetics industry.

The EINECS number for hydrogenated palm oil 271-056-3.

Paraffin

1 Nonproprietary Names

BP: Hard Paraffin
JP: Paraffin
PhEur: Paraffin, Hard
USP–NF: Paraffin

2 Synonyms

Hard wax; paraffinum durum; paraffinum solidum; paraffin wax.

3 Chemical Name and CAS Registry Number

Paraffin [8002-74-2]

4 Empirical Formula and Molecular Weight

Paraffin is a purified mixture of solid saturated hydrocarbons having the general formula C_nH_{2n+2}, and is obtained from petroleum or shale oil.

5 Structural Formula

See Section 4.

6 Functional Category

Coating agent; ointment base; stiffening agent.

7 Applications in Pharmaceutical Formulation or Technology

Paraffin is mainly used in topical pharmaceutical formulations as a component of creams and ointments. In ointments, it may be used to increase the melting point of a formulation or to add stiffness. Paraffin is additionally used as a coating agent for capsules and tablets, and is used in some food applications. Paraffin coatings can also be used to affect the release of drug from ion-exchange resin beads.[1]

8 Description

Paraffin occurs as an odorless and tasteless, translucent, colorless, or white solid. It feels slightly greasy to the touch and may show a brittle fracture. Microscopically, it is a mixture of bundles of microcrystals. Paraffin burns with a luminous, sooty flame. When melted, paraffin is essentially without fluorescence in daylight; a slight odor may be apparent.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Density ≈0.84–0.89 g/cm^3 at 20°C

Melting point Various grades with different specified melting ranges are commercially available.

Solubility Soluble in chloroform, ether, volatile oils, and most warm fixed oils; slightly soluble in ethanol; practically insoluble in acetone, ethanol (95%), and water. Paraffin can be mixed with most waxes if melted and cooled.

Spectroscopy

NIR spectrum *see* Figure 1.

Table I: Pharmacopeial specifications for paraffin.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Congealing range	–	–	47–65°C
Melting point	50–75°C	50–61°C	–
Heavy metals	≤10 ppm	–	–
Arsenic	≤2 ppm	–	–
Sulfates	+	≤150 ppm	+
Polycyclic aromatic hydrocarbons	–	+	+
Readily carbonizable substances	+	–	+
Acidity or alkalinity	+	+	+

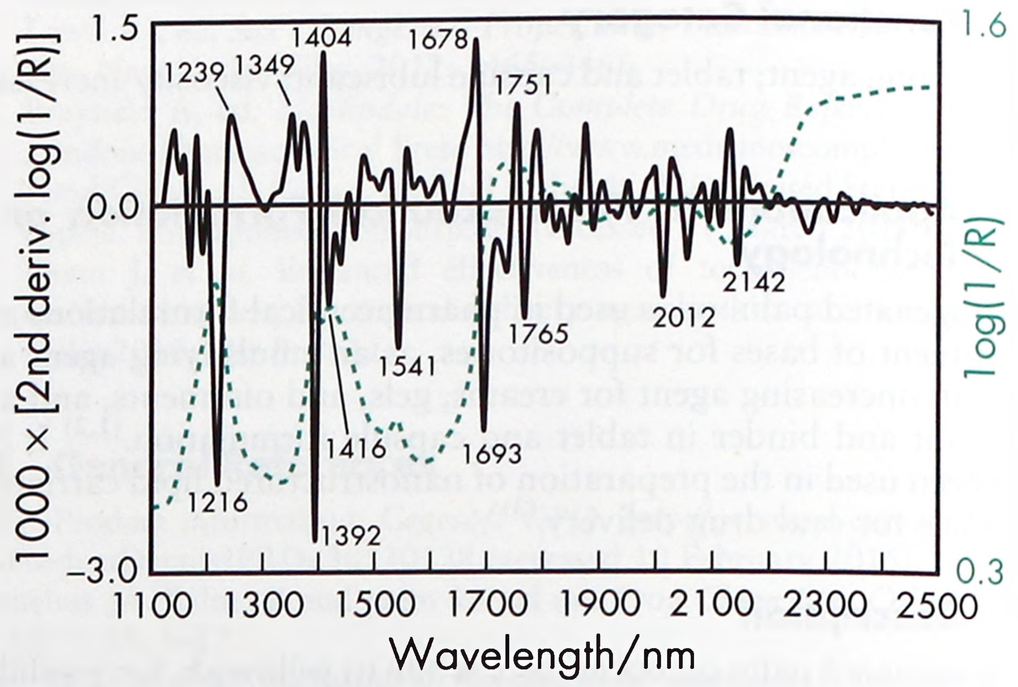

Figure 1: Near-infrared spectrum of paraffin measured by reflectance.

11 Stability and Storage Conditions

Paraffin is stable, although repeated melting and congealing may alter its physical properties. Paraffin should be stored at a temperature not exceeding 40°C in a well-closed container.

12 Incompatibilities

—

13 Method of Manufacture

Paraffin is manufactured by the distillation of crude petroleum or shale oil, followed by purification by acid treatment and filtration. Paraffins with different properties may be produced by controlling the distillation and subsequent congealing conditions.

Synthetic paraffin, synthesized from carbon monoxide and hydrogen is also available; *see* Section 17.

14 Safety

Paraffin is generally regarded as an essentially nontoxic and nonirritant material when used in topical ointments and as a coating agent for tablets and capsules. However, granulomatous reactions (paraffinomas) may occur following injection of paraffin into tissue for cosmetic purposes or to relieve pain. Long-term inhalation of aerosolized paraffin may lead to interstitial pulmonary

disease. Ingestion of a substantial amount of white soft paraffin has led to intestinal obstruction in at least one instance.[2–6]

See also Mineral Oil for further information.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. In the UK, the recommended workplace exposure limits for paraffin wax fumes are 2 mg/m^3 long-term (8-hour TWA) and 6 mg/m^3 short-term.[7]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets; topical emulsions; ointments). Included in nonparenteral medicines licensed in the UK. Accepted in the UK for use in certain food applications. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Light mineral oil; microcrystalline wax; petrolatum; synthetic paraffin.

Synthetic paraffin

Molecular weight 400–1400

Description A hard, odorless, white wax consisting of a mixture of mostly long-chain, unbranched, saturated hydrocarbons along with a small amount of branched hydrocarbons.

Melting point 96–105°C

Viscosity (dynamic) 5–15 mPa s (5–15 cP) at 135°C.

Comments The USP 40–NF 35 S1 states that synthetic paraffin is synthesized by the Fischer–Tropsch process from carbon monoxide and hydrogen, which are catalytically converted to a mixture of paraffin hydrocarbons. The lower molecular weight fractions are removed by distillation and the residue is hydrogenated and further treated by percolation through activated charcoal. This mixture may be fractionated into its components by a solvent-separation method. Synthetic paraffin may contain not more than 0.005% w/w of a suitable antioxidant.

18 Comments

The more highly purified waxes are used in preference to paraffin in many applications because of their specifically controlled physical properties such as hardness, malleability, and melting range.

A specification for synthetic paraffin is contained in the *Food Chemicals Codex* (FCC).[8]

The EINECS numbers for paraffin are 232-315-6 and 265-154-5.

Peanut Oil

1 Nonproprietary Names

BP: Arachis Oil

JP: Peanut Oil

PhEur: Arachis Oil, Refined

USP–NF: Peanut Oil

2 Synonyms

Aextreff CT; arachidis oleum raffinatum; earthnut oil; groundnut oil; katchung oil; nut oil.

3 Chemical Name and CAS Registry Number

Peanut oil [8002-03-7]

4 Empirical Formula and Molecular Weight

A typical analysis of refined peanut oil indicates the composition of the acids present as glycerides to be: arachidic acid 2.4%; behenic acid 3.1%; palmitic acid 8.3%; stearic acid 3.1%; lignoceric acid 1.1%; linoleic acid 26.0%, and oleic acid 56.0%.[1]

5 Structural Formula

See Section 4.

6 Functional Category

Oleaginous vehicle; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Peanut oil is used as an excipient in pharmaceutical formulations primarily as a solvent for sustained-release intramuscular injections.

It is also used as a vehicle for topical preparations and as a solvent for vitamins and hormones. In addition, it has been studied as part of sustained-release bead formulations,[2] nasal drug delivery systems,[3] controlled-release injectables,[4] slow-release intramuscular injections,[5] and self-emulsifying drug delivery systems.[6,7]

8 Description

Peanut oil is a colorless or pale yellow-colored liquid that has a faint nutty odor and a bland, nutty taste. At about 3°C it becomes cloudy, and at lower temperatures it partially solidifies.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Autoignition temperature 443°C
Density 0.915 g/cm^3 at 25°C
Flash point 283°C
Freezing point −5°C
Hydroxyl value 2.5–9.5
Interfacial tension 19.9 mN/m at 25°C[8]
Refractive index n_D^{25} = 1.466–1.470
Solubility Very slightly soluble in ethanol (95%); soluble in benzene, carbon tetrachloride, and oils; miscible with carbon disulfide, chloroform, ether, and hexane.
Spectroscopy

Behenic acid	–	1.0–5.0%	1.0–5.0%
Erucic acid	–	≤0.5%	≤0.5%

11 Stability and Storage Conditions

Peanut oil is an essentially stable material.[9] However, on exposure to air it can slowly thicken and may become rancid. Solidified peanut oil should be completely melted and mixed before use. Peanut oil may be sterilized by aseptic filtration or by dry heat, for example, by maintaining it at 150°C for 1 hour.[10]

Peanut oil should be stored in a well-filled, airtight, light-resistant container, at a temperature not exceeding 40°C. Material intended for use in parenteral dosage forms should be stored in a glass container.

12 Incompatibilities

Peanut oil may be saponified by alkali hydroxides.

13 Method of Manufacture

Refined peanut oil is obtained from the seeds of *Arachis hypogaea* Linné (Fam. Leguminosae). The seeds are separated from the peanut shells and are expressed in a powerful hydraulic press. The crude oil has a light yellow to light brown color, and is then purified to make it suitable for food or pharmaceutical purposes. A suitable antioxidant may be added.

14 Safety

Peanut oil is mildly laxative at a dosage of 15–60 mL orally or of 100–500 mL rectally as an enema.

Adverse reactions to peanut oil in foods and pharmaceutical formulations have been reported extensively.[11–21] These include severe allergic skin rashes[11,12] and anaphylactic shock following consumption of peanut butter.[13] Some workers have suggested

that the use in infancy of preparations containing peanut oil, including infant formula and topical preparations, is associated with sensitization to peanut, with a subsequent risk of hypersensitivity reactions, and that such products should therefore be avoided or banned.[11–15] However, the role of pharmaceutical preparations in later development of hypersensitivity is disputed since such preparations contain highly refined peanut oil that should not contain the proteins associated with allergic reactions in susceptible individuals.[16–18]

Peanut oil is harmful if administered intravenously and it should not be used in such formulations.[19]

See also Section 18.

15 Handling Precautions

Observe normal handling precautions appropriate to the circumstances and quantity of material handled. Spillages of peanut oil are slippery and should be covered with an inert absorbent material prior to disposal.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (IM injections; oral capsules; topical preparations; vaginal emulsions). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Almond oil; canola oil; corn oil; cottonseed oil; sesame oil; soybean oil; sunflower oil.

18 Comments

Therapeutically, emulsions containing peanut oil have been used in nutrition regimens, in enemas as a fecal softener, and in otic drops to soften ear wax. It is also administered orally, usually with sorbitol, as a gall bladder evacuant prior to cholecystography.

Peanut oil is also widely used as an edible oil. As a result of the potentially fatal reactions noted in Section 14, certain food products are now commonly labeled with a statement that they contain peanut oil.

A specification for unhydrogenated peanut oil is contained in the *Food Chemicals Codex* (FCC).[22]

The EINECS number for peanut oil is 232-296-4.

P

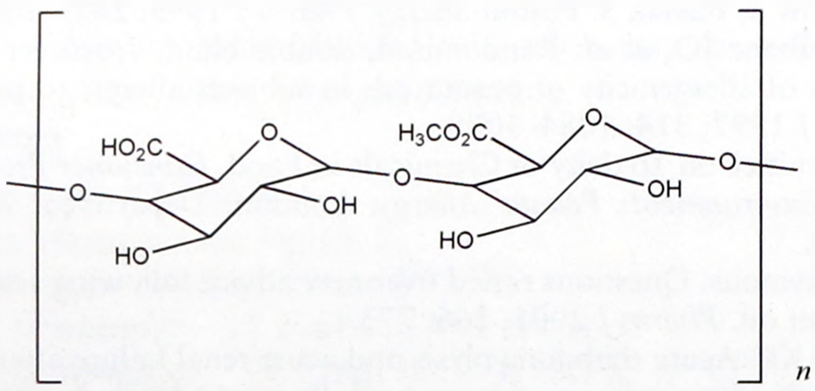
Pectin

1 Nonproprietary Names

USP–NF: Pectin

2 Synonyms

Citrus pectin; E440; *Genu*; methopectin; methyl pectin; methyl pectinate; mexpectin; pectina; pectinic acid; *Unipectine U*.



3 Chemical Name and CAS Registry Number

Pectin [9000-69-5]

4 Empirical Formula and Molecular Weight

Pectin is a high-molecular-weight, carbohydrate-like plant constituent consisting primarily of chains of galacturonic acid units linked as 1,4-α-glucosides, with a molecular weight of 30 000–100 000.

5 Structural Formula

Pectin is a complex polysaccharide comprising mainly esterified D-galacturonic acid residues in an α-(1–4) chain. The acid groups along the chain are largely esterified with methoxy groups in the natural product. The hydroxyl groups may also be acetylated.

Pectin gelation characteristics can be divided into two types: high-methoxy and low-methoxy gelation, and sometimes the low-methoxy pectins may contain amine groups. Gelation of high-methoxy pectin usually occurs at pH <3.5. Low-methoxy pectin is gelled with calcium ions and is not dependent on the presence of acid or high solids content. Amidation may interfere with gelation, causing the process to be delayed. However, gels from amidated pectins have the ability to re-heal after shearing.[1]

The USP 40–NF 35 S1 describes pectin as a purified carbohydrate product obtained from the dilute acid extract of the inner portion of the rind of citrus fruits or from apple pomace. It consists chiefly of partially methoxylated polygalacturonic acids.

6 Functional Category

Emulsifying agent; gelling agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Pectin is used as a gelling agent in intranasal formulations to modify drug absorption characteristics.[2] It has also been used as an emulsion stabilizer.[3]

Experimentally, pectin has been used in gel formulations for the oral sustained delivery of ambroxol.[4] Pectin gel beads have been shown to be an effective medium for controlling the release of a drug within the gastrointestinal (GI) tract.[5] It has also been used in a colon-biodegradable pectin matrix with a pH-sensitive polymeric coating, which retards the onset of drug release, overcoming the problems of pectin solubility in the upper GI tract.[6–9] Amidated pectin matrix patches have been investigated for the transdermal delivery of chloroquine,[10] and gelling pectin formulations for the oral sustained delivery of acetaminophen (paracetamol) have been investigated *in situ*.[11] Pectin-based matrices with varying degrees of esterification have been evaluated as oral controlled-release tablets. Low-methoxy pectins were shown to have a release rate more sensitive to the calcium content of the formulation.[12] Pectins have been used as a component in the preparation of mixed polymer microsphere systems with the intention of producing controlled drug release.[13]

8 Description

Pectin occurs as a coarse or fine, yellowish-white, odorless powder that has a mucilaginous taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for pectin.

Test	USP 40–NF 35 S1
Identification	+
Loss on drying	≤10.0%
Arsenic	≤3 ppm
Lead	≤5 ppm
Sulfur dioxide	≤50 ppm
Sugars and organic acids	≤16.0%
Total methanol, ethanol and isopropanol	≤1.0%
Microbial contamination	
Aerobic microbial count	$\leq 10^3$ cfu/g
Yeasts and molds	$\leq 10^2$ cfu/g
Assay	
Galacturonic acid	≥74.0%

10 Typical Properties

Acidity/alkalinity pH = 6.0–7.2

Solubility Soluble in water; insoluble in ethanol (95%) and other organic solvents.

Spectroscopy

NIR spectrum *see* Figure 1.

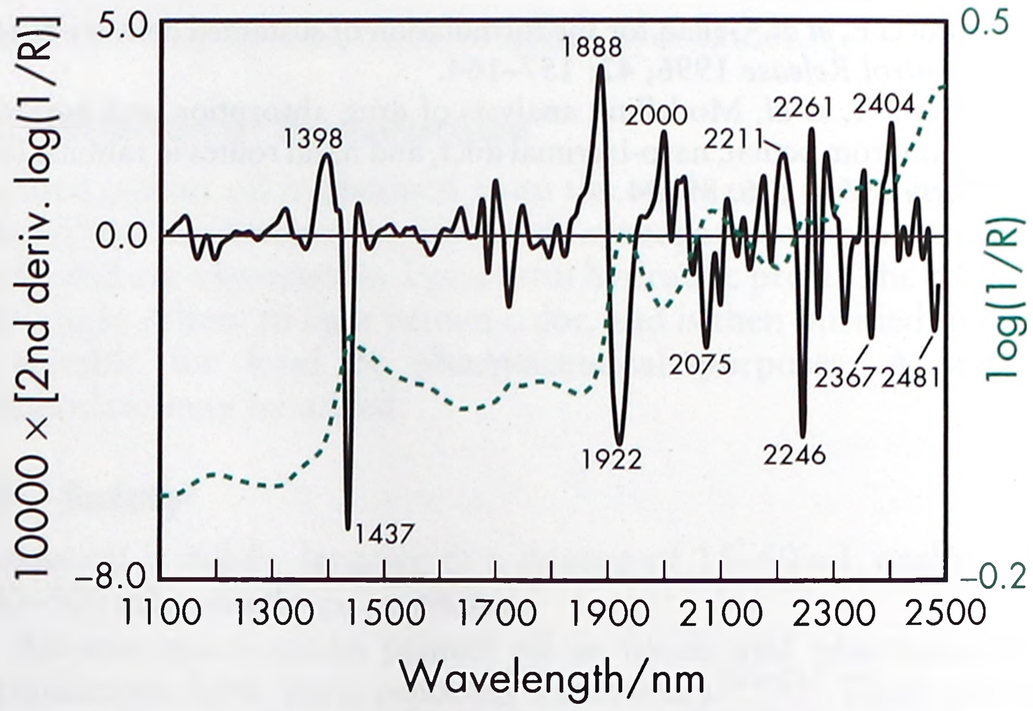


Figure 1: Near-infrared spectrum of pectin measured by reflectance.

11 Stability and Storage Conditions

Pectin is a nonreactive and stable material; it should be stored in a cool, dry place.

12 Incompatibilities

—

13 Method of Manufacture

Pectin is obtained from the diluted acid extract from the inner portion of the rind of citrus fruits or from apple pomace.

14 Safety

Pectin is used in oral pharmaceutical formulations and food products, and is generally regarded as an essentially nontoxic and nonirritant material.

Low toxicity by the subcutaneous route has been reported.[14]

LD_{50} (mouse, SC): 6.4 g/kg[14]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When pectin is heated to decomposition, acrid smoke and irritating fumes are emitted.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (dental paste; oral powders; topical pastes). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Pectin has been used in film-coating formulations containing chitosan and hydroxypropylmethyl cellulose in the investigation of the biphasic drug-release properties of film-coated acetaminophen tablets, both *in vitro*,[15,16] and *in vivo*.[17] It has been shown that chitosan acts as a crosslinking agent for concentrated pectin solutions.[18]

Pectin gel systems have been used to show the partition and release of aroma compounds in foods during storage.[19]

A specification for pectins is included in the *Food Chemical Codex* (FCC).[20] In the food industry it is used as an emulsifying agent, gelling agent, thickener, and stabilizer. Cosmetically, it is used as a binder, emulsifying agent and viscosity-controlling agent.

Pectin has been used therapeutically as an adsorbent and bulk-forming agent, and is present in multi-ingredient preparations for the management of diarrhea, constipation, and obesity.[21]

The EINECS number for pectin is 232-553-0.

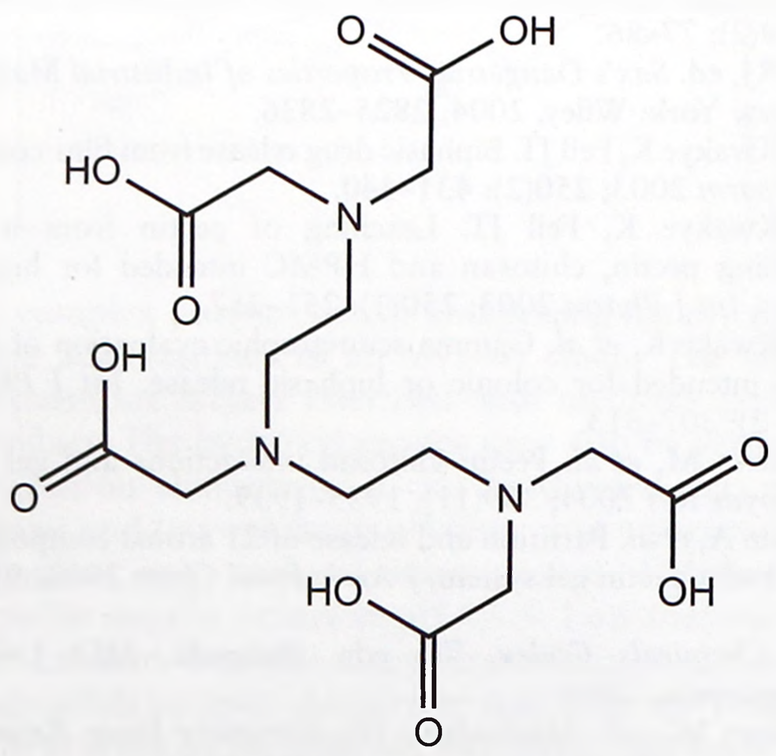
Pentetic Acid

1 Nonproprietary Names

USP–NF: Pentetic Acid

2 Synonyms

Acidicum penteticum; *N*,*N*-bis[2-[bis(carboxymethyl)amino]ethyl]-glycine; [[(carboxymethyl)imino]bis(ethylenenitrilo)]tetraacetic acid; diethylenetriamine pentaacetic acid; diethylenetriamine-*N*,*N*,*N*′,*N*′,*N*″-pentaacetic acid; (diethylenetrinitrilo)pentaacetic acid; DTPA; glycine, *N*,*N*-bis[2-[bis(carboxymethyl)amino]ethyl]; pentacarboxymethyl diethylenetriamine; *Versenex*; ZK-43649.



3 Chemical Name and CAS Registry Number

2-[Bis[2-(bis(carboxymethyl)amino)ethyl]amino]acetic acid
[67-43-6]

4 Empirical Formula and Molecular Weight

$C_{14}H_{23}N_3O_{10}$ 393.35

5 Structural Formula

6 Functional Category

Antimicrobial preservative; complexing agent.

7 Applications in Pharmaceutical Formulation or Technology

Pentetic acid is mainly used as a complexing agent in the preparation of imaging and contrast agents for radionuclide and magnetic resonance imaging.[1,2] It is also used as a carrier excipient for neutron-capture isotopes in, for example, radiotherapy.[3] Pentetic acid–isotope complexes have also been considered as surrogate active substances in scintigraphic imaging studies.[4] Pentetic acid has been used to produce antioxidant effects by forming complexes with metal ions to reduce formation of reactive oxygen species during lyophilization.[5]

See also Table I.

8 Description

Pentetic acid occurs as a white crystalline solid and is almost odorless.

Table I: Uses of pentetic acid.[6]

Use	Concentration (%)
Antioxidant	0.1–0.3
Copreservative	0.05

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for pentetic acid.

Test	USP 40–NF 35 S1
Identification	+
Residue on ignition	≤0.2%
Iron	≤0.01%
Heavy metals	≤0.005%
Nitrilotriacetic acid	≤0.1%
Assay	98.0–100.5%

10 Typical Properties

Acidity/alkalinity pH = 2.1–2.5 (1% w/v aqueous solution) for *Versenex*[7]
Melting point 220–222°C
Solubility 1 in 200 parts of water at 25°C for *Versenex*[7]

11 Stability and Storage Conditions

Pentetic acid should be stored in well-closed containers in a cool, dry place.

12 Incompatibilities

The activity of pentetic acid as a complexing agent may cause unwanted effects in formulations containing metal ions. The desired chelate may be displaced by other ions from the formulation.

13 Method of Manufacture

Pentetic acid is a pentaacetic acid triamine formed during the preparation of the amino carboxylic acid and its salt.[8]

14 Safety

Pentetic acid is used in intrathecal and intravenous injection preparations. The pure form of pentetic acid is moderately toxic by the intraperitoneal route.

LD_{50} (mouse, IP): 0.54 g/kg[9]
LD_{50} (mouse, oral): 4.84 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition pentetic acid emits acrid smoke and irritating fumes.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (intrathecal and intravenous injections). Included in intravenous and intra-articular injections licensed in the UK.

17 Related Substances

Calcium trisodium pentetate; pentasodium pentetate; zinc trisodium pentetate.

Calcium trisodium pentetate

Empirical formula $C_{14}H_{18}CaN_3Na_3O_{10}$
Molecular weight 497.35
CAS number [12111-24-9]
Synonyms Calcium DTPA; calcium pentetate; calcium trisodium DTPA; pentacin; pentetate calcium trisodium; trisodium calcium diethylenetriaminepentaacetate.
Regulatory status Included in the FDA Inactive Ingredients Database (intrathecal and intravenous injections).
Safety Calcium trisodium pentetate is moderately toxic by IV and IP routes. When heated to decomposition, it emits toxic fumes.
Solubility Soluble in water; practically insoluble in ethanol.
Comments The EINECS number for calcium trisodium pentetate is 235-169-1.

Pentasodium pentetate

Empirical formula $C_{14}H_{18}N_3Na_5O_{10}$
Molecular weight 503.25
CAS number [140-01-2]
Synonyms DTPAN; pentasodium DTPA; pentetate pentasodium; sodium DTPA.
Regulatory status Included in the FDA Inactive Ingredients Database (intravenous injections).
Safety Pentasodium pentetate is moderately irritating to the skin and mucous membranes.
Comments The EINECS number for pentasodium pentetate is 205-391-3.

Zinc trisodium pentetate

Synonyms Pentetate zinc trisodium; trisodium zinc diethylenetriaminepentaacetate; zinc DTPA (zinc pentetate or zinc trisodium pentetate).
Empirical formula $C_{14}H_{18}N_3Na_3O_{10}Zn$
Molecular weight 522.7
CAS number [65229-17-6] (zinc pentetate); [125833-02-5] (zinc trisodium pentetate)

18 Comments

The EINECS number for pentetic acid is 200-652-8. The PubChem Compound ID (CID) for pentetic acid is 3053.

Calcium and zinc pentetates have been evaluated as therapeutic agents for the removal of radioisotopes following occupational exposure.[11]

P

Petrolatum

1 Nonproprietary Names

BP: Yellow Soft Paraffin
JP: Yellow Petrolatum
PhEur: Paraffin, Yellow Soft
USP–NF: Petrolatum

2 Synonyms

Merkur; mineral jelly; petroleum jelly; *Pinnacle*; *Silk*; *Silkolene*; *Snow White*; *Soft White*; vaselinum flavum; yellow petrolatum; yellow petroleum jelly.

3 Chemical Name and CAS Registry Number

Petrolatum [8009-03-8]

4 Empirical Formula and Molecular Weight

Petrolatum is a purified mixture of semisolid saturated hydrocarbons having the general formula C_nH_{2n+2}, and is obtained from petroleum. The hydrocarbons consist mainly of branched and unbranched chains although some cyclic alkanes and aromatic molecules with paraffin side chains may also be present. The USP 40–NF 35 S1 and PhEur 9.2 material may contain a suitable stabilizer (antioxidant) that must be stated on the label. The inclusion of a stabilizer is not discussed in the JP XVII monograph.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; ointment base.

7 Applications in Pharmaceutical Formulation or Technology

Petrolatum is mainly used in topical pharmaceutical formulations as an emollient-ointment base; it is poorly absorbed by the skin. Petrolatum is also used in creams and transdermal formulations and as an ingredient in lubricant formulations for medicated confectionery together with mineral oil.

Petrolatum is additionally widely used in cosmetics and in some food applications. *See* Table I.

Table I: Uses of petrolatum.

Use	Concentration (%)
Emollient topical creams	10–30
Topical emulsions	4–25
Topical ointments	Up to 100

8 Description

Petrolatum is a pale yellow to yellow-colored, translucent, soft unctuous mass. It is odorless, tasteless, and not more than slightly fluorescent by daylight, even when melted.

9 Pharmacopeial Specifications

See Table II. *See also* Sections 17 and 18.

Table II: Pharmacopeial specifications for petrolatum.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

10 Typical Properties

Refractive index n_D^{60} = 1.460–1.474

Solubility Practically insoluble in acetone, ethanol, hot or cold ethanol (95%), glycerin, and water; soluble in benzene, carbon disulfide, chloroform, ether, hexane, and most fixed and volatile oils.

Spectroscopy

IR spectrum *see* Figure 1.

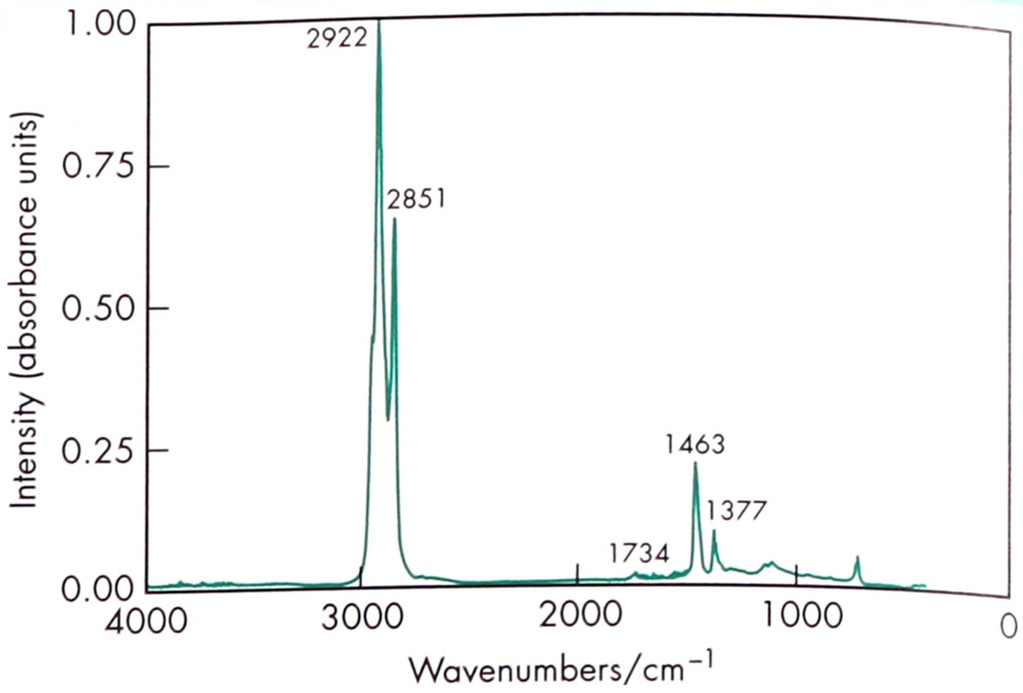

Figure 1: Infrared spectrum of petrolatum measured by transmission. Adapted with permission of Informa Healthcare.

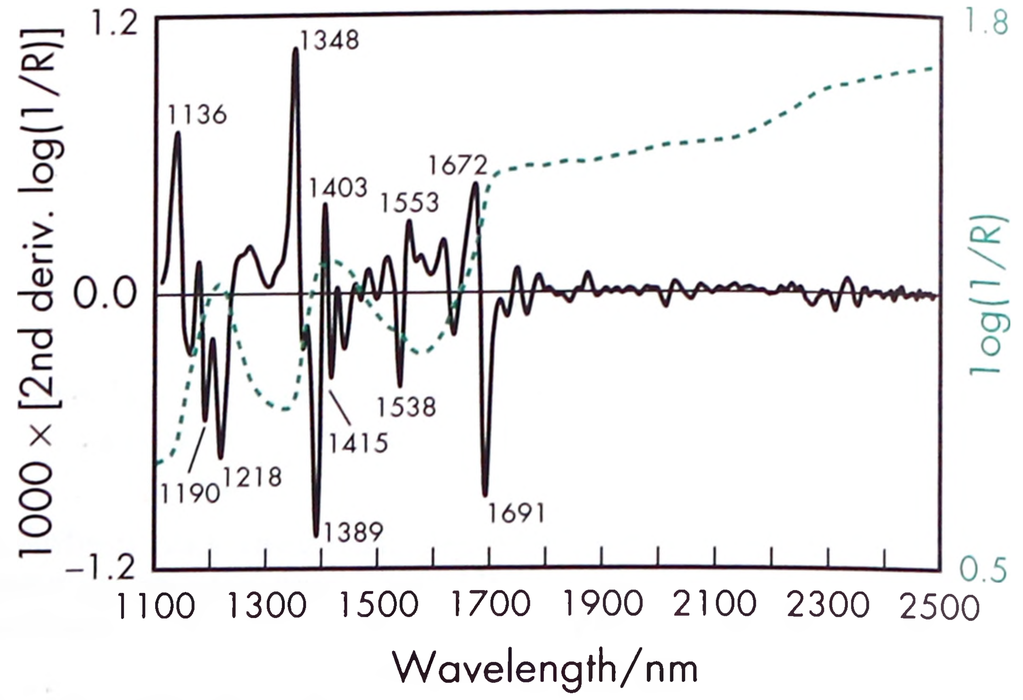

Figure 2: Near-infrared spectrum of petrolatum measured by reflectance.

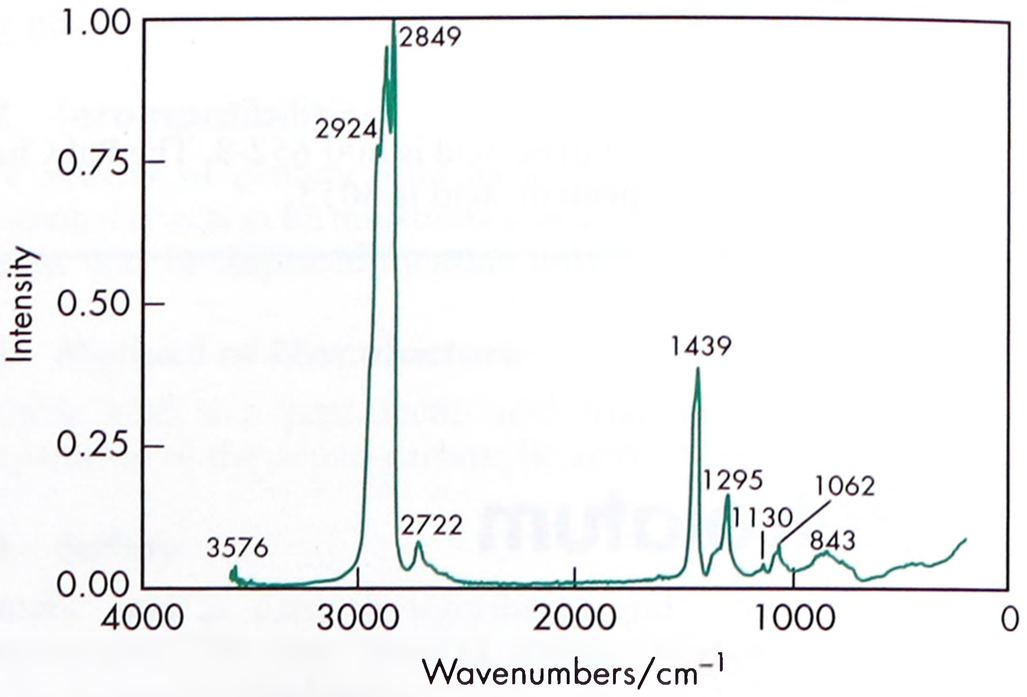

Figure 3: Raman spectrum of petrolatum measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Viscosity (dynamic) The rheological properties of petrolatum are determined by the ratio of the unbranched chains to the branched chains and cyclic components of the mixture. Petrolatum contains relatively high amounts of branched and cyclic hydrocarbons, in contrast to paraffin, which accounts for its softer character and makes it an ideal ointment base.[1–4]

11 Stability and Storage Conditions

Petrolatum is an inherently stable material owing to the unreactive nature of its hydrocarbon components; most stability problems occur because of the presence of small quantities of impurities. On exposure to light, these impurities may be oxidized to discolor the petrolatum and produce an undesirable odor. The extent of the oxidation varies depending upon the source of the petrolatum and the degree of refinement. Oxidation may be inhibited by the inclusion of a suitable antioxidant such as butylated hydroxyanisole, butylated hydroxytoluene, or alpha tocopherol.

Petrolatum should not be heated for extended periods above the temperature necessary to achieve complete fluidity (approximately 70°C). *See also* Section 18.

Petrolatum may be sterilized by dry heat. Although petrolatum may also be sterilized by gamma irradiation, this process affects the physical properties of the petrolatum such as swelling, discoloration, odor, and rheological behavior.[5,6]

Petrolatum should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Petrolatum is an inert material with few incompatibilities.

13 Method of Manufacture

Petrolatum is manufactured from the semisolid residue that remains after the steam or vacuum distillation of petroleum.[7] This residue is dewaxed and/or blended with stock from other sources, along with lighter fractions, to give a product with the desired consistency. Final purification is performed by a combination of high-pressure hydrogenation or sulfuric acid treatment followed by filtration through adsorbents. A suitable antioxidant may be added.

14 Safety

Petrolatum is mainly used in topical pharmaceutical formulations and is generally considered to be a nonirritant and nontoxic material.

Animal studies, in mice, have shown petrolatum to be nontoxic and noncarcinogenic following administration of a single subcutaneous 100 mg dose. Similarly, no adverse effects were observed in a 2-year feeding study with rats fed a diet containing 5% of petrolatum blends.[8]

Although petrolatum is generally nonirritant in humans following topical application, rare instances of allergic hypersensitivity reactions have been reported,[9–11] as have cases of acne, in susceptible individuals following repeated use on facial skin.[12] However, given the widespread use of petrolatum in topical products, there are few reports of irritant reactions. The allergic components of petrolatum appear to be polycyclic aromatic hydrocarbons present as impurities. The quantities of these materials found in petrolatum vary depending upon the source and degree of refining. Hypersensitivity appears to occur less with white petrolatum and it is therefore the preferred material for use in cosmetics and pharmaceuticals.

Petrolatum has also been tentatively implicated in the formation of spherulosis of the upper respiratory tract following use of a petrolatum-based ointment packing after surgery,[13] and lipoid pneumonia following excessive use in the perinasal area.[14] Other adverse reactions to petrolatum include granulomas (paraffinomas) following injection into soft tissue.[15] Also, when taken orally, petrolatum acts as a mild laxative and may inhibit the absorption of lipids and lipid-soluble nutrients.

Petrolatum is widely used in direct and indirect food applications. In the US, the daily dietary exposure to petrolatum is estimated to be 0.404 mg/kg body-weight.[16]

For further information *see* Mineral Oil and Paraffin.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. For recommended workplace exposure limits *see* Mineral Oil and Paraffin.

16 Regulatory Status

GRAS listed. Accepted for use in certain food applications in many countries worldwide. Included in the FDA Inactive Ingredients Database (ophthalmic preparations; oral capsules and tablets; otic, topical, and transdermal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Mineral oil; mineral oil light; paraffin; petrolatum and lanolin alcohols; white petrolatum.

White petrolatum

Synonyms Vaselinum album; white petroleum jelly; white soft paraffin.

Appearance White petrolatum is a white to pale yellow-colored, translucent, soft unctuous mass. It is odorless and tasteless, and not more than slightly fluorescent by daylight, even when melted.

Method of manufacture White petrolatum is petrolatum that has been highly refined so that it is wholly or nearly decolorized. It may contain a stabilizer.

Comments White petrolatum is listed in the JP XVII, PhEur 9.2, and USP 40–NF 35 S1. White petrolatum is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Information Chapter <1196> in the USP–NF, the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP. White petrolatum is associated with fewer instances of hypersensitivity reactions and is the preferred petrolatum for use in cosmetics and pharmaceuticals, *see* Section 14.

18 Comments

Petrolatum is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Various grades of petrolatum are commercially available, which vary in their physical properties depending upon their source and refining process. Petrolatum obtained from different sources may therefore behave differently in a formulation.[17]

Care is required in heating petrolatum because of its large coefficient of thermal expansion. It has been shown by both rheological and spectrophotometric methods that petrolatum undergoes phase transition at temperatures between 30–40°C.

Therapeutically, sterile gauze dressings containing petrolatum may be used for nonadherent wound dressings or as a packing material.[18]

Additives, such as microcrystalline wax, may be used to add body to petrolatum. A specification for petrolatum is contained in the *Food Chemicals Codex* (FCC).[19]

The EINECS number for petrolatum is 232-373-2.

P

Petrolatum and Lanolin Alcohols

1 Nonproprietary Names

None adopted.

2 Synonyms

Amerchol CAB; *Forlan 500*; petrolatum and wool alcohols; *Vilvanolin CAB*; white soft paraffin and lanolin alcohols; yellow soft paraffin and lanolin alcohols.

3 Chemical Name and CAS Registry Number

Petrolatum [8009-03-8]
Lanolin alcohols [8027-33-6]

4 Empirical Formula and Molecular Weight

A mixture of petrolatum and lanolin alcohols.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; ointment base; plasticizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Petrolatum and lanolin alcohols is a soft solid used in topical pharmaceutical formulations and cosmetics as an ointment base with emollient properties. It is also used in the preparation of creams and lotions.

See Table I.

Table I: Uses of petrolatum and lanolin alcohols.

Use	Concentration (%)
Absorption base component	10.0–50.0
Emollient and plasticizer in ointments	5.0–50.0

8 Description

Petrolatum and lanolin alcohols occurs as a pale ivory-colored, soft solid with a faint, characteristic sterol odor.

9 Pharmacopeial Specifications

Petrolatum and lanolin alcohols are listed as separate monographs in the BP, JP, PhEur, and also USP–NF but the combination is not

listed; *see* individual monographs on Petrolatum and Lanolin Alcohols.

See also Section 18.

10 Typical Properties

Acid value ≤1 for *Vilvanolin CAB*
Arsenic ≤2 ppm for *Vilvanolin CAB*
Ash ≤0.2% for *Vilvanolin CAB*
Heavy metals ≤20 ppm for *Vilvanolin CAB*
Hydroxyl value 11–15 for *Vilvanolin CAB*
Iodine value 6–13 for *Forlan 500*
Melting range 46–53°C for *Forlan 500*; 40–46°C for *Vilvanolin CAB*.
Microbiological count The total bacterial count, when packaged, is less than 10 per gram of sample for *Vilvanolin CAB*.
Moisture content ≤0.25% for *Forlan 500*; ≤0.2% for *Vilvanolin CAB*.
Saponification value ≤2 for *Vilvanolin CAB*
Solubility Soluble 1 in 20 parts of chloroform, and 1 in 100 parts of mineral oil; precipitates at higher concentrations. Precipitation occurs in ethanol (95%), hexane, and water. May be dispersed in isopropyl palmitate. Forms a gel in castor oil and corn oil.
Specific gravity 0.96 at 25°C for *Forlan 500*

11 Stability and Storage Conditions

Petrolatum and lanolin alcohols is stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Petrolatum and lanolin alcohols is incompatible with coal tar, ichthammol, phenol, and resorcinol.

13 Method of Manufacture

Lanolin alcohols is blended with petrolatum.

14 Safety

Petrolatum and lanolin alcohols is generally regarded as an essentially nontoxic and nonirritant material. However, lanolin alcohols may be irritant to the skin and cause hypersensitivity in some individuals.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

Accepted for use in topical pharmaceutical formulations and cosmetics. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lanolin alcohols; lanolin alcohols ointment; mineral oil and lanolin alcohols; petrolatum.

Lanolin alcohols ointment

Synonyms *Argobase EU*; wool alcohols ointment.
Appearance White-colored ointment if prepared using white petrolatum; a yellow-colored ointment if yellow petrolatum is used in its preparation.
Comments

The BP 2017 describes lanolin alcohols ointment (wool alcohols ointment BP) as a mixture consisting of:

Lanolin alcohols 60 g
Paraffin 240 g
Yellow or white petrolatum 100 g
Mineral oil 600 g

However, the proportions of paraffin, petrolatum, and mineral oil may be varied to produce an ointment of the desired physical properties.

18 Comments

Petrolatum is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Therapeutically, petrolatum and lanolin alcohols can be used to absorb wound exudates.

See individual monographs on Lanolin Alcohols and Petrolatum for further information.

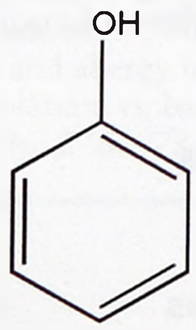
Phenol

1 Nonproprietary Names

BP: Phenol
JP: Phenol
PhEur: Phenol
USP–NF: Phenol

2 Synonyms

Benzophenol; carbolic acid; hydroxybenzene; oxybenzene; phenic acid; phenolum; phenyl hydrate; phenyl hydroxide; phenylic acid; phenylic alcohol.



3 Chemical Name and CAS Registry Number

Phenol [108-95-2]

4 Empirical Formula and Molecular Weight

C_6H_6O 94.11

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Phenol is used mainly as an antimicrobial preservative in parenteral pharmaceutical products. It has also been used in topical pharmaceutical formulations and cosmetics; *see* Table I. Phenol should not be used to preserve preparations that are to be freeze-dried.[1]

Table I: Uses of phenol.

Use	Concentration (%)
Disinfectant	5.0
Injections (preservative)	0.15–1.0
Local anesthetic	0.5–1.0
Mouthwash	≤1.4

8 Description

Phenol occurs as colorless to light pink, caustic, deliquescent needle-shaped crystals or crystalline masses with a characteristic odor. When heated gently phenol melts to form a highly refractive liquid. The USP 40–NF 35 S1 permits the addition of a suitable stabilizer; the name and amount of substance used for this purpose must be clearly stated on the label.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for phenol.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Clarity of solution	+	+	+
Acidity	+	+	+
Congealing temperature	≈40°C	≥39.5°C	≥39°C
Water	–	–	≤0.5%
Nonvolatile residue	≤0.05%	≤0.05%	≤0.05%
Assay	≥98.0%	99.0–100.5%	99.0–100.5%

10 Typical Properties

Acidity/alkalinity pH = 6.0 (saturated aqueous solution)
Antimicrobial activity Phenol exhibits antimicrobial activity against a wide range of microorganisms, such as Gram-negative and Gram-positive bacteria, mycobacteria and some fungi, and viruses; it is only very slowly effective against spores. Aqueous solutions of 1% w/v concentration are bacteriostatic, while stronger solutions are bactericidal. Phenol shows most activity in acidic solutions; increasing temperature also increases the antimicrobial activity. Phenol is inactivated by the presence of organic matter.
Autoignition temperature 715°C
Boiling point 181.8°C
Density 1.071 g/cm^3
Dissociation constant pK_a = 10 at 25°C
Flash point 79°C (closed cup)
Explosive limits 2% lower limit; 9% upper limit.
Freezing point 40.9°C
Melting point 43°C
Osmolarity A 2.8% w/v solution is iso-osmotic with serum.
Partition coefficient Octanol : water = 1.46
Refractive index n_D^{41} = 1.5425
Solubility *see* Table III.
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

Surface tension 38.20 mN/m at 50°C
Vapor density (relative) 3.24 (air = 1)
Vapor pressure 133 Pa (1 mmHg) at 40°C
Viscosity 3.4 mPa S at 50°C

11 Stability and Storage Conditions

When exposed to air and light, phenol turns a red or brown color, the color being influenced by the presence of metallic impurities. Oxidizing agents also hasten the color change. Aqueous solutions of phenol are stable. Oily solutions for injection may be sterilized in hermetically sealed containers by dry heat. The bulk material should be stored in a well-closed, light-resistant container at a temperature not exceeding 15°C.

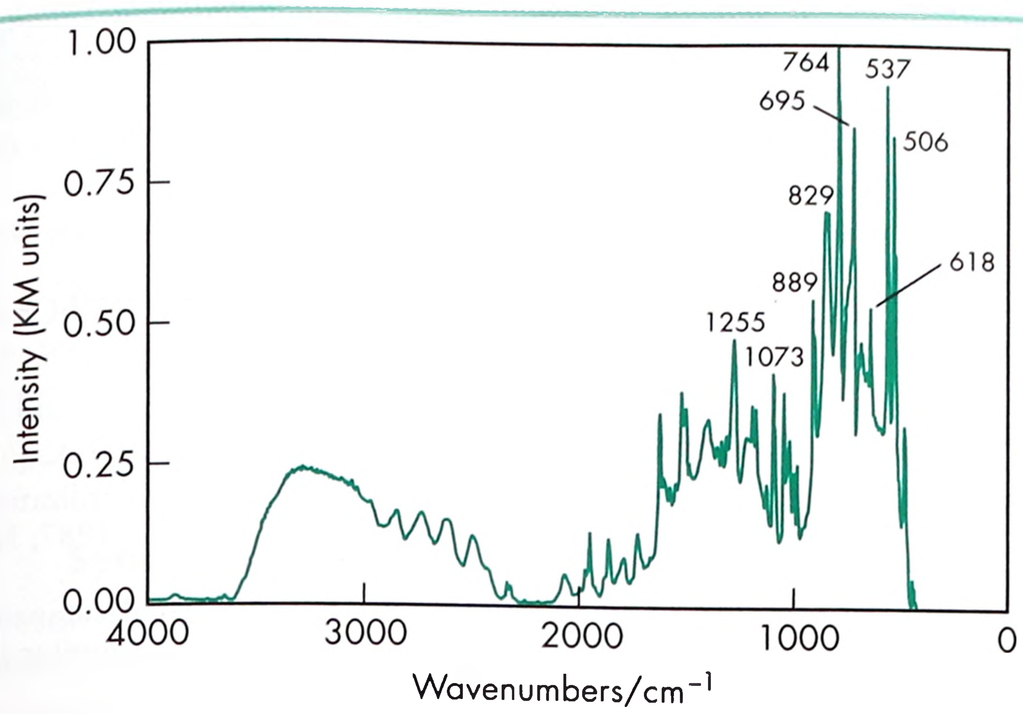


Figure 1: Infrared spectrum of phenol measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

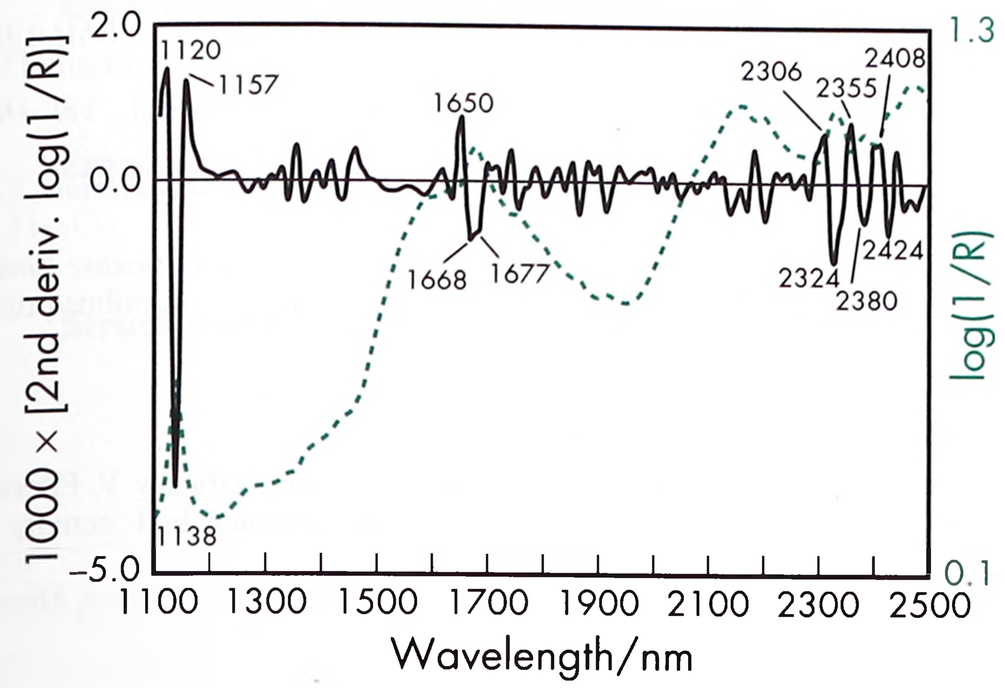

Figure 2: Near-infrared spectrum of phenol measured by reflectance.

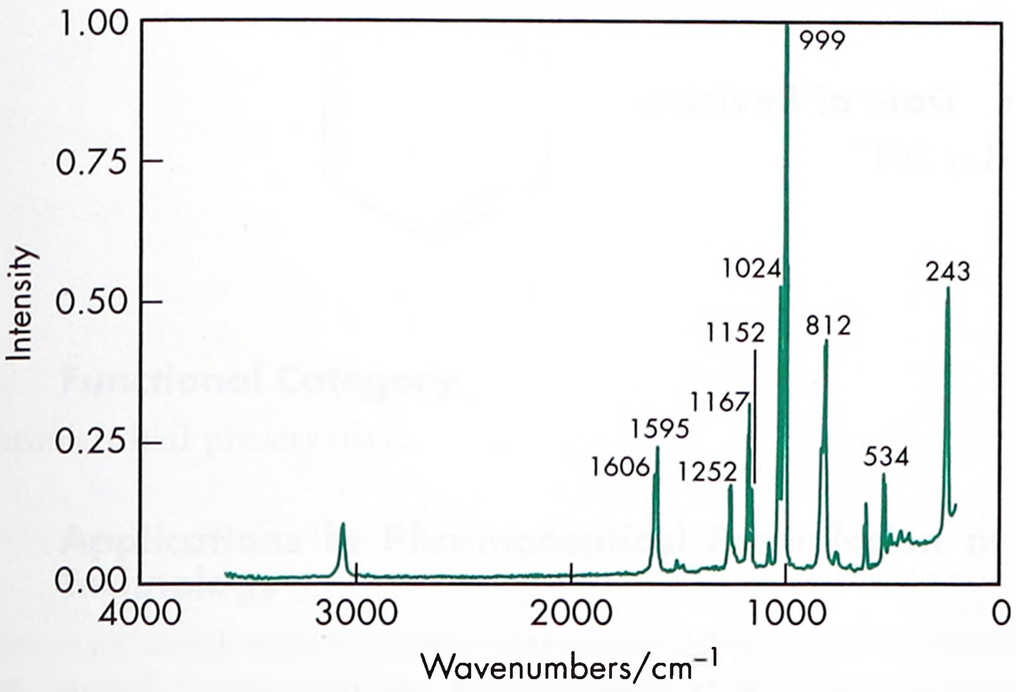

Figure 3: Raman spectrum of phenol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Phenol undergoes a number of chemical reactions characteristic of alcohols; however, it possesses a tautomeric enol structure that is weakly acidic. It will form salts with sodium hydroxide or potassium hydroxide, but not with their carbonates or bicarbonates.

Phenol is a reducing agent and is capable of reacting with ferric salts in neutral to acidic solutions to form a greenish-colored complex. Phenol decolorizes dilute iodine solutions, forming hydrogen iodide and iodophenol; stronger solutions of iodine react with phenol to form the insoluble 2,4,6-triiodophenol.

Phenol is incompatible with albumin and gelatin as they are precipitated. It forms a liquid or soft mass when triturated with compounds such as camphor, menthol, thymol, acetaminophen, phenacetin, chloral hydrate, phenazone, ethyl aminobenzoate, methenamine, phenyl salicylate, resorcinol, terpin hydrate, sodium phosphate, or other eutectic formers. Phenol also softens cocoa butter in suppository mixtures.

Table III: Solubility of phenol.

Solvent	Solubility at 20°C
Carbon disulfide	Very soluble
Chloroform	Very soluble
Ethanol (95%)	Very soluble
Ether	Very soluble
Fixed oils	Very soluble
Glycerin	Very soluble
Mineral oil	1 in 70
Volatile oils	Very soluble
Water	1 in 15

13 Method of Manufacture

Historically, phenol was produced by the distillation of coal tar. Today, phenol is prepared by one of several synthetic methods, such as the fusion of sodium benzenesulfonate with sodium hydroxide followed by acidification, the hydrolysis of chlorobenzene by dilute sodium hydroxide at high temperature and pressure to give sodium phenate, which on acidification liberates phenol (Dow process), or the catalytic vapor-phase reaction of steam and chlorobenzene at 500°C (Raschig process).

14 Safety

Phenol is highly corrosive and toxic, the main effects being on the central nervous system. The lethal human oral dose is estimated to be 1 g for an adult. Phenol is not considered to be carcinogenic.

Phenol is absorbed from the gastrointestinal tract, skin, and mucous membranes, and is metabolized to phenylglucuronide and phenyl sulfate, which are excreted in the urine.

Although there are a number of reports describing the toxic effects of phenol, these largely concern instances of accidental poisoning[2,3] or adverse reactions during its use as a therapeutic agent.[4,5] Adverse reactions associated with phenol used as a preservative are less likely owing to the smaller quantities that are used; however, it has been suggested that the body burden of phenol should not exceed 50 mg in a 10-hour period.[6] This amount could be exceeded following administration of large volumes of phenol-preserved medicines.

LD_{50} (mouse, IV): 0.11 g/kg[7]
LD_{50} (mouse, oral): 0.3 g/kg
LD_{50} (rabbit, skin): 0.85 g/kg
LD_{50} (rat, skin): 0.67 g/kg
LD_{50} (rat, oral): 0.32 g/kg
LD_{50} (rat, SC): 0.46 g/kg

15 Handling Precautions

Phenol is toxic on contact with the skin or if swallowed or inhaled. Phenol is strongly corrosive, producing possibly irreversible damage to the cornea and severe skin burns, although the skin burns are painless owing to the anesthetic effects of phenol.

Phenol should be handled with caution, particularly when hot, owing to the release of corrosive and toxic fumes. The use of fume

cupboards, enclosed plants, or other environmental containment is recommended. Protective polyvinyl chloride or rubber clothing is recommended, together with gloves, eye protection, and respirators. Spillages on the skin or eyes should be washed with copious amounts of water. Affected areas of the skin should be washed with water followed by application of a vegetable oil. Medical attention should be sought.

Phenol poses a slight fire hazard when cold and a moderate hazard when hot and exposed to heat or flame.

In the UK, the workplace exposure limits for phenol are 2 ppm long-term (8-hour TWA).[8] In the US, the permissible exposure limit is 19 mg/m^3 long-term and the recommended exposure limits are 20 mg/m^3 long-term, and a maximum of 60 mg/m^3 short-term.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IA, ID, IL, IM, IS, IV, SC and soft tissue injections). Included in medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Liquefied phenol.

Liquefied phenol

Appearance Liquefied phenol is phenol maintained as a liquid by the presence of approximately 10% water. It is a colorless liquid, with a characteristic aromatic odor, which may develop a red coloration on exposure to air and light. It contains not less than 88% of phenol.

Specific gravity 1.065 at 25°C

Comments Liquefied phenol is often more convenient to use in a formulation than the crystalline form. However, liquefied phenol should not be used with fixed or mineral oils, although the crystalline solid may be used. Caution should be observed when handling liquified phenol to avoid contact with skin, as this could cause serious burns.

P

18 Comments

Although phenol is soluble in approximately 12 parts of water at ambient temperatures, larger amounts of phenol in water produce a two-phase system of phenol solution floating on a lower layer of wet phenol. At 20°C, 100 parts of phenol may be liquefied by the addition of 10 parts of water. At 84°C phenol is miscible with water in all proportions.

Therapeutically, phenol is widely used as an antiseptic and disinfectant.

The EINECS number for phenol is 203-632-7. The PubChem Compound ID (CID) for phenol is 996.

3 Chemical Name and CAS Registry Number

2-Phenoxyethanol [122-99-6]

4 Empirical Formula and Molecular Weight

$C_8H_{10}O_2$ 138.16

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Phenoxyethanol is an antimicrobial preservative used in cosmetics and topical pharmaceutical formulations at a concentration of 0.5–1.0%; it may also be used as a preservative and antimicrobial agent for vaccines.[1,2]

Phenoxyethanol is effective over a wide pH range against strains of *Pseudomonas aeruginosa* and to a lesser extent against *Proteus vulgaris* and other Gram-negative organisms. It is most frequently used in combination with other preservatives, such as parabens, to obtain a wider spectrum of antimicrobial activity.[3–5] *See also* Section 12. For reported minimum inhibitory concentrations (MICs) *see* Section 10.

8 Description

Phenoxyethanol is a colorless, slightly viscous liquid with a faint pleasant odor and burning taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for phenoxyethanol.

Test	PhEur 9.2	USP 40–NF 35 S1

Related substances	+	—
Assay	99.0–100.5%	98.0–102.0%

10 Typical Properties

Acidity/alkalinity pH = 6.0 for a 1% v/v aqueous solution.

Antimicrobial activity *see* Table II.[6,7]

Table II: Minimum inhibitory concentrations (MICs) of phenoxyethanol.

Microorganism	MIC (mg/mL)
Aspergillus niger ATCC 16404	2.5
Candida albicans ATCC 10231	3.2
Escherichia coli NCIB 9517	3.2
Pseudomonas aeruginosa NCTC 6750	10
Staphylococcus aureus ATCC 6538	7.5

Autoignition temperature 135°C

Boiling point 245.2°C

Dissociation constant $pK_a = 15.1$[8]

Flash point 121°C (open cup)

Melting point 14°C

Partition coefficients

Octanol : water = 1.16;[9]

Isopropyl palmitate : water = 2.9;[10]

Mineral oil : water = 0.3;[10]

Peanut oil : water = 2.6.[10]

Refractive index $n_D^{20} = 1.537–1.539$

Solubility *see* Table III.

Table III: Solubility of phenoxyethanol.

Solvent	Solubility at 20°C
Acetone	Miscible
Ethanol (95%)	Miscible
Glycerin	Miscible
Isopropyl palmitate	1 in 26
Mineral oil	1 in 143
Olive oil	1 in 50
Peanut oil	1 in 50
Water	1 in 43

Specific gravity 1.11 at 20°C

11 Stability and Storage Conditions

Aqueous phenoxyethanol solutions are stable and may be sterilized by autoclaving. The bulk material is also stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

The antimicrobial activity of phenoxyethanol may be reduced by interaction with nonionic surfactants and possibly by absorption by polyvinyl chloride.[11] The antimicrobial activity of phenoxyethanol against *Pseudomonas aeruginosa* may be reduced in the presence of cellulose derivatives (methylcellulose, sodium carboxymethylcellulose, and hypromellose (hydroxypropylmethylcellulose)).[12]

13 Method of Manufacture

Phenoxyethanol is prepared by treating phenol with ethylene oxide in an alkaline medium.

14 Safety

Phenoxyethanol produces a local anesthetic effect on the lips, tongue, and other mucous membranes. The pure material is a moderate irritant to the skin and eyes. In animal studies, a 10% v/v solution was not irritant to rabbit skin and a 2% v/v solution was not irritant to the rabbit eye.[7] However, topical formulations containing phenoxyethanol can cause skin irritation,[13] and contact urticaria has been reported upon exposure to 2-phenoxyethanol-containing cosmetics.[14]

Long-term exposure to phenoxyethanol may result in CNS toxic effects similar to other organic solvents.[15] Safety issues related to preservatives used in vaccines, including 2-phenoxyethanol have been reviewed.[16–18]

The US FDA has recommended avoiding at least one topical product containing phenoxyethanol due to concerns over inadvertant exposure to nursing infants.[19]

Phenoxyethanol has been reported to cause protein aggregation when used as an antimicrobial preservative in multi-dose formulations, which can lead to serious immunogenic and toxic side-effects.[20,21]

LD_{50} (rabbit, skin): 5 g/kg[22]

LD_{50} (rat, oral): 1.26 g/kg[22]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phenoxyethanol may be irritant to the skin and eyes; eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Under European regulations for cosmetics (76/768/EEC), the maximum authorized concentration (MAC) of 2-phenoxyethanol is 1.0%.[23]

17 Related Substances

Chlorobutanol.

18 Comments

Aqueous solutions are best prepared by shaking phenoxyethanol with hot water until dissolved, followed by cooling and adjusting the volume to the required concentration.

Therapeutically, a 2.2% solution or 2.0% cream has been used as a disinfectant for superficial wounds, burns, and minor infections of the skin and mucous membranes.[24–26]

The EINECS number for phenoxyethanol is 204-589-7. The PubChem Compound ID (CID) for phenoxyethanol is 31236.

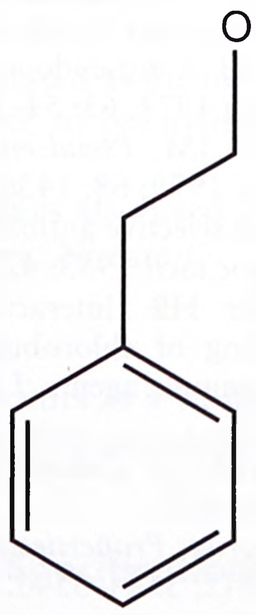
Phenylethyl Alcohol

1 Nonproprietary Names

USP–NF: Phenylethyl Alcohol

2 Synonyms

Benzeneethanol; benzyl carbinol; benzylmethanol; β-fenylethanol; β-fenethylalkohol;β-hydroxyethyl benzene; PEA; phenethanol; β-phenylethyl alcohol; 2-phenylethyl alcohol; phenylethanol.



3 Chemical Name and CAS Registry Number

2-Phenylethanol [60-12-8]

4 Empirical Formula and Molecular Weight

$C_8H_{10}O$ 122.17

5 Structural Formula

6 Functional Category

Antimicrobial preservative; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Phenylethyl alcohol is used as an antimicrobial preservative in nasal, ophthalmic, and otic formulations at 0.25–0.5% v/v concentration; it is generally used in combination with other preservatives.[1–3] Phenylethyl alcohol has also been used on its own as an antimicrobial preservative at concentrations up to 1% v/v in topical preparations. At this concentration, mycoplasmas are inactivated within 20 minutes, although enveloped viruses are resistant.[4] Phenylethyl alcohol is also used in flavors.

8 Description

Phenylethyl alcohol occurs as a clear, colorless liquid with an odor of rose oil. It has a burning taste that irritates and then anesthetizes mucous membranes.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for phenylethyl alcohol.

Test	USP 40–NF 35 S1
Identification	+
Specific gravity	1.017–1.020
Refractive index	1.531–1.534
Residue on ignition	≤0.005%
Chlorinated compounds	+
Aldehyde	+

10 Typical Properties

Antimicrobial activity Phenylethyl alcohol has moderate antimicrobial activity although it is relatively slow acting; it is not sufficiently active to be used alone.[5] Greatest activity occurs at less than pH 5; it is inactive above pH 8. Synergistic effects have been reported when combined with benzalkonium chloride, chlorhexidine gluconate or diacetate, polymyxin B sulfate, and phenylmercuric nitrate.[6–10] With either benzalkonium chloride or chlorhexidine, synergistic effects were observed against *Pseudomonas aeruginosa* and apparently additive effects against Gram-positive organisms. With phenylmercuric nitrate, the effect was additive against *Pseudomonas aeruginosa*. Additive effects against *Pseudomonas cepacia* in combination with either benzalkonium chloride or chlorhexidine have also been reported.[11]

See also Section 12.

Bacteria Fair activity against Gram-positive bacteria; for *Staphylococcus aureus*, the minimum inhibitory concentration (MIC) may be more than 5 mg/mL. Greater activity is shown against Gram-negative organisms.[12] Typical MIC values are: *Salmonella typhi* 1.25 mg/mL; *Pseudomonas aeruginosa* 2.5 mg/mL; *Escherichia coli* 5.0 mg/mL.

Fungi Poor activity against molds and fungi.

Spores Inactive, e.g. at 0.6% v/v concentration, reported to be ineffective against spores of *Bacillus stearothermophilus* at 100°C for 30 minutes.

Boiling point 219–221°C
Flash point 102°C (open cup)
Melting point −27°C
Partition coefficients
Chloroform : water = 15.2;
Heptane : water = 0.58;
Octanol : water = 21.5.
Solubility *see* Table II.

Table II: Solubility of phenylethyl alcohol.

Solvent	Solubility at 20°C
Benzyl benzoate	Very soluble
Chloroform	Very soluble
Diethyl phthalate	Very soluble
Ethanol (95%)	Very soluble
Ether	Very soluble
Fixed oils	Very soluble
Glycerin	Very soluble
Mineral oil	Slightly soluble
Propylene glycol	Very soluble
Water	1 in 60

11 Stability and Storage Conditions

Phenylethyl alcohol is stable in bulk, but is volatile and sensitive to light and oxidizing agents. It is reasonably stable in both acidic and alkaline solutions. Aqueous solutions may be sterilized by autoclaving. If stored in low-density polyethylene containers, phenylethyl alcohol may be absorbed by the containers. Losses to polypropylene containers have been reported to be insignificant over 12 weeks at 30°C. Sorption to rubber closures is generally small.

The bulk material should be stored in a well-closed container, protected from light, in a cool, dry place.

P

12 Incompatibilities

Incompatible with oxidizing agents and protein, e.g. serum. Phenylethyl alcohol is partially inactivated by polysorbates, although this is not as great as the reduction in antimicrobial activity that occurs with parabens and polysorbates.[13]

13 Method of Manufacture

Phenylethyl alcohol is prepared by reduction of ethyl phenylacetate with sodium in absolute alcohol; by hydrogenation of phenylacetaldehyde in the presence of a nickel catalyst; or by addition of ethylene oxide or ethylene chlorohydrin to phenylmagnesium bromide, followed by hydrolysis. Phenylethyl alcohol also occurs naturally in a number of essential oils, especially rose oil.

14 Safety

Phenylethyl alcohol is generally regarded as a nontoxic and nonirritant material. However, at the concentration used to preserve eye-drops (about 0.5% v/v) or above, eye irritation may occur.[14]

LD_{50} (rabbit, skin): 0.79 g/kg[15]
LD_{50} (rat, oral): 1.79 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phenylethyl alcohol is combustible when exposed to heat or flame, and emits acrid smoke when heated to decomposition. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (nasal, ophthalmic, and otic preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Chlorobutanol.

18 Comments

Phenylethyl alcohol is used as a perfumery component, especially in rose perfumes.

The EINECS number for phenylethyl alcohol is 200-456-2. The PubChem Compound ID (CID) for phenylethyl alcohol is 6054.

Phenylmercuric Acetate

1 Nonproprietary Names

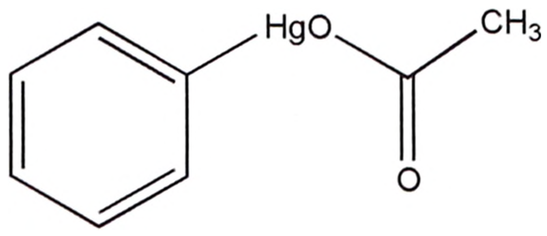
BP: Phenylmercuric Acetate

PhEur: Phenylmercuric Acetate

USP–NF: Phenylmercuric Acetate

2 Synonyms

(Acetato-O)phenylmercury; acetoxyphenylmercury; phenylhydrargyri acetas; phenylmercury acetate; PMA; PMAC; PMAS.



3 Chemical Name and CAS Registry Number

(Acetato)phenylmercury [62-38-4]

4 Empirical Formula and Molecular Weight

$C_8H_8HgO_2$ 336.74

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Phenylmercuric acetate is used as an alternative antimicrobial preservative to phenylmercuric borate or phenylmercuric nitrate in a limited range of cosmetics (in concentrations not exceeding 0.007% of mercury calculated as the metal) and pharmaceuticals. It may be used in preference to phenylmercuric nitrate owing to its greater solubility.

Phenylmercuric acetate is also used as a spermicide; *see* Table I.

See also Phenylmercuric Nitrate.

8 Description

Phenylmercuric acetate occurs as a white to creamy white, odorless or almost odorless, crystalline powder or as small white prisms or leaflets.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Acidity/alkalinity pH ≈ 4 for a saturated aqueous solution at 20°C.

Antimicrobial activity Phenylmercuric acetate is a broad-spectrum antimicrobial preservative with slow bactericidal and fungicidal activity similar to phenylmercuric nitrate; *see* Phenylmercuric Nitrate.

Dissociation constant $pK_a = 3.3$

Melting point 149°C

Partition coefficients Mineral oil : water = 0.1

Solubility *see* Table III.

Spectroscopy

NIR spectrum *see* Figure 1.

11 Stability and Storage Conditions

As for other phenylmercuric salts; *see* Phenylmercuric Nitrate.

Phenylmercuric acetate should be stored in a well-closed container, protected from light, in a cool, dry place.

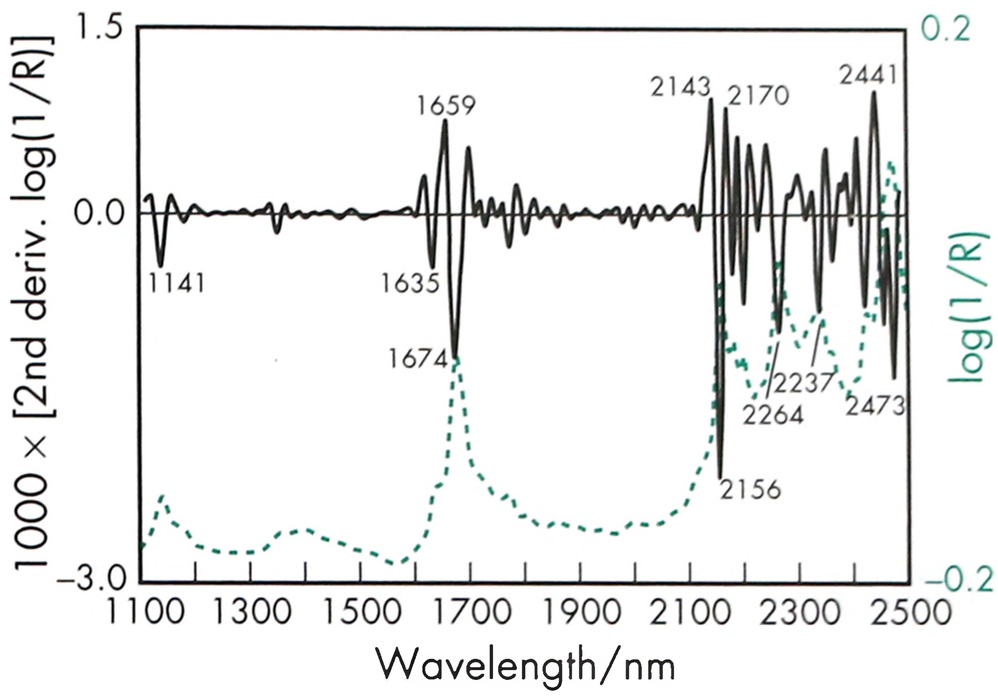


Figure 1: Near-infrared spectrum of phenylmercuric acetate measured by reflectance.

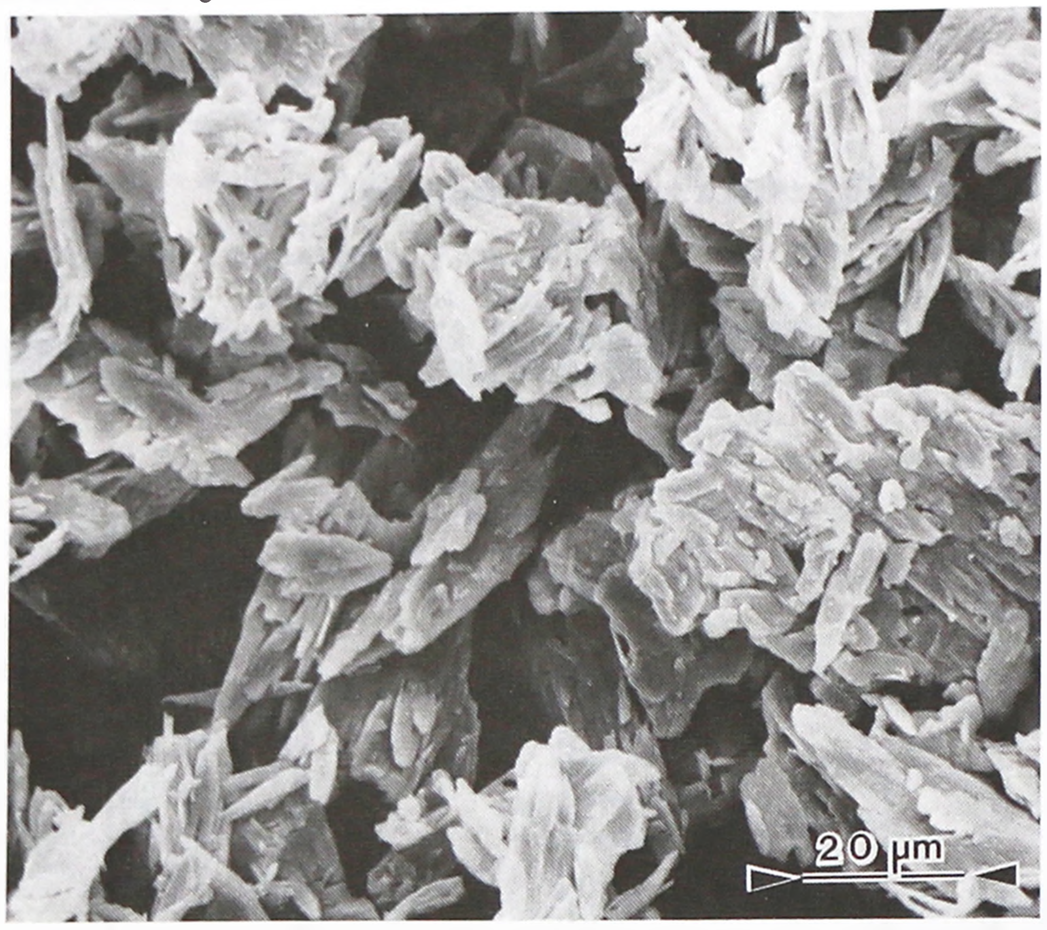
Table I: Uses of phenylmercuric acetate.

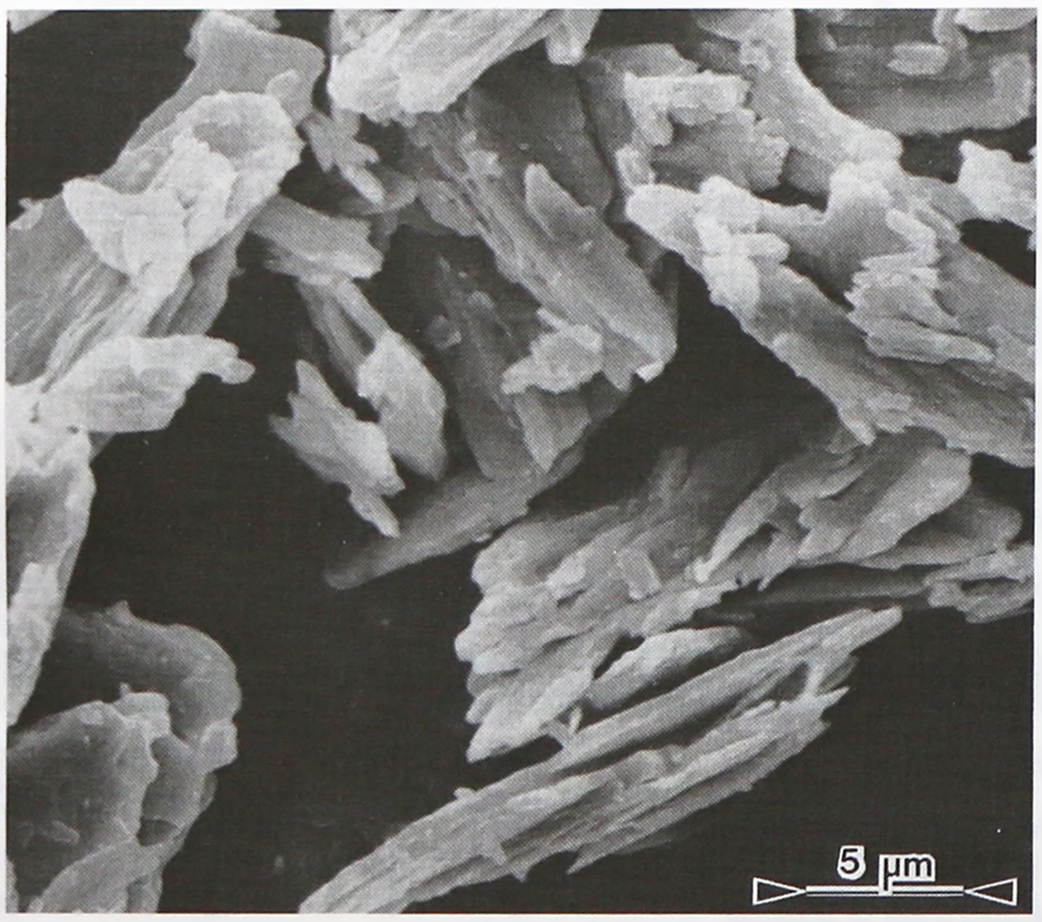
Use	Concentration (%)
Bactericide in parenterals and eye-drops	0.001–0.002
Spermicide in vaginal suppositories and jellies (active ingredient)	0.02

Table II: Pharmacopeial specifications for phenylmercuric acetate.



Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Ionized mercury	≤0.2%	–
Loss on drying	≤0.5%	–
Polymercurated benzene compounds	≤1.5%	≤1.5%
Melting range	–	149–153°C
Residue on ignition	–	≤0.2%
Mercuric salts and heavy metals	–	+
Assay	98.0–100.5%	98.0–100.5%

Table III: Solubility of phenylmercuric acetate.



Solvent	Solubility at 20°C[a]
Acetone	1 in 19
Chloroform	1 in 6.8
Ethanol (95%)	1 in 225
Ether	1 in 200
Water	1 in 180

(a) Compendial values for solubility vary considerably and in most instances do not show close agreement with laboratory-determined values, which also vary.

SEM 1: Excipient: phenylmercuric acetate; manufacturer: Eastman Fine Chemicals; magnification: 600×.

SEM 2: Excipient: phenylmercuric acetate; manufacturer: Eastman Fine Chemicals; magnification: 1800×.

12 Incompatibilities

As for other phenylmercuric salts; *see* Phenylmercuric Nitrate.

Incompatible with: halides; anionic emulsifying agents and suspending agents; tragacanth; starch; talc; sodium metabisulfite; sodium thiosulfate; edetate disodium; silicates; aluminum and other metals; amino acids; ammonia and ammonium salts; sulfur compounds; rubber; and some plastics.

Phenylmercuric acetate is reported to be incompatible with cefuroxime and ceftazidime.[1]

13 Method of Manufacture

Phenylmercuric acetate is readily formed by heating benzene with mercuric acetate.

14 Safety

Phenylmercuric acetate is mainly used as an antimicrobial preservative in topical pharmaceutical formulations. A number of adverse reactions to mercury-containing preservatives have been reported; *see* Phenylmercuric Nitrate.

LD_{50} (chicken, oral): 60 mg/kg[2]
LD_{50} (mouse, IP): 13 mg/kg
LD_{50} (mouse, IV): 18 mg/kg
LD_{50} (mouse, oral): 13 mg/kg
LD_{50} (mouse, SC): 12 mg/kg
LD_{50} (rat, oral): 41 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phenylmercuric acetate may be irritant to the skin, eyes, and mucous membranes. Eye protection, gloves, and a respirator are recommended. Chronic exposure via any route can lead to central nervous system damage.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (ophthalmic ointments; topical emulsions/creams; vaginal emulsions/creams). Included in the Canadian Natural Health Products Ingredients Database (ophthalmic, nasal and otic preparations up to 0.004%; however there must be no other suitable alternative preservative available).

Phenylmercuric acetate is no longer permitted to be used as a pesticide in the US. Its use in cosmetic products in the US is limited to eye area cosmetics at not more than 0.0065% provided that there is no other suitable available preservative. It is specifically prohibited in vaginal contraceptive drug products and antimicrobial diaper rash drug products in the US. Phenylmercuric compounds are prohibited from use in cosmetic products in Canada.

In Europe, use in cosmetic products is limited to eye makeup and eye makeup remover at concentrations not exceeding 0.007% mercury alone or in combination with other permitted mercurial compounds.[3] In France, a maximum concentration of 0.01% is permitted for use in pharmaceuticals. The use of mercurial compounds in cosmetics in Japan is limited to concentrated shampoo or cream at not more than 0.003% Hg and eye makeup at not more than 0.0065% Hg.

17 Related Substances

Phenylmercuric borate; phenylmercuric nitrate; thimerosal.

18 Comments

The EINECS number for phenylmercuric acetate is 200-532-5.

Phenylmercuric Borate

1 Nonproprietary Names

BP: Phenylmercuric Borate

PhEur: Phenylmercuric Borate

2 Synonyms

(Dihydrogen borato)phenylmercury; phenylhydrargyri boras; phenylmercuriborate; phenylmercury borate; PMB.

3 Chemical Name and CAS Registry Number

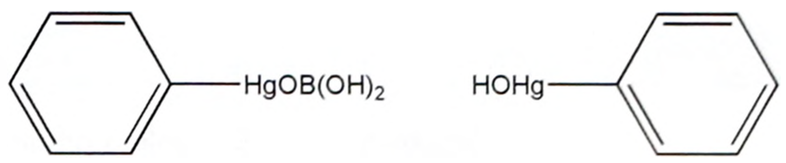
[Orthoborato(3-)-O]-phenylmercurate(2-)dihydrogen [102-98-7]

The CAS Registry Number, chemical name and synonyms all refer to phenylmercuric borate alone, rather than the compound. The name phenylmercuric borate and the synonyms may, however, be applied to the PhEur 9.2 material, which is a compound or a mixture of compounds; *see* Section 4. Unique CAS Registry Numbers for phenylmercuric borate and the compounds are as follows:

$C_6H_7BHgO_3$ [102-98-7]

$C_{12}H_{13}BHg_2O_4$ [8017-88-7]

$C_{12}H_{11}BHg_2O_3$ [6273-99-0]



4 Empirical Formula and Molecular Weight

The PhEur 9.2 material is a compound consisting of equimolecular proportions of phenylmercuric hydroxide and phenylmercuric orthoborate ($C_{12}H_{13}BHg_2O_4$) or of the dehydrated form (metaborate, $C_{12}H_{11}BHg_2O_3$), or a mixture of the two compounds.

Phenylmercuric hydroxide and phenylmercuric orthoborate:
$C_{12}H_{13}BHg_2O_4$ 633.2

Phenylmercuric hydroxide and phenylmercuric metaborate:
$C_{12}H_{11}BHg_2O_3$ 615.2

5 Structural Formula

Phenylmercuric orthoborate and phenylmercuric hydroxide

Phenylmercuric metaborate and phenylmercuric hydroxide

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Phenylmercuric borate is used as an alternative antimicrobial preservative to phenylmercuric acetate or phenylmercuric nitrate. It is more soluble than phenylmercuric nitrate and has also been reported to be less irritant than either phenylmercuric acetate or phenylmercuric nitrate.[1] *See* Table I. *See also* Phenylmercuric Nitrate.

Table I: Uses of phenylmercuric borate.

Use	Concentration (%)
Antimicrobial agent in ophthalmics	0.002–0.004
Antimicrobial agent in parenterals	0.002

8 Description

Phenylmercuric borate occurs as colorless, shiny flakes or as a white or slightly yellow, odorless, crystalline powder.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for phenylmercuric borate.

Test	PhEur 9.2
Identification	+
Characters	+
Appearance of solution	+
Ionized mercury (as heavy metals)	≤0.01%
Loss on drying (at 45°C)	≤3.5%
Assay (dried basis) of	
Mercury	64.5–66.0%
Borates (as H_3BO_3)	9.8–10.3%

10 Typical Properties

Acidity/alkalinity pH = 5.0–7.0 for 0.6% w/v aqueous solution at 20°C.

Antimicrobial activity Phenylmercuric borate is a broad-spectrum antimicrobial preservative with slow bactericidal and fungicidal activity similar to that of phenylmercuric nitrate; *see* Phenylmercuric Nitrate.

Dissociation constant pK_a = 3.3

Melting point 112–113°C

Solubility *see* Table III.

Table III: Solubility of phenylmercuric borate.

Solvent	Solubility at 20°C[a] unless otherwise stated
Ethanol (95%)	1 in 150
Glycerin	Soluble
Propylene glycol	Soluble
Water	1 in 125
	1 in 100 at 100°C

(a) Compendial values for solubility vary considerably.

P

11 Stability and Storage Conditions

As for other phenylmercuric salts; *see* Phenylmercuric Nitrate. Solutions may be sterilized by autoclaving.

Phenylmercuric borate should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

As for other phenylmercuric salts; *see* Phenylmercuric Nitrate.

Incompatible with: halides; anionic emulsifying agents and suspending agents; tragacanth; starch; talc; sodium metabisulfite; sodium thiosulfate; edetate disodium; silicates; aluminum and other metals; amino acids; ammonia and ammonium salts; sulfur compounds; rubber; and some plastics.

13 Method of Manufacture

Phenylmercuric borate may be prepared by heating mercuric borate with benzene or by evaporating to dryness, under vacuum, an alcoholic solution containing equimolar proportions of phenylmercuric hydroxide and boric acid.

14 Safety

Phenylmercuric borate is mainly used as an antimicrobial preservative in topical pharmaceutical formulations. A number of adverse reactions to mercury-containing preservatives have been reported; *see* Phenylmercuric Nitrate.

Although phenylmercuric borate is an irritant, it has been reported to be less so than either phenylmercuric acetate or phenylmercuric nitrate.[1] There is, however, some cross-sensitization potential with other mercurial preservatives.

Systemic absorption has been reported following regular use of a hand disinfectant soap containing 0.04% phenylmercuric borate, resulting in an increase in the estimated total daily body load of mercury from 30–100 µg per 24 hours.[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phenylmercuric borate may be irritant to the skin, eyes, and mucous membranes. Eye protection, gloves, and a respirator are recommended.

16 Regulatory Status

Included in nonparenteral medicines licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database (ophthalmic, nasal and otic preparations up to 0.004%; however there must be no other suitable alternative preservative).

In Europe, use is limited to eye makeup and eye makeup remover at not more than 0.007% mercury alone or in combination with other permitted mercurial substances.[3] In France, a maximum concentration of up to 0.01% is permitted for use in pharmaceutical formulations. Prohibited from use in cosmetic products in Canada. Prohibited in antimicrobial diaper rash drug products in the US. Limited use in Japan (*see* Phenylmercuric Nitrate).

17 Related Substances

Phenylmercuric acetate; phenylmercuric nitrate; thimerosal.

18 Comments

The EINECS number for phenylmercuric borate is 203-068-1.

Phenylmercuric Nitrate

1 Nonproprietary Names

BP: Phenylmercuric Nitrate

PhEur: Phenylmercuric Nitrate

USP–NF: Phenylmercuric Nitrate

2 Synonyms

Basic phenylmercury nitrate; mercuriphenyl nitrate; merphenyl nitrate; nitratophenylmercury; phenylhydrargyri nitras; phenylmercury nitrate; *Phe-Mer-Nite*; PMN.

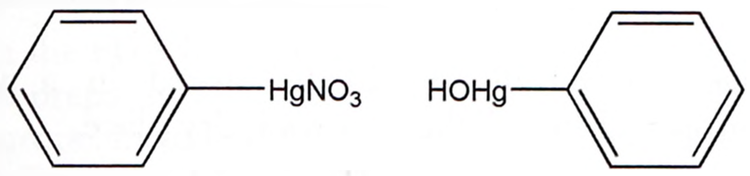
Note that the synonyms above are usually used to refer to phenylmercuric nitrate alone. However, confusion with nomenclature and CAS Registry Number has led to these synonyms also being applied to the PhEur 9.2 and USP 40–NF 35 S1 material, which is a compound of phenylmercuric nitrate and phenylmercuric hydroxide.

3 Chemical Name and CAS Registry Number

There are two CAS Registry Numbers associated with phenylmercuric nitrate. One refers to the mixture of phenylmercuric nitrate and phenylmercuric hydroxide ($C_{12}H_{11}Hg_2NO_4$) while the other refers to phenylmercuric nitrate alone ($C_6H_5HgNO_3$). The PhEur 9.2, and USP 40–NF 35 S1 use the name phenylmercuric nitrate to describe the mixture and use the CAS Registry Number [55-68-5].

Hydroxyphenylmercury mixture with (nitrato-O)phenylmercury:

$C_{12}H_{11}Hg_2NO_4$ [8003-05-2]



(Nitrato-O)phenylmercury:

$C_6H_5HgNO_3$ [55-68-5]

4 Empirical Formula and Molecular Weight

$C_{12}H_{11}Hg_2NO_4$ 634.45

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Phenylmercuric salts are used as antimicrobial preservatives mainly in ophthalmic preparations, but are also used in cosmetics (*see* Section 16), parenteral, and topical pharmaceutical formulations; *see* Table I.

Phenylmercuric salts are active over a wide pH range against bacteria and fungi and are usually used in neutral to alkaline solutions, although they have also been used effectively at slightly acid pH; *see* Section 10. In acidic formulations, phenylmercuric nitrate may be preferred to phenylmercuric acetate or phenylmercuric borate as it does not precipitate.

Phenylmercuric nitrate is also an effective spermicide, although its use in vaginal contraceptives is no longer recommended; *see* Section 14.

A number of adverse reactions to phenylmercuric salts have been reported, and concern at the toxicity of mercury compounds may preclude the use of phenylmercuric salts under certain circumstances; *see* Section 14.

Table I: Uses of phenylmercuric nitrate.

Use	Concentration (%)
Bactericide in parenterals and eye drops	0.001–0.002
Bactericide/spermacide in vaginal suppositories and jellies	0.02

8 Description

Phenylmercuric nitrate PhEur 9.2 and USP 40–NF 35 S1 is an equimolecular compound of phenylmercuric hydroxide and phenylmercuric nitrate; it occurs as a white, crystalline powder with a slight aromatic odor.

9 Pharmacopeial Specifications

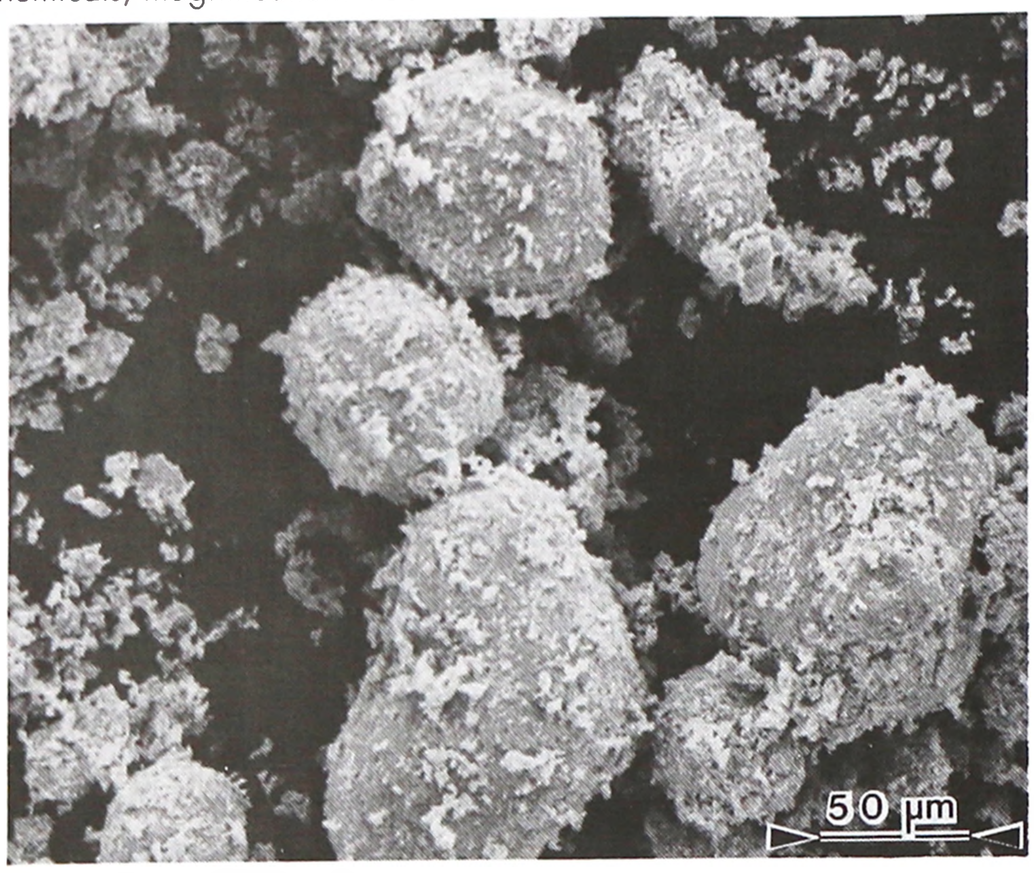
See Table II.

Table II: Pharmcopeial specifications for phenylmercuric nitrate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Loss on drying	≤1.0%	–
Residue on ignition	–	≤0.1%
Mercury ions	–	+
Inorganic mercuric compounds	+	–
Assay (dried basis) of:		
Mercury	62.5–64.0%	62.75–63.50%
Phenylmercuric ion	–	87.0–87.9%

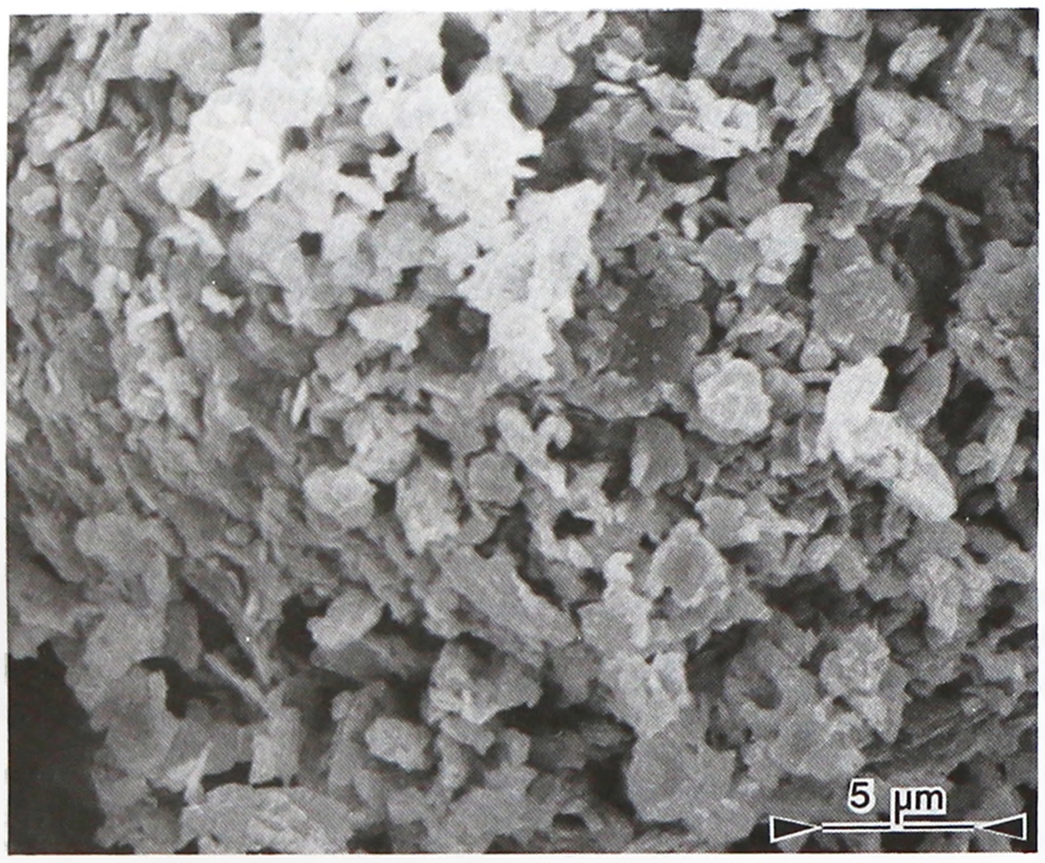
10 Typical Properties

Acidity/alkalinity A saturated aqueous solution is acidic to litmus.



Antimicrobial activity Phenylmercuric salts are broad-spectrum, growth-inhibiting agents at the concentrations normally used for the preservation of pharmaceuticals. They possess slow bactericidal and fungicidal activity. Antimicrobial activity tends to increase with increasing pH, although in solutions of pH 6 and below, activity against *Pseudomonas aeruginosa* has been demonstrated. Phenylmercuric salts are included in several compendial eye drop formulations of acid pH.

Activity is also increased in the presence of phenylethyl alcohol, and in the presence of sodium metabisulfite at acid pH. Activity is decreased in the presence of sodium metabisulfite at alkaline pH.[1–3] When used as preservatives in topical creams, phenylmercuric salts are active at pH 5–8.[4]



Bacteria (Gram-positive): *Staphylococcus aureus* Good inhibition, more moderate cidal activity. Minimum inhibitory concentration (MIC) against *Staphylococcus aureus* is 0.5 µg/mL.

Bacteria (Gram-negative): *Pseudomonas aeruginosa* Inhibitory activity for most Gram-negative bacteria is similar to

SEM 1: Excipient: phenylmercuric nitrate; manufacturer: Eastman Fine Chemicals; magnification: 180×.

SEM 2: Excipient: phenylmercuric nitrate; manufacturer: Eastman Fine Chemicals; magnification: 1800×.

that for Gram-positive bacteria (MIC is approximately 0.3–0.5 µg/mL). Phenylmercuric salts are less active against some *Pseudomonas* species, and particularly *Pseudomonas aeruginosa* (MIC is approximately 12 µg/mL).

Fungi: *Candida albicans* and *Aspergillus niger* Most fungi are inhibited by 0.3–1 µg/mL; phenylmercuric salts exhibit both inhibitory and fungicidal activity; e.g. for phenylmercuric acetate against *Candida albicans*, MIC is 0.8 µg/mL; for phenylmercuric acetate against *Aspergillus niger*, MIC is approximately 10 µg/mL.

Spores Phenylmercuric salts may be active in conjunction with heat. The BP 1980 included heating at 100°C for 30 minutes in the presence of 0.002% w/v phenylmercuric acetate or phenylmercuric nitrate as a sterilization method. However, in practice this may not be sufficient to kill spores and heating with a bactericide no longer appears as a sterilization method in the BP 2017.

Dissociation constant $pK_a = 3.3$

Melting point 187–190°C with decomposition.

Partition coefficients

Mineral oil : water = 0.58;

Peanut oil : water = 0.4.

Solubility More soluble in the presence of either nitric acid or alkali hydroxides. *See* Table III.

Spectroscopy

NIR spectrum *see* Figure 1.

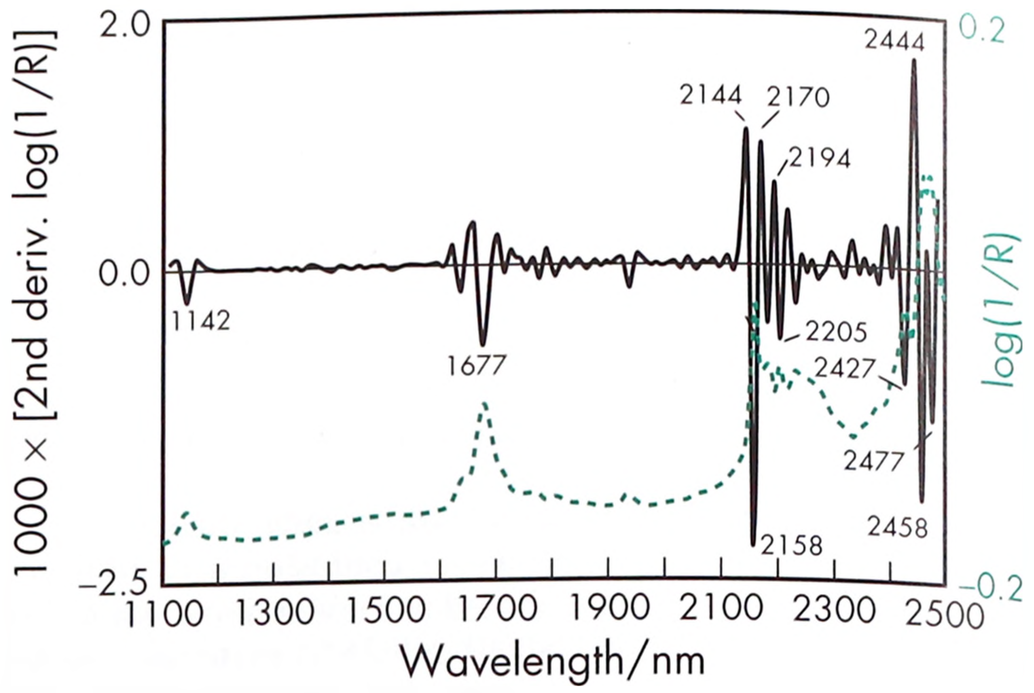


Figure 1: Near-infrared spectrum of phenylmercuric nitrate measured by reflectance.

Table III: Solubility of phenylmercuric nitrate.

Solvent	Solubility at 20°C[a] unless otherwise stated
Ethanol (95%)	1 in 1000
Fixed oils	Soluble
Glycerin	Slightly soluble
Water	1 in 600–1500
	1 in 160 at 100°C

(a) Compendial values for solubility vary considerably.

11 Stability and Storage Conditions

All phenylmercuric compound solutions form a black residue of metallic mercury when exposed to light or after prolonged storage. Solutions may be sterilized by autoclaving, although significant amounts of phenylmercuric salts may be lost, hence reducing preservative efficacy, owing to incompatibilities with packaging components or other excipients, e.g. sodium metabisulfite.[5–7] *See* Section 12.

Phenylmercuric nitrate should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

The antimicrobial activity of phenylmercuric salts may be reduced in the presence of anionic emulsifying agents and suspending agents, tragacanth, starch, talc, sodium metabisulfite,[8] sodium thiosulfate,[2] edetate disodium,[2] and silicates (bentonite, aluminum magnesium silicate, magnesium trisilicate, and kaolin).[9,10]

Phenylmercuric salts are incompatible with halides, particularly bromides and iodides, as they form less-soluble halogen compounds. At concentrations of 0.002% w/v precipitation may not occur in the presence of chlorides. Phenylmercuric salts are also incompatible with aluminum and other metals, ammonia and ammonium salts, amino acids, and with some sulfur compounds, e.g. in rubber.

Phenylmercuric salts are absorbed by rubber stoppers and some types of plastic packaging components; uptake is usually greatest to natural rubbers and polyethylene, and least to polypropylene.[11–16]

Incompatibilities with some types of filter membranes may also result in loss of phenylmercuric salts following sterilization by filtration.[17]

13 Method of Manufacture

Phenylmercuric nitrate is readily formed by heating benzene with mercuric acetate, and treating the resulting acetate with an alkali nitrate.[18]

14 Safety

Phenylmercuric nitrate and other phenylmercuric salts have been widely used as antimicrobial preservatives in parenteral and topical pharmaceutical formulations. However, concern over the use of phenylmercuric salts in pharmaceuticals has increased as a result of greater awareness of the toxicity of mercury and other mercury compounds. This concern must, however, be balanced by the effectiveness of these materials as antimicrobial preservatives and the low concentrations in which they are employed.

Phenylmercuric salts are irritant to the skin at 0.1% w/w concentration in petrolatum.[19] In solution, they may give rise to erythema and blistering 6–12 hours after administration. In a modified repeated insult patch test, a 2% w/v solution was found to produce extreme sensitization of the skin.[20,21]

Eye drops containing phenylmercuric nitrate as a preservative should not be used continuously for prolonged periods as mercurialentis, a brown pigmentation of the anterior capsule of the lens may occur. Incidence is 6% in patients using eye drops for greater than 6 years; however, the condition is not associated with visual impairment.[22,23] Cases of atypical band keratopathy have also been attributed to phenylmercuric nitrate preservative in eye drops.[24]

Concern that the absorption of mercury from the vagina may be harmful has led to the recommendation that phenylmercuric nitrate should not be used in intravaginal formulations.[25]

LD_{50} (mouse, IV): 27 mg/kg[26]

LD_{50} (mouse, oral): 50 mg/kg

LD_{50} (rat, SC): 63 mg/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phenylmercuric nitrate may be irritant to the skin, eyes, and mucous membranes. Eye protection, gloves, and a respirator are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (parenteral and ophthalmic preparations). Included in parenteral products and eye drops in Europe. Included in the Canadian Natural Health Products Ingredients Database (ophthalmic, nasal and otic preparations only up to 0.002%; however there must be no other suitable alternative preservative).

Prohibited in first aid antiseptic drug products, antimicrobial diaper rash drug products, and vaginal contraceptive drug products in the US. Limited uses permitted in Japan and Europe for cosmetics (*see* Phenylmercuric Acetate).

17 Related Substances

Phenylmercuric acetate; phenylmercuric borate; thimerosal.

18 Comments

Phenylmercuric salts should be used in preference to benzalkonium chloride as a preservative for salicylates and nitrates and in solutions of salts of physostigmine and epinephrine that contain 0.1% sodium sulfite.

Phospholipids

1 Nonproprietary Names

See Section 9.

2 Synonyms

Coatsome; glycerol phosphatides; *Lipoid*; phosphatides; phosphatidic acid; phosphatidylcholine; phosphatidylethanolamine; phosphatidylglycerol; phosphatidylinositol; phosphatidylserine; phosphoglycerides; *PhosphoLipid*; purified egg yolk PC; sphingomyelin.

See also Table I.

3 Chemical Name and CAS Registry Number

See Table II.

4 Empirical Formula and Molecular Weight

Phospholipids are formed from two combinations of apolar and 'backbone' moieties: a glycerol (or other polyol) moiety substituted with one or two acyl or alkyl chains; or an *N*-acylated sphingoid base (a ceramide).[1] Typically, the molecular weights range from 600 to 5000.

See also Table III.

5 Structural Formula

See Table IV.

6 Functional Category

Anionic surfactant; biodegradable material; cationic surfactant; dispersing agent; emulsifying agent; emulsion stabilizing agent; membrane-forming agent; nonionic surfactant; solubilizing agent; suspending agent.

7 Applications in Pharmaceutical Formulation or Technology

Phospholipids are amphiphilic molecules and are the major component of most cell membranes.[2] They are able to self-associate and form a variety of structures, including micelles and liposomes.[3]

Numerous pharmaceutical formulations use phospholipids to form various types of liposomes, including unilamellar (one bilayer membrane surrounding an aqueous chamber), multilamellar (two or more concentric membranes, each surrounding an aqueous chamber), and multivesicular (numerous aqueous chambers joined in a honeycomb-like arrangement) liposomes.[4] Modified phospholipids have been used to enhance the properties of the resulting liposomes. The covalent attachment of polyethylene glycol (PEG) to the phospholipid, or PEGylation, provides steric hindrance to the surface of the liposomes, resulting in decreased uptake by the reticuloendothelial system (RES), also known as the mononuclear phagocyte system, and a prolonged circulation half-life following intravenous administration; the so-called 'stealth liposomes'.[5] Conjugation with antibodies produces immunoliposomes, which are able to target specific cell types and deliver a payload of encapsulated drug.[6]

Phospholipids can be anionic, cationic, or neutral in charge. Because of their amphiphilic nature, phospholipids will associate at hydrophobic/hydrophilic interfaces. The charged lipids can be used to provide electrostatic repulsion and physical stability to suspended particles. Thus, they have been used to physically stabilize emulsions and suspensions.[7,8] Phospholipids have also been used in formulations administered as lung surfactants, intravenous fat emulsions, topical and transdermal formulations, and oral solutions.

8 Description

Phospholipids occur as white powders. They are sometimes supplied as clear, nearly colorless chloroform or methylene chloride solutions. Phosphatidylglycerols, phosphatidic acids, and phosphatidylserines are available as sodium or ammonium salts.

9 Pharmacopeial Specifications

Egg Phospholipids USP–NF is defined as a mixture of naturally occurring phospholipids obtained from the yolk of hens' eggs that is suitable for use as an emulsifying agent in injectable emulsions. The content of phosphatidylcholine, phosphatidylethanolamine, lysophosphatidylcholine, and other related phospholipids is to be reported in the certificate of analysis. It may also contain a suitable stabilizer. *See* Table V. *See also* Lecithin.

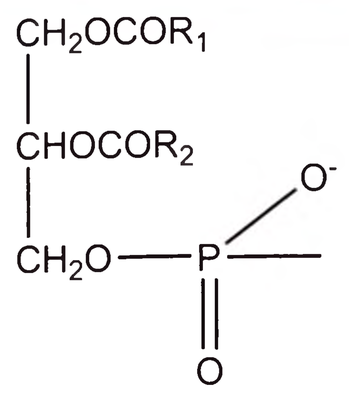
Dioleoyl phosphatidylserine, sodium salt	$C_{42}H_{77}O_{10}NPNa$	810.0

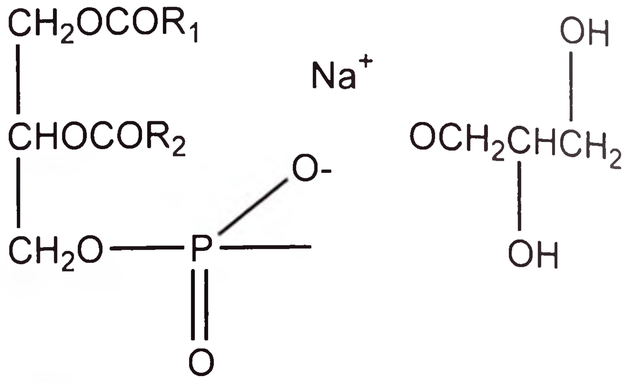
10 Typical Properties

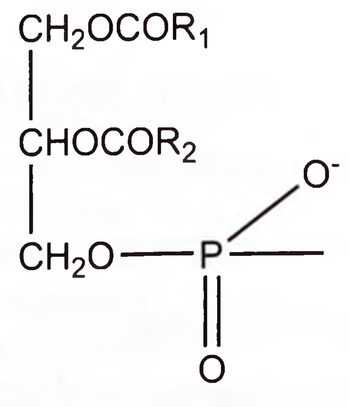
Phospholipids are amphiphilic, surface-active molecules with a high tendency to form aggregates (phases) both in the dry state and when fully hydrated. The temperature of transition from crystalline to mesomorphic (liquid crystalline) state is the transition temperature (T_m).[9] *See* Table VI. Most phospholipids are freely soluble in organic solvents.

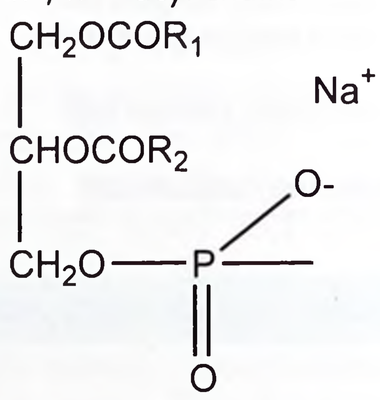
11 Stability and Storage Conditions

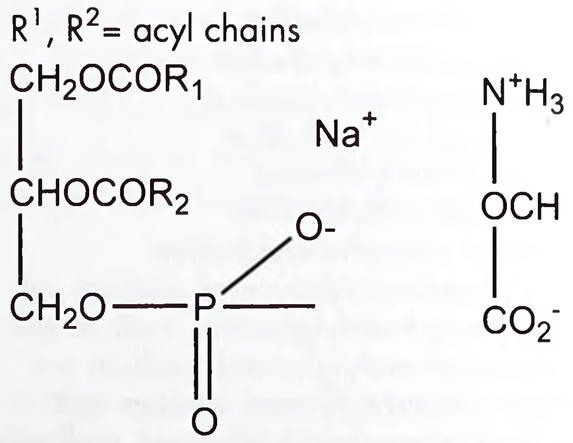
Phospholipids are stable in the solid state if protected from oxygen, heat, and light. Chloroform or dichloromethane solutions are also stable. Both the solid-state and solution forms should be stored at −20°C. Liposomal phospholipids are known to degrade via oxidation and hydrolysis. To minimize oxidation, liposomes can be prepared under oxygen-free environments and antioxidants, such as butylated hydroxytoluene (BHT), can be added.[11,12] To minimize hydrolysis, water can be removed from liposomes by lyophilization. In cases where liposomes are unstable to lyophilization, long-term storage at 2–8°C is recommended. The ester hydrolysis of phospholipids in liposomes typically follows a V-shaped curve, with the minimum at around pH 6.5.[13,14]











12 Incompatibilities

—

13 Method of Manufacture

Phospholipids can be manufactured from naturally occurring materials, especially soybean and egg. The manufacturing process typically involves extraction, fractionation, and purification. They can also be synthesized chemically by reacting glycerol phosphocholine (PC), glycerol phosphoglycerol (PG), glycerol phosphoserine (PS), glycerol phosphoethanolamine (PE), or glycerol phosphoinositol (PI) with purified fatty acids.[15]

Table IV: Structural formulas of selected phospholipids.

Series name	Phosphatidyl moiety	Headgroup
Phosphatidylcholines		$OCH_2CH_2N^+(CH_3)_3$
	R^1, R^2= acyl chains	
Phosphatidylglycerol sodium salts		
	R^1, R^2= acyl chains	
Phosphatidylethanolamines		$OCH_2CH_2N^+H_3$
	R^1, R^2= acyl chains	
Phosphatidic acid sodium salts		
	R^1, R^2= acyl chains	
Phosphatidylserines		
	R^1, R^2= acyl chains	

14 Safety

Generally, phospholipids have little or no acute toxicity (i.e. they are well tolerated even when administered at doses in the g/kg range).[16] While naturally occurring antibodies to phospholipids are observed, the immunology and safety of the antibodies are not considered to be clinically relevant.[17] The clearance of most phospholipids occurs by well-known metabolic pathways.[18]

Table V: Pharmacopeial specifications for egg phospholipids.

Test	USP 40–NF 35 S1
Acid value	≤20.0
Peroxide value	≤3.0
Bacterial endotoxins	≤6 IU/g
Microbial limit	≤100 cfu/g
Water	≤6.0%
Heavy metals	≤10 ppm
Nonphosphatidyl lipids	≤7.0%
Assay (lysophosphatidylcholine)	≤3.0%

Table VI: Properties of common phospholipids.[10]

Name	Transition temperature T_m(°C)	Net charge at pH 7.4

Dioleoyl phosphatidylserine, sodium salt	−11	−1

Liposomes containing stearylamines (cationic liposomes) have been found to induce cytotoxicity through apoptosis in the macrophage-like cell line RA W2647[19] and inhibit the growth of cells *in vitro*.[20,21] In nine cancer-derived cell lines and one normal cultured human cell line, stearylamine- and cardiolipin-containing liposomes were toxic (LD_{50}) at 200 μM liposomal lipid concentration or less, whereas PG- and PS-containing liposomes were toxic in the range 130–3000 μM.[22] Positively charged lipids such as stearylamine can increase the toxicity of liposomes.[23] These studies reported an LD_{50} (IV) of 1.1 g/kg and 7.5 g/kg with and without stearylamine, respectively.

The safety of phospholipids delivered by the intravenous route is complicated by their tendency to form particles that are recognized by macrophages of the RES.[24] Uptake by the RES is dependent on particle size and composition.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredient Database (oral, otic, buccal, vaginal, topical, epidural, intravenous, intramuscular, and inhalation aerosol). A number of phospholipids such as DPPG and DOPC are present in approved products in Europe and the US. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Lecithin.

18 Comments

Therapeutically, oral formulations of phosphatidylcholine with nonsteroidal anti-inflammatory drugs (NSAIDS) have been shown to reduce gastrointestinal bleeding and ulceration associated with NSAIDS.[25]

Phospholipids can be purified from natural sources, such as eggs or soybeans, or can be chemically synthesized. Egg or soy phospholipids are composed of mixtures of individual phospholipids including phosphatidylcholine, phosphatidylethanolamine and lysophosphatidylcholine. The fatty acid content of egg phospholipids depends on the types of fat in the diets of the hen as well as the strain of hen.[26] Likewise, the composition of soy is known to vary.[27] To ensure batch-to-batch reproducibility, phospholipids from synthetic sources are commonly used. Lecithins are partially purified mixtures of naturally occurring phospholipids and other material.

Phosphoric Acid

P

1 Nonproprietary Names

BP: Phosphoric Acid
PhEur: Phosphoric Acid, Concentrated
USP–NF: Phosphoric Acid
See also Section 17.

2 Synonyms

Acid fosforico; acide phosphorique; acidum phosphoricum concentratum; E338; hydrogen phosphate; syrupy phosphoric acid.

3 Chemical Name and CAS Registry Number

Orthophosphoric acid [7664-38-2]

4 Empirical Formula and Molecular Weight

H_3PO_4 98.00

5 Structural Formula

See Section 4.

6 Functional Category

Acidulant; buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Phosphoric acid is widely used as an acidulant in a variety of pharmaceutical formulations. It is used in pharmaceutical products as part of a buffer system when combined with a phosphate salt such as sodium phosphate, monobasic or dibasic. It is also widely used in food preparations as an acidulant, flavor, and synergistic antioxidant (0.001–0.005%) and sequestrant.

Phosphoric acid 35% gel has also been used to etch tooth enamel and to enhance delivery of drugs through the nail.[1]

8 Description

Concentrated phosphoric acid occurs as a colorless, odorless, syrupy liquid.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for phosphoric acid.

	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
Relative density	≈1.7	–
Sulfate	≤100 ppm	+
Chloride	≤50 ppm	–
Heavy metals	–	≤10 ppm
Substances precipitated with ammonia	+	–
Arsenic	≤2 ppm	–
Iron	≤50 ppm	–
Alkali phosphates	–	+
Limit of nitrate	–	+
Phosphorous or hypophosphorous acid	+	+
Assay (of H_3PO_4)	84.0–90.0%	85.0–88.0%

10 Typical Properties

Acidity/alkalinity pH = 1.6 (1% w/w aqueous solution)
Boiling point 117.87°C
Dissociation constant

pK_{a1} = 2.15;
pK_{a2} = 7.09;
pK_{a3} = 12.32.

Melting point 42.35°C
Refractive index

$n_D^{17.5}$ = 1.35846 (30% w/w aqueous solution);
$n_D^{17.5}$ = 1.35032 (20% w/w aqueous solution);
$n_D^{17.5}$ = 1.3423 (10% w/w aqueous solution).

Solubility Miscible with ethanol (95%) and water with the evolution of heat.
Specific gravity

1.874 (100% w/w) at 25°C;
1.6850 (85% w/w aqueous solution) at 25°C;
1.3334 (50% w/w aqueous solution) at 25°C;
1.0523 (10% w/w aqueous solution) at 25°C.

11 Stability and Storage Conditions

When stored at a low temperature, phosphoric acid may solidify, forming a mass of colorless crystals, comprising the hemihydrate, which melts at 28°C. Phosphoric acid should be stored in an airtight container in a cool, dry place. Stainless steel containers may be used.

12 Incompatibilities

Phosphoric acid is a strong acid and reacts with alkaline substances. Mixtures with nitromethane are explosive.

13 Method of Manufacture

The majority of phosphoric acid is made by digesting phosphate rock (essentially tricalcium phosphate) with sulfuric acid; the phosphoric acid is then separated by slurry filtration. Purification is achieved via chemical precipitation, solvent extraction, crystallization, or ion exchange.

14 Safety

In the concentrated form, phosphoric acid is an extremely corrosive and harmful acid. However, when used in pharmaceutical formulations it is usually very diluted and is generally regarded as an essentially nontoxic and nonirritant material.

The lowest lethal oral dose of concentrated phosphoric acid in humans is reported to be 1286 µL/kg.[2]

LD_{50} (rabbit, skin): 2.74 g/kg[2]
LD_{50} (rat, oral): 1.53 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Phosphoric acid is corrosive and can cause burns on contact with the skin, eyes and mucous membranes; contact should be avoided. Splashes should be washed with copious quantities of water. Protective clothing, gloves and eye protection are recommended.

Phosphoric acid is also irritant on inhalation. In the UK, the workplace exposure limit for phosphoric acid is 1 mg/m^3 long-term (8-hour TWA) and 2 mg/m^3 short-term (15-minutes).[3]

Phosphoric acid emits toxic fumes on heating.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (infusions, injections, oral solutions, topical creams, lotions, ointments and solutions, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dilute phosphoric acid.

Dilute phosphoric acid

Synonyms acidum phosphoricum dilutum; diluted phosphoric acid.
Comments The PhEur 9.2 states that dilute phosphoric acid contains 9.5–10.5% w/w H_3PO_4 and may be prepared by mixing phosphoric acid 115 g with 885 g of water. The USP 40–NF 35 S1 contains a monograph for diluted phosphoric acid and states that it contains 9.5–10.5% w/v H_3PO_4 and may be prepared by mixing phosphoric acid 69 mL with water to 1000 mL.

18 Comments

Therapeutically, dilute phosphoric acid has been used well-diluted in preparations used in the treatment of nausea and vomiting.

Nanosized hydroxyapatite powder was made by combining phosphoric acid with egg shells.[4]

In the UK, a 1 in 330 aqueous solution of phosphoric acid is approved as a disinfectant for foot-and-mouth disease. A specification for phosphoric acid is contained in the *Food Chemicals Codex* (FCC).[5]

The EINECS number for phosphoric acid is 231-633-2. The PubChem Compound ID (CID) for phosphoric acid is 1004.

P

Polacrilex Resin

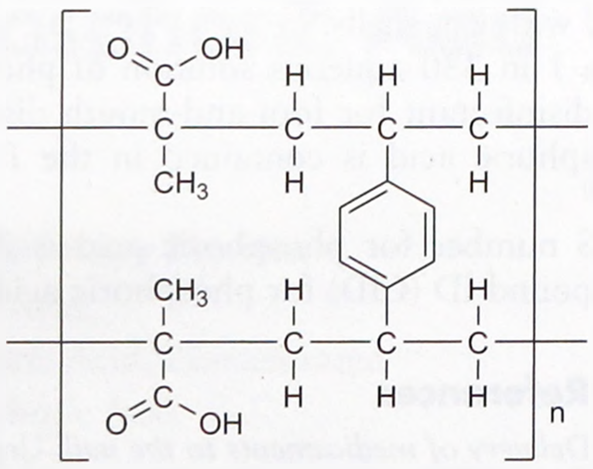
1 Nonproprietary Names

None adopted.

2 Synonyms

Amberlite IRP-64; polacrilex; polacrilin resin; polacrilin; polycrilex resin; 2-propenoic acid, 2-methyl-, polymer with diethenylbenzene.

3 Chemical Name and CAS Registry Number



Copolymer of methacrylic acid and divinylbenzene [50602-21-6] and [80892-32-6]

4 Empirical Formula and Molecular Weight

Polacrilex resin is a weak carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene.

Polacrilex resin is a polymer of infinite molecular weight. The infinite molecular weight is due to the cross-linked structure of the methacrylic acid-divinylbenzene copolymer. The cross-linking nature of methacrylic acid and divinylbenzene leads to one large polymer molecule (tri-dimensional matrix). Due to this chemistry, an average molecular weight determination is not possible.

5 Structural Formula

6 Functional Category

Complexing agent; modified-release agent; solubilizing agent; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Polacrilex resin is used to form a complex ('resinate') with various molecules via hydrogen ion exchange to modify the release profile, increase stability, and to improve solubility and taste-masking.[1,2] For instance, polacrilex resin is used to produce stable complexes of cyanocobalamin (vitamin B12).[1] It is also used to modify the release of nicotine, which is loaded onto the ion exchange resin to form a complex (e.g. Nicotine Polacrilex USP, Nicotine Resinate PhEur) which is further used in a smoking cessation gum. The so formed 'complex' or 'resinate' is often designated as the API in such formulations. Dosage forms for the finished drug product include lozenges, tablets, chewing-gums, capsules, creams (ointments), and transdermal patches. Polacrilex resin is also used in veterinary products as a taste-masking agent[3–6] and is used in the analysis and manufacture of pharmaceuticals and food products.

The amount of drug loaded is dependent on factors such as selectivity of exchange resin for the drug, concentration of the drug for exchange, and competition from cations in, and pH of the exchange solution. Drug loading typically occurs above pH 6. The rate of loading will be influenced by drug size and the extent of resin swelling.[1]

Batch equilibration is the preferred drug loading method as the resin is a finely divided powder. It may be necessary to repeat the loading stage two or more times to achieve maximum drug loading.[1] High drug charge density, low drug molecular weight, and high concentration of the drug with few competing anions are properties that favor high loading capacity. Drug release *in vivo* is controlled by the diffusion rate of the drug from the resin, the selectivity of the drug for the resin, and concentration of electrolytes in the exchange environment.[1] The resin readily releases the absorbed species in acidic environments due to the resins high affinity for hydrogen ions.[1]

8 Description

Polacrilex resin occurs as a white to off white powder.

9 Pharmacopeial Specifications

—

10 Typical Properties

Density (tapped) ~700 g/L
Exchange capacity ≥10 mEq/g
Moisture content ≤10%
Solubility Insoluble in water and most solvents
Spectroscopy IR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Polacrilex resin is stable for at least 2 years. It is recommended to store the product in its original packaging, well-closed and under normal storage conditions and away from heat (<40°C), light or moisture.

12 Incompatibilities

Polacrilex resin is incompatible with oxidising agents.

13 Method of Manufacture

Polacrilex resin is produced by the copolymerization of methacrylic acid and divinylbenzene monomers in suspension. This leads to a weak acid cation–exchange resin in the form of spherical beads. This intermediate is further ground to obtain a powder.[7]

14 Safety

Polacrilex resin is not mutagenic in the Ames Test based on testing conducted on an aqueous leachate of polacrilex resin.[8] A 90-day oral subchronic toxicity study established the no observed effect level (NOEL) in rats as 1000 mg/kg (highest dose tested).[8]

LD_{50} (rat, oral): >2 g/kg[8]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Polacrilex resin emits irritating and toxic gases when burnt.

Dust formation should be avoided. Avoid contact with eyes. Eye protection and gloves are recommended.

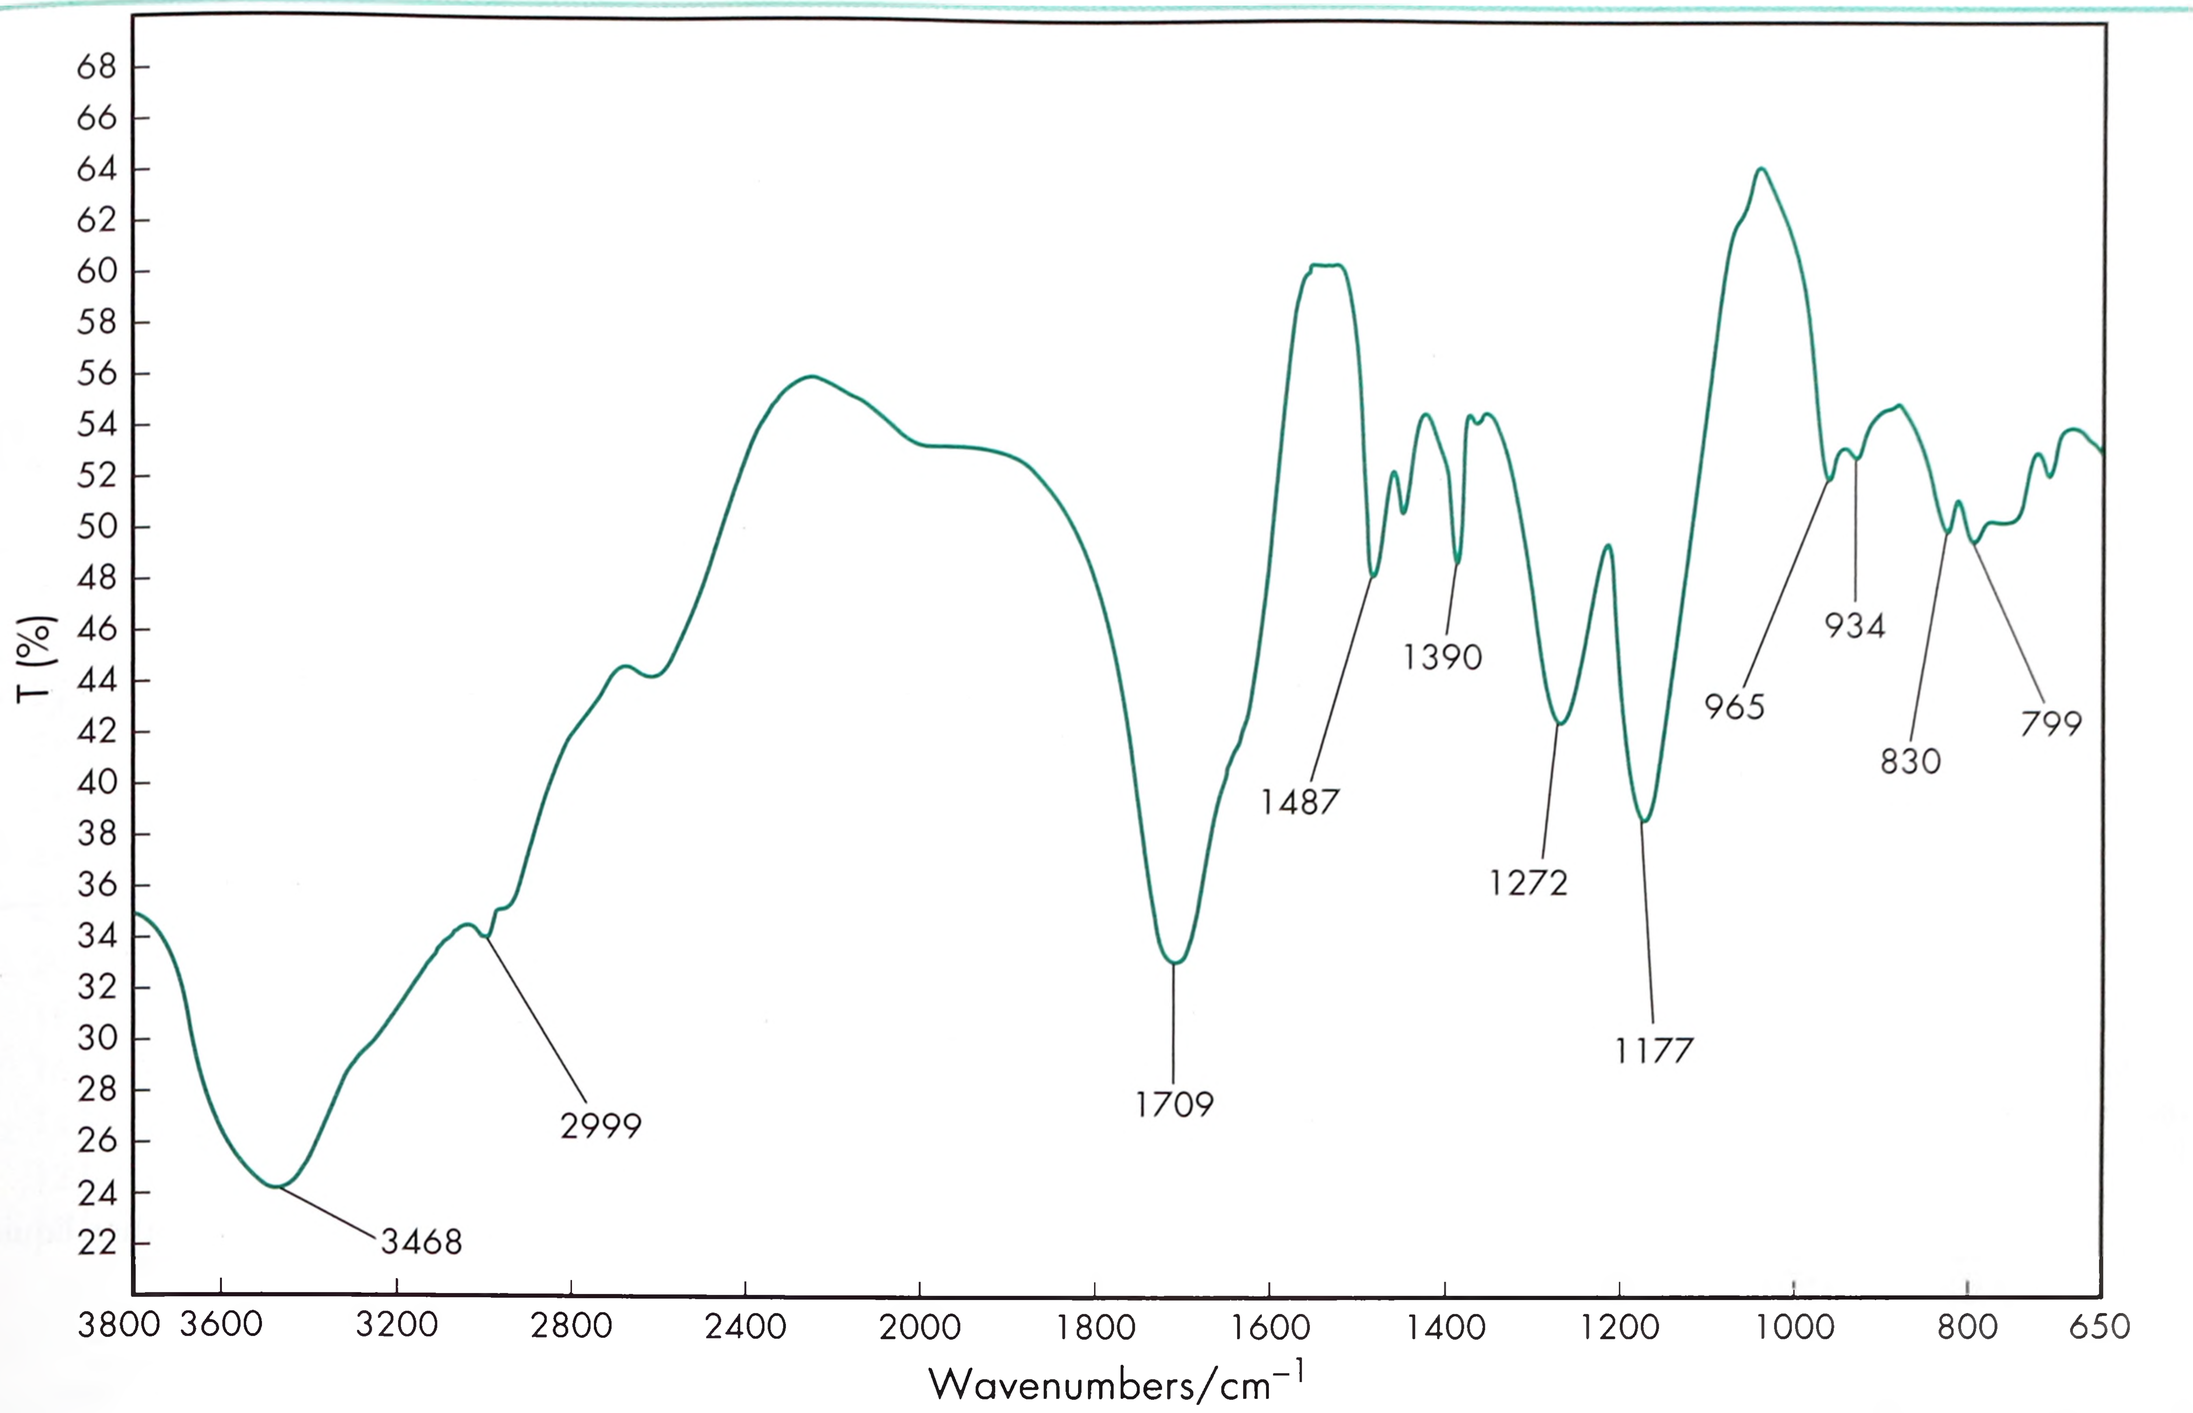


Figure 1: Infrared spectrum of polacrilex resin measured by transmission.

16 Regulatory Status

Included in the FDA inactive ingredients database (oral tablets, transdermal and iontophoresis drug delivery systems). Included in nonparenteral medicines licensed in the UK. Included in veterinary formulations. Approved as a food additive in the US. Included in the Canadian Natural Health Products database.

17 Related Substances

—

18 Comments

Although there is not a USP-NF monograph for Polacrilex resin, a USP reference standard is available for the purpose of IR identification testing.

The EINECS number for polacrilex resin is 610-547-2. The UNII code for polacrilex resin is RCZ785HI7S.

Polacrilin Potassium

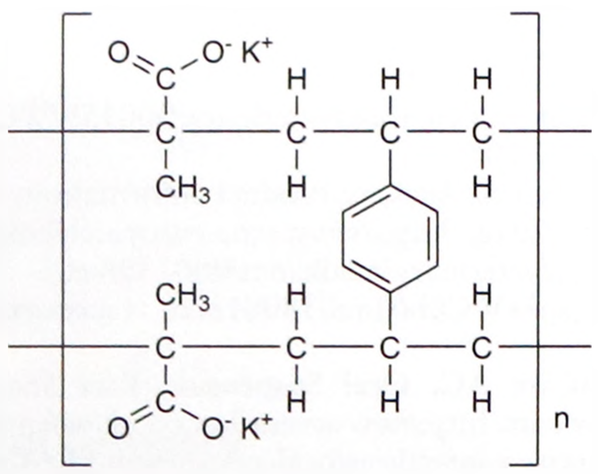
1 Nonproprietary Names

USP–NF: Polacrilin Potassium

2 Synonyms

Amberlite IRP-88; methacrylic acid polymer with divinylbenzene, potassium salt; polacrilinum kalii; potassium methacrylate-divinylbenzene, copolymer.

3 Chemical Name and CAS Registry Number



2-Propenoic acid, 2-methyl-, potassium salt, polymer with diethenylbenzene [65405–55–2]

4 Empirical Formula and Molecular Weight

Polacrilin potassium is the potassium salt of a unifunctional low-cross-linked carboxylic cation exchange resin prepared from methacrylic acid and divinylbenzene.

The substance polacrilin potassium is a polymer of infinite molecular weight. The infinite molecular weight is due to the cross-linked structure of the methacrylic acid-divinylbenzene copolymer. The cross-linking nature of methacrylic acid and divinylbenzene leads to one large polymer molecule (tri-dimensional matrix). Due to this chemistry, an average molecular weight determination is not possible.

5 Structural Formula

6 Functional Category

Complexing agent; modified-release agent; tablet and capsule disintegrant; taste-masking agent.

7 Applications in Pharmaceutical Formulation or Technology

Polacrilin potassium is a weakly acidic cation-exchange resin used in oral pharmaceutical formulations as a tablet disintegrant.[1–3] In an aqueous environment the resin swells due to its hydrophilic nature disrupting the tablet.[4] Concentrations of 2–10% w/w have been used for this purpose, although 2% w/w of polacrilin potassium is usually sufficient. It is also proposed for use as a taste-masking agent.[4,5]

Polacrilin potassium is also used in the analysis and manufacture of pharmaceuticals and food products.[6]

8 Description

Polacrilin potassium occurs as a cream-colored, odorless and tasteless, free-flowing powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for polacrilin potassium.

Test	USP 40–NF 35 S1
Identification	+
Loss on drying	≤10.0%
Powder fineness	≤1.0% on a #100 mesh ≤30.0% on a #200 mesh
Iron	≤0.01%
Sodium	≤0.20%
Heavy metals	≤20 µg/g
Assay of potassium (dried basis)	20.6%–25.1%

10 Typical Properties

Density (bulk) 0.48 g/cm^3 for *Amberlite IRP-88*.[3]
Density (tapped) 0.62 g/cm^3 for *Amberlite IRP-88*.[3]
Hygroscopicity Hygroscopic powder.
Solubility Practically insoluble in water and most other liquids, although polacrilin resins swell rapidly when wetted.
Spectroscopy IR spectrum *see* Figure 1.

11 Stability and Storage Conditions

Polacrilin Potassium is stable for at least 2 years. It should be stored in its original packaging, tightly closed and under normal storage conditions (away from heat, light or moisture).

12 Incompatibilities

Polacrilin potassium is incompatible with strong oxidizing agents, and amines, particularly tertiary amines.[4,7]

13 Method of Manufacture

Polacrilin potassium is prepared by the copolymerization of methacrylic acid with divinylbenzene (DVB), resulting in a copolymer (beads) in the hydrogen (H^+) form. It is then (partially) converted to the potassium form (K^+) using potassium hydroxide or potassium carbonate, so as to meet the USP–NF monograph's prescribed potassium content (20.6–25.1%). This intermediate is further ground to obtain a powder.[8]

14 Safety

Polacrilin potassium is used in oral pharmaceutical formulations and is generally regarded as nontoxic and nonirritant materials. Polacrilin potassium is not mutagenic as assessed by the Ames Test.[7]

LD_{50} (rat, oral): >2 g/kg[7]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Polacrilin potassium may be irritating to the eyes; eye protection and gloves are recommended. Dust formation should be avoided.

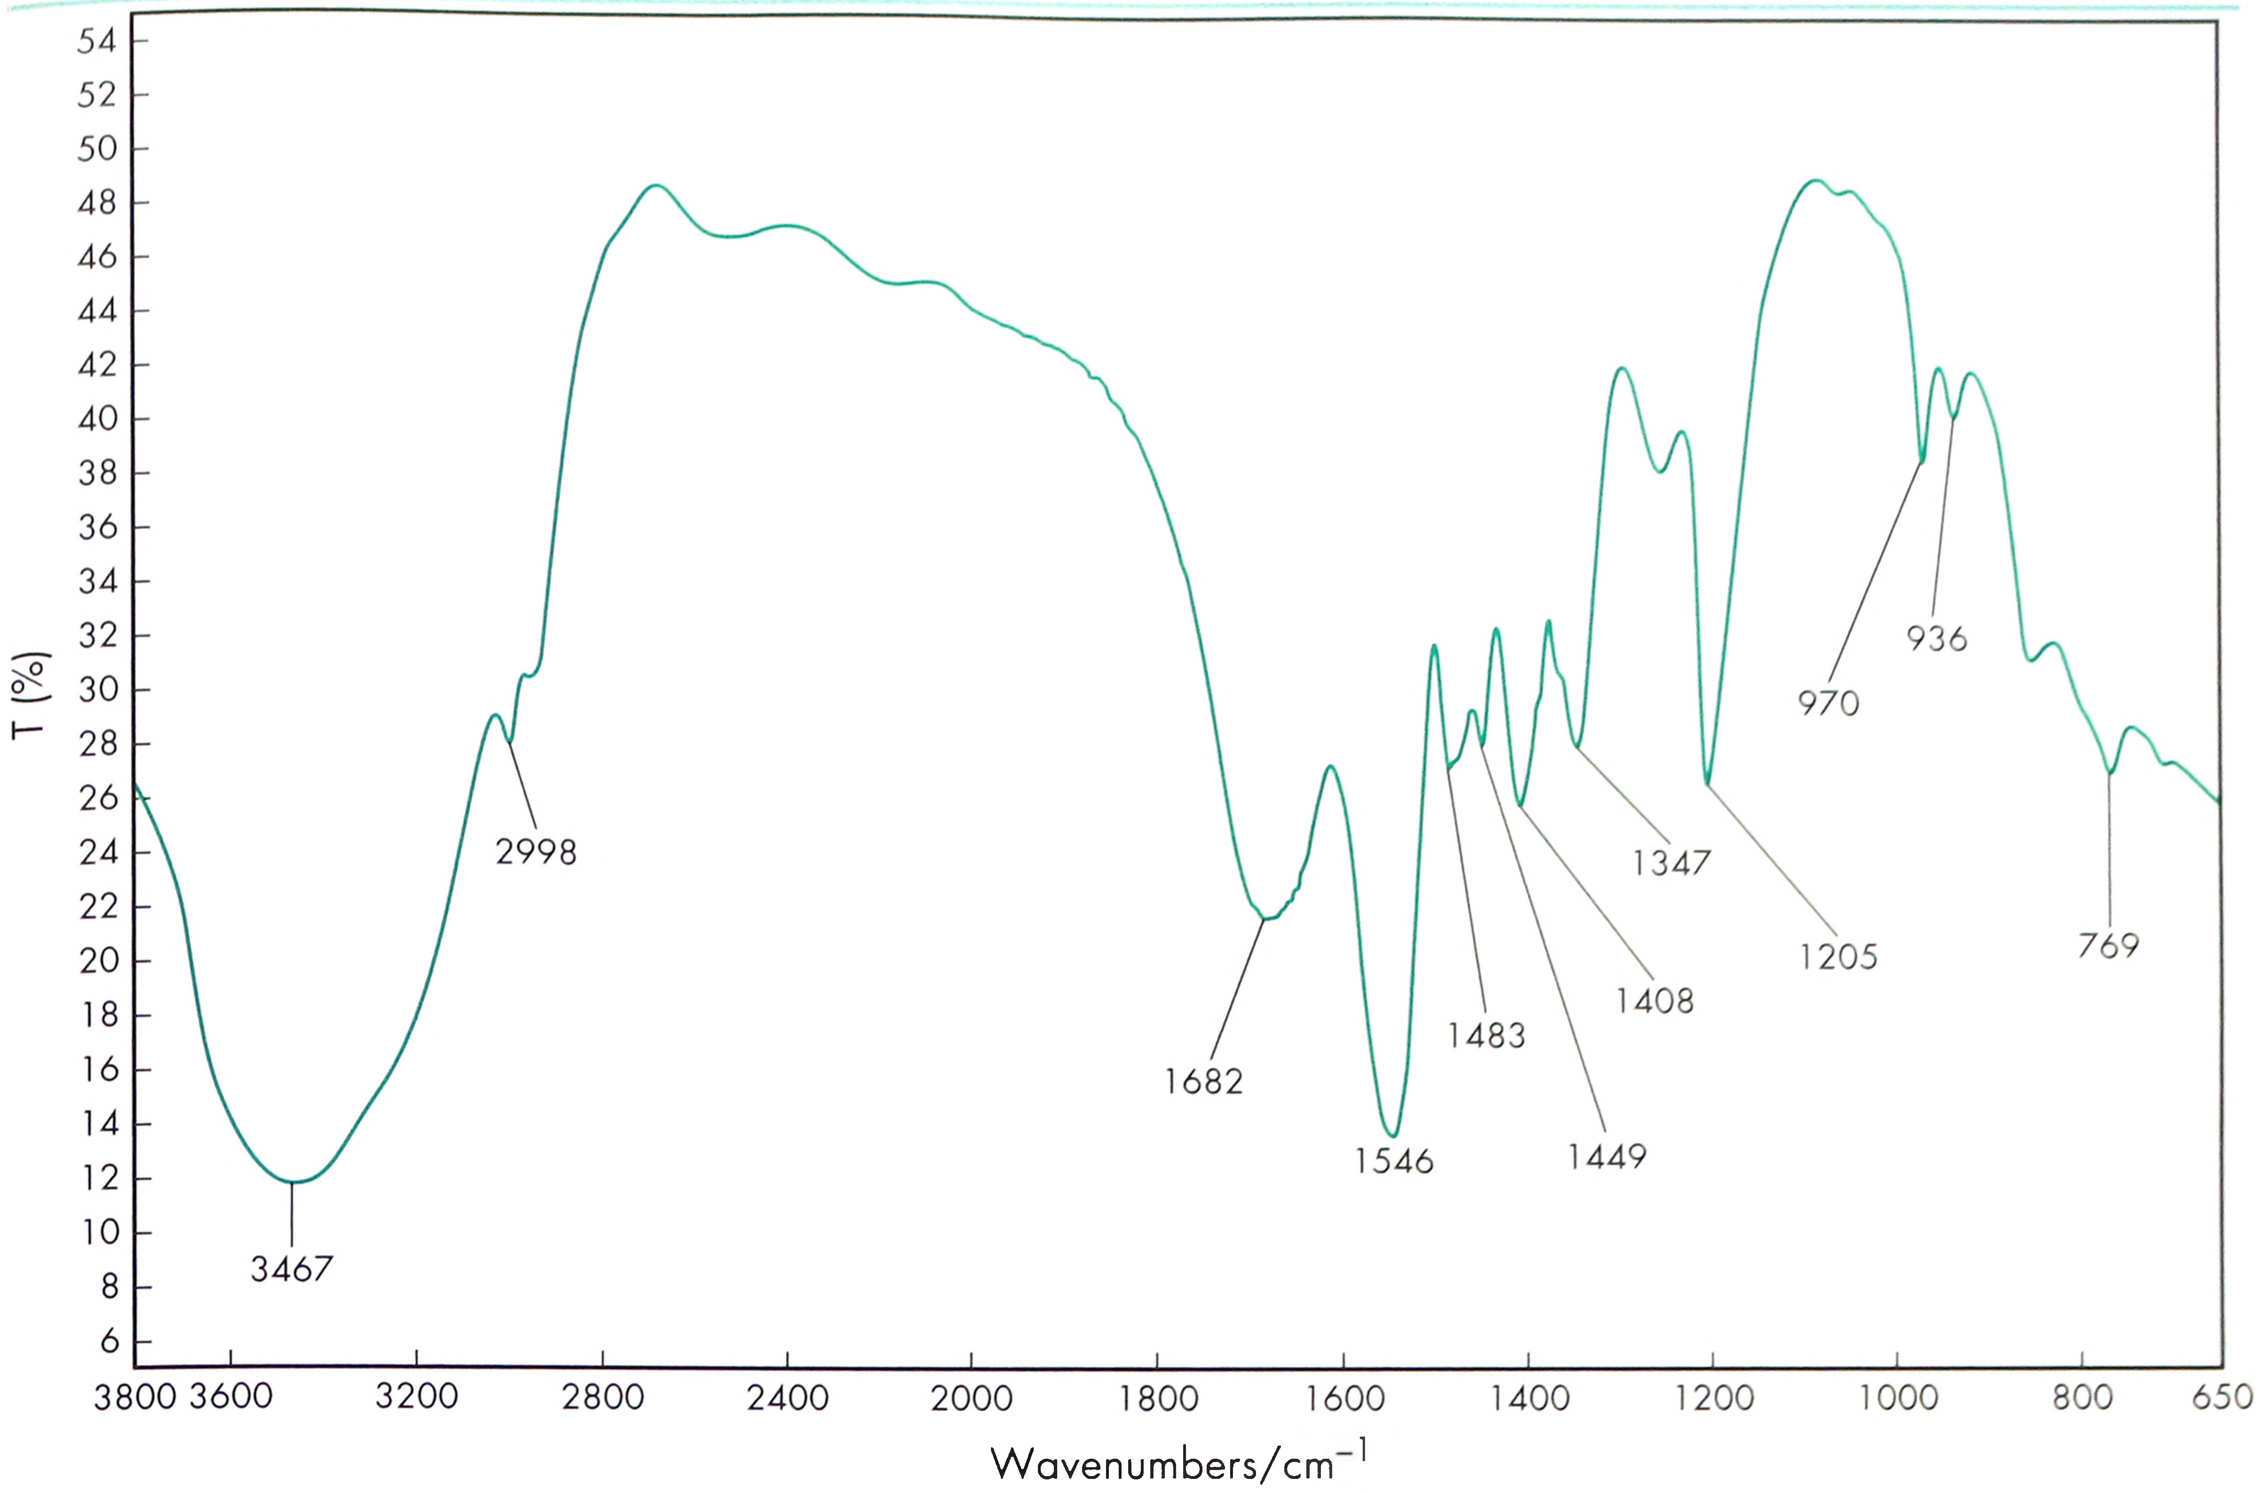


Figure 1: Infrared spectrum of polacrilin potassium measured by transmission.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, tablets and suspensions). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Poloxamer

1 Nonproprietary Names

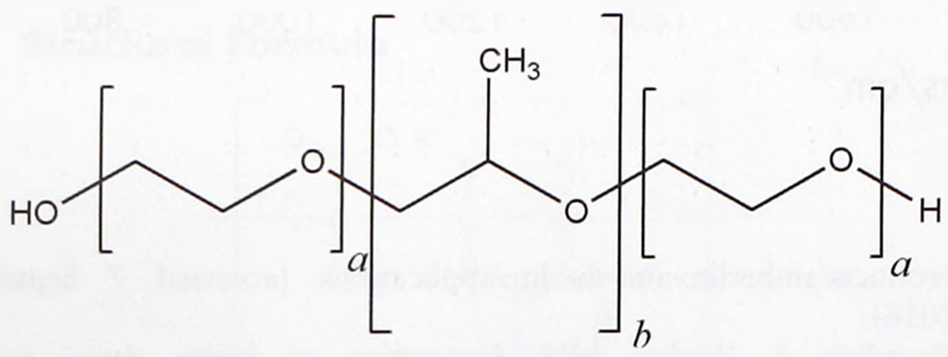
BP: Poloxamers

PhEur: Poloxamers

USP–NF: Poloxamer

2 Synonyms

Lutrol; *Monolan*; *Pluracare*; *Pluronic*; poloxalkol; poloxamera; polyethylene–propylene glycol copolymer; polyoxyethylene–polyoxypropylene copolymer; *Supronic*; *Surfonic*; *Synperonic*.



3 Chemical Name and CAS Registry Number

α-Hydro-ω-hydroxypoly(oxyethylene)poly(oxypropylene) poly(oxyethylene) block copolymer [9003-11-6]

4 Empirical Formula and Molecular Weight

The poloxamer polyols are a series of closely related block copolymers of ethylene oxide and propylene oxide conforming to the general formula $HO(C_2H_4O)_a(C_3H_6O)_b(C_2H_4O)_aH$. The grades included in the PhEur 9.2 and USP 40–NF 35 S1 are shown in Table I. The PhEur 9.2 and the USP 40–NF 35 S1 both states that a suitable antioxidant may be added.

5 Structural Formula

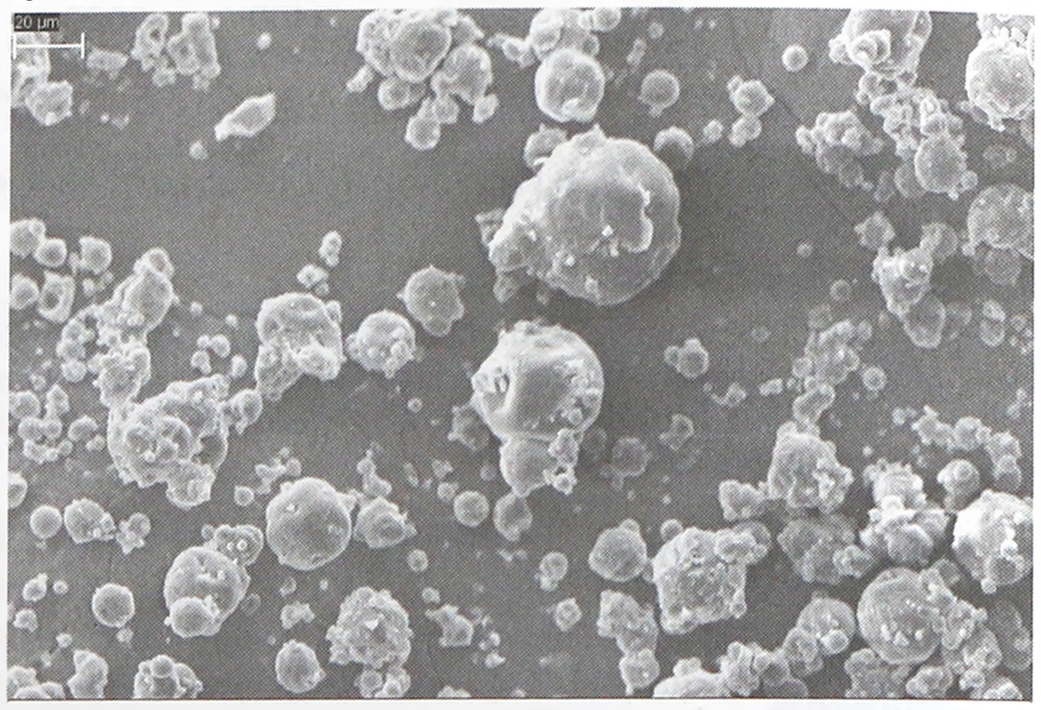
6 Functional Category

Dispersing agent; emulsifying agent; nonionic surfactant; solubilizing agent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Poloxamers are nonionic polyoxyethylene–polyoxypropylene copolymer surfactants used primarily in pharmaceutical formulations as emulsifying or solubilizing agents.[1-3] The polyoxyethylene segment is hydrophilic while the polyoxypropylene segment is hydrophobic. All of the poloxamers are chemically similar in composition, differing only in the relative amounts of propylene and ethylene oxides added during manufacture. Their physical and surface-active properties vary over a wide range and a number of different types are commercially available; *see* Sections 4, 9, 10, and 18.

Poloxamers are used as emulsifying agents in intravenous fat emulsions, and as solubilizing and stabilizing agents to maintain the clarity of elixirs and syrups. Poloxamers may also be used as wetting agents in ointments, suppository bases, and gels, and as tablet binders and coatings. Solid poloxamers often include butylated hydroxytoluene (50–125 ppm) as an antioxidant.



Poloxamer 338 and 407 are used in solutions for contact lens care. *See* Table II. Poloxamers are also used in the cosmetics industry. *See also* Section 18.

8 Description

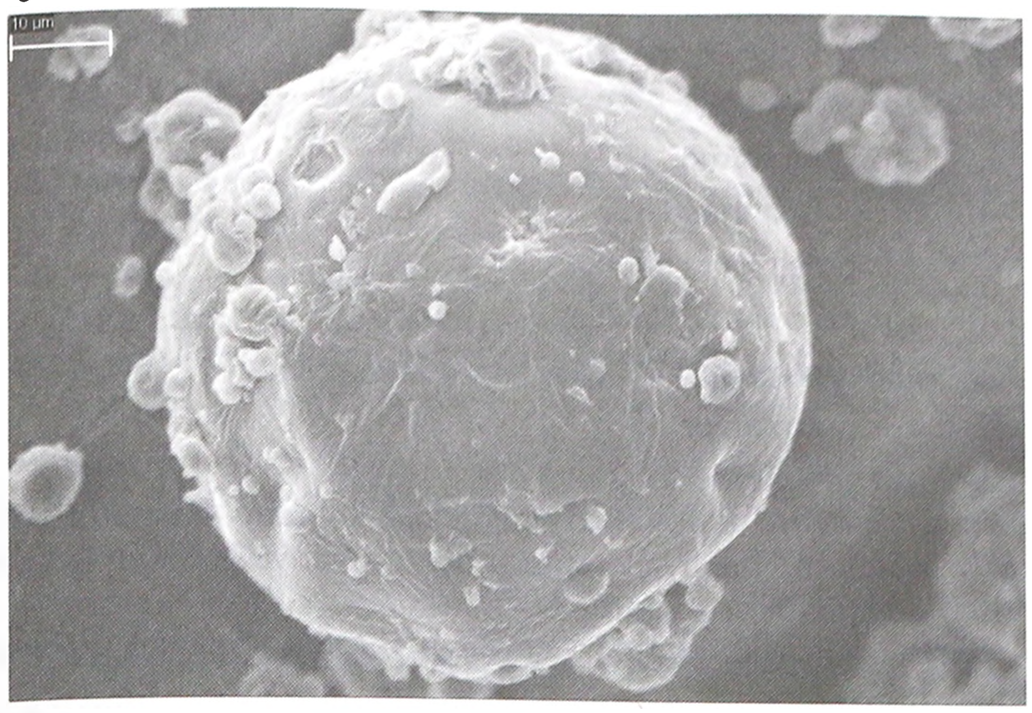
Poloxamers 188, 237, 338, and 407 occur as white or almost white, waxy powders, microbeads or flakes. Poloxamer 124 is a colorless or almost colorless liquid. Poloxamers are practically odorless and tasteless.

SEM 1 and SEM 2 show poloxamer 185 as spherical particles approx. 20 µm in size. SEM 3 and SEM 4 show poloxamer 338 particles ranging in size from 100 to 200 µm, which break apart easily.

SEM 1: Excipient: Poloxamer 185; manufacturer: BASF; lot no.: IDJ0633; magnification: 1000X; voltage: 10.00 kV.

9 Pharmacopeial Specifications

See Table III.



10 Typical Properties

Acidity/alkalinity pH = 5.0–7.5 for a 2.5% w/v aqueous solution.

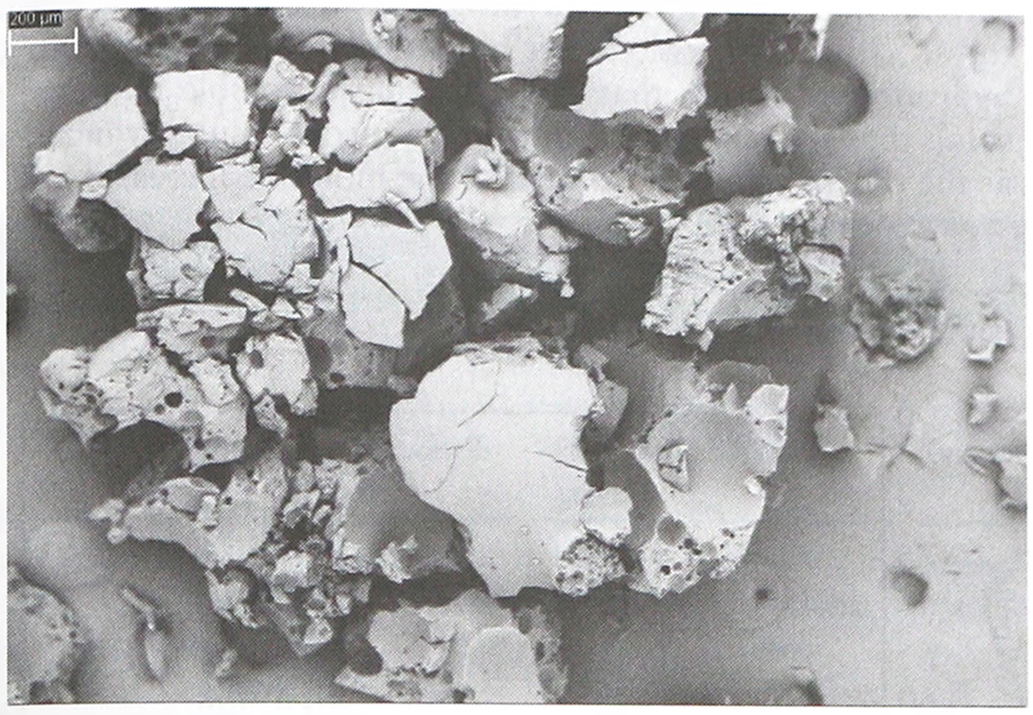


Table I: Typical poloxamer grades at 25°C.

Poloxamer type	Physical form	Ethylene oxide units (a)	Propylene oxide units (b)	Content of oxyethylene (%)	Average relative molecular mass
124	Liquid	10–15	18–23	44.8–48.6	2090–2360

Table IV: Critical micelle concentration (CMC) for typical grades of poloxamer.

Grade	Molecular weight	CMC at –37°C (M)
188	8000	1.4×10^{-3}
407	12 000	8.0×10^{-4}

Cloud point

>100°C for both a 1%, and a 10% w/v aqueous solution of poloxamer 188, 237, 338, and 407;

71–75°C for a 10% solution, and 65°C for a 1% solution of poloxamer 124;

15–19°C for a 10% solution, and 24°C for a 1% solution of poloxamer 181;

22–26°C for a 10% solution, and 32°C for a 1% solution of poloxamer 182;

9–13°C for a 10% solution, and 15°C for a 1% solution of poloxamer 331.

Critical micelle concentration In general, surfactants with higher molecular weights tend to possess lower critical micelle concentration (CMC) values, and vice-versa. CMC values for typical grades of poloxamer are shown in Table IV.

Density 1.06 g/cm^3 at 25°C

Flash point

≈240°C for poloxamer 124;

≈235°C for poloxamer 181 and poloxamer 182;

≈260°C for poloxamer 188;

≈244°C for poloxamer 237;

≈257°C for poloxamer 338;

>204°C for poloxamer 331;

>150°C for poloxamer 407.

Flowability The majority of solid poloxamers are free flowing; however, micronized grades tend to have poor flowability. Typical flow function (ff_c) values for granular *Pluronic F 108NF* (free flowing) and micronized *Lurtol micro 68NF* (poor flowing) grades of poloxamer are shown in Figure 1.[4]

HLB value

12–18 for poloxamer 124;

1–7 for poloxamer 181;

1–7 for poloxamer 182;

>24 for poloxamer 188, 237, and 338;

1–7 for poloxamer 331;

18–23 for poloxamer 407.

Melting point (onset of melt)

16°C for poloxamer 124;

-29°C for poloxamer 181;

-4°C for poloxamer 182;

52°C for poloxamer 188;

49°C for poloxamer 237;

-23°C for poloxamer 331;

57°C for poloxamer 338;

56°C for poloxamer 407.

Moisture content Poloxamers generally contain less than 0.5% w/w water and are hygroscopic only at relative humidity greater than 80%. *See also* Figure 2.

Solubility Solubility varies according to the poloxamer type; *see also* Table V.

The aqueous solubility of poloxamers decreases as the temperature increases due to reduced hydration of the polymer caused by the breaking of hydrogen bonds at higher temperatures. Grades of poloxamer are available that range from hydrophobic liquids that are practically insoluble in water, to solids that are very soluble in water; aqueous solubility increases as the polyoxyethylene content of the molecule increases.

Spectroscopy

IR spectrum *see* Figure 3.

Raman spectrum *see* Figure 4.

Poloxamer 407	Freely soluble	Freely soluble	—	Freely soluble	—

11 Stability and Storage Conditions

Poloxamers are stable materials that are not liable to polymerization. Aqueous solutions are stable in the presence of acids, alkalis, and metal ions. However, aqueous solutions support mold growth.

Poloxamer solutions can be sterilized by autoclaving. At high temperatures, poloxamers may be combustible, producing carbon oxides and phosphates.

Poloxamer 335 micelles stabilized with a cross-linked network of diethylacrylamide were exposed to ultrasound frequencies of 70 kHz and 476 kHz; it was shown that ultrasound did not disrupt the covalent network stabilizing the micelles.[5] Perflunafene emulsions stabilized with poloxamer 188 were more stable than emulsions prepared with lecithin, but required the addition of soybean oil to stabilize the emulsions to enable them to withstand the temperatures required for sterilization by autoclaving.[6]

The material should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Depending on the relative concentrations, poloxamer 188 is incompatible with phenols and parabens. Poloxamer 331 may react violently with isocyanates. Dimethyl sulfoxide has been shown to induce reductions in the critical micellization and the gelation temperatures of poloxamer systems, as well as influencing the rate of drug release from these systems.[7]

13 Method of Manufacture

Poloxamer polymers are prepared by reacting propylene oxide with propylene glycol to form a polyoxypropylene chain. Polyoxyethylene chains are then added to each end of the polyoxypropylene chain to form the block copolymer.

14 Safety

Poloxamers are used in a variety of oral, parenteral, and topical pharmaceutical formulations, and are generally regarded as nontoxic and nonirritant materials. Poloxamers are not absorbed from the gastrointestinal tract, and may increase the absorption of liquid paraffin and other fat-soluble substances. Poloxamers are not metabolized in the body. Poloxamer 407 has been reported to cause alterations to lipid profiles and possible renal toxicity, which have compromised its use in parenteral applications.[8]

Animal toxicity studies, with dogs and rabbits, have shown poloxamers to be nonirritating and nonsensitizing when applied in 5% w/v and 10% w/v concentration to the eyes, gums, and skin.

In a 14-day study of intravenous administration at concentrations up to 0.5 g/kg/day to rabbits, no overt adverse effects were noted. A similar study with dogs also showed no adverse effects at dosage levels up to 0.5 g/kg/day. In a longer-term study, rats fed 3% w/w or 5% w/w of poloxamer in food for up to 2 years did not exhibit any significant symptoms of toxicity. However, rats receiving 7.5% w/w of poloxamer in their diet showed some decrease in growth rate.

No hemolysis of human blood cells was observed over 18 hours at 25°C, with 0.001–10% w/v poloxamer solutions.

Acute animal toxicity data for poloxamer 188:[9]

LD_{50} (mouse, IV): 1 g/kg
LD_{50} (mouse, oral): 15 g/kg
LD_{50} (mouse, SC): 5.5 g/kg
LD_{50} (rat, IV): 7.5 g/kg
LD_{50} (rat, oral): 9.4 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database. Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database. *See also* Table VI.

17 Related Substances

—

18 Comments

Although the USP 40–NF 35 S1 and the PhEur 9.2 contain specifications for five poloxamer grades, many more different poloxamers are commercially available that vary in their molecular weight and the proportion of oxyethylene present in the polymer. A series of poloxamers with greatly varying physical properties are thus available.

The nonproprietary name 'poloxamer' is followed by a number, the first two digits of which, when multiplied by 100, correspond to the approximate average molecular weight of the polyoxypropylene portion of the copolymer and the third digit, when multiplied by 10,

Table VI: Poloxamers listed in the US FDA Inactive Ingredients Database and included in licensed medicines in the UK.

Type	US FDA	UK
Poloxamer 124	Oral suspensions Topical gels and lotions	—
Poloxamer 181	Topical lotions	—
Poloxamer 182	Topical gels	Topical gels
Poloxamer 188	Oral capsules, concentrates, extended release tablets, granules, powders for oral suspensions, powders for oral solution, solutions, suspensions, syrups, and tablets Topical creams Intravenous injections, powders for intravenous injections, subcutaneous injections Ophthalmic solutions	Oral capsules, granules for suspensions, orodispersible tablets, prolonged-release tablets, solutions, tablets, and suspensions Topical gels Subcutaneous injections, and powders for reconstitution for intravenous infusions
Poloxamer 237	Topical sponges	—
Poloxamer 331	Oral suspensions, powders for oral suspensions	—
Poloxamer 338	Enteric-coated pellets for oral capsules	—
Poloxamer 407	Oral enteric-coated capsule pellets, solutions, suspensions, and tablets Topical creams, gels, solutions and suspensions Ophthalmic solutions	Oral tablets Oromucosal spray Topical gels and creams

P

corresponds to the percentage by weight of the polyoxyethylene portion. Similarly, with many of the trade names used for poloxamers, e.g. *Pluronic F-68* (BASF Corp.), the first digit arbitrarily represents the molecular weight of the polyoxypropylene portion and the second digit represents the weight percent of the oxyethylene portion. The letters 'L', 'P', and 'F', stand for the physical form of the poloxamer: liquid, paste, or flakes; *see also* Table VII.

Table VII: Nonproprietary name and corresponding commercial grade.

Nonproprietary name	Commercial grade
Poloxamer 124	L-44
Poloxamer 188	F-68
Poloxamer 237	F-87
Poloxamer 338	F-108
Poloxamer 407	F-127

Note that in the US the trade name *Pluronic* is used by BASF Corp. for pharmaceutical-grade and industrial-grade poloxamers, while in Europe the trade name *Lutrol* is used by BASF Corp. for the pharmaceutical-grade material.

Poloxamer 188 has been used as an emulsifying agent for fluorocarbons used as artificial blood substitutes, in the preparation of solid-dispersion systems, as a tablet lubricant,[10] and in liquid suppositories.[11,12] More recently, poloxamers have found use in drug-delivery systems.[13–16]

The thermoreversible, rheological, and solubilizing properties of poloxamer 407 have been reviewed, and immunomodulation and cytotoxicity-promoting properties demonstrated.[8]

The thermoresponsive properties of poloxamers, particularly poloxamer 407, have been exploited in a range of gel formulations for buccal,[17–19] ophthalmic,[20–25] rectal,[26,27] vaginal,[28,29] nasal,[30] and oral[31] drug delivery. Poloxamers have also been investigated for use in the preparation of nanoparticles,[32–34] subcutaneous implants,[35] intravenous emulsions,[36] topical foams,[37] organogels,[38] and self-emulsifying drug delivery systems.[39]

Poloxamer has been used in a poly(lactic-*co*-glycolic acid) (PLGA) : poloxamer and PLGA : poloxamine blend nanoparticle composition as novel carriers for gene delivery.[40] Poloxamers have also been utilized as absorption enhancers.[41]

Poloxamers for use in the cosmetic industry as oil-in-water emulsifiers, cleansers for mild facial products, and dispersing agents are marketed by BASF Corp. as *Pluracare*; the grades available are listed in Table VIII.

Therapeutically, poloxamer 188 is administered orally as a wetting agent and stool lubricant in the treatment of constipation; it is usually used in combination with a laxative such as danthron. Poloxamers may also be used therapeutically as wetting agents in eye-drop formulations, in the treatment of kidney stones, and as skin-wound cleansers.

Specifications for poloxamer 331 and poloxamer 407 are contained in the *Food Chemicals Codex* (FCC).[42]

The PubChem Compound ID (CID) for poloxamer is 24751.

Table VIII: Nonproprietary name and corresponding *Pluracare* grade (BASF Corp.).

Nonproprietary name	Commercial grade	HLB value	pH of 2.5% w/v aqueous solution
Poloxamer 184	L-64	12–18	5–7.5
Poloxamer 185	P-65	12–18	6–7.4
Poloxamer 407	F-127	18–23	6–7.4

Polycarbophil

1 Nonproprietary Names

USP–NF: Polycarbophil

2 Synonyms

Noveon AA-1.

3 Chemical Name and CAS Registry Number

Polycarbophil [9003-97-8]

4 Empirical Formula and Molecular Weight

Polycarbophil is a high molecular weight acrylic acid polymer crosslinked with divinyl glycol. The molecular weight of this polymer is theoretically estimated to range from 700 000 to 3–4 billion. However, there are no methods currently available to measure the actual molecular weight of a crosslinked (i.e. three-dimensional) polymer of this type.

5 Structural Formula

See Section 4.

6 Functional Category

Adsorbent; bioadhesive material; emulsifying agent; gelling agent; modified-release agent; suspending agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Conventionally, polycarbophil is used as a viscosity-increasing agent at very low concentrations (less than 1%) to produce a wide range of viscosities and flow properties in topical lotions, creams, and gels, in oral suspensions, and in transdermal gel reservoirs. It is also used as an emulsifying agent in topical oil-in-water systems.

Polycarbophil is an excellent bioadhesive in various applications.[1,2]

Buccal tablets prepared using polycarbophil and carbomer have shown good bioadhesive force and prolonged residence time for the treatment of oral candidiasis.[3] Mucoadhesive patches have also been formulated with polycarbophil and other polymers for buccal administration of various actives.[4,5] Polycarbophil has been evaluated with ethylcellulose as a matrix former for controlling drug delivery.[6]

Polycarbophil alone and with other polymers has been used in topical,[7] ocular,[8–11] rectal,[12] and vaginal[13] drug delivery systems. Polycarbophil with chitosan are the polymers of choice for the formulation of a bioadhesive vaginal tablet containing metronidazole.[14]

Microspheres have been formulated using polycarbophil and other mucoadhesive polymers, such as carbomer or chitosan, for drug delivery to oral[15] and nasal[16,17] cavities. Polycarbophil has also been incorporated in microemulsions[18] and nanoemulsions[19] as a mucoadhesive agent for intranasal delivery of various drugs.

Tablet matrices prepared using a combination of polycarbophil with hydrophobic polymer ethyl cellulose showed a sigmodial release pattern that is ideal for colonic drug delivery.[20,21] Extended-release floating tablets have also been designed using polycarbophil and other hydrophilic matrix-forming polymers.[22] Mucoadhesive nanoparticles formulated using polycarbophil have been effective in sustaining drug release for a prolonged period.[23] Mucoadhesive pellets have been extruded using polycarbophil and carbomer and further coated for targeting drug delivery to the colon.[24]

P

8 Description

Polycarbophil occurs as fluffy, white to off-white, mildly acidic polymer powder with slightly ester-like odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for polycarbophil.

Test	USP 40–NF 35 S1
Identification	+
pH (1% dispersion)	≤4.0
Loss on drying	≤1.5%
Absorbing power	≥62 g/g
Limit of acrylic acid	≤0.3%
Limit of ethyl acetate	≤0.45%
Residue on ignition	≤4.0%

10 Typical Properties

Density (bulk) ≤0.24 g/cm^3

Dissociation constant $pK_a = 6.0 \pm 0.5$

Equilibrium moisture content 8–10% (at 50% relative humidity)

Glass transition temperature 100–105°C

Particle size distribution Polycarbophils are produced from primary polymer particles of an average diameter of about 0.2 µm. These polymers are then flocculated, resulting in powders averaging 2–7 µm in diameter. Once formed, the flocculated agglomerates cannot be broken down into their primary particles.

Residual solvents

Benzene 0.50 ppm;

Ethyl acetate 0.45%.

Solubility Polycarbophil polymers do not dissolve in water but can swell in water to around 1000 times their original volume (and ten times their original diameter) to form gels when exposed to a pH environment above 4–6. Since the pK_a of these polymers is 6.0 ± 0.5, the carboxylate groups on the polymer backbone ionize, resulting in electrostatic repulsion between the negative particles, which extends the molecule, adding to the swelling of the polymer.

Specific gravity 1.41 at 20°C

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

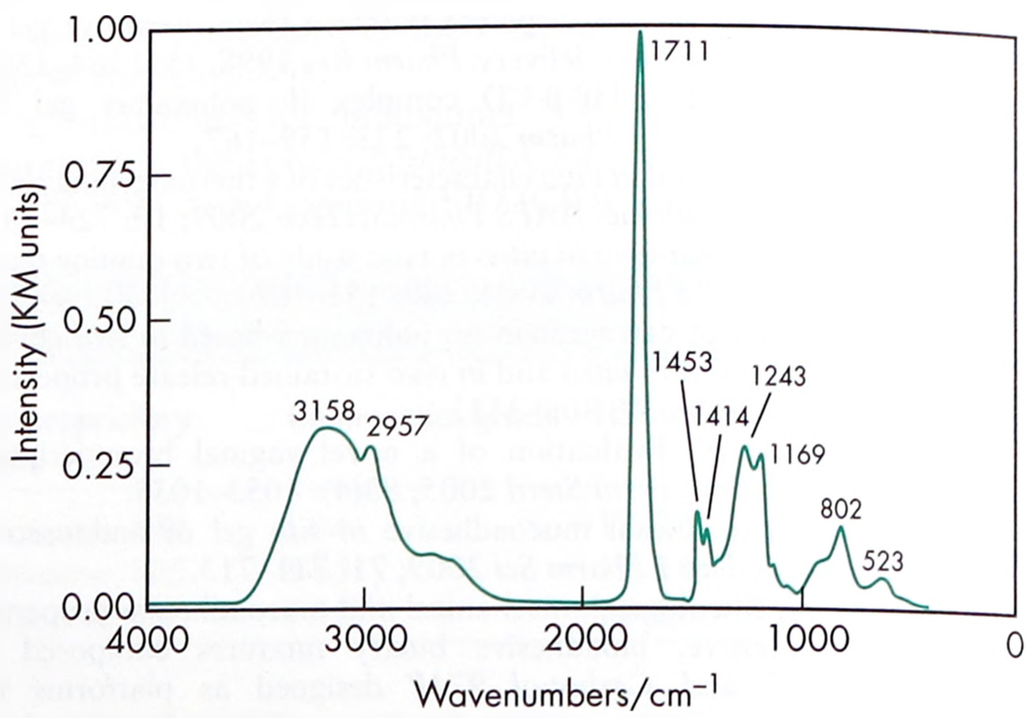

Figure 1: Infrared spectrum of polycarbophil measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

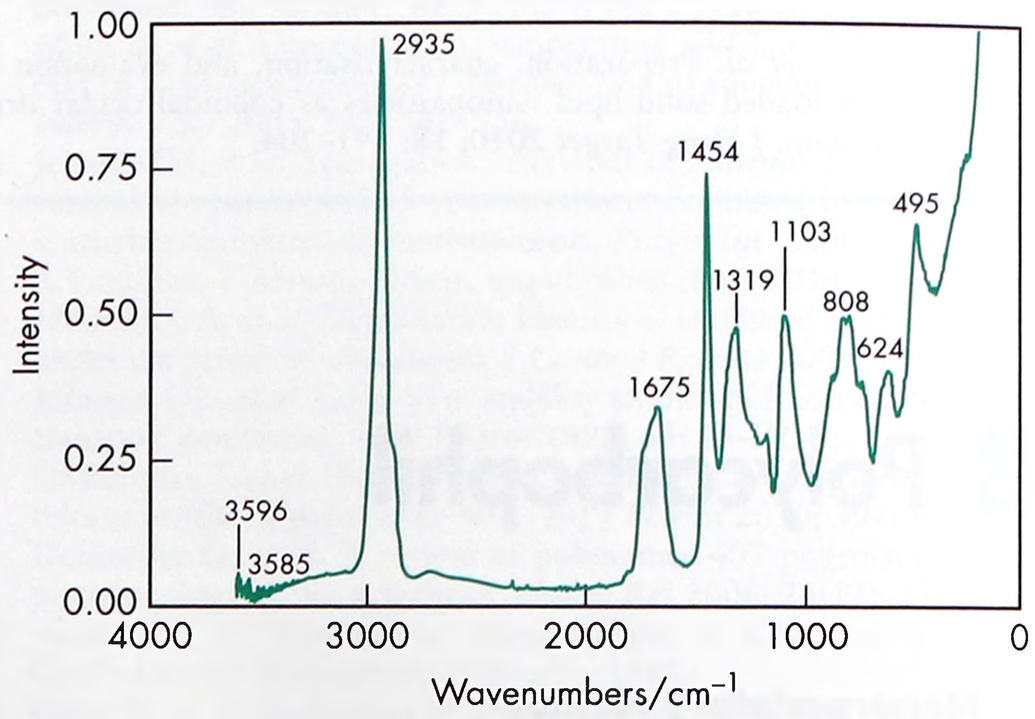

Figure 2: Raman spectrum of polycarbophil measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Polycarbophil polymers are stable, hygroscopic materials. They do not undergo hydrolysis or oxidation under normal conditions. Heating at temperatures below 104°C and for up to 2 hours does not affect the efficiency of the dry polymer. However, prolonged exposure to excessive temperatures can result in sintering of the polymer, which alters the drug release rate from tablets, and slows dispersion and gel formation in liquid formulations. Discoloration

may occur depending on temperature and exposure time. Complete decomposition occurs with heating for 30 minutes at 260°C.

Polycarbophil polymers do not support bacteria, mold, or fungal growth in dry powder form. Microbial growth may occur in mucilages of the polymer solution. Although the gel properties are not affected by such growth, this phenomenon is usually unacceptable. The addition of appropriate preservatives prevents mold and bacterial growth in these mucilages. Mucilages and emulsions containing these polymers are stable under freeze–thaw conditions but exposure to high temperatures results in a drop in viscosity.

Polycarbophil polymers are very hygroscopic and should be packed in airtight, corrosion-resistant containers. They should be stored in a cool, dry place, and the container should be kept closed when not in use. Moisture pickup does not affect the efficiency of the resins, but resin containing high levels of moisture is more difficult to disperse and weigh accurately. Glass, plastic, or resin-lined containers are recommended for products containing polycarbophil. Packaging in aluminum tubes usually requires formulations to have a pH of 6.5 or less, and for packaging in other metallic tubes or containers a pH of 7.7 or greater to is preferred.

12 Incompatibilities

Heat may be generated if polycarbophil comes into contact with strong basic materials such as ammonia, sodium hydroxide, potassium hydroxide, or strongly basic amines. Polycarbophil polymers are not compatible with cationic polymers, strong acids, and high levels of electrolytes, as electrolytes tend to reduce the viscosity of polycarbophil-based gels.

13 Method of Manufacture

Polycarbophils are synthetic, high-molecular-weight, crosslinked polymers of acrylic acid. These poly(acrylic acid) polymers are crosslinked with divinyl glycol. They are synthesized via precipitation polymerization in ethyl acetate and then dried.

14 Safety

Polycarbophil polymers have a long history of safe and effective use in topical gels, creams, lotions, and ointments. They have been shown to have extremely low irritancy properties and are nonsensitizing with repeated usage.

Polycarbophil dust can be an irritant to eyes, mucous membranes, and the respiratory tract. Dust inhalation may cause coughing, mucus production, and shortness of breath. Contact dermatitis may occur in individuals under extreme conditions of prolonged and repeated contact, high exposure, high temperature, and occlusion (being held onto the skin) by clothing.

The use of these polymers is supported by extensive toxicological studies.[25]

LD_{50} (guinea pig, oral): 2.0 g/kg
LD_{50} (mouse, IP): 0.039 g/kg
LD_{50} (mouse, IV): 0.070 g/kg
LD_{50} (mouse, oral): 4.6 g/kg
LD_{50} (rat, oral): >2.5 g/kg
LD_{50} (rabbit, skin): >3.0 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Excessive dust generation should be minimized to avoid the risk of explosion (lowest explosive concentration is 130 g/m^3). Gloves, eye protection, and a dust respirator are recommended during handling. Polycarbophil should be used in well-ventilated conditions.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (buccal tablets and films; ophthalmic preparations; topical patches and gels; vaginal gel). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium polycarbophil; carbomer.

18 Comments

Polycarbophil-cysteine conjugate, a thiolated derivative of the polycarbophil has been used as a platform for oral,[26] nasal,[27] and buccal[28] delivery showing higher stability, and improved controlled drug release and permeation enhancing properties.[27]

A chitosan-polycarbophil interpolyelectrolyte complex has been evaluated as a matrix former for controlled release oral,[29] buccal, vaginal and rectal drug delivery.[30]

Polydextrose

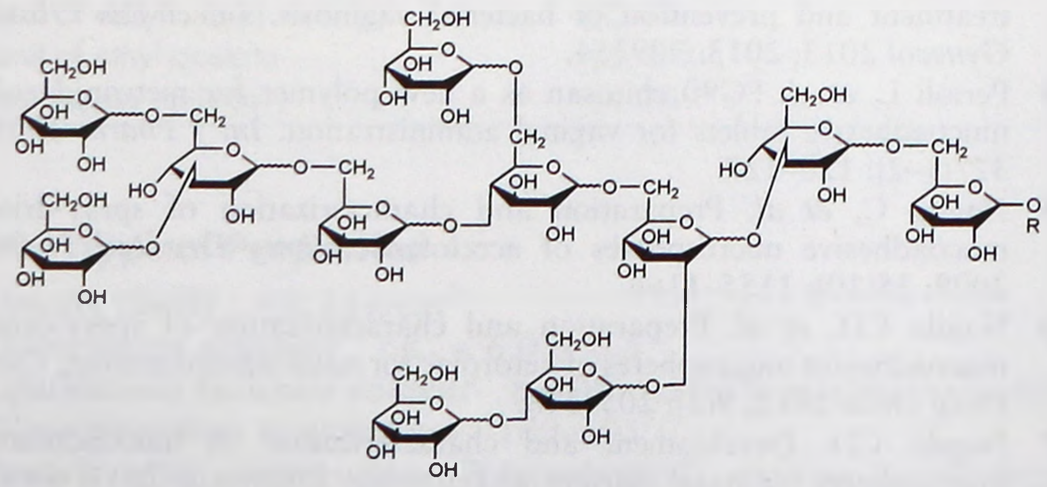
P

1 Nonproprietary Names

USP–NF: Polydextrose

2 Synonyms

E1200; *Litesse*; polydextrose A; polydextrose K; *STA-Lite*.



3 Chemical Name and CAS Registry Number

Polydextrose [68424-04-4]

4 Empirical Formula and Molecular Weight

$(C_6H_{10}O_5)_x$ 1 200–2 000 (average)

5 Structural Formula

R = H, sorbitol, dextrose, polydextrose or citric acid.
See Section 18.

6 Functional Category

Coating agent; flavor enhancer; humectant; tablet and capsule binder; tablet and capsule diluent; taste-masking agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polydextrose is widely used in pharmaceutical formulations and food products. In food products it is predominantly used as a low-calorie speciality carbohydrate with texturizing and humectant properties, whilst also facilitating a number of nutrition claims.

Although polydextrose can be used in a wide range of pharmaceutical formulations, its primary use is in solid-dosage forms.

In tableting, polydextrose solutions are used as binders in wet-granulation processes. Polydextrose is also used in the manufacture of directly compressible tableting excipients. Polydextrose solutions may also be used, in conjunction with other materials, as a film and tablet coating agent.

Polydextrose acts as a bulking agent in the formulation of 'sugar-free' confectionery-type dosage forms. In conjunction with isomalt, lactitol, or maltitol, polydextrose can be used in the manufacture of 'sugar-free' hard-boiled candies and acacia lozenges or pastilles as a base for medicated confectionery.

The combination of high water solubility and high viscosity of polydextrose facilitates the processing of sugar-free candies of excellent quality. Polydextrose is amorphous and does not crystallize at low temperatures or high concentrations, so it can be used to control the crystallization of polyols and sugars and therefore the structure and texture of the final product.

8 Description

Polydextrose occurs as an odorless, off-white to light tan powder with a bland, slightly sweet to slightly tart taste, dependent upon grade. Polydextrose is also available as a clear, light yellow to colorless liquid (70% dry substance), which is odorless with a slightly sweet taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for polydextrose.

Test	USP 40–NF 35 S1
Identification	+
Water	≤4.0%
pH (10% solution)	2.5–5.0
Residue on ignition	≤0.3%
5-Hydroxymethylfurfural and related compounds	≤0.1%
Molecular weight limit	≤22 000
Limit of monomers	
Glucose and sorbitol	≤6.0%
1,6 Anhydrous-D-glucose (levoglucosan)	≤4.0%
Lead	≤0.5 µg/g
Dextrose polymer assay (anhydrous basis)	≥90%

10 Typical Properties

Acidity/alkalinity pH = 2.5–7.0 (10% w/v aqueous solution)
Density (bulk) 0.7–0.8 g/cm^3 (dependent upon grade)
Heat of solution 8 kcal/g
Melting point Polydextrose is an amorphous polymer that does not have a melting range. However, it can undergo a viscosity transition at a temperature as low as 150–160°C.
Moisture content ≤4.0%. At relative humidities above approximately 60%, polydextrose powders absorb significant amounts of moisture; *see* Section 11. *See also* Figure 1.
Refractive index n_D^{20} = 1.3477 (10% w/v aqueous solution)
Solubility Completely miscible in water. Sparingly soluble to insoluble in most organic solvents. Polydextrose has a higher water solubility than most carbohydrates and polyols, allowing the preparation of 80% w/w solutions at 20°C. Polydextrose is soluble in ethanol and only partially soluble in glycerin and propylene glycol.
Viscosity (dynamic) Polydextrose solutions behave as Newtonian fluids. Polydextrose has a higher viscosity than sucrose or sorbitol at equivalent temperatures. This characteristic enables polydextrose to provide the desirable mouthfeel and textural qualities that are important when formulating syrups and viscous solutions. *See* Figure 2.

11 Stability and Storage Conditions

Polydextrose powder is hygroscopic and absorbs significant amounts of moisture at relative humidities greater than 60%. Under dry storage conditions, and in original sealed packaging, polydextrose powders can be expected to retain stability for at least 3 years. Solution grades have a shorter shelf-life of 3 to 12 months (dependent upon grade) at an ambient temperature of 25°C, although this can be extended through the use of refrigeration.

Bulk material should be stored in a cool, dry place in well-closed containers.

12 Incompatibilities

Incompatible with oxidizing agents, strong acids, and alkalis, forming a brown coloration and depolymerizing.

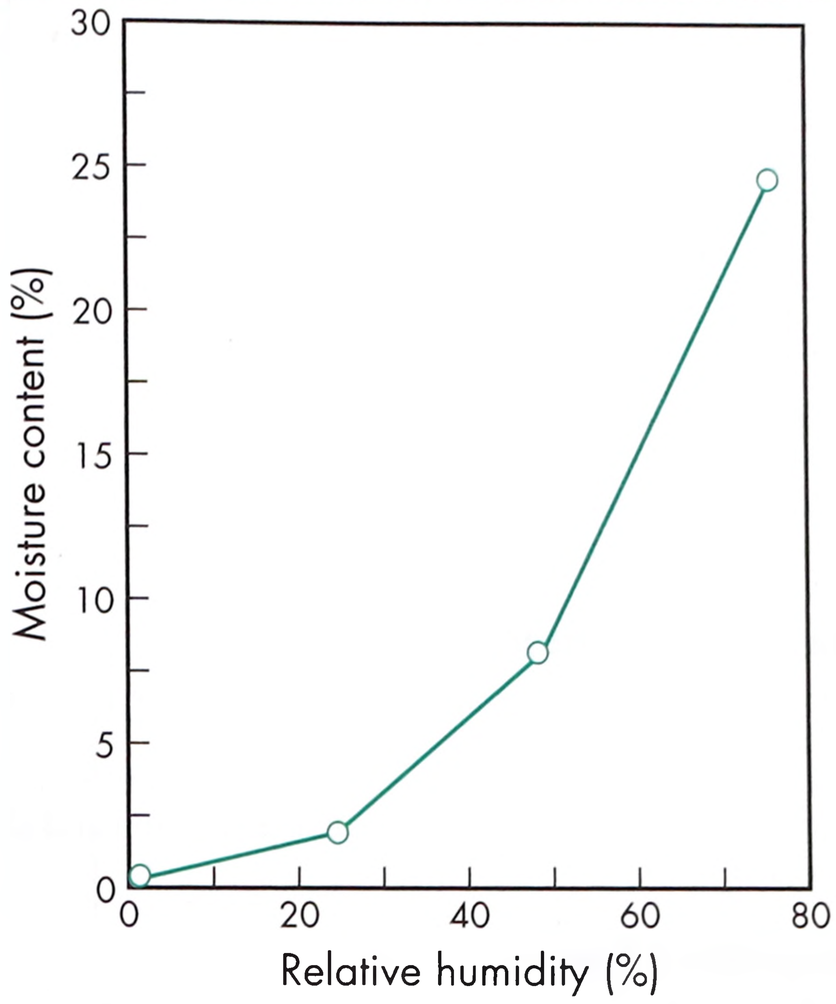


Figure 1: Moisture content of polydextrose at 20°C.

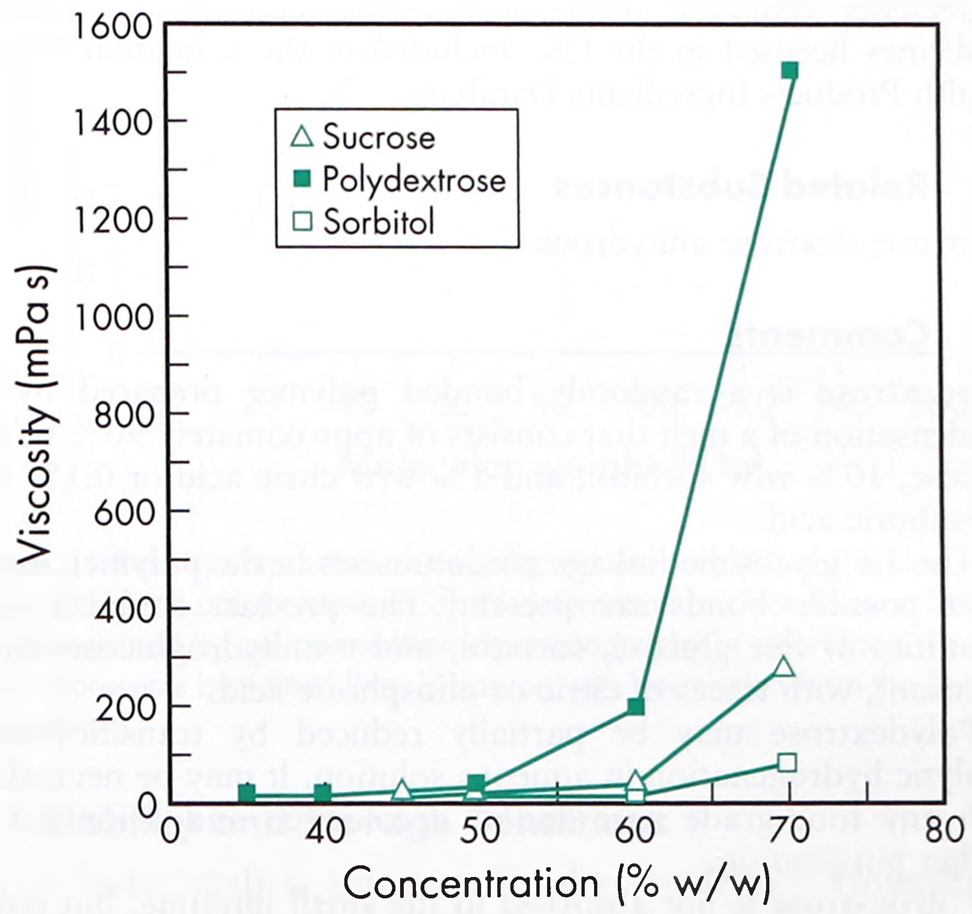

Figure 2: Viscosity of polydextrose solutions at 25°C at various concentrations.

13 Method of Manufacture

Polydextrose is prepared by the bulk melt polycondensation of glucose and sorbitol in conjunction with small amounts of food-grade acid *in vacuo*. Further purification steps are then involved to generate a range of products with improved organoleptic properties by the removal of acidity and flavor notes generated during the condensation reaction. A partially hydrogenated version of polydextrose, which is suited for high inclusion rates, for sugar-free applications, and where Maillard reactions are not required, is also available.[1]

14 Safety

Polydextrose is used in oral pharmaceutical applications, food products, and confectionery, and is generally regarded as a relatively nontoxic and nonirritant material.[2,3]

However, excessive consumption of non-digestible carbohydrates, such as polydextrose, can lead to gastrointestinal distress.

P

After evaluating a series of clinical studies, the Joint FAO/WHO Expert Committee on Food Additives (JECFA) and the European Commission Scientific Committee for Food (EC/SCF) concluded that polydextrose was better tolerated than other nondigestible carbohydrates such as polyols. The committee concluded that polydextrose has a mean laxative threshold of approximately 90 g/day (1.3 g/kg body-weight) or 50 g as a single dose.[4,5] *See also* Section 18.

LD_{50} (dog, oral): >20 g/kg[3]
LD_{50} (dog, IV): >2 g/kg[3]
LD_{50} (mouse, oral): >30 g/kg[3]
LD_{50} (rat, oral): >19 g/kg[3]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Polydextrose may be irritant to the eyes. Conventional dust-control practices should be employed. Eye protection and gloves are recommended.

16 Regulatory Status

Approved as a food additive in over 60 countries worldwide, including Europe and the US. Included in the FDA Inactive Ingredients Database (oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dextrose; dextrose anhydrous.

18 Comments

Polydextrose is a randomly bonded polymer prepared by the condensation of a melt that consists of approximately 90% w/w D-glucose, 10% w/w sorbitol, and 1% w/w citric acid or 0.1% w/w phosphoric acid.

The 1,6 glycosidic linkage predominates in the polymer, but all other possible bonds are present. The product contains small quantities of free glucose, sorbitol, and D-anhydroglucoses (levoglucosan), with traces of citric or phosphoric acid.

Polydextrose may be partially reduced by transition-metal catalytic hydrogenation in aqueous solution. It may be neutralized with any food-grade base and/or decolorized and deionized for further purification.

Polydextrose is not absorbed in the small intestine, but passes intact to the large intestine where approximately 50% of the ingested dose is fermented by intestinal microorganisms to produce volatile fatty acids, whilst the remaining 50% of the dose is excreted. The volatile fatty acids are subsequently absorbed in the large intestine. Because of the inefficient way the human body derives energy from volatile fatty acids, and the amount of the ingested dose subsequently excreted, polydextrose contributes only one-quarter of the energy of the equivalent weight of sugar, i.e. ≈4 kJ/g (1 kcal/g).[6–9]

When consumed, polydextrose has a negligible effect on blood glucose levels and is metabolized independently of insulin, making it suitable for diabetics and those on carbohydrate-controlled diets.

A specification for polydextrose is contained in the *Food Chemicals Codex* (FCC).[10]

Poly(DL-Lactic Acid)

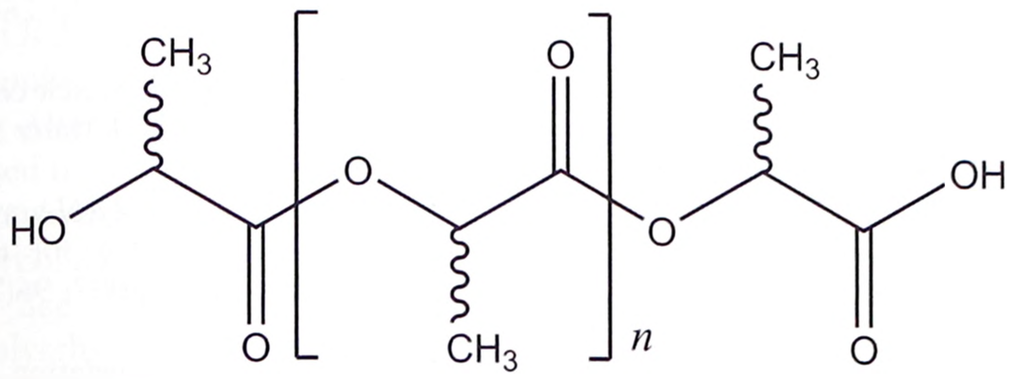
1 Nonproprietary Names

None adopted.

2 Synonyms

DL-Dilactide homopolymer; DL-dilactide polymer; DL-PLA; DL-3,6-dimethyl-1,4-dioxane-2,5-dione homopolymer; DL-PLA; lactic acid homopolymer; D,L-lactic acid homopolymer; D,L-lactic acid polymer; D-lactic acid-L copolymer; DL-lactide polymer; D-lactide-L-lactide copolymer; PDLLA; poly (*RS*)-2-hydroxypropanoic acid; D,L-polylactic acid; poly(*dl*-lactic acid); polylactide; poly(DL-lactide); poly-DL-lactide; *RS*-propanoic acid, 2-hydroxy-, homopolymer.

3 Chemical Name and CAS Registry Number



Poly[oxy(1-methyl-2-oxo-1,2-ethanediyl)] [26023-30-3] and [26680-10-4] and [202832-99-3]

4 Empirical Formula and Molecular Weight

$(C_3H_4O_2)_n$

The molecular weight of this polymer varies according to the intended application. The end group of the polymer chains may be altered to become ester, hydroxyl, or carboxylic acid.

5 Structural Formula

6 Functional Category

Biodegradable material; coating agent; modified-release agent.

7 Applications in Pharmaceutical Formulation or Technology

Poly(DL-lactic acid) is used in drug delivery systems in implants, injections, and oral solid dispersions. It is also used as a coating agent.

8 Description

Poly(DL-lactic acid) is a glassy material, occurring as white to golden-yellow pellets or granules.

9 Pharmacopeial Specifications

—

10 Typical Properties

Thermal and mechanical properties of poly(DL-lactic acid) are directly affected by the molecular weight and the composition of the polymer.[1–3]

Density 1.21–1.28 g/cm^3

Elongation (%) 2.5–7.0 (according to molecular weight)

Glass transition temperature 40–69°C (according to the molecular weight and the percentage of DL-lactic acid monomers)

Inherent viscosity 0.55–0.75 dL/g.[4] *See* also Figure 1.

Melting point Amorphous (some sources quote a melting point in the range 165–180°C)

Solubility Soluble in dichloromethane, tetrahydrofuran, ethyl acetate, chloroform, hexafluoroisopropanol, and acetone. Insoluble in water.

Tensile strength 35–85 MPa (according to molecular weight)

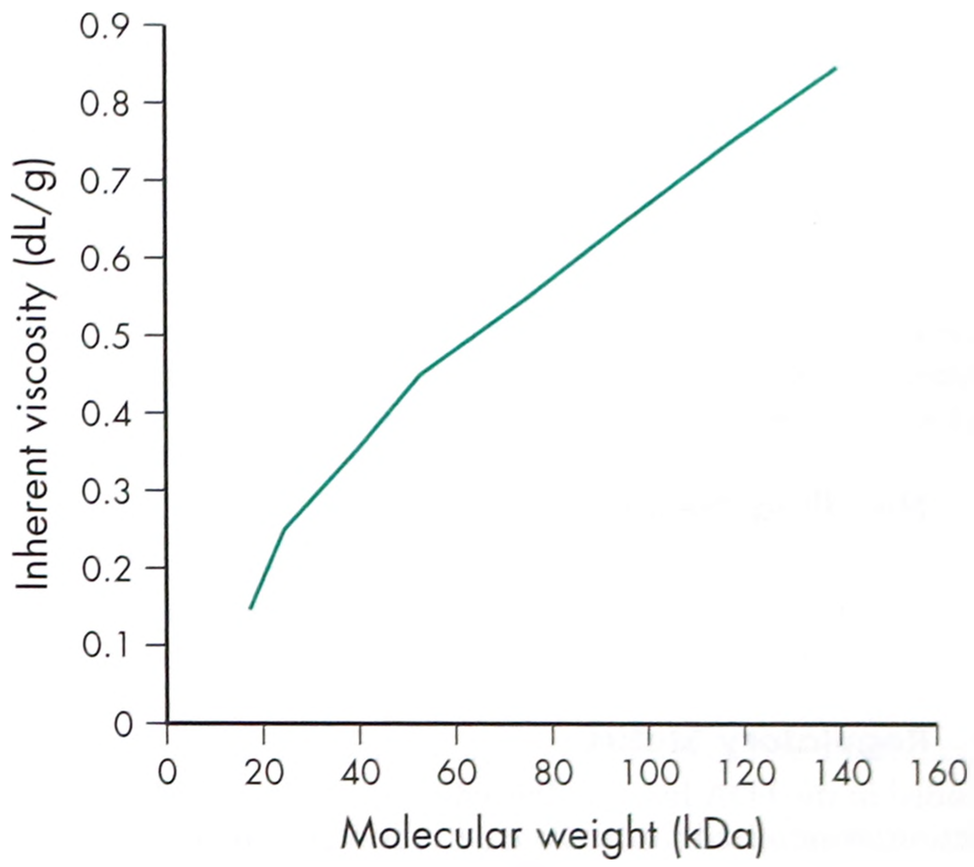


Figure 1: Relationship between the inherent viscosity (IV) and molecular weight (MW) for poly(DL-lactic acid). IV determined in chloroform at 30°C; MW determined by gel permeation chromatography in chloroform. The graph represents best fitted line. (Adapted with permission from the Durect Corporation).

11 Stability and Storage Conditions

Poly(DL-lactic acid) is stable under dry conditions. However, it typically biodegrades over a period of 10–15 months according to the molecular weight. Increasing moisture and temperature enhances biodegradation; the onset of degradation in water at 25°C is 6 months.[5] In contrast to many other biodegradable polymers, poly(DL-lactic acid) degrades through a two-step mechanism. The primary degradation step involves the hydrolysis of the ester bonds independently of microbial activity to produce a low-molecular-weight polymer. When the molecular weight drops below 10 000, microorganisms digest the polymer into carbon dioxide and water.[5] The nature of the functional group at the end of the chains has a significant impact on the water uptake of the polymer. Chains with carboxylic end groups are more hydrophilic and therefore exhibit a higher hydrolysis rate and drug release profile than those with hydroxyl or ester end groups.[6] In general, poly(DL-lactic acid) is more stable than poly(L-lactic acid) or poly(D-lactic acid) alone.[7]

Poly(DL-lactic acid) should be stored in a dry inert environment at a temperature of −15°C to −20°C.

12 Incompatibilities

Poly(DL-lactic acid) is incompatible with strong acids or alkaline materials.

13 Method of Manufacture

Lactic acid is a chiral molecule and has two optically active forms: L-lactic acid and D-lactic acid. Poly(DL-lactic acid) is produced from the racemic mixture of lactic acid. Lactic acid is produced either from ethylene (petrochemical pathway) or by bacterial fermentation of D-glucose derived from food stocks. The former pathway involves an oxidation step followed by treatment with hydrogen cyanide and produces only racemic DL-lactic acid. In contrast, lactic acid produced by fermentation occurs mainly as L-lactic acid. Low-molecular-weight poly-DL-(lactic acid) (500–10 000 Da) is produced directly from lactic acid by condensation. Higher-molecular-weight product is produced by one of two major pathways. The first involves a depolymerization of low-molecular-weight polymer into the cyclic dimer form (lactide) followed by ring-opening polymerization. Alternatively, it can be produced by a direct condensation using azeotropic distillation.

14 Safety

Poly(DL-lactic acid) degrades to produce lactic acid, which is considered a well-tolerated nontoxic material. Several *in vitro* and *in vivo* studies demonstrated that poly(lactic acid) in general (including poly(DL-lactic acid)) is well tolerated and does not induce a significant immune response.[8–12] However, some studies have illustrated signs of a mild immune response.[13,14] The FDA has also reported some rare cases of inflammatory responses in patients treated with cosmetic poly(DL-lactic acid) injections.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Eye and skin protection are recommended. Handle under dry, inert conditions.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM, powder for injection, lyophilized suspension; periodontal drug delivery system). Poly(DL-lactic acid) is considered as 'not hazardous' according to the European Directive 67/548/EEC. Included in parenteral preparations (prolonged-release powder for suspension for subcutaneous or intramuscular injection) licensed in the UK.

17 Related Substances

Aliphatic polyesters; lactic acid.

18 Comments

Poly(DL-lactic acid) has various IUPAC names, CAS registry numbers, empirical and structural formulae, which is due to some sources quoting the reactants (either lactic acid or lactide) as the repeating unit.

Owing to its high brittleness, poly(DL-lactic acid) is rarely used alone. It is often mixed and copolymerized with other polymers (poly(L-lactide-co-glycolide) (PLGA),[15] poly(ethylene oxide) (PEO),[16] poly(ethylene glycol) (PEG),[17,18] poly(vinylpyrrolidone) (PVP),[17] and poly(vinyl alcohol) (PVA).[19,20] The method of sterilization can affect the mechanical properties of the polymer.

Poly(DL-lactic acid) is a biodegradable thermoplastic polymer. It is used as a component of medical devices such as surgical dressings, sutures, stents, scaffolds for tissue engineering, and dental and bone fixation.

PEG 20000	450	16 000–25 000

5 Structural Formula

6 Functional Category

Coating agent; ointment base; plasticizing agent; solvent; suppository base; tablet and capsule diluent; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Polyethylene glycols (PEGs) are widely used in a variety of pharmaceutical formulations, including parenteral, topical, ophthalmic, oral, and rectal preparations. Polyethylene glycol has been used experimentally in biodegradable polymeric matrices used in controlled-release systems.[1]

Polyethylene glycols are stable, hydrophilic substances that are essentially nonirritating to the skin; *see* Section 14. They do not readily penetrate the skin and are water-soluble, so are easily removed from the skin by washing, making them useful as ointment bases.[2] Solid grades are generally employed in topical ointments, with the consistency of the base being adjusted by the addition of liquid grades of polyethylene glycol. Polyethylene glycols have good dissolving properties and are suitable for many active substances in topical applications.

Mixtures of polyethylene glycols can also be used as suppository bases,[3] for which they have many advantages over fats. For example, the melting point of the suppository can be modified by choice of polyethylene glycol of an appropriate molecular weight to provide improved physical stability on storage and ability to withstand exposure to warmer climates. The release of the active drug is not dependent upon melting point and polyethylene glycol-based suppositories are readily miscible with rectal fluids. Polyethylene glycols have the following disadvantages: they are chemically more reactive than fats; greater care is needed in processing to avoid inelegant contraction holes in the suppositories; the rate of release of water-soluble medications decreases with the increasing molecular weight of the polyethylene glycol; and polyethylene glycols tend to be more irritating to mucous membranes than fats.

In other applications, aqueous polyethylene glycol solutions can be used either as suspending agents or to adjust the viscosity and consistency of other suspending vehicles. When used in conjunction with other emulsifiers, polyethylene glycols can act as emulsion stabilizers.

Liquid polyethylene glycols are used as water-miscible solvents for the contents of soft gelatin capsules. However, if not controlled in the formulation, polyethylene glycols may cause hardening of the capsule shell by preferential absorption of moisture from gelatin in the shell. Gelatin capsule hardening can also be accelerated by inherent trace carbonyl impurities found in polyethylene glycols.

In concentrations up to approximately 30% v/v, PEG 300 and PEG 400 have been used as the vehicle for parenteral dosage forms.

In solid-dosage formulations, higher-molecular-weight polyethylene glycols can enhance the effectiveness of tablet binders and impart plasticity to granules.[4] However, they have only limited binding action when used alone, and can prolong disintegration if present in concentrations greater than 5% w/w. When used for thermoplastic granulations,[5–7] a mixture of the powdered con-

stituents with 10–15% w/w PEG 6000 is heated to 70–75°C. The mass becomes pastelike and forms granules if stirred while cooling. This technique is useful for the preparation of dosage forms such as lozenges when prolonged disintegration is required.

Polyethylene glycols can also be used to enhance the aqueous solubility or dissolution characteristics of poorly soluble compounds by making solid dispersions with an appropriate polyethylene glycol.[8] Animal studies have been performed using polyethylene glycols as solvents for steroids in osmotic pumps.

In film coatings, solid grades of polyethylene glycol can be used alone (6000-8000 molecular weight is common) for the film-coating of tablets or can be useful as hydrophilic polishing materials. Solid grades are also widely used as plasticizers in conjunction with film-forming polymers.[9] The presence of polyethylene glycols in film coats, especially of lower molecular weight liquid grades, tends to increase water permeability of the coating and may reduce protection against low pH in enteric-coating films. Polyethylene glycols are useful as plasticizers in microencapsulated products to avoid rupture of the coating film when the microcapsules are compressed into tablets.

Polyethylene glycol grades with molecular weights of 6000 and above are useful as lubricants, particularly for soluble tablets. The lubricant action is not as effective as that of magnesium stearate, and stickiness may develop if the material becomes too warm during compression. An antiadherent effect is also exerted, again subject to the avoidance of overheating.

Polyethylene glycols have been used in the preparation of urethane hydrogels, which are used as controlled-release agents. Polyethylene glycol has also been used in insulin-loaded microparticles for the oral delivery of insulin;[10,11] it has been used in inhalation preparations to improve aerosolization;[12] polyethylene glycol nanoparticles have been used to improve the oral bioavailability of cyclosporine;[13] polyethylene glycols have been used in self-assembled polymeric nanoparticles as a drug carrier;[14] and copolymer networks of polyethylene glycol grafted with poly(-methacrylic acid) have been used as bioadhesive controlled drug delivery formulations.[15]

P

8 Description

Polyethylene glycol grades 200–600 are liquids under common ambient temperature conditions, occuring as clear, colorless or slightly yellow-colored, viscous liquids. They have a slight but characteristic odor and a bitter, slightly burning taste. PEG 600 can occur as a solid at ambient temperatures (melting point 15–25°C).

Higher molecular weight grades (>900) are solids at ambient temperatures. Solid grades are white or off-white in color, and range in consistency from pastes to hard waxes. They have a faint, sweet odor. The solid grades can be solidified into flakes and polyethylene glycols with average molecular weights of 3000 and above are available as free-flowing powders.

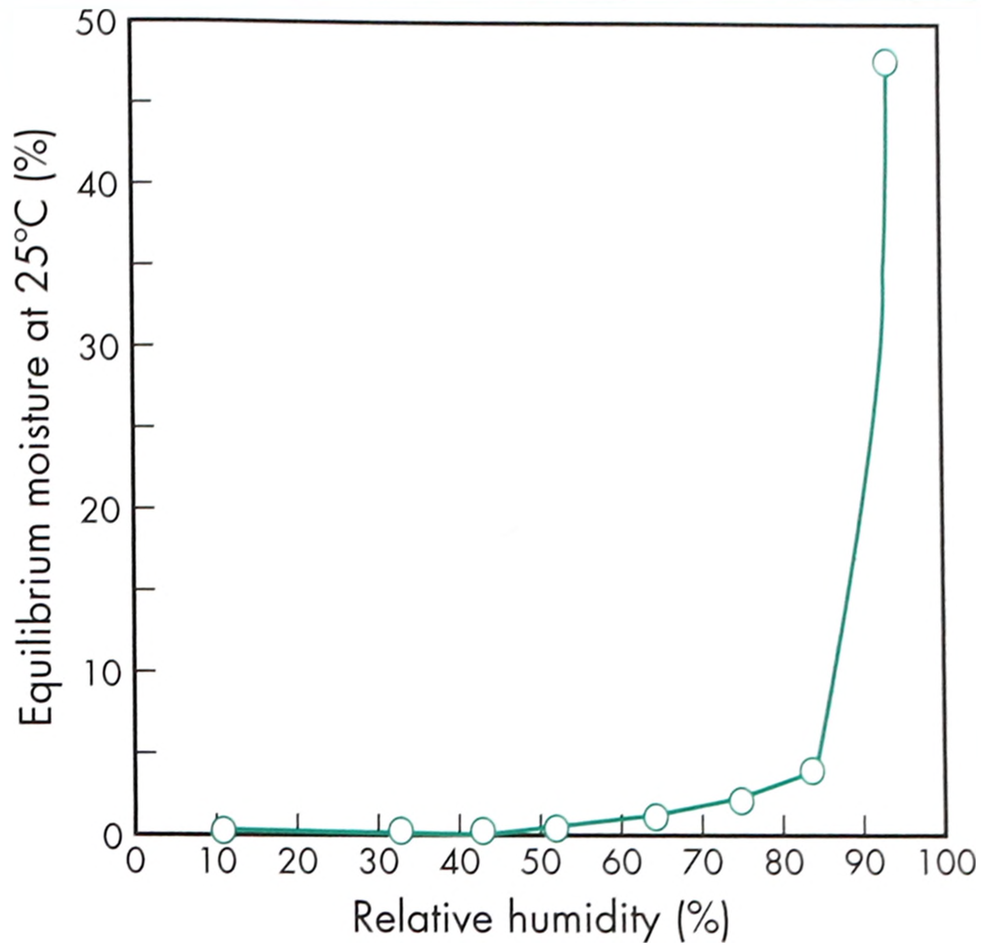

Figure 1: Equilibrium moisture content of PEG 4000 (McKesson, Lot No. B192–8209) at 25°C.

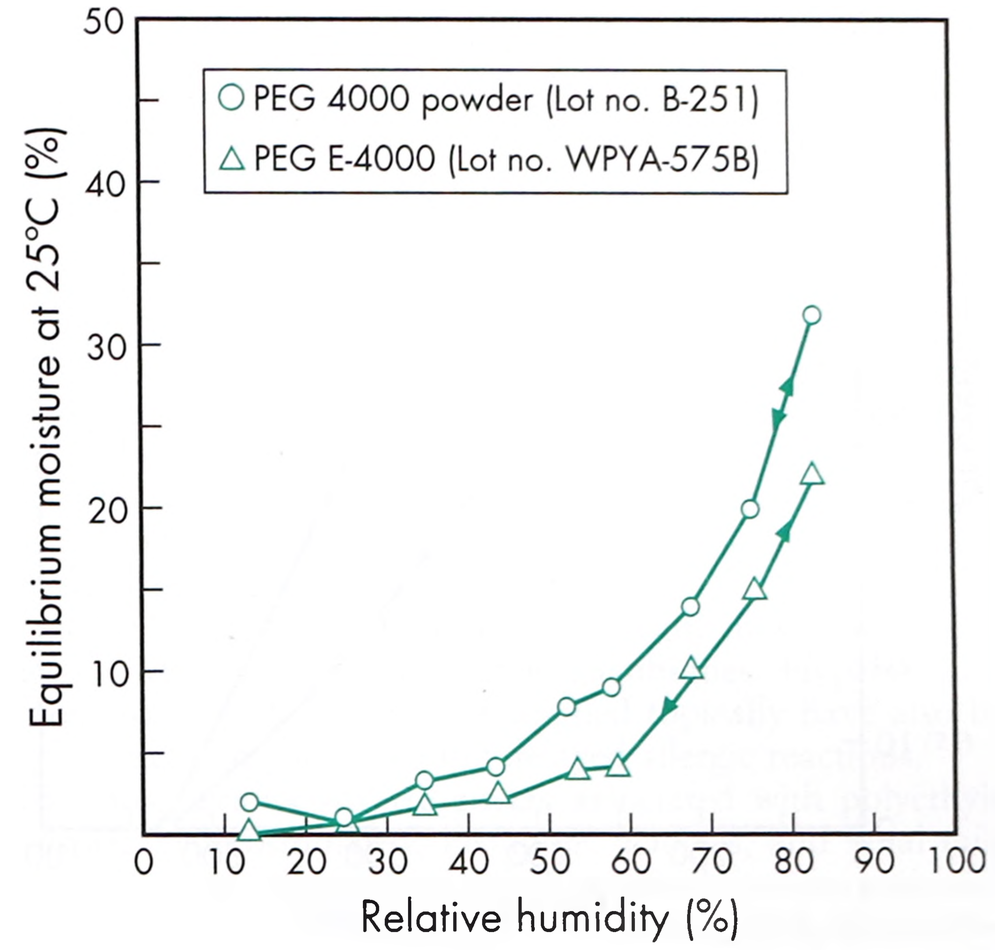

Figure 2: Equilibrium moisture content of PEG 4000 (Dow Chemical Company) and PEG E-4000 (BASF) at 25°C.

10 Typical Properties

Density

1.11–1.14 g/cm³ at 25°C for liquid PEGs (average molecular weights 300–600);

1.08–1.10 g/cm³ at 60°C for solid PEGs (average molecular weights 900 and above).

Flash point

182°C for PEG 200;

213°C for PEG 300;

227°C for PEG 400;

238°C for PEG 600;

246°C for PEG 1000 and higher average molecular weight.

Freezing point

Below −65°C PEG 200 sets to a glass;

−15 to −8°C for PEG 300;

4–8°C for PEG 400;

15–25°C for PEG 600.

Melting point

35–40°C for PEG 1000;

42–48°C for PEG 1500;

40–48°C for PEG 1540;

45–50°C for PEG 2000;

50–56°C for PEG 3000;

53–57°C for PEG 3350;

53–59°C for PEG 4000;

55–63°C for PEG 6000;

55–62°C for PEG 8000;

57–63°C for PEG 20 000.

P

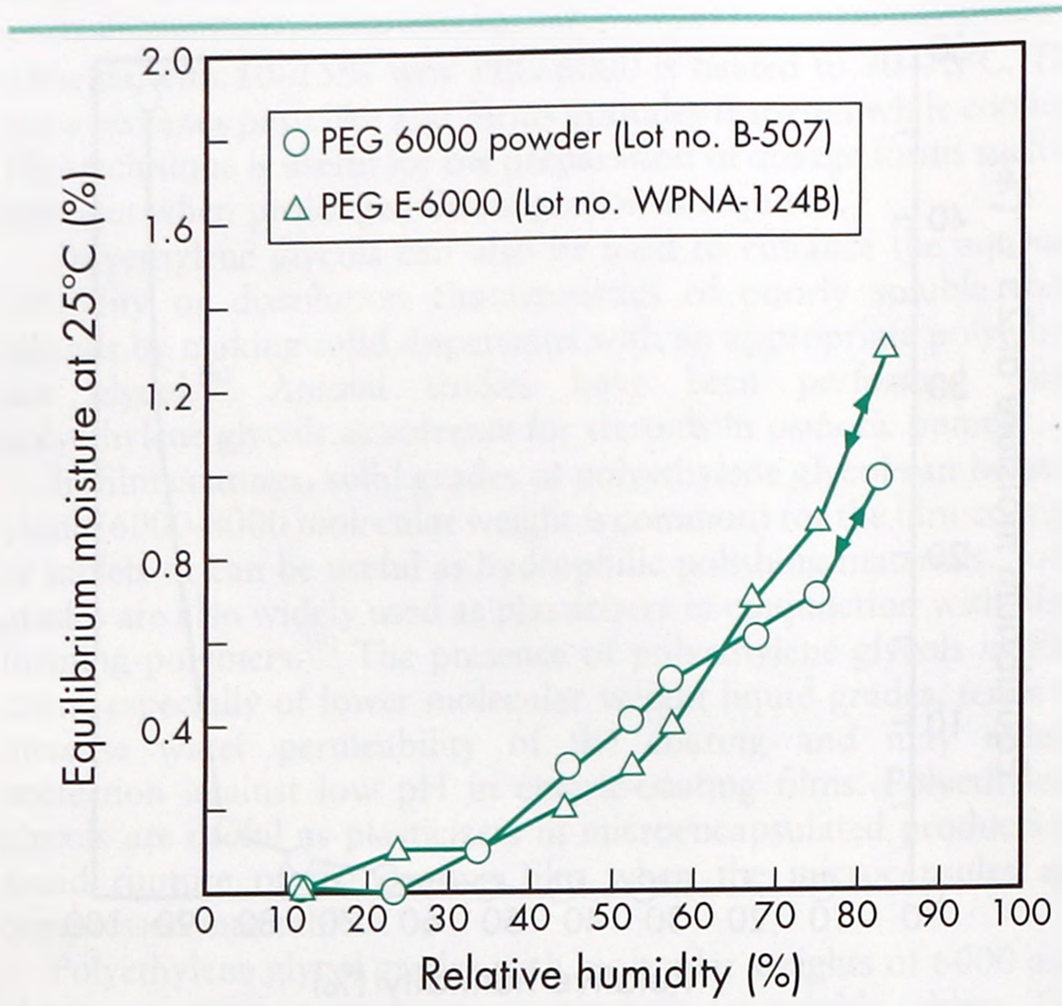

Figure 3: Equilibrium moisture content of PEG 6000 (Dow Chemical Company) and PEG E-6000 (BASF) at 25°C.

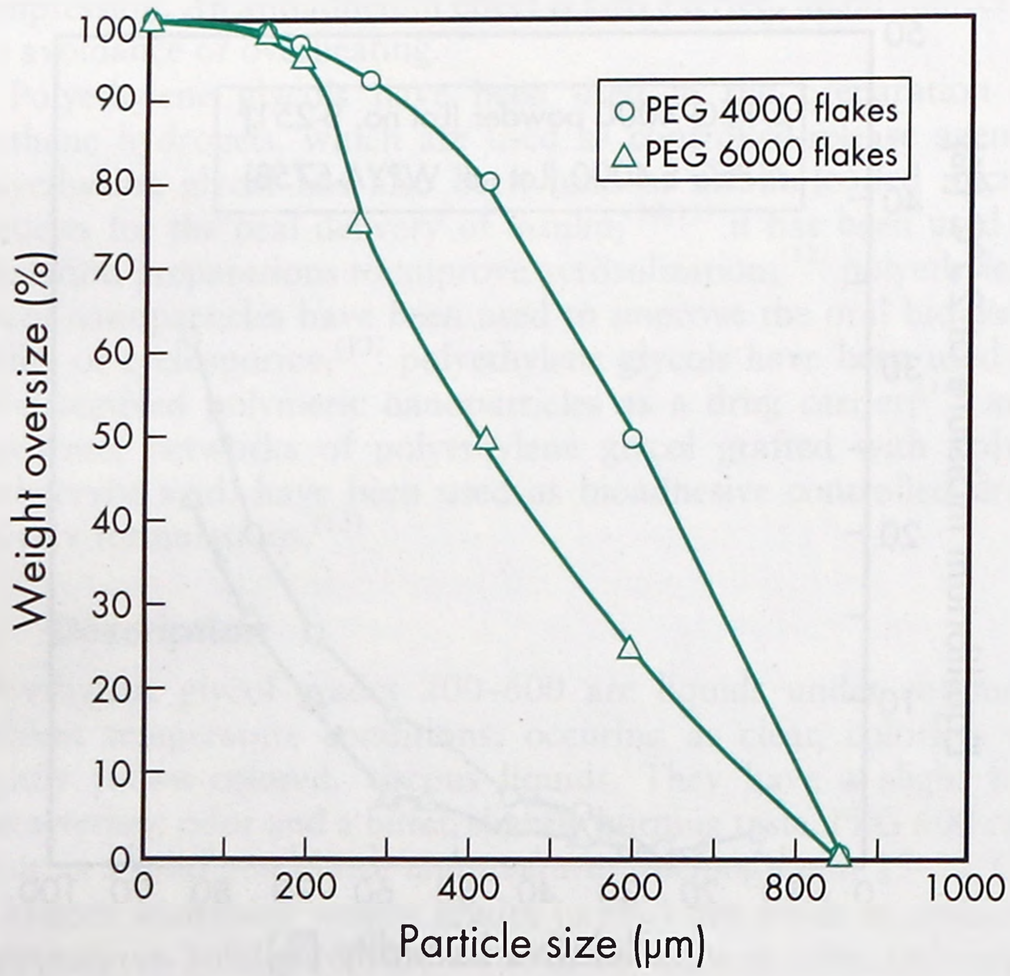

Figure 4: Particle size distribution of PEG 4000 and PEG 6000 flakes.

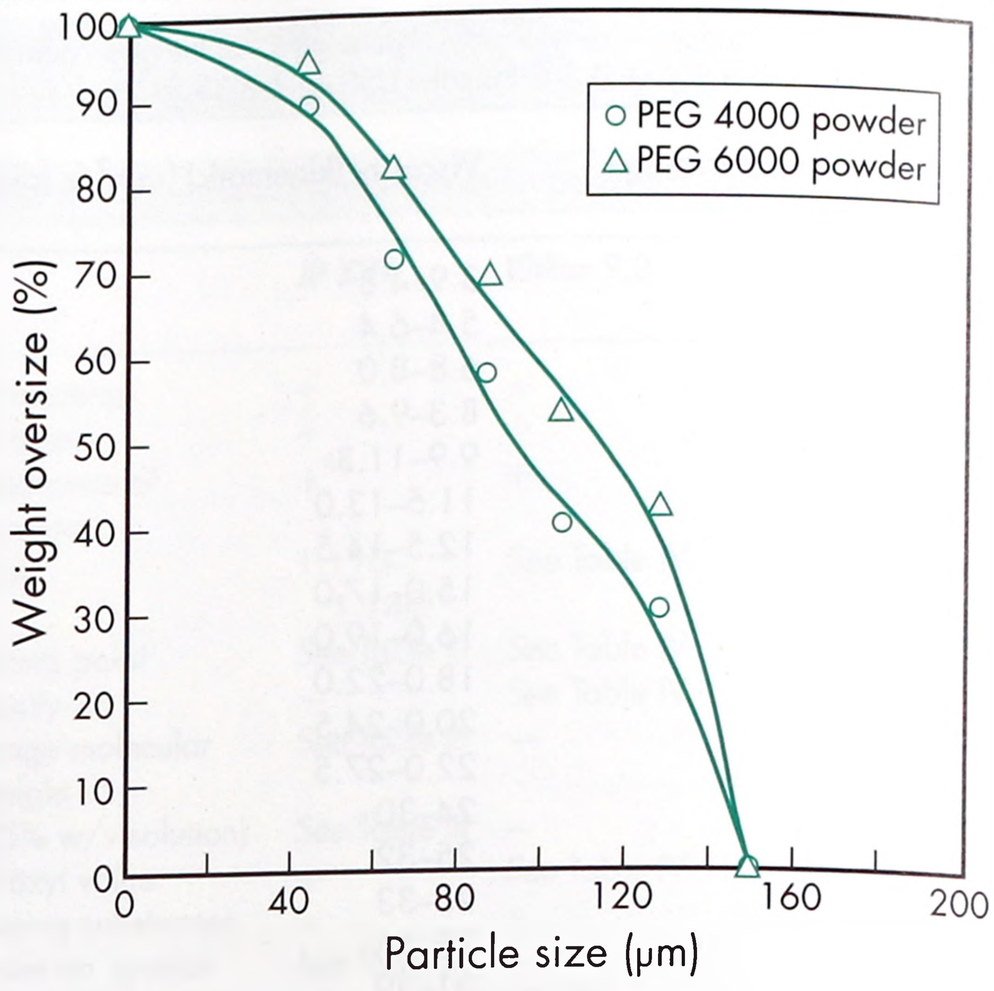

Figure 5: Particle size distribution of PEG 4000 and PEG 6000 powder.

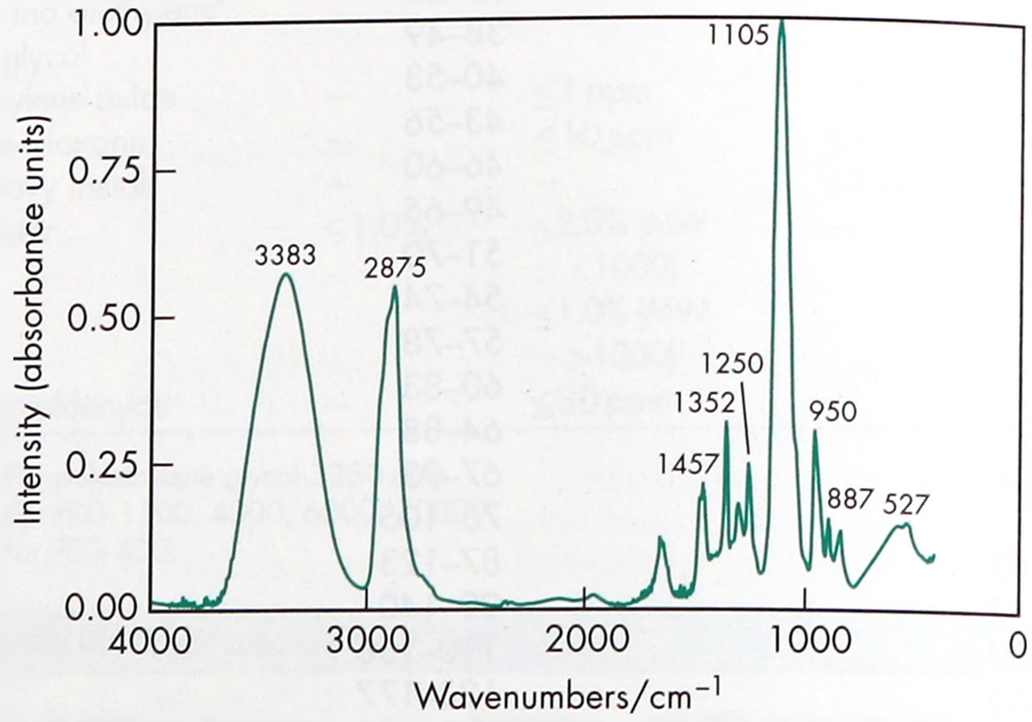

Figure 6: Infrared spectrum of polyethylene glycol (300 NF) measured by transmission. Adapted with permission of Informa Healthcare.

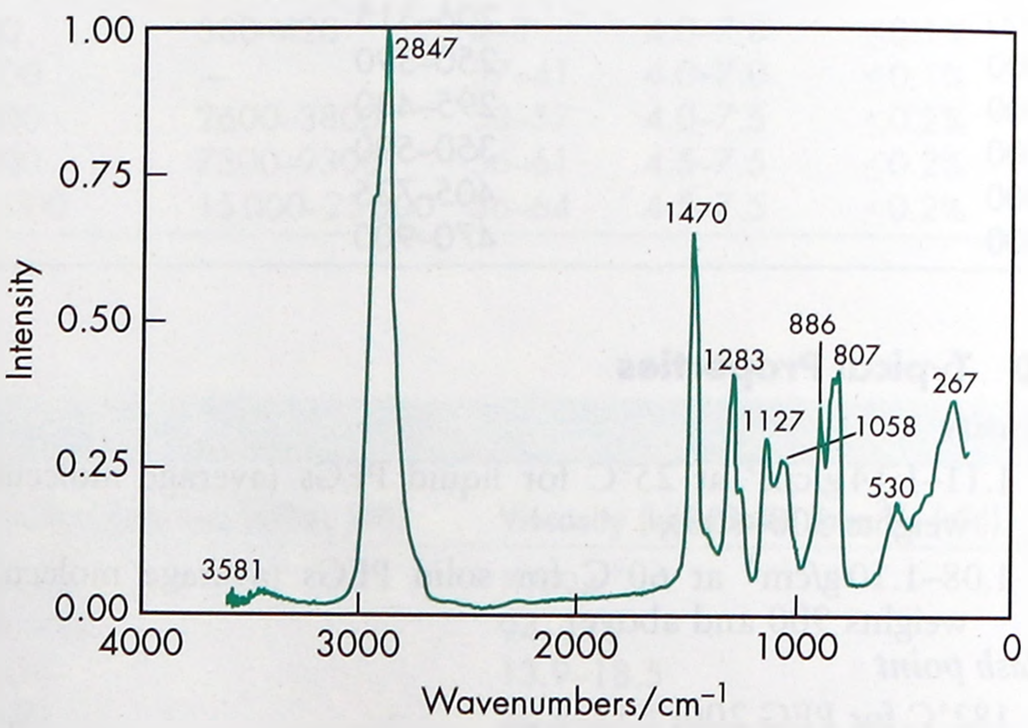

Figure 7: Raman spectrum of polyethylene glycol (300 NF) measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Moisture content Liquid polyethylene glycols are very hygroscopic, although hygroscopicity decreases with increasing molecular weight. Solid grades, e.g. PEG 4000 and above, are not hygroscopic. *See* Figures 1, 2, and 3.

Particle size distribution *see* Figures 4 and 5.

Refractive index

n_D^{25} = 1.459 for PEG 200;
n_D^{25} = 1.463 for PEG 300;
n_D^{25} = 1.465 for PEG 400;
n_D^{25} = 1.467 for PEG 600.

Solubility All grades of polyethylene glycol are soluble in water and miscible in all proportions with other polyethylene glycols (after melting, if necessary). Aqueous solutions of higher-molecular-weight grades may form gels. Liquid polyethylene glycols are soluble in acetone, alcohols, benzene, glycerin, and glycols. Solid polyethylene glycols are soluble in acetone, dichloromethane, ethanol (95%), and methanol; they are slightly soluble in aliphatic hydrocarbons and ether, but insoluble in fats, fixed oils, and mineral oil.

Spectroscopy

IR spectrum *see* Figure 6.

Raman spectrum *see* Figure 7.

Surface tension Approximately 44 mN/m (44 dynes/cm) for liquid polyethylene glycols; approximately 55 mN/m (55 dynes/cm) for 10% w/v aqueous solution of solid polyethylene glycol.

Viscosity (kinematic) *see* Tables IV, V, and VI.

Table VI: Viscosity of selected polyethylene glycols at 25°C and 99°C.

Type of PEG	Viscosity [mm^2/s (cSt)]	
	25°C	99°C
PEG 200	39.9	4.4
PEG 300	68.8	5.9
PEG 400	90.0	7.4
PEG 600	131	11.0
PEG 1000 solid	—	17.2
PEG 2000 solid	—	47
PEG 3350	—	90
PEG 4000 solid	—	140
PEG 6000 solid	—	320
PEG 8000 solid	—	820
PEG 20 000 solid	—	6900

11 Stability and Storage Conditions

Polyethylene glycols exhibit good chemical stability in air and in solution, although grades with a molecular weight less than 2000 are hygroscopic. Polyethylene glycols do not support microbial growth, and they do not become rancid.

Polyethylene glycols and aqueous polyethylene glycol solutions can be sterilized by autoclaving, filtration, or gamma irradiation.[16] Sterilization of solid grades by dry heat at 150°C for 1 hour may induce oxidation, discoloration or darkening, and the formation of acidic degradation products. Ideally, sterilization should be carried out in an inert atmosphere. Oxidation of polyethylene glycols may also be inhibited by the inclusion of a suitable antioxidant such as butylated hydroxytoluene.

If heated tanks are used to maintain normally solid polyethylene glycols in a molten state for extended periods of time, care must be taken to avoid contamination with iron, which can lead to discoloration. The temperature must be kept to the minimum necessary to ensure fluidity; oxidation may occur if polyethylene glycols are exposed for long periods to temperatures exceeding 50°C. However, storage under nitrogen reduces the possibility of oxidation. Aqueous solutions of polyethylene glycols are corrosive to steel and are often handled in stainless steel. Lined steel can be used if the lining is completely free of pinholes. Stainless steel, aluminum, glass, or lined steel containers are preferred for the storage of liquid grades.

Polyethylene glycols should be stored in well-closed containers in a cool, dry place.

12 Incompatibilities

The chemical reactivity of polyethylene glycols is mainly confined to the two terminal hydroxyl groups, which can be either esterified or etherified. However, all grades can exhibit some oxidizing activity owing to the presence of trace peroxide impurities and secondary products formed by autoxidation.

Liquid and solid polyethylene glycol grades may be incompatible with some coloring agents.

The antibacterial activity of certain antibiotics is reduced in polyethylene glycol bases, particularly that of penicillin and bacitracin.[17] The preservative efficacy of the parabens may also be impaired owing to binding with polyethylene glycols.

Physical effects caused by polyethylene glycol bases include softening and liquefaction in mixtures with phenol, tannic acid, and salicylic acid. Discoloration of sulfonamides and dithranol can also occur, and sorbitol may be precipitated from mixtures. Migration of polyethylene glycol can occur from tablet film coatings, leading to interaction with core components.

13 Method of Manufacture

Polyethylene glycol polymers are formed by the reaction of ethylene oxide and ethylene glycols under pressure in the presence of a catalyst. After the desired molecular weight is achieved, the reaction is terminated by the addition of a suitable acid to neutralize the catalyst.

14 Safety

Polyethylene glycols are widely used in a variety of pharmaceutical formulations. Generally, they are regarded as having a very low order of toxicity and as nonirritant materials.[18–20]

Adverse reactions to polyethylene glycols have been reported; glycols of low molecular weight have the greatest toxicity. However, the toxicity of glycols is relatively low.

Polyethylene glycols administered topically may cause stinging, especially when applied to mucous membranes. Hypersensitivity reactions to polyethylene glycols applied topically have also been reported, including urticaria and delayed allergic reactions.[21]

The most serious adverse effects associated with polyethylene glycols are hyperosmolarity, metabolic acidosis, and renal failure following the topical use of polyethylene glycols in burn patients.[22] Topical preparations containing polyethylene glycols should therefore be used cautiously in patients with renal failure, extensive burns, or open wounds.

Liquid polyethylene glycols may be absorbed when taken orally, but the higher-molecular-weight polyethylene glycols are not significantly absorbed from the gastrointestinal tract.

Table VII: Animal toxicity data (LD_{50}) for various grades of polyethylene glycol.[24]

PEG grade	LD_{50} (g/kg)								
	Guinea pig (oral)	Mouse (IP)	Mouse (IV)	Mouse (oral)	Rabbit (oral)	Rabbit (IV)	Rat (IP)	Rat (IV)	Rat (oral)
PEG 200	—	7.5	—	34	19.9	—	—	—	28.0
PEG 300	19.6	—	—	—	17.3	—	17.0	—	27.5
PEG 400	15.7	10.0	8.6	28.9	26.8	—	9.7	7.3	—
PEG 600	—	—	—	47	—	—	—	—	38.1
PEG 1000	—	20	—	—	—	—	15.6	—	32
PEG 1500	28.9	—	—	—	28.9	8	17.7	—	44.2
PEG 4000	50.9	—	16	—	76	—	11.6	—	50
PEG 6000	50	—	—	—	—	—	6.8	—	—

The WHO has set an estimated acceptable daily intake of polyethylene glycols at up to 10 mg/kg body-weight.[23]

In parenteral products, the maximum recommended concentration of PEG 300 is approximately 30% v/v as hemolytic effects have been observed at concentrations greater than about 40% v/v.

For animal toxicity data, *see* Table VII.[24]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection is recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (auricular and dental preparations; IM and IV injections; nasal aerosols; ophthalmic preparations; oral aerosols, capsules, solutions, syrups, and tablets; rectal, topical, urethral, and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Poloxamer; polyoxyethylene alkyl ethers; polyoxyethylene castor oil derivatives; polyethylene oxide; polyoxyethylene sorbitan fatty acid esters; polyoxyethylene stearates; suppository bases.

18 Comments

Polyethylene glycol is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Oral administration of large quantities of polyethylene glycols can have a laxative effect and are now commonly available for the relief of occasional constipation. Therapeutically, up to 4 L of an aqueous mixture of electrolytes and high-molecular-weight polyethylene glycol is consumed by patients undergoing bowel cleansing.[25]

A specification for polyethylene glycol is contained in the *Food Chemicals Codex* (FCC).[26]

Specifications for PEG 200, PEG 300, PEG 600, PEG 1000, and PEG 1540 are included in the *Japanese Pharmaceutical Excipients* (JPE).[27]

Polyethylene Oxide

1 Nonproprietary Names

USP–NF: Polyethylene Oxide

2 Synonyms

Polyox; polyoxiante; polyoxirane; polyoxyethylene.

3 Chemical Name and CAS Registry Number

Polyethylene oxide [25322-68-3]

4 Empirical Formula and Molecular Weight

See Table I.

5 Structural Formula

The USP 40–NF 35 S1 describes polyethylene oxide as a nonionic homopolymer of ethylene oxide, represented by the formula $(CH_2CH_2O)_n$, where n represents the average number of oxyethylene groups. It may contain up to 3% of silicon dioxide or suitable antioxidant.

6 Functional Category

Bioadhesive material; coating agent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyethylene oxide can be used as a tablet binder at concentrations of 5–85%. The higher molecular weight grades provide delayed drug release via the hydrophilic matrix approach;[1,2] *see* Table I. Polyethylene oxide has also been shown to facilitate coarse extrusion for tableting[3] as well as being an aid in hot-melt extrusion.[4,5]

The relationship between swelling capacity and molecular weight is a good guide when selecting products for use in immediate- or sustained-release matrix formulations; *see* Figure 1.

Polyethylene oxide has been shown to be an excellent mucoadhesive polymer.[6] Low levels of polyethylene oxide are effective thickeners, although alcohol is usually added to water-based formulations to provide improved viscosity stability; *see* Table II. Polyethylene oxide films demonstrate good lubricity when wet. This property has been utilized in the development of coatings for medical devices. Polyethylene oxide can be radiation crosslinked in solution to produce a hydrogel that can be used in wound care applications.

8 Description

White to off-white, free-flowing powder. Slight ammoniacal odor.

9 Pharmacopeial Specifications

See Table III.

10 Typical Properties

Angle of repose 34°
Density (true) 1.3 g/cm^3
Melting point 65–70°C
Moisture content <1%
Solubility Polyethylene oxide is soluble in water and a number of common organic solvents such as acetonitrile, chloroform, and methylene chloride. It is insoluble in aliphatic hydrocarbons, ethylene glycol, and most alcohols.[7]

Table I: Number of repeat units and molecular weight as a function of polymer grade for polyethylene oxide.

Polyox grade	Approximate number of repeating units	Approximate molecular weight
WSR *N*-10	2 275	100 000
WSR *N*-80	4 500	200 000

Spectroscopy

IR spectrum *see* Figure 2.

NIR spectrum *see* Figure 3.

Raman spectrum *see* Figure 4.

Viscosity (dynamic) *see* Table II.

11 Stability and Storage Conditions

Store in tightly sealed containers in a cool, dry place. Avoid exposure to high temperatures since this can result in reduction in viscosity.

12 Incompatibilities

Polyethylene oxide is incompatible with strong oxidizing agents.

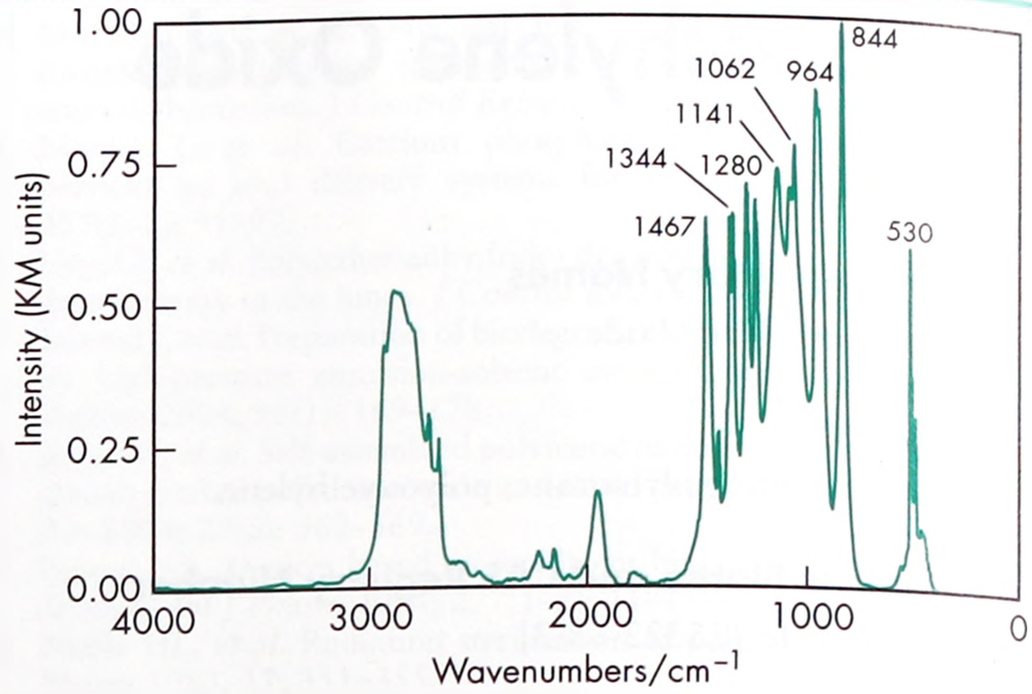

Figure 2: Infrared spectrum of polyethylene oxide measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

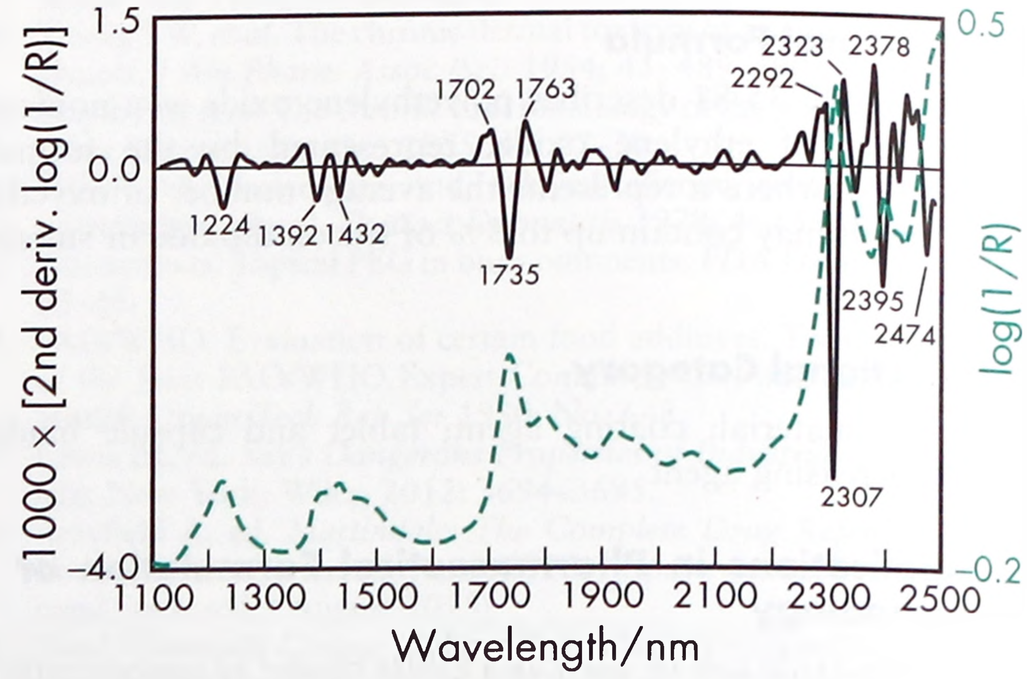

Figure 3: Near-infrared spectrum of polyethylene oxide measured by reflectance.

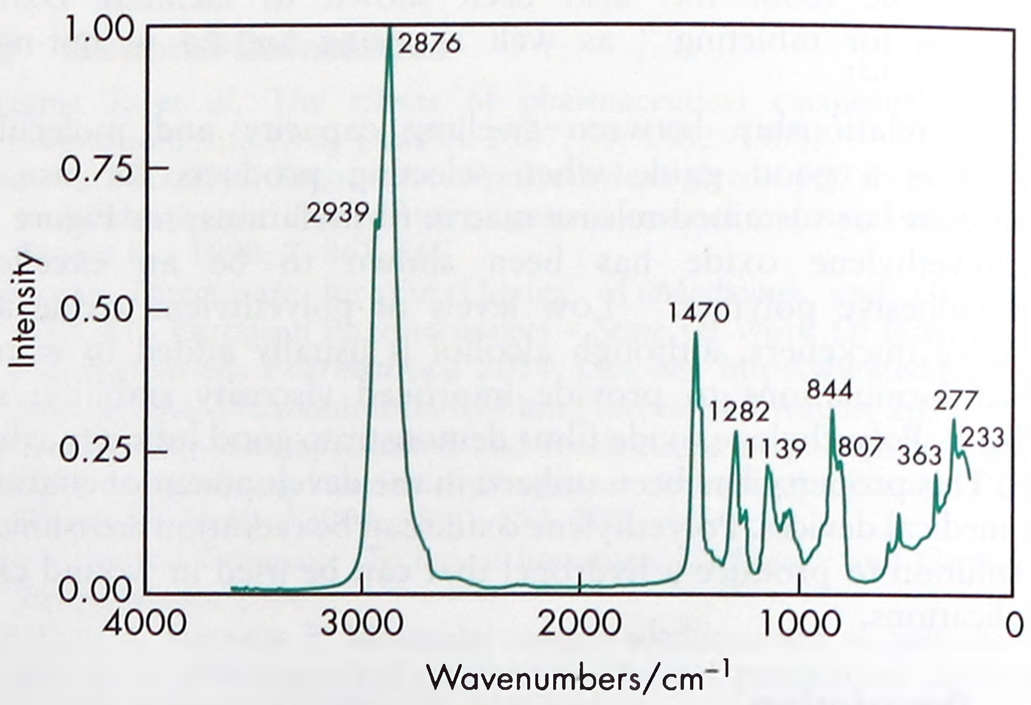

Figure 4: Raman spectrum of polyethylene oxide measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Polyethylene oxide is prepared by the polymerization of ethylene oxide using a suitable catalyst.[6]

14 Safety

Animal studies suggest that polyethylene oxide has a low level of toxicity regardless of the route of administration. It is poorly absorbed from the gastrointestinal tract but appears to be

completely and rapidly eliminated. The resins are neither skin irritants nor sensitizers, and they do not cause eye irritation.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Polyethylene oxide may form an explosive dust–air mixture. Gloves, eye protection, a respirator, and other protective clothing should be worn.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (sustained-release tablets). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyethylene glycol.

18 Comments

Polyethylene oxide and polyethylene glycol have the same CAS Registry Number [25322-68-3].

4 Empirical Formula and Molecular Weight

The PhEur 9.2 describes methacrylic acid–ethyl acrylate copolymer (1 : 1) as a copolymer of methacrylic acid and ethyl acrylate having a mean relative molecular mass of about 250 000. The ratio of carboxylic groups to ester groups is about 1 : 1. The substance is in

the acid form (type A) or partially neutralized using sodium hydroxide (type B). It may contain suitable surfactants such as sodium dodecyl sulfate or polysorbate 80. An aqueous 30% w/v dispersion of this material is also defined in a separate monograph. Methacrylic acid–methyl methacrylate copolymer (1 : 1) is described in the PhEur 9.2 as a copolymer of methacrylic acid and methyl methacrylate having a mean relative molecular mass of about 135 000. The ratio of carboxylic acid to ester groups is about 1 : 1. A further monograph in the PhEur 9.2 describes methacrylic acid–methyl methacrylate copolymer (1 : 2), where the ratio of carboxylic acid to ester groups is about 1 : 2. The PhEur 9.2 describes basic butylated methyacrylate copolymer as a copolymer of (2-dimethylaminoethyl) methacrylate, butyl methyacrylate, and methyl methacrylate having a mean relative molecular mass of about 150 000. The ratio of (2-dimethylaminoethyl) methacrylate groups to butyl methyacrylate and methyl methacrylate groups is about 2 : 1 : 1. The PhEur 9.2 describes ammonio methyacrylate copolymer as a poly(ethyl propenoate-*co*-methyl 2-methylpropenoate-*co*-2-(trimethylammonio)ethyl 2-methylpropenoate) chloride having a mean relative molecular mass of about 150 000. The ratio of ethyl propenoate to methyl 2-methylpropenoate to 2-(trimethylammonio)ethyl 2-methylpropenoate is about 1 : 2 : 0.2 for Type A and 1 : 2 : 0.1 for Type B. Polyacrylate dispersion (30 per cent) is described in the PhEur 9.2 as a dispersion in water of a copolymer of ethyl acrylate and methyl methacrylate having a mean relative molecular mass of about 800 000. It may contain a suitable emulsifier.

The USP 40–NF 35 S1 describes methacrylic acid copolymer as a fully polymerized copolymer of methacrylic acid and an acrylic or methacrylic ester. Three types of copolymers, namely Type A, Type B, and Type C, are defined in the monograph. They vary in their methacrylic acid content and solution viscosity. All types A, B, and C may contain suitable surface-active agents. Ammonio methacrylate copolymers Type A and Type B, consisting of fully polymerized copolymers of acrylic and methacrylic acid esters with a low content of quaternary ammonium groups, are also described in the USP 40–NF 35 S1. They vary in their ammonio methacrylate units. The USP 40–NF 35 S1 also describes amino methacrylate copolymer as a fully polymerized copolymer of 2-dimethylaminoethyl methacrylate, butyl methacrylate and methyl methacrylate. *See* Sections 9 and 18. Further monographs for aqueous dispersions of Type C methacrylic acid copolymer, ammonio methacrylate copolymer, and also ethyl acrylate and methyl methacrylate copolymer are also defined; *see* Section 9.

The molecular weight information currently reported in the pharmacopeias is ≥10 000. Using size exclusion chromatography (SEC), the average molecular weights are typically ≥30 000.[1,2]

5 Structural Formula

For *Eudragit E*:
R^1, R^3 = CH_3
R^2 = $CH_2CH_2N(CH_3)_2$
R^4 = CH_3, C_4H_9

For *Eudragit L* and *Eudragit S*:
R^1, R^3 = CH_3
R^2 = H
R^4 = CH_3

For *Eudragit FS*:
R^1 = H
R^2 = H, CH_3
R^3 = CH_3

Table II: Summary of properties and uses of commercially available polymethacrylates.

Grade	Supply form	Polymer dry weight content	Recommended solvents or diluents	Solubility/permeability	Applications
Eudragit E 12.5	Organic solution	12.5%	Acetone, alcohols	Soluble in gastric fluid to pH 5	Film coating
Eudragit E 100	Granules	98%	Acetone, alcohols	Soluble in gastric fluid to pH 5	Film coating
Eudragit E PO	Powder	98%	Acetone, alcohols	Soluble in gastric fluid to pH 5	Film coating
Eudragit L 12.5	Organic solution	12.5%	Acetone, alcohols	Soluble in intestinal fluid from pH 6	Enteric coatings
Eudragit L 100	Powder	95%	Acetone, alcohols	Soluble in intestinal fluid from pH 6	Enteric coatings
Eudragit L 100–55	Powder	30%	Water	Soluble in intestinal fluid from pH 5.5	Enteric coatings
Eudragit S 12.5	Organic solution	30%	Water	Soluble in intestinal fluid from pH 7	Enteric coatings
Eudragit S 100	Powder	95%	Acetone, alcohols	Soluble in intestinal fluid from pH 7	Enteric coatings

Kollicoat MAE 100 P	Powder	95%	Acetone, alcohols	Soluble in intestinal fluid from pH 5.5	Enteric coatings
Acryl-EZE	Powder	40–60%	Water	Soluble in intestinal fluid from pH 5.5	Enteric coatings

Note: Recommended plasticizers for the above polymers include dibutyl phthalate, polyethylene glycols, triethyl citrate, triacetin, and 1,2-propylene glycol. The recommended concentration of the plasticizer is approximately 10–25% of the dry polymer weight. A plasticizer is not necessary with *Eudragit E 12.5*, *Eudragit E PO*, *Eudragit E 100* and *Eudragit NE 30 D*.

$R^4 = CH_3$

For *Eudragit RL* and *Eudragit RS*:

$R^1 = H, CH_3$

$R^2 = CH_3, C_2H_5$

$R^3 = CH_3$

$R^4 = CH_2CH_2N(CH_3)_3\ ^+Cl^-$

For *Eudragit NE 30 D* and *Eudragit NE 40 D*:

$R^1, R^3 = H, CH_3$

$R^2, R^4 = CH_3, C_2H_5$

For *Acryl-EZE 93A* and *Acryl-EZE MP*; *Eudragit L 30 D-55* and *Eudragit L 100-55*, *Eastacryl 30 D*, *Kollicoat MAE 100 P*, and *Kollicoat MAE 30 DP*:

$R^1, R^3 = H, CH_3$

$R^2 = H$

$R^4 = CH_3, C_2H_5$

6 Functional Category

Film-forming agent; modified-release agent; solubilizing agent; tablet and capsule binder.

7 Applications in Pharmaceutical Formulation or Technology

Polymethacrylates are primarily used in oral capsule and tablet formulations as film-coating agents.[3–23] Depending on the type of polymer used, films of different solubility characteristics can be produced; *see* Table II.

Eudragit E is used as a plain or insulating film former. It is soluble in gastric fluid below pH 5 and is used effectively for moisture protection and taste-masking, as well as solubility enhancement. In contrast, *Eudragit L*, *S* and *FS* types are used as enteric coating agents because they are resistant to gastric fluid. Different types of enteric coatings are soluble at different pH values: e.g. *Eudragit L* is soluble at pH > 6 whereas *Eudragit S* and *FS* are soluble at pH > 7 and suitable for colonic delivery applications. The S grade is generally used for coating tablets, while the flexible *FS 30 D* dispersion is preferred for coating particles for further compression.

Eudragit RL, *RS*, *NE 30 D*, *NE 40 D*, and *NM 30 D* are used to form water-insoluble film coats for sustained-release products. *Eudragit RL* films are more permeable than those of *Eudragit RS*, and films of varying permeability can be obtained by mixing the two

Table III: Solubility of commercially available polymethacrylates in various solvents.

(a) Alcohols including ethanol (95%), methanol, and propan-2-ol.
(b) Supplied as a milky-white aqueous dispersion.
(c) A 1 : 5 mixture forms a clear, viscous, solution.
S = soluble; M = miscible; I = insoluble; P = precipitates.
1 part of *Eudragit RL 30 D* or of *Eudragit RS 30 D* dissolves completely in 5 parts acetone, ethanol (95%), or propan-2-ol to form a clear or slightly turbid solution. However, when mixed in a ratio of 1 : 5 with methanol, *Eudragit RL 30 D* dissolves completely, whereas *Eudragit RS 30 D* dissolves only partially.

types together. The neutral Eudragit *NE/NM* grades do not have functional ionic groups. They swell in aqueous media independently of pH without dissolving.

Eudragit L 30 D-55 is used as an enteric coating film former for solid-dosage forms. The coating is resistant to gastric juice but dissolves readily at above pH 5.5.

Eudragit L 100-55 is the spray-dried version of *Eudragit L 30 D-55*. It is commercially available as a redispersible powder.

Kollicoat MAE 100 P, *Acryl-EZE 93A* and *Acryl-EZE MP* are also commercially available as redispersible powder forms, which are designed for enteric coating of tablets or beads.

Eastacryl 30 D and *Kollicoat MAE 30 DP* are aqueous dispersions of methacrylic acid–ethyl acrylate copolymers. They are also used as enteric coatings for solid-dosage forms.

Polymethacrylates are also used as binders in both aqueous and organic wet-granulation processes. Larger quantities (5–20%) of dry polymer are used to control the release of an active substance from a tablet matrix. Solid polymers may be used in direct-compression processes in quantities of 10–50%.

Polymethacrylate polymers may additionally be used to form the matrix layers of transdermal delivery systems and have also been used to prepare novel gel formulations for rectal administration.[24]

See also Section 18.

8 Description

Polymethacrylates are synthetic cationic and anionic polymers of dimethylaminoethyl methacrylates, methacrylic acid, and methacrylic acid esters in varying ratios. Several different types are commercially available and may be obtained as the dry powder, as an aqueous dispersion, or as an organic solution. A (60 : 40) mixture of acetone and propan-2-ol is most commonly used as the organic solvent. *See* Tables I and III.

Eudragit E is a cationic polymer based on dimethylaminoethyl methacrylate and other neutral methacrylic acid esters. It is soluble in gastric fluid as well as in weakly acidic buffer solutions (up to pH ≈ 5). *Eudragit E* is available as a 12.5% ready-to-use solution in propan-2-ol–acetone (60 : 40). It is light yellow in color with the characteristic odor of the solvents. Solvent-free granules (*Eudragit E 100*) contain ≈98% dried weight content of *Eudragit E*. *Eudragit E PO* is a white free-flowing powder with at least 98% of dry polymer.

Eudragit L and *S*, also referred to as methacrylic acid copolymers in the USP 40–NF 35 S1 monograph, are anionic copolymerization products of methacrylic acid and methyl methacrylate. The ratio of free carboxyl groups to the ester is approximately 1 : 1 in *Eudragit L* (Type A) and approximately 1 : 2 in *Eudragit S* (Type B). Both polymers are readily soluble in neutral to weakly alkaline conditions (pH 6–7) and form salts with alkalis, thus affording film coats that are resistant to gastric media but soluble in intestinal fluid. They are available as a 12.5% solution in propan-2-ol without plasticizer (*Eudragit L 12.5* and *S 12.5*). Solutions are colorless, with the characteristic odor of the solvent. *Eudragit L 100* and *Eudragit S-100* are white free-flowing powders with at least 95% of dry polymers.

Eudragit FS 30 D is the aqueous dispersion of an anionic copolymer based on methyl acrylate, methyl methacrylate, and methacrylic acid. The ratio of free carboxyl groups to ester groups is approximately 1 : 10. The dispersion also contains 0.3% sodium lauryl sulfate and 1.2% polysorbate 80 as emulsifiers. It is a highly flexible polymer, designed for use in enteric-coated solid-dosage forms, and dissolves in aqueous systems at pH >7.

Eudragit RL and *Eudragit RS*, also referred to as ammonio methacrylate copolymers in the USP 40–NF 35 S1 monograph, are copolymers synthesized from acrylic acid and methacrylic acid esters, with *Eudragit RL* (Type A) having 10% of functional quaternary ammonium groups and *Eudragit RS* (Type B) having

5% of functional quaternary ammonium groups. The ammonium groups are present as salts and give rise to pH-independent permeability of the polymers. Both polymers are water-insoluble, and films prepared from *Eudragit RL* are freely permeable to water, whereas films prepared from *Eudragit RS* are only slightly permeable to water. They are available as 12.5% ready-to-use solutions in propan-2-ol–acetone (60 : 40). Solutions are colorless or slightly yellow in color, and may be clear or slightly turbid; they have an odor characteristic of the solvents. Solvent-free granules (*Eudragit RL 100* and *Eudragit RS 100*) contain ≥97% of the dried weight content of the polymer.

Eudragit RL PO and *Eudragit RS PO* are fine, white powders with a slight amine-like odor. They are characteristically the same polymers as *Eudragit RL* and *RS*. They contain ≥97% of dry polymer.

Eudragit RL 30 D and *Eudragit RS 30 D* are aqueous dispersions of copolymers of acrylic acid and methacrylic acid esters with a low content of quaternary ammonium groups. The dispersions contain 30% polymer. The quaternary groups occur as salts and are responsible for the permeability of films made from these polymers. Films prepared from *Eudragit RL 30 D* are readily permeable to water, whereas films prepared from *Eudragit RS 30 D* are less permeable to water. Film coatings prepared from both polymers give pH-independent release of active substance. Plasticizers are usually added to improve film properties.

Eudragit NE 30 D and *Eudragit NE 40 D* are aqueous dispersions of a neutral copolymer based on ethyl acrylate and methyl methacrylate. The dispersions are milky-white liquids of low viscosity and have a weak aromatic odor. The *Eudragit NE 30 D* and *40 D* dispersions contain 30% or 40% dry substance. It also contains 1.5% or 2.0% nonoxynol 100 as an emulsifier, respectively. Films prepared from the lacquer swell in water, to which they become permeable. Thus, films produced are insoluble in water, but give pH-independent drug release.

Eudragit NM 30 D is an aqueous dispersion of a neutral copolymer based on ethyl acrylate and methyl methacrylate. The dispersion also contains 0.7% macrogol stearyl ether (20) as an emulsifier. The product complies with the USP–NF monograph 'Ethyl Acrylate Methyl Methacrylate Copolymer Dispersion' except for the slightly lower molecular weight.

Eudragit L 30 D-55 is an aqueous dispersion of an anionic copolymer based on methacrylic acid and ethyl acrylate. The copolymer corresponds to USP 40–NF 35 S1 methacrylic acid copolymer, Type C. The ratio of free-carboxyl groups to ester groups is 1 : 1. Films prepared from the copolymers dissolve above pH 5.5, forming salts with alkalis, thus affording coatings that are insoluble in gastric media but soluble in the small intestine.

Eastacryl 30D and *Kollicoat MAE 30 DP* are also aqueous dispersions of the anionic copolymer based on methacrylic acid and ethyl acrylate. The copolymer also corresponds to USP 40–NF 35 S1 methacrylic acid copolymer, Type C. The ratio of free-carboxyl groups to ester groups is 1 : 1. Films prepared from the copolymers dissolve above pH 5.5, forming salts with alkalis, thus affording coatings that are insoluble in gastric media but soluble in the small intestine.

Eudragit L 100-55 (prepared by spray-drying *Eudragit L 30 D-55*) is a white, free-flowing powder that is redispersible in water to form a latex that has properties similar to those of *Eudragit L 30 D-55*.

Acryl-EZE 93A and *Acryl-EZE MP* are commercially available as redispersible powder forms, which are designed for enteric coating of tablets and beads, respectively.

9 Pharmacopeial Specifications

Specifications for polymethacrylates from PhEur 9.2 are shown in Table IV, and those from the USP 40–NF 35 S1 in Table V. *See also* Section 18.

10 Typical Properties

Acid value

300–330 for *Eudragit L 12.5*, *L 100*, *L 30 D-55*, *L 100-55*, *Eastacryl 30 D*, *Kollicoat MAE 100 P*, and *Kollicoat MAE 30 DP*;

180–200 for *Eudragit S 12.5* and *S 100*.

Alkali value

162–198 for *Eudragit E 12.5* and *E 100*;

23.9–32.3 for *Eudragit RL 12.5*, *RL 100*, and *RL PO*;

27.5–31.7 for *Eudragit RL 30 D*;

12.1–18.3 for *Eudragit RS 12.5*, *RS 100*, and *RS PO*;

16.5–22.3 for *Eudragit RS 30 D*.

Density (bulk) 0.390 g/cm^3

Density (tapped) 0.424 g/cm^3

Density (true)

0.811–0.821 g/cm^3 for *Eudragit E*;

0.83–0.85 g/cm^3 for *Eudragit L*, *S 12.5*;

1.058–1.068 g/cm^3 for *Eudragit FS 30 D*;

0.831–0.852 g/cm^3 for *Eudragit L*, *S 100*;

1.062–1.072 g/cm^3 for *Eudragit L 30 D-55*;

0.821–0.841 g/cm^3 for *Eudragit L 100-55*;

0.816–0.836 g/cm^3 for *Eudragit RL* and *RS 12.5*;

0.816–0.836 g/cm^3 for *Eudragit RL* and *RS PO*;

1.047–1.057 g/cm^3 for *Eudragit RL* and *RS 30 D*;

1.037–1.047 g/cm^3 for *Eudragit NE 30 D*;

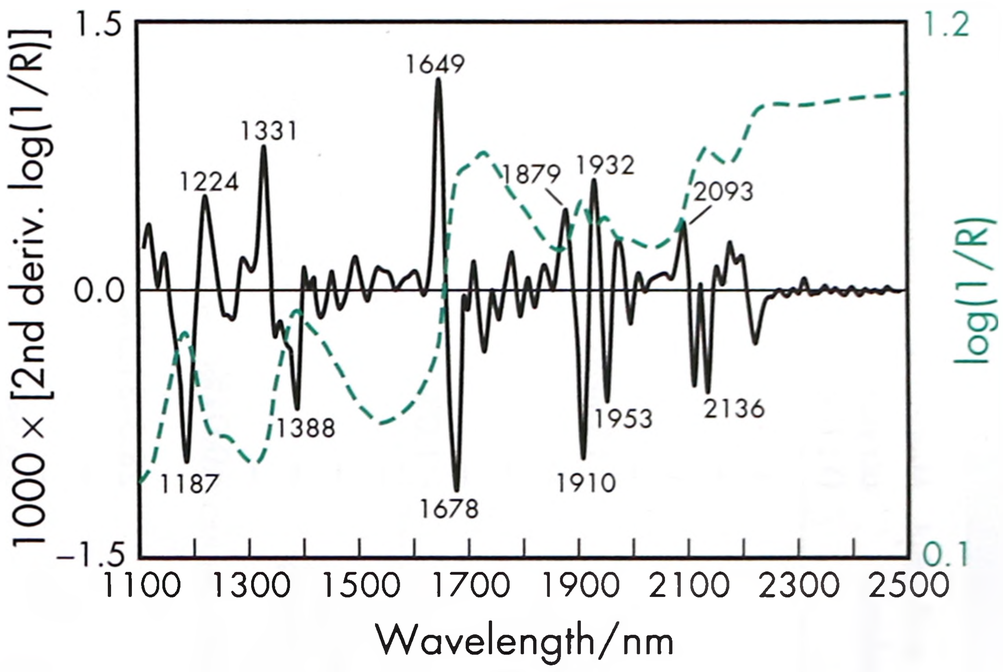

Figure 1: Near-infrared spectrum of polymethacrylates (*Eudragit E 100*) measured by reflectance.

50–200 mPa s for *Eudragit L* and *S*;
≤20 mPa s for *Eudragit FS 30 D*;
≤15 mPa s for *Eudragit L 30 D-55*;
100–200 mPa s for *Eudragit L 100-55*;
≤15 mPa s for *Eudragit RL* and *RS*;
≤200 mPa s for *Eudragit RL* and *RS 30 D*;
≤15 mPa s for *Kollicoat MAE 100 P* and *Kollicoat MAE 30 DP*;
145 mPa s for *Eastacryl 30D*.

11 Stability and Storage Conditions

Dry powder polymer forms are stable at temperatures less than 30°C. Above this temperature, powders tend to form clumps, although this does not affect the quality of the substance and the clumps can be readily broken up. Dry powders are stable for at least 3 years if stored in a tightly closed container at less than 30°C.

Dispersions are sensitive to extreme temperatures and phase separation occurs below 0°C. Dispersions should therefore be stored at temperatures between 5 and 25°C and are stable for at least 18 months after shipping from the manufacturer's warehouse if stored in a tightly closed container at the above conditions.

12 Incompatibilities

Incompatibilities occur with certain polymethacrylate dispersions depending upon the ionic and physical properties of the polymer and solvent. For example, coagulation may be caused by soluble electrolytes, pH changes, some organic solvents, and extremes of temperature; *see* Table II. For example, dispersions of *Eudragit L 30 D*, *RL 30 D*, *L 100-55*, and *RS 30 D* are incompatible with magnesium stearate. *Eastacryl 30 D*, *Kollicoat MAE 100 P*, and *Kollicoat MAE 30 DP* are also incompatible with magnesium stearate.

Interactions between polymethacrylates and some drugs can occur, although solid polymethacrylates and organic solutions are generally more compatible than aqueous dispersions.

13 Method of Manufacture

Prepared by the polymerization of acrylic and methacrylic acids or their esters, e.g. butyl ester or dimethylaminoethyl ester.

14 Safety

Polymethacrylate copolymers are widely used as film-coating materials in oral pharmaceutical formulations. They are also used in topical formulations and are generally regarded as nontoxic and nonirritant materials.

Acute and chronic toxicity studies have shown that polymethacrylate copolymers may be regarded as essentially safe in humans.[25–28]

See also Section 15.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Additional measures should be taken when handling organic solutions of polymethacrylates. Eye protection, gloves, and a dust mask or respirator are recommended. Polymethacrylates should be handled in a well-ventilated environment and measures should be taken to prevent dust formation.

Acute and chronic adverse effects have been observed in workers handling the related substances methyl methacrylate and poly(methyl methacrylate) (PMMA).[29] In the UK, the workplace exposure limit for methyl methacrylate has been set at 208 mg/m^3 (50 ppm) long-term (8-hour TWA), and 416 mg/m^3 (100 ppm) short-term.[30]

See also Section 17.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Methyl methacrylate; poly(methyl methacrylate).

Methyl methacrylate

Empirical formula $C_5H_8O_2$
Molecular weight 100.13
CAS number [80-62-6]
Synonyms Methacrylic acid, methyl ester; methyl 2-methacrylate; methyl 2-methylpropenoate; MME.
Safety

LD_{50} (dog, SC): 4.5 g/kg
LD_{50} (mouse, IP): 1 g/kg
LD_{50} (mouse, oral): 5.2 g/kg
LD_{50} (mouse, SC): 6.3 g/kg
LD_{50} (rat, IP): 1.33 g/kg
LD_{50} (rat, SC): 7.5 g/kg

Comments Methyl methacrylate forms the basis of acrylic bone cements used in orthopedic surgery.

Poly(methyl methacrylate)

Empirical formula $(C_5H_8O_2)_n$
Synonyms Methyl methacrylate polymer; PMMA.
Comments Poly(methyl methacrylate) has been used as a material for intraocular lenses, for denture bases, and as a cement for dental prostheses.

18 Comments

A number of different polymethacrylates are commercially available that have different applications and properties; *see* Table II.

For spray coating, polymer solutions and dispersions should be diluted with suitable solvents. Some products need the addition of a plasticizer such as dibutyl sebacate, dibutyl phthalate, glyceryl triacetate, or polyethylene glycol. Different types of plasticizer may be mixed to optimize the polymer properties for special requirements.

The *Japanese Pharmaceutical Excipients* (JPE) 2004 includes specifications for aminoalkyl methacrylate copolymer RS, aminoalkyl methacrylate copolymer E, dried methacrylic acid copolymer LD, ethyl acrylate and methyl methacrylate copolymer dispersion, methacrylic acid copolymer L, methacrylic acid copolymer S, and methacrylic acid copolymer LD.

Poly(methyl vinyl ether/maleic anhydride)

P

1 Nonproprietary Names

None adopted.

2 Synonyms

Butyl ester of poly(methylvinyl ether-co-maleic anhydride); calcium and sodium salts of poly(methylvinyl ether-co-maleic anhydride); *Gantrez*; PVM/MA copolymer.

3 Chemical Name and CAS Registry Number

See Table I.

4 Empirical Formula and Molecular Weight

$(C_4H_2O_3 \cdot C_3H_6O)_x$ *See* Table II.

5 Structural Formula

See Section 4.

6 Functional Category

Bioadhesive material; complexing agent; emulsion stabilizing agent; film-forming agent; transdermal delivery component; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Poly(methylvinyl ether/maleic anhydride) copolymers and derivatives are used in denture adhesive bases,[1] controlled-release coatings, enteric coatings, ostomy adhesives,[2] transdermal patches,[3] toothpastes,[4] mouthwashes,[5] and transdermal gels.[6,7]

8 Description

In the solid state, poly(methylvinyl ether/maleic anhydride) copolymers are a white to off-white free flowing, odorless, hygroscopic powders. In solution, poly(methylvinyl ether/maleic anhydride) is a slightly hazy, odorless, viscous liquid.

9 Pharmacopeial Specifications

—

10 Typical Properties

See Table III.

11 Stability and Storage Conditions

Poly(methylvinyl ether/maleic anhydride) and related free acids are hygroscopic powders, and therefore excessive exposure to moisture should be avoided. Aqueous solutions exhibit decreases in viscosity upon exposure to UV light. Poly(methylvinyl ether/maleic anhydride) should be stored in a cool, dry place out of direct sunlight.

12 Incompatibilities

Poly(methylvinyl ether/maleic anhydride) and copolymers are incompatible with strong oxidizing agents and reducing agents, concentrated nitric acid, sulfuric acid, nitrofoam, oleum, potassium *t*-butoxide, aluminum, aluminum triisopropoxide, and crotonalde-

Gantrez ES-425	90 000–150 000

hyde. In addition, the anhydride will hydrolyze in water to form a water-soluble free acid that can subsequently be ionized to form salts in the presence of cations (Na^+, Zn^{2+}, Ca^{2+}, and Al^{3+}). Excessive addition of bivalent and trivalent metal ions to aqueous solution will result in precipitation, particularly in solutions containing high polymer concentrations.

13 Method of Manufacture

Poly(methylvinyl ether/maleic anhydride) and copolymers are manufactured from methylvinyl ether and maleic anhydride. *See also* Section 18.

14 Safety

Poly(methylvinyl ether/maleic anhydride) and copolymers are widely used in a diverse range of topical and oral pharmaceutical formulations.[8] These copolymers are generally regarded as nontoxic and nonirritant, although there are exceptions; *see* Section 18.

LD_{50} (rat, oral): 8 g/kg (*Gantrez AN-130 Powder*)[9]

LD_{50} (rat, oral): 40 ml/kg (*Gantrez AN-139* 20% w/w aqueous solution)

LD_{50} (rat, oral): >25.6 g/kg (*Gantrez ES-225*)

LD_{50} (rat, oral): 25.6 g/kg (*Gantrez ES-425* 40% w/v corn oil solution)

LD_{50} (rat, oral): >5.0 g/kg (*Gantrez MS-955* 20% aqueous solution)

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Excessive dust generation should be avoided when using powders, and an appropriate ventilation area and dust mask are recommended. Hand and eye protection is also recommended. *See also* Section 18.

16 Regulatory Status

Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

18 Comments

Gantrez AN-119 has been used to manufacture specific bioadhesive ligand-nanoparticle conjugates[10] to aid gastrointestinal retention for oral drug delivery applications. *Gantrez* has also been used to develop novel polyethylene surface-modified medical devices with enhanced hydrophilicity and wettability.[11]

The *S*, *ES*, and *MS* grades of *Gantrez* are manufactured by dispersing *AN* copolymers in a number of different solvents or salt solutions.[9]

The *A*, *ES*, and *MS* copolymers of *Gantrez* are extremely irritating to the eyes and a NIOSH-approved respirator and suitable eye protection are recommended when using *Gantrez ES-435*, *Gantrez ES-225*, and *Gantrez A-425*.

Polyoxyethylene Alkyl Ethers

1 Nonproprietary Names

The polyoxyethylene alkyl ethers are a series of polyoxyethylene glycol ethers of *n*-alcohols (lauryl, oleyl, myristyl, cetyl, and stearyl alcohol). Of the large number of different materials commercially available, four types are listed in the USP 40–NF 35 S1, one type in the JP XVII, and four types in the PhEur 9.2.

BP: Macrogol Cetostearyl Ether
Macrogol Lauryl Ether
Macrogol Oleyl Ether
Macrogol Stearyl Ether

JP: Lauromacrogol

PhEur: Macrogol Cetostearyl Ether
Macrogol Lauryl Ether
Macrogol Oleyl Ether
Macrogol Stearyl Ether

USP–NF: Polyoxyl 20 Cetostearyl Ether
Polyoxyl 10 Oleyl Ether
Polyoxyl Lauryl Ether
Polyoxyl Stearyl Ether

Polyoxyethylene alkyl ethers are employed extensively in cosmetics, where the CTFA names laureth-*N*, myreth-*N*, ceteth-*N*, and steareth-*N* are commonly used. In this nomenclature, *N* is the number of ethylene oxide groups, e.g. steareth-20.

See also Sections 2–5.

2 Synonyms

Synonyms applicable to polyoxyethylene alkyl ethers are shown below.

Brij; *Cremophor A*; *Cyclogol 1000*; *Emalex*; *Emulgen*; *Ethosperse*; *Genapol*; *Hetoxol*; *Hostacerin*; *Jeecol*; *Lipocol*; *Lumulse*; *Nikkol*; macrogol ethers; macrogoli aether cetostearylicus; macrogoli aether laurilicus; macrogoli aether oleicus; macrogoli aether stearylicus; polyoxyethylene lauryl alcohol ether; *Procol*; *Ritoleth*; *Ritox*.

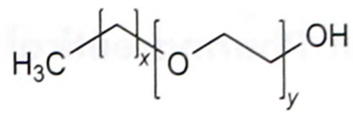
Table I shows synonyms for specific materials.

3 Chemical Name and CAS Registry Number

Polyethylene glycol monocetyl ether [9004-95-9]
Polyethylene glycol monolauryl ether [9002-92-0]
Polyethylene glycol monooleyl ether [9004-98-2]
Polyethylene glycol monostearyl ether [9005-00-9]

4 Empirical Formula and Molecular Weight

See Sections 1, 2, and 5.



$CH_3(CH_2)_x(OCH_2CH_2)_yOH$

In the formula, y is the number of ethylene oxide groups in the hydrophilic chain, typically 10–60, and $(x + 1)$ is the number of carbon atoms in the alkyl chain, typically:

12 lauryl (dodecyl), 14 myristyl (tetradecyl), 16 cetyl (hexadecyl), 18 stearyl (octadecyl).

The polyoxyethylene alkyl ethers tend to be mixtures of polymers of slightly varying molecular weights, and the numbers quoted are average values. In cetomacrogol 1000, for example, x is 15 or 17, and y is 20–24.

5 Structural Formula

See Section 4.

P

Table I: Synonyms of selected polyoxyethylene alkyl ethers.

Name	Synonym
Cetomacrogol 1000	*Cresmer 1000*; polyethylene glycol 1000; macrocetyl ether; polyoxyethylene glycol 1000 monocetyl ether.
Polyoxyl 6 cetostearyl ether	*Ceteareth 6*; *Cremophor A6*.
Polyoxyl 20 cetostearyl ether	*Brij CS-20*; *Ceteareth 20*; *Cremophor A 20 polyether*; *Genapol T200*; *Hetoxol CS-20*; *Jeecol CS-20*; *Lipocol SC-20*; *Lumulse CS-20*; *Ritacet 20*.
Polyoxyl 25 cetostearyl ether	*Brij CS25*; *Ceteareth 25*; *Cremophor A25*; *Hetoxol CS-25*.
Polyoxyl 2 cetyl ether	*Brij C2*; ceteth-2; *Hetoxol CA-2*; *Jeecol CA-10*; *Lipocol C-2*; *Nikkol BC-2*; *Procol CA-2*.
Polyoxyl 10 cetyl ether	*Brij C10*; ceteth-10; *Jeecol CA-10*; *Lipocol C-10*; *Nikkol BC-10TX*; *Procol CA-10*.
Polyoxyl 20 cetyl ether	*Brij C20*; ceteth-20; *Hetoxol CA-20*; *Jeecol CA-20*; *Lipocol C-20*; *Nikkol BC-20TX*.
Polyoxyl 26 glyceryl ether	*Ethosperse G-26*; *Genapol G-260*; Glycereth-26; *Hetoxide G-26*; *Jeechem GL-26*.
Polyoxyl 4 lauryl ether	*Brij L4*; *Ethosperse LA-4*; *Genapol LA 040*; *Hetoxol LA-4*; *Jeecol LA-4*; laureth-4; *Lipocol L-4*; *Lumulse L-4*; *Nikkol BL-4.2*; *Procol LA-4*.
Polyoxyl 9 lauryl ether	*Brij L9*; *Hetoxol LA-9*; *Jeecol LA-9*; laureth-9; lauromacrogol 400; *Nikkol BL-9EX*; polidocanol.
Polyoxyl 12 lauryl ether	*Hetoxol LA-12*; *Jeecol LA-12*; laureth-12; *Lipocol L-12*; *Lumulse L-12*; *Procol LA-12*.
Polyoxyl 23 lauryl ether	*Brij L23*; *Ethosperse LA-23*; *Genapol LA 230*; *Hetoxol LA-23*; *Jeecol LA-23*; laureth-23; *Lipocol L-23*; *Lumulse L-23*; *Procol LA-23*; *Ritox 35*.
Polyoxyl 2 oleyl ether	*Brij O2*; *Genapol O 020*; *Jeecol OA-2*; *Lipocol O-2*; *Nikkol BO-2V*; oleth-2; *Procol OA-2*; *Ritoleth 2*.
Polyoxyl 10 oleyl ether	*Brij O10*; *Genapol O 100*; *Hetoxol OA-10*; *Jeecol OA-10*; *Lipocol O-10*; *Nikkol BO-10V*; oleth-10; polyethylene glycol monooleyl ether; *Procol OA-10*; *Ritoleth 10*.
Polyoxyl 20 oleyl ether	*Brij O20*; *Genapol O 200*; *Jeecol OA-20*; *Lipocol O-20*; *Nikkol BO-20V*; oleth-20; *Procol OA-20*; *Ritoleth 20*.
Polyoxyl 2 stearyl ether	*Brij S2*; *Genapol HS 020*; *Hetoxol STA-2*; *Jeecol SA-2*; *Lipocol S-2*; *Nikkol BS-2*; *Procol SA-2*; steareth-2.
Polyoxyl 10 stearyl ether	*Brij S10*; *Hetoxol STA-10*; *Jeecol SA-10*; *Lipocol S-10*; *Procol SA-10*; steareth-10.
Polyoxyl 20 stearyl ether	*Brij S20*; *Jeecol SA-20*; *Lipocol S-20*; steareth-20.
Polyoxyl 21 stearyl ether	*Brij S721*; *Jeecol SA-21*; *Lipocol S-21*; *Ritox 721*; steareth-21.
Polyoxyl 100 stearyl ether	*Brij S100*; *Hetoxol STA-100*; *Jeecol SA-100*; steareth-100.

6 Functional Category

Dispersing agent; emulsifying agent; gelling agent; nonionic surfactant; penetration enhancer; solubilizing agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyoxyethylene alkyl ethers are nonionic surfactants widely used in topical pharmaceutical formulations and cosmetics, primarily as emulsifying agents for water-in-oil and oil-in-water emulsions, and the stabilization of microemulsions and multiple emulsions.

Polyoxyethylene alkyl ethers are used as solubilizing agents for essential oils, perfumery chemicals, vitamin oils, and drugs of low-water solubility such as cortisone acetate and griseofulvin. They have applications as antidusting agents for powders; wetting and dispersing agents for coarse-particle liquid dispersions; and detergents, especially in shampoos, face washes and similar cosmetic cleaning preparations. They are used as gelling and foaming agents.

Polyoxyethylene alkyl ethers have also been used in suppository formulations to increase drug release from suppository bases, and as solubilizing and coating agents to provide hydrophilicity to polymeric nanoparticles.

Polyoxyethylene alkyl ethers such as polidocanol are suitable for use as solubilizers or dispersants.[1]

8 Description

Polyoxyethylene alkyl ethers vary considerably in their physical appearance from liquids, to pastes, to solid waxy substances. They occur as colorless, white, cream-colored or pale yellow materials with a slight odor.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

See Tables III and IV.

11 Stability and Storage Conditions

Polyoxyethylene alkyl ethers are chemically stable in strongly acidic or alkaline conditions. The presence of strong electrolytes may, however, adversely affect the physical stability of emulsions containing polyoxyethylene alkyl ethers.

On storage, polyoxyethylene alkyl ethers can undergo autoxidation, resulting in the formation of peroxides with an increase in acidity. Many commercially available grades are thus supplied with added antioxidants. Typically, a mixture of 0.01% butylated hydroxyanisole and 0.005% citric acid is used for this purpose.

Polyoxyethylene alkyl ethers should be stored in an airtight container, in a cool, dry place.

12 Incompatibilities

Discoloration or precipitation may occur with iodides, mercury salts, phenolic substances, salicylates, sulfonamides, and tannins.

The antimicrobial efficacy of some preservatives with a phenolic moiety, such as the parabens, is reduced owing to hydrogen bonding. Cloud points are similarly depressed by such preservatives owing to hydrogen bonding between ether oxygen atoms and phenolic hydroxyl groups.

13 Method of Manufacture

Polyoxyethylene alkyl ethers are prepared by the condensation of linear fatty alcohols with ethylene oxide. The reaction is controlled so that the required ether is formed with the polyethylene glycol of the desired molecular weight. Products tend to be mixtures of polymers of slightly varying molecular weights.

14 Safety

Polyoxyethylene alkyl ethers are used as nonionic surfactants in a variety of topical pharmaceutical formulations and cosmetics. The polyoxyethylene alkyl ethers form a series of materials with varying physical properties; manufacturers' literature should be consulted for information on the applications and safety of specific materials.

Although generally regarded as essentially nontoxic and non-irritant materials, some polyoxyethylene alkyl ethers, particularly

when used in high concentration (>20%), appear to have a greater irritant potential than others. It has been demonstrated that the toxicity exerted by these surfactants to erythrocytes can be mitigated when combined with egg phosphatidylcholine.[2]

Animal toxicity studies suggest that polyoxyethylene alkyl ethers have a similar oral toxicity to other surfactants and can be regarded as being moderately toxic. An acute toxicity study in aquatic organisms has shown that higher molecular weight compounds show higher toxicity. The study also reported polyoxyethylene alkyl ethers are not genotoxic at 1000 mg/L.[3]

Polyoxyethylene cetyl ether:[4]

LD_{50} (mouse, oral): 2.60 g/kg

LD_{50} (rabbit, skin): 40 g/kg for 4 week intermittent dosing

LD_{50} (rat, IV): 0.027 g/kg

LD_{50} (rat, oral): 8.60 g/kg

LD_{50} (rat, SC): 0.95 g/kg

Polyoxyethylene oleyl ether:[4]

LD_{50} (rat, oral): 25.8 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA inactive ingredient database (topical aerosols, emulsions, gels, lotions and ointments). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Nonionic emulsifying wax.

18 Comments

Two systems of nomenclature are used to describe these materials. The number '10' in the name *Brij C10* refers to the approximate polymer length in oxyethylene units (i.e. *y*; *see* Section 4). The number '1000' in the name 'cetomacrogol 1000' refers to the average molecular weight of the polymer chain.

Many other polyoxyethylene ethers are commercially available and are also used as surfactants. In addition to their surfactant properties, the series of polyoxyethylene ethers with lauryl side chains, e.g. nonoxynol 10, are also widely used as spermicides. *Brij* (Croda Chemicals) surfactants show synergistic effects when used in combination and readily produce stable difficult-to-formulate emulsions, such as clear gel microemulsions and alkali-based hair straighteners, e.g. *Brij S2* and *S721* work well in combination giving rise to oleosomes, thereby providing flexibility to emulsify a wide range of oils and can be used in formulating emulsions from water-thin milks to thicker medicated creams. *Brij O10* stabilizes and solubilizes unsaturated materials such as fatty acids, and is used in gel systems.

Polyoxyethylene alkyl ethers have been studied in drug delivery systems containing hydrogels,[5] oleosomes, hydrosomes, phosphosomes, ethosomes,[6] and niosomes.[7,8] Polyoxyethylene alkyl ether niosomes encapsulating insulin have been investigated for oral drug delivery.[9]

Polyoxyethylene alkyl ethers have been found to have an enhancing effect on the skin permeation of drugs such as ibuprofen,[10] They have also been evaluated as penetration enhancers for drugs such as donepezil[11] and zolmitriptan.[12] A combination of a mucolytic agent possessing a free thiol group and a polyoxyethylene alkyl ether surfactant of similar polyoxyethylene and alkyl chain length have been reported to show effective enhancement in the intestinal absorption of poorly absorbed hydrophilic compounds.[13]

Long chain polyoxyethylene alkyl ethers have proved useful in the soluble expression of membrane proteins up to a certain threshold concentration,[14] and in sieving matrices for the separation of DNA fragments by capillary electrophoresis.[15]

Polyoxyethylene Castor Oil Derivatives

1 Nonproprietary Names

BP: Polyoxyl Castor Oil
Hydrogenated Polyoxyl Castor Oil

PhEur: Macrogolglycerol Ricinoleate
Macrogolglycerol Hydroxystearate

USP–NF: Polyoxyl 35 Castor Oil
Polyoxyl 40 Hydrogenated Castor Oil

Polyoxyethylene castor oil derivatives are a series of materials obtained by reacting varying amounts of ethylene oxide with either castor oil or hydrogenated castor oil. Several different types of material are commercially available, the best-known being the *Kolliphor* series. Of these, two castor oil derivatives are listed in the PhEur 9.2 and USP 40–NF 35 S1.

See also Sections 2, 3, and 4.

2 Synonyms

Synonyms applicable to polyoxyethylene castor oil derivatives are shown below. *See* Table I for information on specific materials.

Acconon; *Etocas*; *Eumulgin*; *Jeechem*; *Kolliphor*; *Lipocol*; *Lumulse*; macrogolglyceroli hydroxystearas; macrogolglyceroli ricinoleas; *Nikkol*; *Protachem*; *Simulsol*.

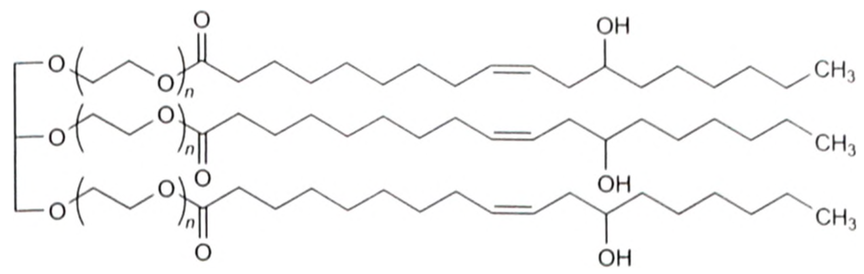
3 Chemical Name and CAS Registry Number

Polyethoxylated castor oil [61791-12-6]

4 Empirical Formula and Molecular Weight

Polyoxyethylene castor oil derivatives are complex mixtures of various hydrophobic and hydrophilic components. Members within each range have different degrees of ethoxylation (moles)/PEG units as indicated by their numerical suffix (*n*). The chemical structures of the polyethoxylated hydrogenated castor oils are analogous to polyethoxylated castor oils with the exception that the double bond in the fatty chain has been saturated by hydrogenation.

The PhEur 9.2 states that polyoxyl castor oil contains mainly ricinoleyl glycerol ethoxylated with 30–50 molecules of ethylene oxide (nominal value), with small amounts of macrogol ricinoleate, and of the corresponding free glycols. The PhEur 9.2 also states that polyoxyl hydrogenated castor oil contains mainly tris(12-hydroxystearyl) glycerol ethoxylated with 7–60 molecules of ethylene oxide (nominal value), with small amounts of macrogol hydroxystearate, and of the corresponding free glycols.



In polyoxyl 35 castor oil, the relatively hydrophobic constituents comprise about 83% of the total mixture, the main component being glycerol polyethylene glycol ricinoleate. Other hydrophobic constituents include fatty acid esters of polyethylene glycol along with some unchanged castor oil. The hydrophilic part (17%) consists of free polyethylene glycols and glycerol ethoxylates. *Kolliphor ELP*, a 'purified' grade of *Kolliphor EL* is also a polyoxyl 35 castor oil; it has a lower content of water (<0.5%), potassium ions (<15 ppm), and free fatty acids (C_{12}–C_{18} <1%), particularly ricinoleic (<0.2%), oleic (<0.1%) and palmitic (<0.1%) acids, and hence is claimed to contribute to improved stability of some sensitive active ingredients.

In polyoxyl 40 hydrogenated castor oil and polyoxyl 60 hydrogenated castor oil the main constituent is glycerol polyethylene glycol oxystearate, which together with fatty acid glycerol polyglycol esters, forms the hydrophobic constituent. The hydrophilic portion consists of polyethylene glycols and glycerol ethoxylate. *Kolliphor RH 410* (90% *Kolliphor RH 40* + 10% water), *Kolliphor CO 40*, *Kolliphor 410* (90% *Kolliphor CO 40* + 10% water), and *Kolliphor CO 455* (90% *Kolliphor CO 40* + 5% water + 5% propylene glycol) are cosmetic grades of polyoxyl hydrogenated castor oils.

5 Structural Formula

n = degree of ethoxylation

For polyethoxylated hydrogenated castor oils the double bond in the fatty chain is saturated.

See Section 4.

6 Functional Category

Emulsifying agent; nonionic surfactant; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyoxyethylene castor oil derivatives are nonionic solubilizers and emulsifying agents used in oral, topical, and parenteral pharmaceutical formulations.

Polyoxyl 35 castor oil is mainly used as an emulsifying and solubilizing agent, and is particularly suitable for the production of aqueous liquid preparations containing volatile oils, fat-soluble vitamins, and other hydrophobic substances, including aqueous solutions of hydrophobic drugs (e.g. miconazole, hexetidine, clotrimazole, benzocaine). In oral formulations, the taste of polyoxyl 35 castor oil can be masked by a banana flavor. Polyoxyl 35 castor oil has been used as a buffering agent for aqueous tropicamide eyedrops.[1] Polyoxyl 35 castor oil is also used in the production of glycerin suppositories to enhance drug release.[2,3] In cosmetics, polyoxyl 35 castor oil is mainly used as a solubilizing agent for perfume bases and volatile oils in vehicles containing 30–50% v/v alcohol (ethanol or propan-2-ol). In hand lotions, it can be used to replace castor oil.

Polyoxyl 40 hydrogenated castor oil may be used in preference to polyoxyl 35 castor oil in oral formulations as a solubilizer for fat soluble vitamins, essential oils and other hydrophobic pharmaceuticals. It has very little odor and it is almost tasteless. In aqueous alcoholic or completely aqueous solutions, polyoxyl 40 hydrogenated castor oil can be used to solubilize vitamins, essential oils, and certain drugs. In aerosol vehicles that include water, the addition of polyoxyl 40 hydrogenated castor oil improves the solubility of the propellant in the aqueous phase. Foam formation in aqueous ethanol solutions containing polyoxyl 40 hydrogenated castor oil can be suppressed by the addition of small amounts of polypropylene glycol 2000.

Polyoxyl 60 hydrogenated castor oil derivatives have been reported to provide a self-microemulsifying system with enhanced oral absorption.[4]

8 Description

Polyoxyl 35 castor oil occurs as a pale yellow, oily liquid that is clear at temperatures above 26°C. It has a faint but characteristic odor and can be completely liquefied by heating to 26°C.

Polyoxyl 40 hydrogenated castor oil occurs as a white to yellowish, semisolid paste at 20°C that liquefies at 30°C. It has a very faint characteristic odor and is almost tasteless in aqueous solution.

Polyoxyl 60 hydrogenated castor oil occurs as a white paste at room temperature. It has little taste or odor in aqueous solution.

See also Table II.

9 Pharmacopeial Specifications

See Table III.

10 Typical Properties

See Tables II, IV, and V.

11 Stability and Storage Conditions

Polyoxyl 35 castor oil forms stable solutions in many organic solvents such as chloroform, ethanol, and propan-2-ol; it also forms clear, stable, aqueous solutions. Polyoxyl 35 castor oil is miscible with other polyoxyethylene castor oil derivatives and on heating with fatty acids, fatty alcohols, and certain animal and vegetable oils. Aqueous solutions and aqueous alcohol solutions of polyoxyl 40 hydrogenated castor oil are stable. Solutions become cloudy as temperature increases.

On heating an aqueous solution, the solubility of polyoxyl 35 castor oil is reduced and the solution becomes turbid. Aqueous solutions of polyoxyl hydrogenated castor oil heated for prolonged periods may separate into solid and liquid phases on cooling. However, the product can be restored to its original form by homogenization.

Aqueous solutions of polyoxyl 35 castor oil are stable in the presence of low concentrations of electrolytes such as acids or salts, with the exception of mercuric chloride; *see* Section 12. Heating together with very acidic or basic substances results in saponification.

Aqueous solutions of polyoxyl 35 castor oil can be sterilized by autoclaving for 30 minutes at 120°C. In this process, a product may acquire a deeper color but this has no significance for product stability. Aqueous solutions of polyoxyl hydrogenated castor oil can similarly be sterilized by autoclaving at 120°C, but this may cause a slight decrease in the pH value. Phase separation may also be observed during sterilization, but can be remedied by agitating the solution while it is still hot.

Although the method of manufacture used for polyoxyethylene castor oil derivatives ensures that they are near-sterile, microbial contamination can occur on storage.

Polyoxyethylene castor oil derivatives should be stored in a well-filled, airtight container, protected from light, in a cool, dry place. They are stable for at least 2 years if stored in the unopened original containers at room temperature (maximum 25°C).

12 Incompatibilities

In strongly acidic or alkaline solutions, the ester components of polyoxyethylene hydrogenated castor oil are liable to saponify.

In aqueous solution, polyoxyl 35 castor oil is stable toward most electrolytes in the concentrations normally employed. However, it is incompatible with mercuric chloride since precipitation occurs.

Some organic substances may cause precipitation at certain concentrations, especially compounds containing phenolic hydroxyl groups, e.g. phenol, resorcinol, and tannins.

Polyoxyl 40 hydrogenated castor oil and polyoxyl 60 hydrogenated castor oil are largely unaffected by the salts that cause hardness in water.

13 Method of Manufacture

Polyoxyethylene castor oil derivatives are prepared by reacting varying amounts of ethylene oxide with either castor oil or hydrogenated castor oil under controlled conditions.

Polyoxyl 35 castor oil is produced in this way by reacting 1 mole

Table II: Typical physical properties of selected commercially available polyoxyethylene castor oil derivatives.

Name	Description	Acid val
Castor oil derivatives		
Polyoxyl 35 castor oil (*Kolliphor EL*)	Pale yellow oily liquid, clear above 26°C with faint characteristic odor	≤2.0

of castor oil with 35 moles of ethylene oxide, which may be followed by purification.

Polyoxyl 40 hydrogenated castor oil is produced by reacting 1 mole of hydrogenated castor oil with 40–45 moles of ethylene oxide. Polyoxyl 60 hydrogenated castor oil is similarly produced by reacting 1 mole of hydrogenated castor oil with 60 moles of ethylene oxide.

14 Safety

Polyoxyethylene castor oil derivatives are used in a variety of oral, topical, and parenteral pharmaceutical formulations.

Acute and chronic toxicity tests in animals have shown polyoxyethylene castor oil derivatives to be essentially nontoxic and nonirritant materials; *see* Table VI.[5,6] However, there are reports of cardiovascular changes and nephrotoxicity in various species of animals.[7] Several serious anaphylactic reactions,[8–19] cardiotoxicity,[20–22] nephrotoxicity,[23,24] neurotoxicity,[25] and pulmonary toxicity[26] have also been observed in humans and animals following parenteral administration of formulations containing polyoxyethylene castor oil derivatives. The precise mechanism of the reaction is not known.

Table VI: LD_{50} values of selected polyoxyethylene castor oil derivatives.

Name	Animal and route	LD_{50} (g/kg body-weight)[6]
Polyoxyl 35 castor oil (*Kolliphor EL*)	Rat (oral)	>6.4

Polyoxyl 35 castor oil, purified (*Kolliphor ELP*)	Rat (oral)	>6.4
	Rat (dermal)	>5.0
Polyoxyl 40 hydrogenated castor oil (*Kolliphor RH 40*) and polyoxyl 60 hydrogenated castor oil	Rat (oral)	>20.0

P

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IV injections and ophthalmic solutions). Included in parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyoxyethylene alkyl ethers; polyoxyethylene stearates.

18 Comments

Polyoxyl 60 hydrogenated castor oil derivative has been investigated as an absorption enhancer in the absorption of erythropoietin from rat small intestine using gastrointestinal patches.[27] Polyoxyethylene castor oil derivatives have also been used experimentally as surfactants for a controlled-release matrix pellet formulation containing nanocrystalline ketoprofen,[28] and for the transdermal delivery of vinpocetin.[29] Itraconazole has been incorporated in an aqueous parenteral formulation in an o/w microemulsion system containing polyoxyl 40 hydrogenated castor oil[30] and polyoxyl 50 hydrogenated castor oil.[31] A novel o/w microemulsion containing various emulsifiers including polyoxyl 40 hydrogenated castor oil was found to increase the solubility from 60 to 20 000 times of as many as nine poorly water soluble compounds, as well as to enhance the oral bioavailability of these compounds.[32] Hydrogenated castor oil derivatives containing more than 20 oxyethylene units were found to prolong the plasma circulation times of menatetrenone incorporated in lipid emulsions.[33,34]

Kolliphor EL (BASF) has been used as a solubilizing agent for drugs like cyclosporine A,[35] paclitaxel,[36] and cisplatin.[37] A self-microemulsifying drug delivery system (SMEDDS) containing *Kolliphor EL* has been reported to enhance the oral bioavailability of halofantrin,[38] and simvastatin.[39] *Kolliphor EL* has been found to improve solubilization of volatile oil[40] and the dissolution profile of naproxen in solid dosage form.[41]

Kolliphor ELP (BASF) and *Super Refined Etocas 35* (Croda) are purity grades of polyoxyl 35 castor oil for topical, oral and parenteral use, designed specially to provide the highest level of purity in formulations containing extremely sensitive APIs, and improve the solubilization of vitamins and drugs (e.g. paclitaxel). Polyurethane and polyurea nanoparticles designed using *Kolliphor ELP* have shown good biocompatibility indicating their potential use as drug carriers.[42]

Kolliphor RH 40 was found to prolong the dissolution time of digoxin tablets[43] and improve oral bioavailability of lovostatin in a self microemulsifying drug delivery system.[44]

In veterinary practice, polyoxyl 35 castor oil can be used to emulsify cod liver oil, and oils and fats incorporated into animal feeding stuffs. *Kolliphor EL* can enhance the bioavailability of substances such as vitamins in feed and veterinary medicines, improving their efficacy.

Polyoxyethylene Sorbitan Fatty Acid Esters

1 Nonproprietary Names

BP: Polysorbate 20
Polysorbate 40
Polysorbate 60
Polysorbate 80

JP: Polysorbate 80

PhEur: Polysorbate 20
Polysorbate 40
Polysorbate 60
Polysorbate 80

USP–NF: Polysorbate 20
Polysorbate 40
Polysorbate 60
Polysorbate 80

2 Synonyms

Macrogol sorbitan esters; polyethylene glycol sorbitan esters; polyoxyethylene sorbitan esters; sorbimacrogols.

For synonyms of selected polysorbates, *see* Table I; *see also* Section 3.

3 Chemical Names and CAS Registry Numbers

See Table II.

Table II: Chemical names and CAS Registry Numbers of selected polysorbates.

Polysorbate	Chemical name	CAS number
Polysorbate 20	Polyoxyethylene 20 sorbitan monolaurate	[9005-64-5]
Polysorbate 21	Polyoxyethylene (4) sorbitan monolaurate	[9005-64-5]
Polysorbate 40	Polyoxyethylene 20 sorbitan monopalmitate	[9005-66-7]
Polysorbate 60	Polyoxyethylene 20 sorbitan monostearate	[9005-67-8]
Polysorbate 61	Polyoxyethylene (4) sorbitan monostearate	[9005-67-8]
Polysorbate 65	Polyoxyethylene 20 sorbitan tristearate	[9005-71-4]
Polysorbate 80	Polyoxyethylene 20 sorbitan monooleate	[9005-65-6]
Polysorbate 81	Polyoxyethylene (5) sorbitan monooleate	[9005-65-6]
Polysorbate 85	Polyoxyethylene 20 sorbitan trioleate	[9005-70-3]
Polysorbate 120	Polyoxyethylene 20 sorbitan monoisostearate	[66794-58-9]

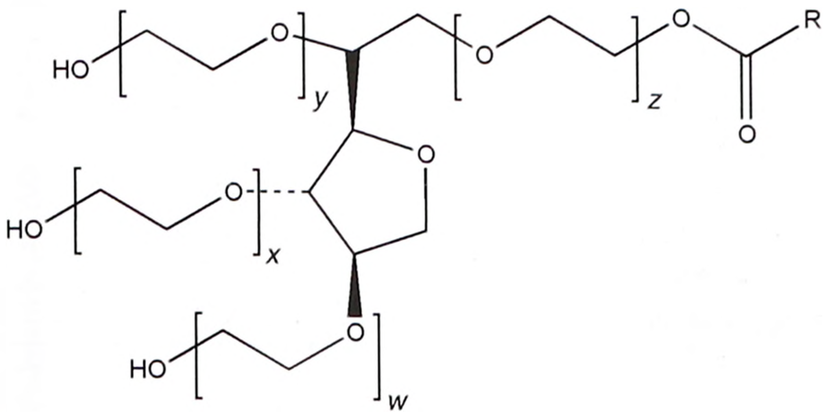
4 Empirical Formula and Molecular Weight

Polyoxyethylene sorbitan fatty acid esters (polysorbates) are a series of partial fatty acid esters that differ in the number of polymerized oxyethylene subunits, and in the number and type of fatty acid moieties.



Polysorbates are composed of 1 or 3 moles of a fatty acid, such as lauric, palmitic, stearic, or oleic acids, and up to 20 moles of ethylene oxide per mole of sorbitol and its anhydrides. The resulting product is therefore a mixture of molecules of varying sizes rather than a single uniform compound.

Approximate molecular weights for selected polysorbates are shown in Table III.

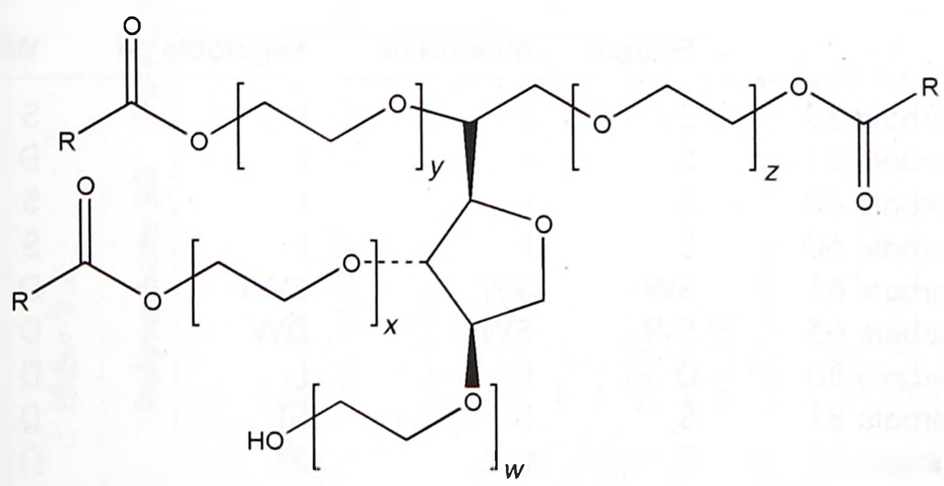


Table III: Empirical formula and molecular weight of selected polysorbates.

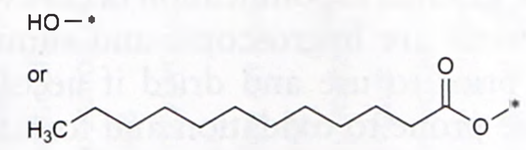
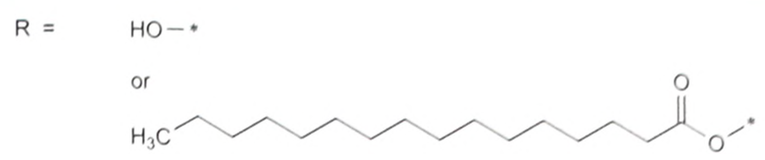
Polysorbate	Formula	Molecular weight
Polysorbate 20	$C_{58}H_{114}O_{26}$	1128
Polysorbate 21	$C_{26}H_{50}O_{10}$	523
Polysorbate 40	$C_{62}H_{122}O_{26}$	1284
Polysorbate 60	$C_{64}H_{126}O_{26}$	1312
Polysorbate 61	$C_{32}H_{62}O_{10}$	607
Polysorbate 65	$C_{100}H_{194}O_{28}$	1845
Polysorbate 80	$C_{64}H_{124}O_{26}$	1310
Polysorbate 81	$C_{34}H_{64}O_{11}$	649
Polysorbate 85	$C_{100}H_{188}O_{28}$	1839
Polysorbate 120	$C_{64}H_{126}O_{26}$	1312

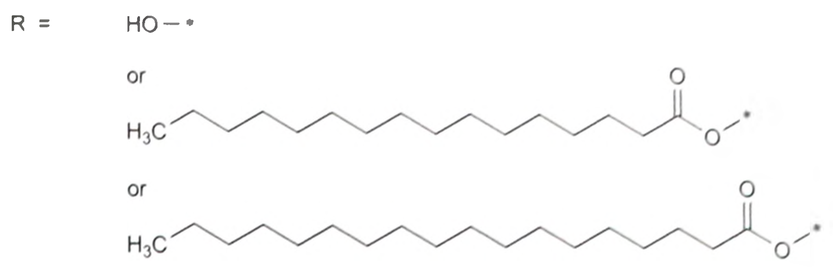
5 Structural Formula



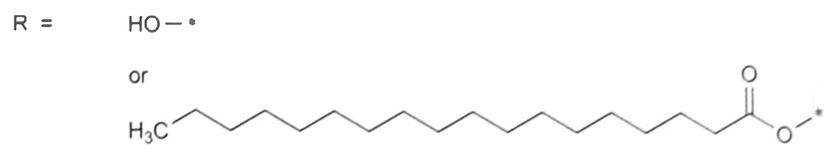
Polyoxyethylene sorbitan monoester



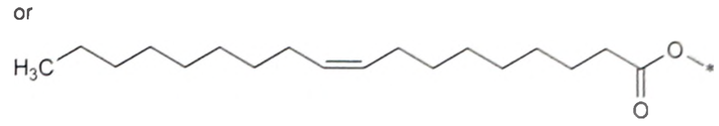
Polyoxyethylene sorbitan triester



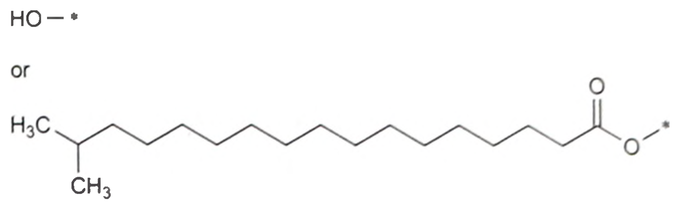
$w + x + y + z = 20$ (Polysorbates 20, 40, 60, 65, 80, 85 and 120)
$w + x + y + z = 5$ (Polysorbates 81)
$w + x + y + z = 4$ (Polysorbates 21 and 61)
R = fatty acid



Polysorbate 20 and 21 (fatty acid = lauric acid)



Polysorbate 40 (fatty acid = palmitic acid)



Polysorbate 60 (fatty acids = palmitic or stearic acid)

Polysorbate 61 and 65 (fatty acid = stearic acid)

Polysorbate 80, 81 and 85 (fatty acid = oleic acid)

Polysorbate 120 (fatty acid = isostearic acid)

6 Functional Category

Dispersing agent; emollient; emulsifying agent; nonionic surfactant; plasticizing agent; solubilizing agent; suspending agent.

7 Applications in Pharmaceutical Formulation or Technology

Polysorbates are used in a wide variety of pharmaceutical formulations including oral (syrups, suspensions, solutions, powders, and tablets), otic, ophthalmic, nasal sprays, topical, vaginal suppositories, and parenteral (intravitreal, intrasynovial, intralesional, intra-articular, intravenous infusions, intramuscular, subcutaneous) preparations.

Polysorbates containing 20 units of oxyethylene are hydrophilic nonionic surfactants that are widely used as emulsifying agents in the preparation of stable oil-in-water pharmaceutical emulsions. Polysorbate 80 is more hydrophilic than polysorbate 65, and is the most commonly used surfactant in FDA-approved parenteral products.[1]

Polysorbates may be used as solubilizing agents for a variety of substances including essential oils and oil-soluble vitamins, and as nonionic surfactants in the formulation of oral, otic, topical, and parenteral suspensions. Polysorbates have also been used to improve the chemical stability of solution formulations.[2]

It has also been reported that polysorbates can be used as plasticizing agents to reduce the melting temperature of drug molecules and the glass transition temperature of solid dispersion formulations.[3] In topical applications, polysorbates are used as

P

Table IV: Uses of polysorbates.

Use	Concentration (%)
Emollient in topical formulations	1–15
Emulsifying agent in oil-in-water emulsions	1–15
Nonionic surfactant in ophthalmic preparations	≤1
Nonionic surfactant in lipophilic bases	≤5
Solubilizing agent in lipophilic bases	≤15
Surfactants in oral preparations	≤10
Surfactants in parenteral preparations	2–12
Used as or in combination with plasticizing agents	≤10

Table V: Appearance of selected polysorbates at 25°C.

Polysorbate	Color and form at 25°C
Polysorbate 20	Yellow oily or brownish yellow liquid
Polysorbate 21	Yellow oily liquid
Polysorbate 40	Yellow oily or brownish yellow liquid
Polysorbate 60	Yellowish brown liquid
Polysorbate 61	Tan solid
Polysorbate 65	Tan solid
Polysorbate 80	Colorless, organge-yellow or brownish-yellow oily liquid
Polysorbate 81	Amber liquid
Polysorbate 85	Amber liquid
Polysorbate 120	Yellow liquid

emollients to increase the water holding capacity of the formulation. Polysorbates have been found to be useful in improving the oral bioavailability of drug molecules that are substrates for P-glycoprotein.[4,5]

Polysorbates are also widely approved for use as emulsifiers, defoaming agents, synthetic flavorings agents, stabilizers, and thickeners in food, cosmetic, and medical products.

See also Table IV.

P

8 Description

Polysorbates occur as viscous, oily liquids or waxy solids, and have a faint characteristic odor and a bitter taste. The appearances of polysorbates at 25°C are shown in Table V, although it should be noted that the absolute color intensity of the products may vary from batch to batch and from manufacturer to manufacturer.

9 Pharmacopeial Specifications

The pharmacopeial specifications for polysorbate 80 have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Tables VI, VII and VIII. *See also* Section 18.

10 Typical Properties

Acid value *see* Table IX.
Acidity/alkalinity pH = 6.0–8.0 for a 5% w/v aqueous solution.
Critical micelle concentration (CMC) *see* Table IX.[6]
Flash point 149°C
HLB value *see* Table IX.
Hydroxyl value *see* Table IX.
Moisture content *see* Table IX.
Partition coefficient *see* Section 18.
Saponification value *see* Table IX.
Solubility Polysorbates are soluble or dispersible in water; *see also* Table X.
Specific gravity *see* Table IX.
Surface tension For 0.1% w/v solutions, *see* Table IX.
Viscosity (dynamic) *see* Table IX.

Table VII: Pharmacopeial specifications for the fatty acid composition of polysorbate 20, 40, 60, and 80 (PhEur 9.2 and USP 40–NF 35 S1).

Fatty acid	Polysorbate 20	Polysorbate 40	Polysorbate 60	Polysorbate 80[a]
Caproic acid	≤1.0%	—	—	—
Caprylic acid	≤10.0%	—	—	—
Capric acid	≤10.0%	—	—	—
Lauric acid	40.0–60.0%	—	—	—
Myristic acid	14.0–25.0%	—	—	≤5.0%
Palmitic acid	7.0–15.0%	≥92.0%	+[b]	≤16.0%
Palmitoleic acid	—	—	—	≤8.0%
Stearic acid	+[c]	—	40.0–60.0%	≤6.0%
Oleic acid	≤11.0%	—	—	≥58.0%
Linolenic acid	—	—	—	≤4.0%
Linoleic acid	≤3.0%	—	—	≤18.0%

(a) PhEur only. *See* Table VIII for JP XVII and USP 40–NF 35 S1.
(b) Sum of the contents of palmitic and stearic acids ≥90.0%.
(c) PhEur 9.2: ≤7.0%; USP 40–NF 35 S1: ≤11.0%

Table VIII: Pharmacopeial specifications for the fatty acid methyl ester composition of polysorbate 80 (JP XVII and USP 40–NF 35 S1).

Fatty acid methyl ester	Polysorbate 80
Methyl myristate	5%
Methyl palmitate	10%
Methyl stearate	15%
Methyl arachidate	20%
Methyl oleate	20%
Methyl eicosenoate	10%
Methyl behenate	10%
Methyl lignocerate	10%

Table X: Solubilities of selected polysorbates in various solvents

Polysorbate	Solvent			
	Ethanol	Mineral oil	Vegetable oil	Water
Polysorbate 20	S	I	I	S
Polysorbate 21	S	I	I	D
Polysorbate 40	S	I	I	S
Polysorbate 60	S	I	I	S
Polysorbate 61	SW	SW	SWT	D
Polysorbate 65	SW	SW	DW	D
Polysorbate 80	D	I	I	D
Polysorbate 81	S	S	ST	D
Polysorbate 85	S	I	ST	D
Polysorbate 120	S	I	I	S

D = dispersible; I = insoluble; S = soluble; T = turbid; W = on warming.

11 Stability and Storage Conditions

Polysorbates are stable in the presence of electrolytes and weak acids and bases; gradual saponification occurs with strong acids and bases. Polysorbates are hygroscopic and should be examined for water content prior to use and dried if necessary. Upon storage, polysorbates are prone to oxidation and formation of peroxides.

Polysorbates should be stored in a well-closed container, protected from light, in a cool, dry place.

Table VI: Pharmacopeial specifications for polysorbates.

Polysorbate 85	2.0	39–52	3.0	80–95	≈0.0023	11.0	1.00	300	41.0
Polysorbate 120	2.0	65–85	5.0	40–50	–	14.9	–	–	–

12 Incompatibilities

Discoloration and/or precipitation occur with various substances, especially phenols, tannins, tars, and tarlike materials.

The antimicrobial activity of paraben preservatives is reduced in the presence of polysorbates.[7] *See* Methylparaben.

13 Method of Manufacture

Polysorbates are prepared from sorbitol in a three-step process. Water is initially removed from the sorbitol to form a sorbitan (a cyclic sorbitol anhydride). The sorbitan is then partially esterified with a fatty acid, such as oleic or stearic acid, to yield a hexitan ester. Finally, ethylene oxide is chemically added in the presence of a catalyst to yield the polysorbate.

14 Safety

Polysorbates are widely used in cosmetics, food products, and oral, parenteral and topical pharmaceutical formulations, and are generally regarded as nontoxic and nonirritant materials. They show low acute toxicity by oral and dermal routes, and in general their chronic and subchronic toxicity is also low.

There have, however, been occasional reports of hypersensitivity to polysorbates following their topical, subcutaneous and intramuscular use.[8,10] Polysorbates have also been associated with serious adverse effects in low-birthweight infants, including some deaths, following intravenous administration of a vitamin E preparation containing a mixture of polysorbates 20 and 80.[11,13] In addition, anaphylactoid reactions to anti-IgE therapy with omalizumab, where polysorbate is used as an excipient, have been reported in patients with asthma.[14] Unwanted immunogenicity has been reported due to auto-oxidation of polysorbates in biotherapeutics.[15,16] The change in erythropoietin formulation (Eprex) from human serum albumin to polysorbates has been indicated in the increase of Pure Red-Cell Aplasia cases linked to its subcutaneous administration, which peaked in 2002. Suggested reasons for this toxic effect include, the formation of epoetin-containing polysorbate 80 micelles; contact between polysorbate 80 and the uncoated pre-filled syringe stoppers resulting in the release of leachates; denaturation or aggregate formation due to inadequate storage.[17]

Polysorbates have also shown potential for reproductive or developmental effects, but are generally not considered mutagenic or carcinogenic via oral exposure.

Due to their solid or viscous liquid state, large molecular weight, and low vapor pressure, polysorbates are not volatile, and therefore, inhalation is not expected to be a major route of exposure.[18]

The WHO has set an estimated acceptable daily intake for polysorbates 20, 40, 60, 65, and 80, calculated as total polysorbate esters, at up to 1500 mg/person/day or 25 mg/kg body-weight.[19]

Polysorbate 20 Moderate toxicity by IP and IV routes. Moderately toxic by ingestion. Human skin irritant.

LD_{50} (hamster, oral): 18 g/kg[20]

LD_{50} (mouse, IV): 1.42 g/kg

LD_{50} (rat, oral): 37 g/kg

Polysorbate 21 Moderately toxic by IV route.

Polysorbate 40 Moderately toxic by IV route.

LD_{50} (rat, IV): 1.58 g/kg[20]

Polysorbate 60 Moderately toxic by IV route. Experimental tumorigen; reproductive effects.

LD_{50} (rat, IV): 1.22 g/kg[20]

Polysorbate 61 Moderately toxic by IV route.

Polysorbate 80 Moderately toxic by IV route. Mildly toxic by ingestion. Eye irritation. Experimental tumorigen, reproductive effects. Mutagenic data.

LD_{50} (mouse, IP): 7.6 g/kg[20]

LD_{50} (mouse, IV): 4.5 g/kg

LD_{50} (mouse, oral): 25 g/kg

LD_{50} (rat, IP): 6.8 g/kg

LD_{50} (rat, IV): 1.8 g/kg

Polysorbate 85 Skin irritant.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, the polysorbates emit acrid smoke and irritating fumes. Eye protection and gloves are recommended.

16 Regulatory Status

Polysorbates 60, 65, and 80 are GRAS listed. Polysorbates 20, 40, 60, 65, and 80 are accepted as food additives in Europe. Polysorbates 20, 40, 60, and 80 are included in the FDA Inactive Ingredients Database (IM, IV, oral, ophthalmic, otic, rectal, topical, and vaginal preparations). Polysorbates are included in parenteral and nonparenteral medicines licensed in the UK. Polysorbates 20, 21, 40, 60, 61, 65, 80, 81, 85, and 120 are included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyethylene glycol; sorbitan esters (sorbitan fatty acid esters).

18 Comments

Polysorbate 80 has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The solubilization capacities and micellar partition coefficients in polysorbate 80 for a wide range of drugs have been reported.[21] It has been shown that the ability of polysorbate 80 to solubilize a drug can be predicted from its Log *P* value. Polysorbates may also increase the absorption of fat-soluble substances.

The PubChem Compound ID (CID) for polysorbates includes 443314 and 5281955.

Polyoxyethylene Stearates

1 Nonproprietary Names

JP: Polyoxyl 40 Stearate

PhEur: Macrogol Stearate

USP–NF: Polyoxyl Stearate

The polyoxyethylene stearates are a series of polyethoxylated derivatives of stearic acid.

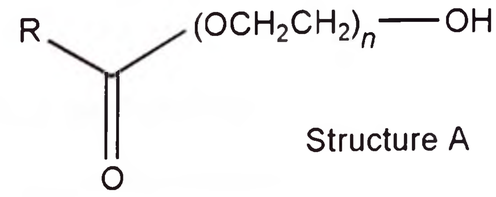
See also Sections 2, 3, 4, and 5.

2 Synonyms

Ethoxylated fatty acid esters; macrogol stearates; macrogoli stearas; *Marlosol*; PEG fatty acid esters; PEG stearates; polyethylene glycol stearates; poly(oxy-1,2-ethanediyl) α-hydro-ω-hydroxyoctadecanoate; polyoxyethylene glycol stearates.

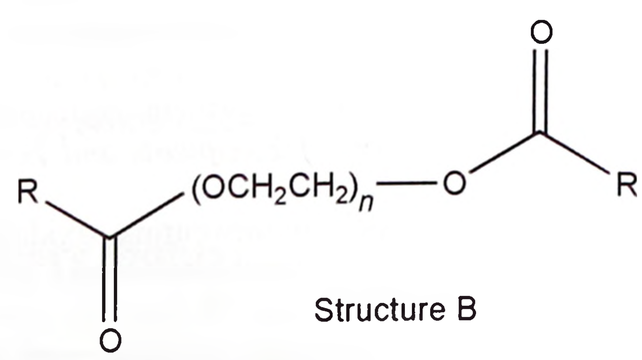
For synonyms applicable to specific polyoxyethylene stearates, *see* Table I.

3 Chemical Name and CAS Registry Number



Polyethylene glycol stearate [9004-99-3]

Polyethylene glycol distearate [9005-08-7]



4 Empirical Formula and Molecular Weight

See Table II.

5 Structural Formula

Structure A

Structure B

Polyoxyethylene stearates are nonionic surfactants produced by polyethoxylation of stearic acid. Two systems of nomenclature are used for these materials. The number '8' in the names 'poloxyl 8 stearate' or 'polyoxyethylene 8 stearate' refers to the approximate polymer length in oxyethylene units. The same material may also be designated 'polyoxyethylene glycol 400 stearate' or 'macrogol stearate 400' in which case, the number '400' refers to the average molecular weight of the polymer chain.

Structure A applies to the monostearate; for example, the average value of *n* is 6 for polyoxyl 6 stearate, and 8 for polyoxyl 8 stearate.

Structure B applies to the distearate; for example, the average value of *n* is 12 for polyoxyl 12 distearate, and 32 for polyoxyl 32 distearate.

Table I: Synonyms of selected polyoxyethylene stearates and distearates.

Name	Synonym
Polyoxyl 2 stearate	*Hodag DGS*; *Lipo DGS*; *Lipopeg 2-DEGS*; PEG-2 stearate.
Polyoxyl 4 stearate	*Acconon 200-MS*; *Hodag 20-S*; *Lipopeg 2-DEGS*; PEG-4 stearate; polyethylene glycol 200 monostearate; polyoxyethylene (4) monostearate; *Protamate 200-DPS*.
Polyoxyl 6 stearate	*Cerasynt 616*; *DUB SPEG*; *Kessco PEG 300 Monostearate*; *Lipal 300S*; *Lipopeg 3-S*; PEG-6 stearate; polyethylene glycol 300 monostearate; polyoxyethylene (6) monostearate; *Polystate C*; *Protamate 300-DPS*.
Polyoxyl 8 stearate	*Acconon 400-MS*; *Cerasynt 660*; *Cithrol 4MS*; *Crodet S8*; *Emerest 2640*; *Grocor 400*; *Hodag 40-S*; *Kessco PEG-400 Monostearate*; *Lipopeg 4-S*; macrogol ester 400; macrogol stearate 400; *Myrj 45*; PEG-400 monostearate; PEG-8 stearate; *Pegosperse 400 MS*; polyethylene glycol 400 monostearate; polyoxyethylene (8) monostearate; *Protamate 400-DPS*; *Ritapeg 400 MS*.
Polyoxyl 12 stearate	*Hodag 60-S*; *Kessco PEG 600 Monostearate*; *Lipopeg 6-S*; PEG-12 stearate; *Pegosperse 600 MS*; polyethylene glycol 600 monostearate; polyoxyethylene (12) monostearate; *Protamate 600-DPS*.
Polyoxyl 20 stearate	*Cerasynt 840*; *Hodag 100-S*; *Kessco PEG 1000 Monostearate*; *Lipopeg 10-S*; *Myrj 49*; *Pegosperse 1000 MS*; PEG-20 stearate; polyethylene glycol 1000 monostearate; polyoxyethylene (20) monostearate; *Protamate 1000-DPS*.
Polyoxyl 30 stearate	*Myrj 51*; PEG-30 stearate; polyoxyethylene (30) stearate.
Polyoxyl 40 stearate	*Crodet S40*; E431; *Emerest 2672*; *Hodag POE (40) MS*; *Lipal 395*; *Lipopeg 39-S*; macrogol stearate 2000; *Myrj 52*; PEG-40 stearate; polyoxyethylene glycol 2000 monostearate; polyoxyethylene (40) monostearate; *Protamate 2000-DPS*; *Ritox 52*; *Simulsol M52*.
Polyoxyl 50 stearate	*Atlas G-2153*; *Crodet S50*; *Lipal 505*; *Myrj 53*; PEG-50 stearate; polyoxyethylene (50) monostearate.
Polyoxyl 100 stearate	*Lipopeg 100-S*; *Myrj 59*; PEG-100 stearate; polyethylene glycol 4400 monostearate; polyoxyethylene (100) monostearate; *Protamate 4400-DPS*; *Ritox 53*.
Polyoxyl 150 stearate	*Hodag 600-S*; PEG-150 stearate; *Ritox 59*.
Polyoxyl 4 distearate	*Hodag 22-S*; PEG-4 distearate.
Polyoxyl 8 distearate	*Hodag 42-S*; *Kessco PEG 400 DS*; PEG-8 distearate; polyethylene glycol 400 distearate; *Protamate 400-DS*.
Polyoxyl 12 distearate	*Hodag 62-S*; *Kessco PEG 600 Distearate*; PEG-12 distearate; polyethylene (12) distearate; polyethylene glycol 600 distearate; *Protamate 600-DS*.
Polyoxyl 32 distearate	*Hodag 154-S*; *Kessco PEG 1540 Distearate*; PEG-32 distearate; polyethylene glycol 1540 distearate; polyoxyethylene (32) distearate.
Polyoxyl 150 distearate	*Hodag 602-S*; *Kessco PEG 6000 DS*; *Lipopeg 6000-DS*; PEG-150 distearate; polyethylene glycol 6000 distearate; polyoxyethylene (150) distearate; *Protamate 6000-DS*.

In both structures, R represents the alkyl group of the parent fatty acid. With stearic acid, R is $CH_3(CH_2)_{16}$. However, it should be noted that stearic acid usually contains other fatty acids, primarily palmitic acid, and consequently a polyoxyethylene stearate may also contain varying amounts of other fatty acid derivatives such as palmitates.

USP40-NF35 S1 states that polyoxyl stearate Type I or Type II differs in its content of stearic acid, where Type I contains 40-60% stearic acid, and Type II 90-99% stearic acid.

6 Functional Category

Emulsifying agent; nonionic surfactant.

7 Applications in Pharmaceutical Formulation or Technology

Polyoxyethylene stearates are generally used as emulsifiers in oil-in-water-type creams and lotions. Their hydrophilicity or lipophilicity depends on the number of ethylene oxide units present: the larger the number, the greater the hydrophilic properties.

Polyoxyethylene stearates are particularly useful as emulsifying agents when astringent salts or other strong electrolytes are present. They can also be blended with other surfactants to obtain any hydrophilic–lipophilic balance for lotions or ointment formulations. Polyoxyl stearates, in particular polyoxyl 40 stearate, have also been used in oral, ophthalmic, and intravenous pharmaceutical preparations.[1–4] *See also* Table III.

Table II: Empirical formulas and molecular weights of selected polyoxyethylene stearates.

Name	Empirical formula	Molecular weight
Polyoxyl 6 stearate	$C_{30}H_{60}O_8$	548.80
Polyoxyl 8 stearate	$C_{34}H_{68}O_{10}$	636.91
Polyoxyl 12 stearate	$C_{42}H_{84}O_{14}$	813.12
Polyoxyl 20 stearate	$C_{58}H_{116}O_{22}$	1165.55
Polyoxyl 40 stearate	$C_{98}H_{196}O_{42}$	2046.61
Polyoxyl 50 stearate	$C_{118}H_{236}O_{52}$	2487.15
Polyoxyl 100 stearate	$C_{218}H_{436}O_{102}$	4689.80

Table III: Uses of polyoxyethylene stearates.

Use	Concentration (%)
Auxiliary emulsifier for o/w intravenous fat emulsion	0.5–5
Emulsifier for o/w creams or lotions	0.5–10
Ophthalmic ointment	7
Suppository component	1–10
Tablet lubricant	1–2

Table IV: Description of various polyoxyethylene stearates.

Name	Description
Polyoxyl 6 stearate	Soft solid
Polyoxyl 8 stearate	Waxy cream
Polyoxyl 12 stearate	Pasty solid
Polyoxyl 20 stearate	Waxy solid
Polyoxyl 40 stearate	Waxy solid, with a faint, bland, fat-like odor, off-white to light tan in color
Polyoxyl 50 stearate	Solid, with a bland, fat-like odor or odorless
Polyoxyl 100 stearate	Solid
Polyoxyl 12 distearate	Paste
Polyoxyl 32 distearate	Solid
Polyoxyl 150 distearate	Solid

8 Description

See Table IV.

9 Pharmacopeial Specifications

(a) 40–50 ethylene oxide units per molecule.

10 Typical Properties

Flash point >149°C for poloxyl 8 stearate (*Myrj 45*).
Solubility *see* Table VI.
See also Table VII.

Table VI: Solubility of polyoxyethylene stearates.

Name	Solvent		
	Ethanol (95%)	Mineral oil	Water
Polyoxyl 6 stearate	S	S	DH
Polyoxyl 8 stearate	S	I	D
Polyoxyl 12 stearate	S	I	S
Polyoxyl 20 stearate	S	I	S
Polyoxyl 40 stearate	S	I	S
Polyoxyl 50 stearate	S	I	S
Polyoxyl 100 stearate	S	I	S
Polyoxyl 12 distearate	S	—	DH
Polyoxyl 32 distearate	S	—	S
Polyoxyl 150 distearate	I	—	S

D = dispersible; I = insoluble; S = soluble; DH = dispersible (with heat).

11 Stability and Storage Conditions

Polyoxyethylene stearates are generally stable in the presence of electrolytes and weak acids or bases. Strong acids and bases can cause gradual hydrolysis and saponification.

The bulk material should be stored in a well-closed container, in a dry place, at room temperature.

12 Incompatibilities

Polyoxyethylene stearates are unstable in hot alkaline solutions owing to hydrolysis, and will also saponify with strong acids or bases. Discoloration or precipitation can occur with salicylates, phenolic substances, iodine salts, and salts of bismuth, silver, and tannins.[5–7] Complex formation with preservatives may also occur.[8] The antimicrobial activity of some materials such as bacitracin, chloramphenicol, phenoxymethylpenicillin, sodium penicillin, and tetracycline may be reduced in the presence of polyoxyethylene stearate concentrations greater than 5% w/w.[9,10]

13 Method of Manufacture

Polyoxyethylene stearates are prepared by the direct reaction of fatty acids, particularly stearic acid, with ethylene oxide.

14 Safety

Although polyoxyethylene stearates are primarily used as emulsifying agents in topical pharmaceutical formulations, certain materials, particularly polyoxyl 40 stearate, have also been used in intravenous injections, ophthalmic, and oral preparations.[1–4]

Polyoxyethylene stearates have been tested extensively for toxicity in animals[11-16] and are widely used in pharmaceutical formulations and cosmetics. They are generally regarded as essentially nontoxic and nonirritant materials.

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) have concluded that the acceptable daily intake is up to 25 mg/kg body weight daily as total for polyoxyethylene derivatives.[17]

Polyoxyl 8 stearate

LD_{50} (hamster, oral): 27 g/kg

LD_{50} (rat, oral): 64 g/kg

Polyoxyl 20 stearate

LD_{50} (mouse, IP): 0.2 g/kg

LD_{50} (mouse, IV): 0.87 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Polyoxyethylene stearates that contain greater than 100 ppm of free ethylene oxide may present an explosion hazard when stored in a closed container. This is due to the release of ethylene oxide into the container headspace, where it can accumulate and so exceed the explosion limit.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (dental solutions; IV injections; ophthalmic preparations; oral capsules and tablets; otic suspensions; topical creams, emulsions, lotions, ointments, and solutions; and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyethylene glycol; stearic acid.

18 Comments

It has been reported that polyoxyl 40 stearate may also enhance the activity of chemotherapeutic agents and reverse multidrug resistance of tumor cells.[18]

Polyoxyl 15 Hydroxystearate

P

1 Nonproprietary Names

BP: Macrogol 15 Hydroxystearate
PhEur: Macrogol 15 Hydroxystearate
USP–NF: Polyoxyl 15 Hydroxystearate

2 Synonyms

12-Hydroxyoctadecanoic acid polymer with α-hydro-ω-hydroxy-poly(oxy-1,2-ethanediyl); 12-hydroxystearic acid polyethylene glycol copolymer; macrogol 15 hydroxistearate; macrogoli 15 hydroxystearas; polyethylene glycol-15-hydroxystearate; polyethylene glycol 660 12-hydroxystearate; *Solutol HS 15*.

3 Chemical Name and CAS Registry Number

2-Hydroxyethyl-12-hydroxyoctadecanoate [70142-34-6]

4 Empirical Formula and Molecular Weight

$C_{20}H_{40}O_4$ 344.53

The PhEur 9.2 describes polyoxyl 15 hydroxystearate as a mixture of mainly monoesters and diesters of 12-hydroxystearic acid (lypophilic) and macrogols (hydrophilic) obtained by the ethoxylation of 12-hydroxystearic acid. The number of moles of ethylene oxide reacted per mole of 12-hydroxystearic acid is 15 (nominal value). It contains about 30% free macrogols.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; nonionic surfactant; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyoxyl 15 hydroxystearate is mainly used as a nonionic solubulizing agent for aqueous parenteral preparations, and is frequently used in preclinical testing of drugs.[1–4] The solubilizing capacity for some tested drugs (clotrimazole, carbamazepine, 17β-estradiol, sulfathiazole, and piroxicam) increases almost linearly with increasing concentration of solubilizing agent; *see* Figure 1. This is due to the formation of spherical micelles even at high concentrations of polyoxyl 15 hydroxystearate. Similarly, tests have revealed that viscosity increases with increasing amount of solubilizer, but the amount of solubilized drugs does not have any additional influence on the kinematic viscosity; *see* Figure 2. Lipid nanocapsules comprising polyoxyl 15 hydroxystearate and soybean phosphatidylcholine containing 3% docetaxel have been successfully prepared by a solvent-free inversion process.

Polyoxyl 15 hydroxystearate has been used in the manufacture of aqueous parenteral preparations with vitamin A, D, E and K, and a number of other lipophilic pharmaceutical active agents, such as propanidid, miconazole, alfadolone, alfaxalone, nifedipine, carba-

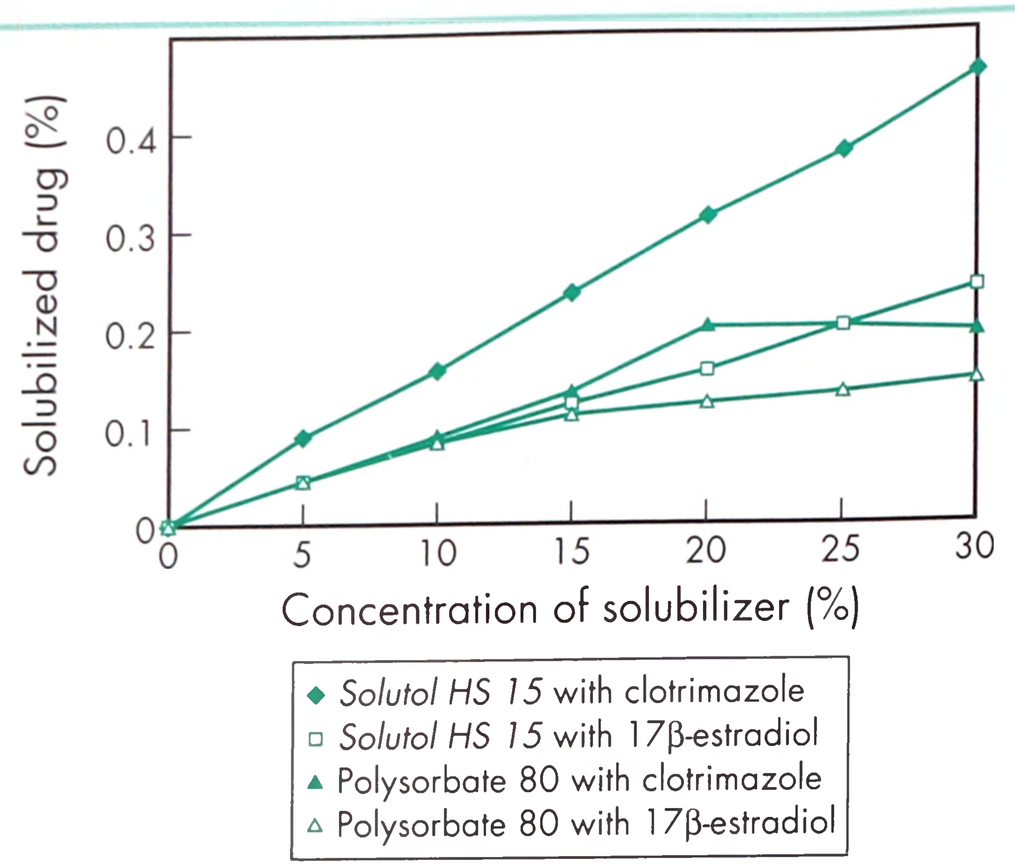

Figure 1: Solubilizing capacity of polyoxyl 15 hydroxystearate (*Solutol HS 15*, BASF plc).

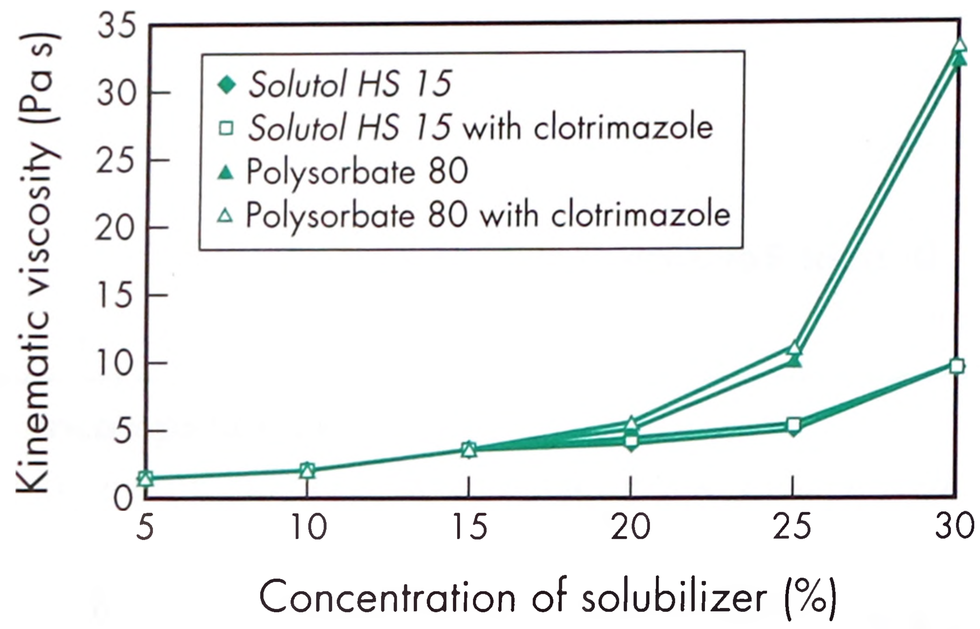

Figure 2: Kinematic viscosity of polyoxyl 15 hydroxystearate (*Solutol HS 15*, BASF plc).

mazepine, and piroxicam. It is very efficient at solubilizing substances like fat-soluble vitamins and active ingredients of hydrophobic nature. It is an excellent solubilizer for parenteral use, at a concentration of 20%, and the water solubility of different drugs may be enhanced by a factor of 10–100, depending on the structure of the drug molecule.

Polyoxyl 15 hydroxystearate is not restricted solely to parenteral use, but is also suitable for oral applications.

8 Description

Polyoxyl 15 hydroxystearate occurs as a yellowish-white, almost odorless waxy mass or paste at room temperature, which becomes liquid at approximately 30°C.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for polyoxyl 15 hydroxystearate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance of solution	+	—
Acid value	≤1.0	≤1.0
Hydroxyl value	90–110	90–110
Iodine value	≤2.0	≤2.0
Peroxide value	≤5.0	≤5.0
Saponification value	53–63	53–63
Free macrogols	27.0–39.0%	27.0–39.0%
Ethylene oxide	≤1 ppm	≤1 ppm
Dioxane	≤50 ppm	≤50 ppm
Nickel	≤1 ppm	1 µg/g
Water	≤1.0%	≤1.0%
Total ash	≤0.3%	≤0.3%

10 Typical Properties

Acidity/alkalinity pH = 6–7 (10% w/v aqueous solution at 20°C)
Critical micelle concentration 0.005–0.02%
Density 1.03 g/cm^3
Flash point 272°C
Heavy metals ≤10 ppm
HLB value 14–16
Ignition temperature 360°C
Solidification temperature 25–30°C
Solubility Soluble in organic solvents such as ethanol (96%), propan-2-ol, and very soluble in water to form clear solutions. The solubility in water is >200 g/L at 30°C and decreases with increasing temperature. It is insoluble in liquid paraffin.
Viscosity (dynamic) 12 mPa s (12 cP) for a 30% w/v aqueous solution at 25°C; 73 mPa s (73 cP) for a 30% w/v aqueous solution at 60°C.

11 Stability and Storage Conditions

Polyoxyl 15 hydroxystearate has a high chemical stability. The prolonged action of heat may induce physical separation into a liquid and a solid phase after cooling, which can be reversed by subsequent homogenization. Polyoxyl 15 hydroxystearate is stable for at least 24 months if stored in unopened airtight containers at room temperature (maximum 25°C). Aqueous solutions of polyoxyl 15 hydroxystearate can be heat-sterilized (121°C, 0.21 MPa). The pH may drop slightly during heating, which should be taken into account. Separation into phases may also occur, but agitating the hot solution can reverse this. Aqueous solutions can be stabilized with the standard preservatives used in pharmaceuticals.

Polyoxyl 15 hydroxystearate should be stored in airtight containers in a dry place and protected from light.

12 Incompatibilities

—

13 Method of Manufacture

Polyoxyl 15 hydroxystearate is produced by reacting 15 moles of ethylene oxide with 1 mole of 12-hydroxystearic acid.

14 Safety

Polyoxyl 15 hydroxystearate is used in parenteral pharmaceutical preparations in concentrations up to 50% to solubilize diclofenac, propanidid, and vitamin K1. It has also been used in preclinical formulations in preparing supersaturated injectable formulations of water-insoluble molecules. It is generally regarded as a relatively nontoxic and nonirritant excipient. However, although nonirritating to skin, it may cause sensitization on skin contact in guinea pigs.

Polyoxyl 15 hydroxystearate is reported not to be mutagenic in bacteria, mammalian cell cultures and mammals.

LD_{50} (dog, IV): >3.10 g/kg[5]
LD_{50} (mouse, IP): >0.0085 g/kg
LD_{50} (mouse, IV): >3.16 g/kg
LD_{50} (mouse, oral): >20 g/kg
LD_{50} (rabbit, IV): 1.0–1.4 g/kg

LD_{50} (rat, oral): >20 g/kg
LD_{50} (rat, IV): 1.0–1.47 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Polyoxyl 15 hydroxystearate undergoes thermal decomposition at >300°C. Ensure adequate ventilation and wear suitable respiratory protection.

16 Regulatory Status

Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Polyethylene glycol.

18 Comments

Polyoxyl 15 hydroxystearate has been investigated as a nonionic surfactant and coemulsifier in the preparation of parenteral emulsions,[6] microemulsions,[1,7–10] nanoemulsions,[11] self-emulsifying drug delivery systems (SEDDS),[12] self-nanoemulsifying drug delivery systems (SNEDDS),[13] nanostructured lipid carriers (NLC),[14] and lipid nanoparticles.[15,16]

Oral bioavailability of the highly lipophilic and poorly water-soluble immunosuppressive agent, cyclosporine A, showed twofold higher bioavailability with a polyoxyl 15 hydroxystearate-based formulation compared to a microsuspension.[17] It has also been studied along with microcrystalline cellulose to prepare self-emulsifying pellets using an extrusion/spheronization technique to increase the bioavailability of lipophilic drugs.[18]

Polyoxyl 15 hydroxystearate has been incorporated as a solubility-increasing additive in a rectal suppository dosage form to study the increase in bioavailability of poorly water-soluble drugs.[19]

Polyoxyl 15 hydroxystearate has been investigated as a therapeutic agent in the preparation of lipid nanoparticles of an anticancer drug,[20] and has also been shown to be effective for reversing multidrug resistance, with low toxicity *in vivo*.[21] It has also been investigated as a weak inhibitor of cytochrome P450 3A activity on the metabolism of colchicine and midazolum.[22–25]

Polyoxyl 15 hydroxystearate is also used in veterinary injections.

The PubChem Compound ID (CID) for *Solutol HS 15* is 124898.

See Table II.

4 Empirical Formula and Molecular Weight

Polyoxylglycerides are mixtures of monoesters, diesters, and triesters of glycerol, and monoesters and diesters of polyethylene glycols (PEG).

Caprylocaproyl polyoxylglycerides Mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols with mean relative molecular mass between 200 and 400. They are obtained by partial alcoholysis of medium-chain triglycerides using polyethylene glycol or by esterification of glycerin and polyethylene glycol with caprylic (octanoic) acid and capric (decanoic) acid or a mixture of glycerin esters and condensates of ethylene oxide with caprylic acid and capric acid. They may contain free polyethylene glycols.

Lauroyl polyoxylglycerides Mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols with mean relative molecular mass between 300 and 1500. They are obtained by partial alcoholysis of saturated oils mainly containing triglycerides of lauric (dodecanoic) acid, using polyethylene glycol, or by esterification of glycerol and polyethylene glycol with saturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of these hydrogenated oils.

Linoleoyl polyoxylglycerides Mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. They are obtained by partial alcoholysis of an unsaturated oil mainly containing triglycerides of linoleic (*cis*,*cis*-9,12-octadecadienoic) acid, using polyethylene glycol with mean relative molecular mass between 300 and 400, or by esterification of glycerol and polyethylene glycol with unsaturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of this unsaturated oil.

Oleoyl polyoxylglycerides Mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. They are obtained by partial alcoholysis of an unsaturated oil mainly containing triglycerides of oleic (*cis*-9-octadecenoic) acid, using polyethylene glycol with mean relative molecular mass between 300 and 400, or by esterification of glycerol and polyethylene glycol with unsaturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of this unsaturated oil.

Stearoyl polyoxylglycerides Mixtures of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols with mean relative molecular mass between 300 and 4000. They are obtained by partial alcoholysis of saturated oils containing mainly triglycerides of stearic (octade-

Capsule	10–90%	16, 18, 26, 31, 46, 48, 49

8 Description

Polyoxylglycerides are inert liquid or semisolid waxy materials and are amphiphilic in character. Caprylocaproyl polyoxylglycerides are pale-yellow oily liquids. Lauroyl polyoxylglycerides and stearoyl polyoxylglycerides occur as pale-yellow waxy solids. Oleoyl polyoxylglycerides and linoleoyl polyoxylglycerides occur as amber oily liquids, which may give rise to a deposit after prolonged periods at 20°C.

Table VII: Uses of stearoyl polyoxylglycerides.

Use	Concentration	Reference
Oral route		
Adsorption (tablet)	<80%	34, 35, 50
Capsule	60–99%	34, 39, 51–54
Melt granulation	15–50%	34, 55–57
Spray congealing	95%	58
Spray drying	<60%	34, 54

9 Pharmacopeial Specifications

See Tables VIII and IX.

10 Typical Properties

Solubility

Caprylocaproyl and lauroyl polyoxylglycerides: dispersible in hot water; freely soluble in methylene chloride.

Linoleoyl and oleoyl polyoxylglycerides: practically insoluble but dispersible in water; freely soluble in methylene chloride.

Stearoyl polyoxylglycerides: dispersible in warm water and warm liquid paraffin; soluble in warm ethanol; freely soluble in methylene chloride.

Viscosity

Linoleoyl polyoxylglycerides: 70–90 mPa s at 20°C, ≈35 mPa s at 40°C for PEG 300.

Oleoyl polyoxylglycerides: 75–95 mPa s at 20°C, ≈35 mPa s at 40°C for PEG 300.

See also Section 9.

See also Table X.

11 Stability and Storage Conditions

Polyoxylglycerides are very stable and inert. However, preventive measures against the risk of oxidation or hydrolysis may be taken to ensure stability during handling. *See* Section 15.

Polyoxylglycerides should be preserved in their original containers, and exposure to air, light, heat, and moisture should be prevented.

12 Incompatibilities

—

13 Method of Manufacture

Polyoxylglycerides are obtained by partial alcoholysis of vegetable oils using macrogols, by esterification of glycerol and macrogols with unsaturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of the vegetable oil.

14 Safety

Polyoxylglycerides are used in oral and topical pharmaceutical formulations, and also in cosmetics and food products. They are generally regarded as relatively nonirritant and nontoxic materials.

Caprylocaproyl polyoxylglycerides:
LD_{50} (rat, oral): >22 ml/(kg day).[59]

Lauroyl polyoxylglycerides:
LD_{50} (rat, oral): >2004 mg/(kg day).[60]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantities of the material handled (refer to manufacturers' safety information).

Polyoxylglycerides are heterogeneous. Owing to their composition and physical characteristics, semisolid polyoxylglycerides can segregate by molecular weight over time during storage in containers, resulting in a nonhomogenous distribution. In addition, semisolid polyoxylglycerides must be heated to at least 20°C above melting point in order to ensure that all crystallization clusters are fully melted. Therefore, it is essential that the entire contents of each container are melted to facilitate sample withdrawal or transfer, ensuring sample homogeneity.

For liquid polyoxylglycerides, owing to their composition and physical characteristics, partial crystallization of saturated glycerides may be observed after long-term storage. In case of crystallization, heat to 60–70°C before use.

Polyoxylglycerides are hygroscopic. Only heat in a water bath if the materials are contained in a sealed glass container or are for immediate use. Otherwise, heat in a microwave or convention oven. Avoid exposure to excessive and repeated high temperatures (i.e. above 100°C) and cooling cycles.

To ensure stability during handling, and avoid the risk of oxidation or hydrolysis, the following measures should be taken:

Risk of oxidation:

- minimize aeration of the mixture (avoid use of high-speed homogenizers);
- minimize and control the degree of exposure to heat and light;
- use a nitrogen blanket.

Risk of hydrolysis:

- minimize and control relative humidity;
- do not heat near a source of humidity (e.g. water bath).

16 Regulatory Status

Lauroyl polyoxylglycerides and stearoyl polyoxylglycerides are approved as food additives in the US. Included in the FDA Inactive Ingredients Database (oral route: capsules, tablets, solutions; topical route: emulsions, creams, lotions; vaginal route: emulsions, creams). Oleyl polyoxylglycerides are included in a topical cream formulation licensed in the UK.

Polyvinyl Acetate Dispersion

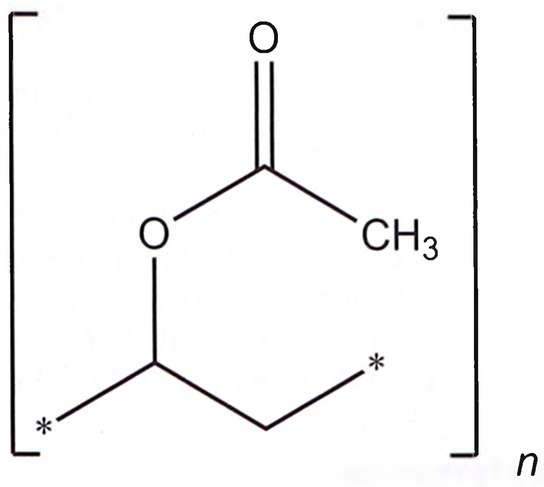
1 Nonproprietary Names

PhEur: Poly(Vinyl Acetate) Dispersion 30 per cent
USP–NF: Polyvinyl Acetate Dispersion

2 Synonyms

Kollicoat SR 30 D; poly(vinylis acetas) dispersio 30 per centum.

3 Chemical Name and CAS Registry Number



Aqueous dispersion of vinyl acetate homopolymer [900-20-7]

USP 40–NF 35 S1 states that polyvinyl acetate dispersion contains 25–30% polyvinyl acetate. It may contain suitable surface active agents and stabilizers. Suitable such agents are sodium monododecyl sulfate and 1-vinyl-2-pyrrolidinone polymer.

4 Empirical Formula and Molecular Weight

Polyvinyl acetate $[C_4H_6O_2]_n$
where n is between approx. 100 to 17 000 (molecular mass approx. 450 000).

5 Structural Formula

6 Functional Category

Coating agent; film-forming agent; modified-release agent.

7 Applications in Pharmaceutical Formulation or Technology

Aqueous polyvinyl acetate dispersion was developed as a film-coating agent for oral sustained-release applications. Most formulations require a plasticizer such as triethyl citrate, triacetin or propylene glycol, usually at a concentration of 5–10% based on the polymer weight.[1] Polyvinyl acetate films are insoluble in water (independent of the pH value) and act as an effective diffusion barrier. The permeability of the film can be adjusted by the addition of hydrophilic pore formers, such as povidone K-30 or polyethyleneglycol–polyyvinyl alcohol graft copolymer.[2–7] The films have a good mechanical stability and their self-healing properties help to reduce the risk of dose dumping.[8,9] Owing to these characteristics, polyvinyl acetate dispersion is highly suitable for manufacturing multiple unit particulate systems (MUPS).[10]

Polyvinyl acetate dispersion is also used for sustained-release matrix tablets by granulation and subsequent compression. The release profile depends on the solubility and particle size of the active ingredient, the amount of polyvinyl acetate, and the use of other excipients (hydrophilic fillers or pore formers) in the formulation.[10–12]

8 Description

Polyvinyl acetate dispersion occurs as an opaque, white or off-white, slightly viscous liquid. It is an aqueous colloidal dispersion of polyvinyl acetate, where the mean size of the polymer particles is approx. 170 nm.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for polyvinyl acetate dispersion.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Agglomerates	≤0.5 g	–
Coagulum content	–	≤0.5 g
Vinyl acetate	≤100 ppm	≤100 ppm
Povidone	≤4.0%	≤4.0%
Acetic acid	≤1.5%	≤1.5%
pH	–	3.0–5.5
Residue on evaporation	28.5–31.5%	–
Loss on drying	–	28.5–31.5%
Sulfated ash	≤0.5%	–
Residue on ignition	–	≤0.5%
Microbial contamination		
Aerobic bacteria	$\leq 10^3$ cfu/g	$\leq 10^3$ cfu/g
Fungi and yeast	$\leq 10^2$ cfu/g	$\leq 10^2$ cfu/g
Apparent viscosity	≤100 mPa s	–
Solubility of a film	+	–
Assay (polyvinyl acetate)	25.0–30.0%	25.0–30.0%

10 Typical Properties

Density 1.045–1.065 g/mL
Minimum film-forming temperature 18°C
Solubility Miscible with water, ethanol and acetone; the polymer first precipitates on adding less hydrophilic solvents, but dissolves again on adding further solvent.
Viscosity <100 mPa s at 20°C; low viscosity very similar to water, and is stable against sedimentation.[13,14]

11 Stability and Storage Conditions

Polyvinyl acetate dispersion should be stored between 5°C and 25°C in a tightly closed container. Exposure to frost or high shear forces will cause an irreversible phase separation.

12 Incompatibilities

The addition of methacrylic acid–ethyl acrylate (1 : 1) copolymer dispersion will cause an irreversible coagulation. Alkaline substances (i.e. strong bases) favor the hydrolysis of the polymer.

As polyvinyl acetate films are soluble in aqueous sodium lauryl sulfate solutions,[15] this surfactant cannot be used as a solubilizer in the dissolution medium for poorly soluble drugs.

13 Method of Manufacture

Polyvinyl acetate dispersion is manufactured by emulsion polymerization of the monomer vinyl acetate.

14 Safety

Polyvinyl acetate dispersion is used in oral pharmaceutical preparations and is generally regarded as safe, being based on polyvinyl acetate, the safety of which is documented by a variety of studies.[16–22]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (sustained-release tablets, transdermal films and patches).

17 Related Substances

Polyvinyl acetate.

Polyvinyl acetate

Comments Listed in PhEur 9.2 and USP 40–NF 35 S1. Included in the Japanese Standard for Food Additives. Included in the Canadian Natural Health Products Ingredients Database.

18 Comments

Polyvinyl acetate dispersion is used as a base for chewing gum; it has also been used to coat fruits and vegetables in Asian countries.

Aqueous sodium lauryl sulfate solutions may be used to clean coating equipment.

A specification for polyvinyl acetate is contained in *Japanese Pharmaceutical Excipients* (JPE).[23]

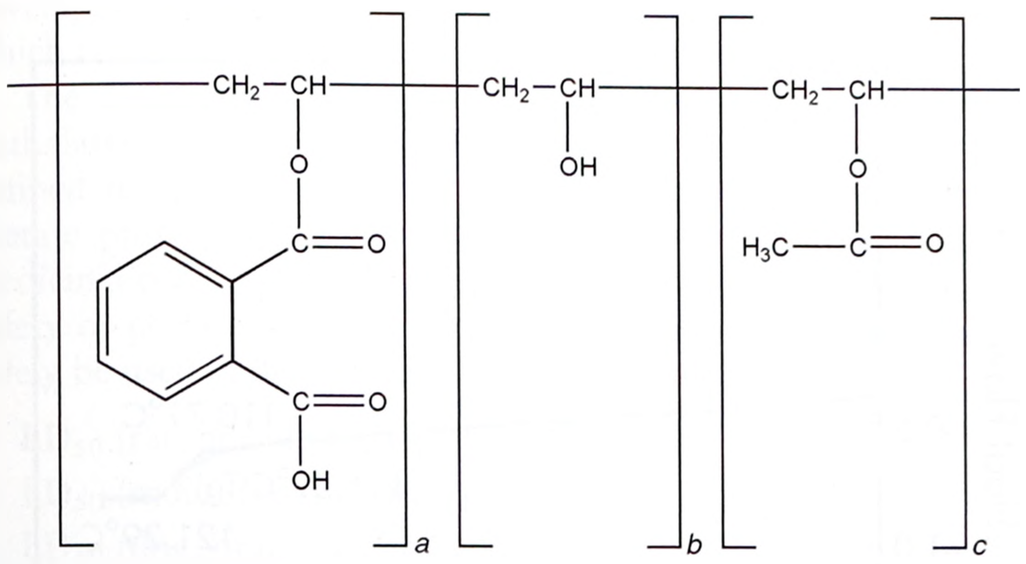
Polyvinyl Acetate Phthalate

1 Nonproprietary Names

USP–NF: Polyvinyl Acetate Phthalate

2 Synonyms

Phthalavin; PVAP.



3 Chemical Name and CAS Registry Number

Polyvinyl acetate phthalate [34481-48-6]

4 Empirical Formula and Molecular Weight

The USP 40–NF 35 S1 describes polyvinyl acetate phthalate as a reaction product of phthalic anhydride and a partially hydrolyzed polyvinyl acetate. It contains not less than 55.0% and not more than 62.0% of phthalyl (*o*-carboxybenzoyl, $C_8H_5O_3$) groups, calculated on an anhydrous acid-free basis.

5 Structural Formula

Depending on the phthalyl content, *a* will vary with vinyl alcohol content, *b* in mole percent. The acetyl content *c* remains constant depending on the starting material.

6 Functional Category

Coating agent; film-forming agent; solubilizing agent; suspending agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyvinyl acetate phthalate is an anionic, film-forming enteric polymer that dissolves in buffer media above pH 5.0, which is a property that has been primarily used for enteric coating applications in tablets and capsules.[1–5] Polyvinyl acetate phthalate film coating systems are also used for sealing the tablet cores, before sugar coating steps. This prevents moisture uptake from sugar solution into the tablet core during bulking or ladling steps. Factors affecting drug release kinetics from polyvinyl acetate phthalate enteric-coated tablets have also been described.[6]

Film coating formulations containing polyvinyl acetate phthalate exhibit low or no tackiness during aqueous or organic film coating process, and produce strong robust films. Non-optimized plasticization of polyvinyl acetate phthalate systems may show varying degrees of cracking when coated on tablets. A number of common plasticizers, such as polyethylene glycol, triethylcitrate, glyceryl triacetate, acetyl triethylcitrate, and acetyl tributylcitrate, have been found compatible with polyvinyl acetate phthalate and can be included in coating formulations to enable a continuous, homogeneous, noncracking film to be produced. Polyethylene glycol and triethylcitrate are generally recommended and used in current pharmaceutical applications.

A method for enteric coating hypromellose capsules that avoids the sealing step prior to coating has been developed. The properties of several enteric coating polymers, including polyvinyl acetate phthalate, have been assessed.[7]

Polyvinyl acetate phthalate has also been evaluated for hot-melt extrusion to form hollow enteric capsules, which have potential to be used for drugs that are sensitive to conventional aqueous or hydro-alcoholic coatings.[8] Triacetin and triethyl citrate were found to effectively plasticize polyvinyl acetate phthalate in hot-melt extrusion experiments at 40% concentration (with respect to polymer) to produce clear and flexible films. Lower than 40% concentration of plasticizer produced brittle films, whereas higher than 40% concentration produced a sticky mass during the hot-melt extrusion process.

Polyvinyl acetate phthalate is insoluble in deionized water and this property gives the polymer a lower water permeability when compared to other enteric polymers, such as cellulose acetate phthalate and hypromellose phthalate.[9] The low permeability of polyvinyl acetate phthalate to water vapour may provide a stability advantage over other enteric polymers previously used to produce solid dispersions.[10]

Polyvinyl acetate phthalate has been used to produce amorphous solid dispersions of poorly water soluble drugs to enhance their solubility, dissolution rate,[10–13] and bioavailability.[14,15]

It has been reported that polyvinyl acetate phthalate shows unique ability to synergistically enhance viscosity irrespective of media pH in combination with hypromellose.[16] This ability has been explored in the sustained release of weakly basic drugs such as verapamil hydrochloride.[17]

See Table I. *See also* Section 18.

Table I: Uses of polyvinyl acetate phthalate.

Use	Quantity
In hydrophilic matrices (% w/w)	10–40
Pharmaceutical and nutritional printing inks (% in ink system)	20–40
Solubility enhancement (% with respect to drug)	10–90
Tablet enteric film coating formulation (% weight gain)	9–10
Tablet sealant for sugar-coating (number of applications)	2–6

8 Description

Polyvinyl acetate phthalate is a synthetic anionic polymer that occurs as a white to off-white powder and may have a slight odor of acetic acid.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Density (bulk) 0.26–0.30 g/cm^3
Density (tapped) 0.35–0.4 g/cm^3
Density (true) 1.31–1.37 g/cm^3
Flowability Poor; 26% (Carr compressibility index)
Equilibrium moisture content ~3.5% at 25°C. *See also* Figure 1.
Particle size distribution ~100–125 µm;

SEM 1: Excipient: polyvinyl acetate phthalate (*Phthalavin*); manufacturer: Colorcon Inc.; magnification: 600×; voltage: 10 kV.

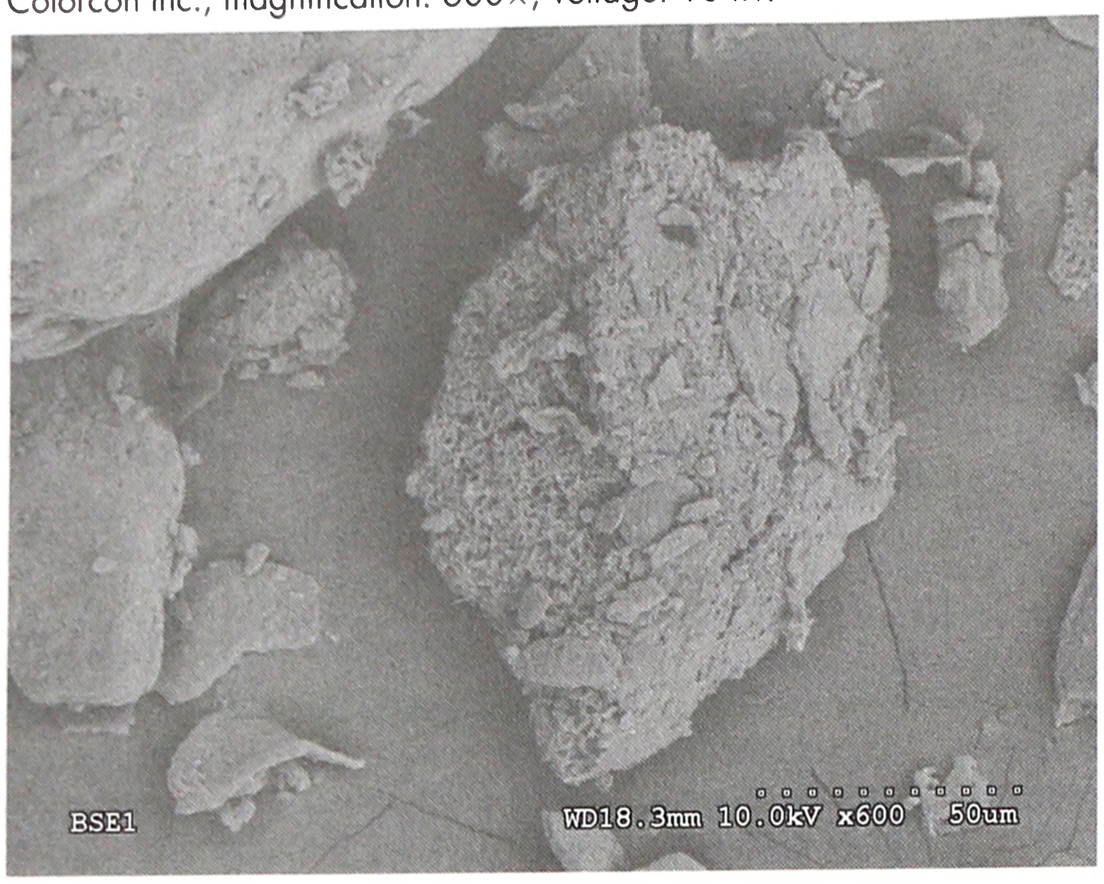


Table II: Pharmacopeial specifications for polyvinyl acetate phthalate.

Test	USP 40–NF 35 S1
Identification	+
Apparent viscosity at 25°C	7–11 cP
Water	≤5.0%
Residue on ignition	≤1.0%
Free phthalic acid	≤0.6%
Free acid other than phthalic	≤0.6%
Phthalyl content	55.0–62.0%

Table III: Solubility of polyvinyl acetate phthalate.

Solvent	Solubility at 25°C
Acetone/ethanol (1 : 1 w/w)	1 in 3
Acetone/methanol (1 : 1 w/w)	1 in 4
Ethanol (95%)	1 in 4
Methanol	1 in 2
Methanol/dichloromethane (1 : 1 w/w)	1 in 3

Solubility Soluble in ethanol and methanol; sparingly soluble in acetone and propan-2-ol; practically insoluble in chloroform, dichloromethane, and deionized water. Polyvinyl acetate phthalate shows a sharp solubility response with pH; this occurs at pH 5.0, which is lower than for most other polymers used for enteric coatings. Solubility is also influenced by ionic strength of the media.[18] *See* Table III.

Thermal properties Although previous work has indicated that the glass transition temperature (Tg) of polyvinyl acetate phthalate is 42.5°C,[19] recent studies have shown a much higher Tg.[15] The lower Tg value may be due to sample preparation, where organic solvent-casted films retained some solvent in the film or included a plasticizer. The Tg for polyvinyl acetate phthalate is in the region of 116–118°C (*see* Figure 2). At temperature ranges of 120–145°C, polyvinyl acetate phthalate is in a rubbery state. Above 140°C, degradation rate of the polymer significantly increases (non-oxidative thermal degradation), characterized by browning above 150°C and charring above 180°C.

Viscosity (dynamic) The viscosity of a solution of polyvinyl acetate phthalate : methanol (1 : 1) is 5000 mPa s. In methanol/dichloromethane systems, viscosity increases as the concentration of methanol in the system increases. Viscosity studies have shown that polyvinyl acetate phthalate solutions are less viscous than other enteric polymers at comparable concentrations in methanol : dichloromethane (1 : 1 w/w) solvent mixture.[18]

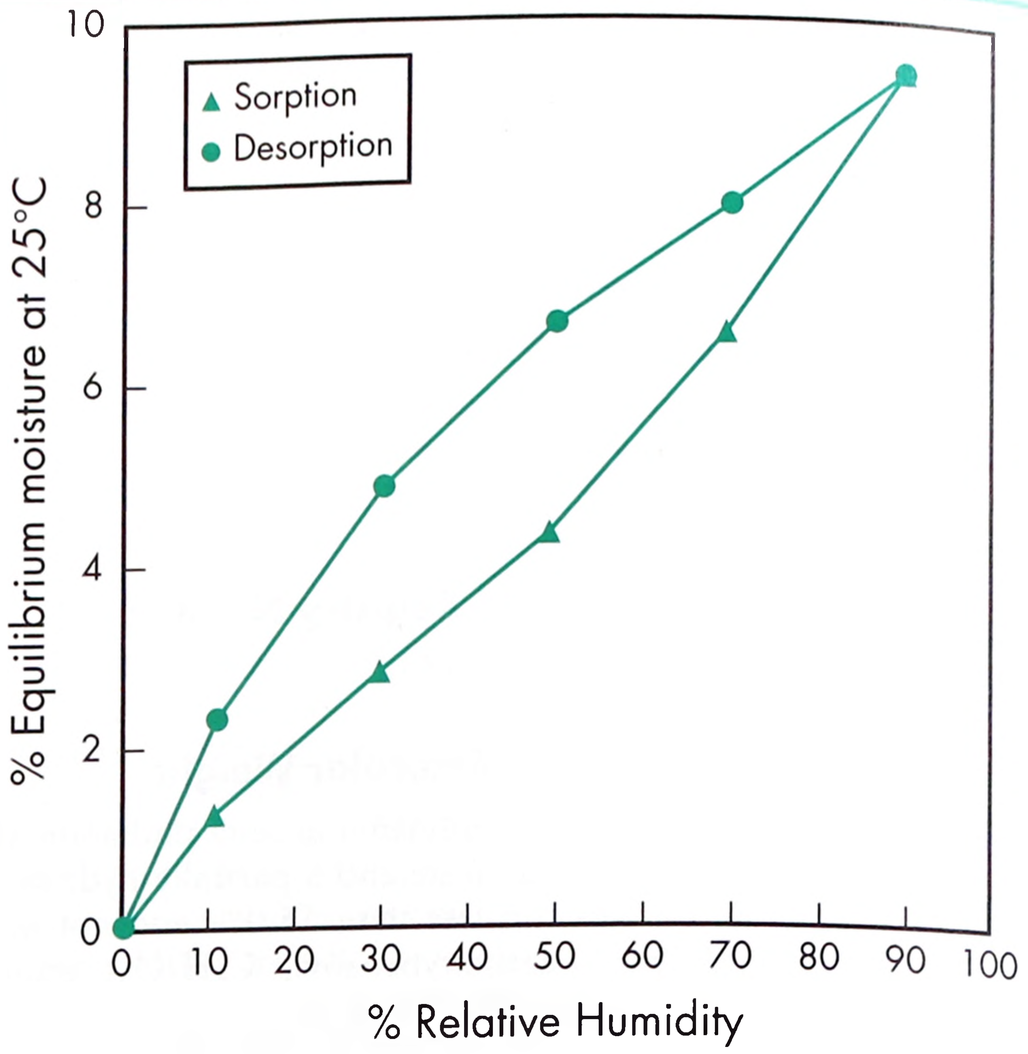

Figure 1: Absorption–desorption isotherm using dynamic vapor sorption (DVS) for polyvinyl acetate phthalate; courtesy of Colorcon Inc.

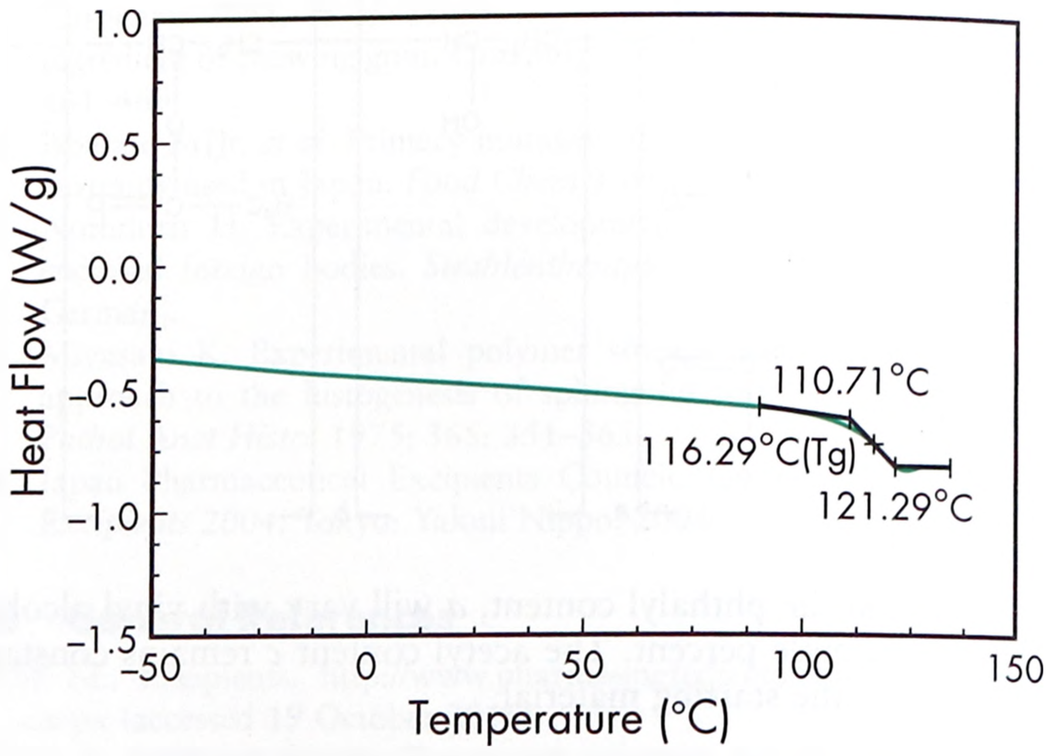

Figure 2: Conventional differential scanning calorimetry (DSC) isotherm of polyvinyl acetate phthalate powder showing glass transition temperature; courtesy of Colorcon Inc.

11 Stability and Storage Conditions

Polyvinyl acetate phthalate should be stored in airtight containers. It is relatively stable to temperature and humidity,[20] and does not age, giving predictable enteric release profiles even after prolonged storage.[21]

At high temperature and humidity, polyvinyl acetate phthalate undergoes less hydrolysis than other phthalate enteric coating polymers, such as cellulose acetate phthalate and hypromellose phthalate.[22] *See also* Section 18.

12 Incompatibilities

Polyvinyl acetate phthalate reacts with povidone to form an insoluble complex that precipitates out of solution.[23] It has been

reported that benzocaine is also incompatible with polyvinyl acetate phthalate.[24]

In the presence of strong oxidizing agents, such as strong alkalis and acids, it may undergo hydrolysis similar to other esters.

13 Method of Manufacture

Polyvinyl acetate phthalate is a reaction product of phthalic anhydride, sodium acetate, and a partially hydrolyzed polyvinyl acetate. The polyvinyl acetate is a low molecular weight grade, and 87–89 mole percent is hydrolyzed. Therefore, the polyvinyl acetate phthalate polymer is a partial esterification of a partially hydrolyzed polyvinyl acetate.

14 Safety

Polyvinyl acetate phthalate is used in oral pharmaceutical formulations and is generally regarded as an essentially nonirritant and nontoxic material when used as an excipient.

Polyvinyl acetate phthalate was found to have no toxic, reproductive or carcinogenic effects in 2-year animal studies.[25] The no-observed-adverse-effect level (NOAEL) of polyvinyl acetate phthalate in a 90-day subchronic study was reported as 5% dietary concentration, which corresponds to a dose of 3120 mg/kg/day for male rats and 3640 mg/kg/day for female rats.[26] The maternal and developmental NOAEL was reported as 3% dietary concentration, which corresponds to a dose of 2324 mg/kg/day in rats.[27]

The European Medical Agency has published guidelines on phthalates in which no permitted daily exposure is deemed to be defined for polyvinyl acetate phthalate, and concludes polyvinyl acetate phthalate does not constitute a risk to human safety in medicinal products.[28] An independent expert panel evaluated the safety of polyvinyl acetate phthalate and concluded that it could safely be used in drug products up to 829 mg per day.[29]

LD_{50} (rat, oral): >8 g/kg[25]

LD_{50} (mouse, oral): >8 g/kg[25]

LD_{50} (dog, oral): >7.5 g/kg[25]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Gloves and eye protection are recommended.[30]

16 Regulatory Status

GRAS listed for use in printing inks for dietary supplements. Included in the FDA Inactive Ingredients Database (enteric-coated and sustained-action oral tablets). Included in nonparenteral medicines (enteric coated tablets; in printing ink formulations used for oral tablets and capsules) licensed in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cellulose acetate phthalate; hypromellose phthalate.

18 Comments

Fully formulated systems of polyvinyl acetate phthalate are available for aqueous (*Sureteric*, Colorcon) and organic (*Opadry Enteric*, Colorcon) solvent applications, and film coating systems for sealing the tablet cores before sugar-coating steps (*Opaseal*, Coloron).

Polyvinyl acetate phthalate coprocessed with titanium dioxide has been extensively tested for safety and toxicity, and is used in some film coating systems for application in moisture-sensitive formulations.

Polyvinyl Alcohol

1 Nonproprietary Names

BP: Poly(Vinyl Alcohol)
PhEur: Poly(Vinyl Alcohol)
USP–NF: Polyvinyl Alcohol

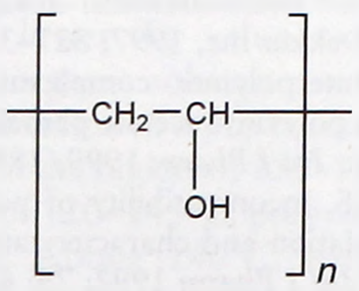
2 Synonyms

Airvol; *Alcotex*; *Celvol*; *Elvanol*; *Gelvatol*; *Gohsenol*; *Kollicoat*; *Lemol*; *Mowiol*; poly(alcohol vinylicus); *Polyvinol*; PVA; vinyl alcohol polymer.

3 Chemical Name and CAS Registry Number

Ethenol, homopolymer [9002-89-5]

4 Empirical Formula and Molecular Weight



$L(C_2H_4O)_n$ 20 000–200 000

Polyvinyl alcohol is a water-soluble synthetic polymer represented by the formula $(C_2H_4O)_n$. The value of *n* for commercially available materials lies between 500 and 5000, equivalent to a molecular weight range of approximately 20 000–200 000; *see* Table I.

Table I: Commercially available grades of polyvinyl alcohol.

Grade	Molecular weight
High viscosity	≈200 000
Medium viscosity	≈130 000
Low viscosity	≈20 000

5 Structural Formula

6 Functional Category

Coating agent; emulsion stabilizing agent; film-forming agent; lubricant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Polyvinyl alcohol is used primarily in topical pharmaceutical and ophthalmic formulations; *see* Table II.[1–3] It is used as a stabilizing agent for emulsions (0.25–3.0% w/v). Polyvinyl alcohol is also used as a viscosity-increasing agent for viscous formulations such as ophthalmic products. It is used in artificial tears and contact lens solutions for lubrication purposes, in sustained-release formulations for oral administration,[4] and in transdermal patches.[5] Polyvinyl alcohol may be made into microspheres when mixed with a glutaraldehyde solution[6] and is a commonly used emulsifier in the formulation of polylactide and poly(DL-lactide-*co*-glycolide) (PLGA) polymeric nanoparticles.[7–9]

Polyvinyl alcohol is also used in coating formulations for tablets as the film forming polymer.[10]

Table II: Uses of polyvinyl alcohol.

Use	Concentration (%)
Emulsions	0.5
Ophthalmic formulations	0.25–3.00
Topical lotions	2.5

8 Description

Polyvinyl alcohol occurs as an odorless, white to cream-colored granular powder.

9 Pharmacopeial Specifications

See Table III.

10 Typical Properties

Melting point

228°C for fully hydrolyzed grades;

180–190°C for partially hydrolyzed grades.

Refractive index n_D^{25} = 1.49–1.53

Solubility Soluble in water; slightly soluble in ethanol (95%); insoluble in organic solvents. Dissolution requires dispersion (wetting) of the solid in water at room temperature followed by heating the mixture to about 90°C for approximately 5 minutes. Mixing should be continued while the heated solution is cooled to room temperature.

Specific gravity

1.19–1.31 for solid at 25°C;

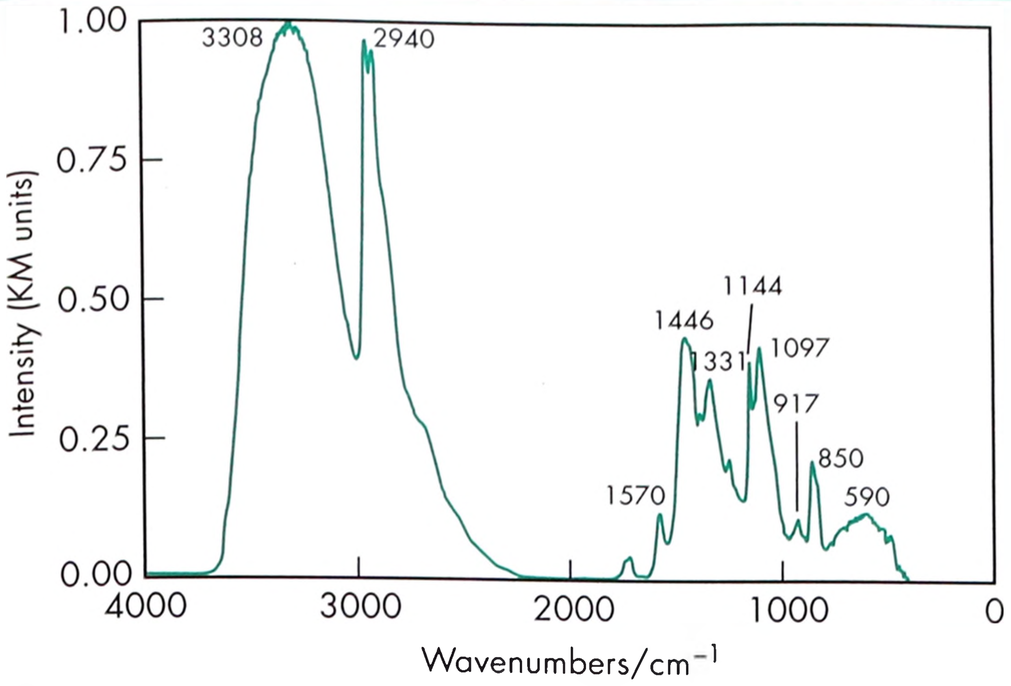


Figure 1: Infrared spectrum of polyvinyl alcohol measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

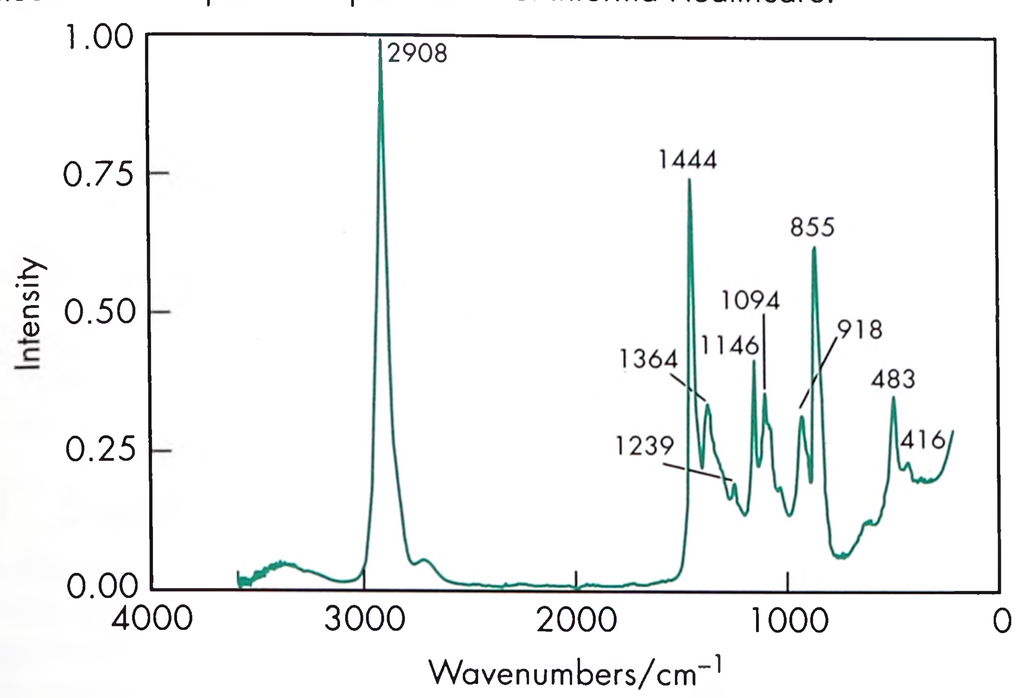

Figure 2: Raman spectrum of polyvinyl alcohol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

1.02 for 10% w/v aqueous solution at 25°C.

Specific heat 1.67 J/g (0.4 cal/g)

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (dynamic) *see* Table IV.

11 Stability and Storage Conditions

Polyvinyl alcohol is stable when stored in a tightly sealed container in a cool, dry place. Aqueous solutions are stable in corrosion-resistant sealed containers. Preservatives may be added to the solution if extended storage is required. Polyvinyl alcohol undergoes slow degradation at 100°C and rapid degradation at 200°C; it is stable on exposure to light.

12 Incompatibilities

Polyvinyl alcohol undergoes reactions typical of a compound with secondary hydroxy groups, such as esterification. It decomposes in strong acids, and softens or dissolves in weak acids and alkalis. It is incompatible at high concentration with inorganic salts, especially sulfates and phosphates; precipitation of polyvinyl alcohol 5% w/v can be caused by phosphates. Gelling of polyvinyl alcohol solution may occur if borax is present.

13 Method of Manufacture

Polyvinyl alcohol is produced through the hydrolysis of polyvinyl acetate. The repeating unit of vinyl alcohol is not used as the starting material because it cannot be obtained in the quantities and purity required for polymerization purposes. The hydrolysis proceeds rapidly in methanol, ethanol, or a mixture of alcohol and methyl acetate, using alkalis or mineral acids as catalysts.

Table III: Pharmacopeial specifications for polyvinyl alcohol.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—

Methanol	—	≤1.0%
Methyl acetate	—	≤1.0%

Table IV: Viscosity of commercial grades of polyvinyl alcohol.

Grade	Dynamic viscosity of 4% w/v aqueous solution at 20°C (mPa s)
High viscosity	40.0–65.0
Medium viscosity	21.0–33.0
Low viscosity	4.0–7.0

14 Safety

Polyvinyl alcohol is generally considered a nontoxic material. It is nonirritant to the skin and eyes at concentrations up to 10%; concentrations up to 7% are used in cosmetics.

Studies in rats have shown that polyvinyl alcohol 5% w/v aqueous solution injected subcutaneously can cause anemia and infiltrate various organs and tissues.[11]

LD_{50} (mouse, oral): 14.7 g/kg

LD_{50} (rat, oral): >20 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Polyvinyl alcohol dust may be an irritant on inhalation. Handle in a well-ventilated environment.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (ophthalmic preparations and oral tablets). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Various grades of polyvinyl alcohol are commercially available. The degree of polymerization and the degree of hydrolysis are the two determinants of their physical properties. Pharmaceutical grades are partially hydrolyzed materials and are named according to a coding system. The first number following a trade name refers to the degree

of hydrolysis and the second set of numbers indicates the approximate viscosity (dynamic), in mPa s, of a 4% w/v aqueous solution at 20°C.

A specification for polyvinyl alcohol is contained in the *Food Chemicals Codex* (FCC).[12]

Potassium Alginate

P

1 Nonproprietary Names

USP–NF: Potassium Alginate

2 Synonyms

Alginic acid, potassium salt; E402; *Improved Kelmar*; potassium polymannuronate; *Protanal*.

3 Chemical Name and CAS Registry Number

Potassium alginate [9005-36-1]

4 Empirical Formula and Molecular Weight

$(C_6H_7O_6K)_n$

Potassium alginate is the potassium salt of alginic acid, a polyuronide made up of a sequence of two hexuronic acid residues, namely D-mannuronic acid and L-guluronic acid. The two sugars form blocks of up to 20 units along the chain, with the proportion of the blocks dependent on the species of seaweed and also the part of the seaweed used. The number and length of the blocks is important in determining the physical properties of the alginate produced; the number and sequence of the mannuronate and guluronate residues varies in the naturally occurring alginate.

The USP 40–NF 35 S1 describes potassium alginate as consisting chiefly of the potassium salt of alginic acid, a linear glycuronoglycan consisting of β-1,4 linked D-mannuronic acid and L-guluronic acid units in the pyranose form.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; gelling agent; suspending agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Potassium alginate is widely used in foods as a stabilizer, thickener, and emulsifier; however, its use as a pharmaceutical excipient is currently limited to dental impression applications and experimental hydrogel systems. The effect of calcium ions on the rheological properties of procyanidin hydrogels containing potassium alginate and intended for oral administration has also been investigated.[1]

8 Description

Potassium alginate occurs as a white to yellowish, fibrous or granular powder; it is almost odorless and tasteless.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Particle size distribution Average particle size ≈150 μm (*Improved Kelmar*).

Solubility Potassium alginate is soluble in water, dissolving to form a viscous hydrophilic colloidal solution. It is insoluble in ethanol (95%) and in hydroalcoholic solutions in which the alcohol content is greater than 30% by weight; also insoluble in chloroform, ether, and acids having a pH lower than about 3. When preparing solutions of potassium alginate it is important to ensure proper dispersion of the particles, as poor dispersion

Table I: Pharmacopeial specifications for potassium alginate.

Test	USP 40–NF 35 S1
Identification	+
Microbial limits	
Total aerobic count	$\leq 10^3$ cfu/g
Total combined molds and yeasts	$\leq 10^2$ cfu/g
Loss on drying	≤15%
Total ash	24–32%
Arsenic	1.5 ppm
Lead	≤10 ppm
Heavy metals	≤40 ppm
Assay	89.2–105.5%

will lead to the formation of large lumps of unhydrated powder and significantly extended hydration times.

Viscosity (dynamic) 400 mPa s (for a 1% dispersion of *Improved Kelmar*). Vicosities of 4.32×10^3 mPa s (2.5% dispersion) and 31.1×10^3 mPa s (4% dispersion) have been reported.[2]

Potassium alginate hydrates readily in hot or cold water; in solution, the acid groups of the alginate become ionized and a viscous solution is obtained. The viscosity is proportional to the concentration and molecular weight of the material used. As the temperature rises, a reversible decrease in viscosity occurs. The addition of calcium ions to potassium alginate solutions results in crosslinking and in the formation of gels; where the crosslinks formed are strong and numerous, the gel becomes thermally irreversible.

11 Stability and Storage Conditions

In the solid state, potassium alginate is a stable material that is not prone to microbial spoilage. Over time, a slow reduction in the degree of polymerization can occur, which may be reflected in a reduction in the viscosity of solutions. As both temperature and moisture can impair the performance of potassium alginate, storage below 25°C is recommended.

Potassium alginate solutions are stable at pH 4–10; long-term storage outside this range can result in depolymerization of the polymer through hydrolysis. Gelation or precipitation of the alginate can occur at pH values less than 4. Liquid or semisolid alginate formulations should be preserved: suitable preservatives are sodium benzoate, potassium sorbate, or parabens.

Potassium alginate should be stored under cool, dry conditions in a well-closed container.

12 Incompatibilities

Potassium alginate is incompatible with strong oxidizing agents.

13 Method of Manufacture

Alginate obtained from brown seaweed is subjected to demineralization, extraction, and precipitation of alginic acid. Following neutralization, the potassium alginate obtained is dried and milled.

14 Safety

Potassium alginate is widely used in food products. Potassium alginate may be irritant to the skin, eyes and lungs.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, potassium alginate emits acrid smoke and irritating fumes.[3] Potassium alginate may be irritant to the skin, eyes and lungs. Gloves, eye protection, suitable protective clothing, and respiratory equipment should be worn.

16 Regulatory Status

GRAS listed. Accepted for use in foods in the US and Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Alginic acid; ammonium alginate; calcium alginate; propylene glycol alginate; sodium alginate.

18 Comments

Studies on elastic alginates, such as potassium alginate and sodium alginate, have shown that they may be more appropriate for tableting pressure-sensitive materials than microcrystalline cellulose.[4]

The viscosity, adhesiveness, elasticity, stiffness, and cohesiveness of potassium alginate hydrogels have been determined and compared with values from a range of other hydrogel-forming materials.[2] A specification for potassium alginate is contained in the *Food Chemicals Codex* (FCC).[5]

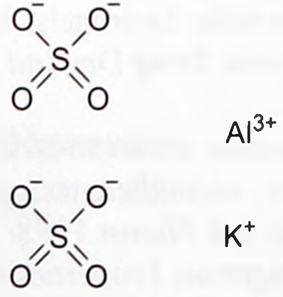
Potassium Alum

1 Nonproprietary Names

BP: Alum
JP: Aluminum Potassium Sulfate Hydrate
PhEur: Alum
USP–NF: Potassium Alum

2 Synonyms

Alumen; alum flour; alum meal; alum potassium; aluminum potassium alum; aluminum potassium disulfate; aluminum potassium sulfate; dialuminum dipotassium sulfate; kalinite; potash alum; potassium aluminum sulfate (1 : 1 : 2); potassium aluminum sulfate-12-hydrate; rock alum; sulfuric acid aluminum potassium salt (2 : 1 : 1) dodecahydrate.



3 Chemical Name and CAS Registry Number

Aluminum potassium sulfate anhydrous [10043-67-1]
Aluminum potassium sulfate dodecahydrate [7784-24-9]

4 Empirical Formula and Molecular Weight

$AlK(SO_4)_2$ 258.21 (for anhydrous)
$AlK(SO_4)_2 \cdot 12H_2O$ 474.39 (for dodecahydrate)

5 Structural Formula

6 Functional Category

Vaccine adjuvant.

7 Applications in Pharmaceutical Formulation or Technology

Potassium alum has the ability to precipitate proteins and is utilized in the manufacture of vaccines, where purified proteins are coprecipitated with and adsorbed onto potassium alum.[1,2]

A study has demonstrated that thin-film freeze-drying is a viable platform technology to produce dry powders of vaccines that contain aluminum salts. This approach may address the limitations involved in the cold chain storage and transportation of vaccines.[3]

Potassium alum is often included in preparations used as mouthwashes or gargles and in dermatological preparations.

8 Description

The PhEur 9.2 describes potassium alum as a granular powder, or colorless, transparent, crystalline masses. The JP XVII describes it as colorless or white crystals or powder. Potassium alum is odorless and has a slightly sweet, strongly astringent taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for potassium alum.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Appearance of solution	–	+	–
Loss on drying	–	–	43.0–46.0%
pH	–	3.0–3.5	–
Ammonium	–	≤0.2%	–
Iron	≤20 ppm	≤100 ppm	+
Arsenic	≤3.3 ppm	–	–
Heavy metals	≤20 ppm	–	≤0.002%
Assay	≥99.5%	99.0–100.5%	99.0–100.5%

10 Typical Properties

Acidity/Alkalinity pH = 3.0–3.5 (10% w/v aqueous solutions at 20°C).
Density (bulk) 1 g/cm^3[3(4)]
Density (true) 1.725 g/cm^3
Melting point 92.5°C
Solubility Freely soluble in water, very soluble in boiling water; soluble in glycerol; practically insoluble in ethanol (96%).
Vapor density (relative) 16.4 (air = 1)[5]

11 Stability and Storage Conditions

Store in a cool, dry place in tightly closed containers. Stable under normal temperatures and pressures. When kept for a long time at 60–65°C (or over sulfuric acid) potassium alum dodecahydrate loses water, which is reabsorbed on exposure to air. It becomes anhydrous at about 200°C.

12 Incompatibilities

Potassium alum is incompatible with strong oxidizing agents, aluminum, copper, steel, and zinc. When it is dispersed in powders with phenol, salicylates, or tannic acid, gray or green colors may be developed owing to traces of iron in the alum.

13 Method of Manufacture

Potassium alum is manufactured by treating bauxite with sulfuric acid and then potassium sulfate. Alternatively, aluminum sulfate is reacted with potassium sulfate.[6]

14 Safety

Potassium alum is often included in preparations used as mouthwashes or gargles and in dermatological preparations.

Large doses of potassium alum act as an irritant and may be corrosive; gum necrosis and gastrointestinal hemorrhage have occurred. Acute encephalopathy has been reported[7,8] following bladder irrigation with alum solutions in the treatment of bladder hemorrhage. Anecdotal evidence suggests that this practice should be avoided in patients with renal insufficiency.[7] A study in mice has shown that alum induces a Sjögren's syndrome-like disorder.[9] Thus, the potential of aluminum-based adjuvants for induction of autoimmunity should be closely monitored in individuals genetically susceptible to developing autoimmune disorders.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. It causes eye and skin irritation and may cause respiratory tract irritation.

During a fire, irritating and highly toxic gases may be generated by thermal decomposition or combustion of potassium alum. Hazardous decomposition products include oxides of sulfur, aluminum oxide, and oxides of potassium.

The American Conference of Governmental Industrial Hygienists (ACGIH) value for potassium alum is 2 mg/m^3 TWA (as aluminum).

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (vaginal suppositories). Included in medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

The JP XVII has separate monographs for aluminum potassium sulfate and dried aluminum potassium sulfate.

Potassium alum is a powerful astringent, and may also be used therapeutically as a topical hemostatic, either as a solid or as a solution. Intravesical instillation of potassium alum, typically as a 1% solution, has been used for hemorrhagic cystitis.

A specification for potassium alum is contained in the *Food Chemicals Codex* (FCC).[10]

The EINECS number for potassium alum (anhydrous) is 233-141-3. The PubChem Compound ID (CID) for potassium alum dodecahydrate is 62667.

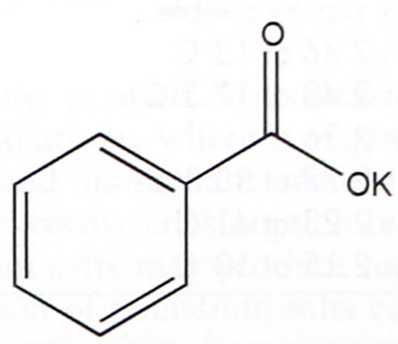
Potassium Benzoate

1 Nonproprietary Names

USP–NF: Potassium Benzoate

2 Synonyms

Benzoate of potash; benzoic acid potassium salt; E212; kalium benzoat; potassium salt trihydrate; *ProBenz PG*.



3 Chemical Name and CAS Registry Number

Potassium benzoate [582-25-2]

4 Empirical Formula and Molecular Weight

$C_7H_5KO_2$ 160.21

5 Structural Formula

6 Functional Category

Antimicrobial preservative; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Potassium benzoate is predominantly used as an antimicrobial preservative in a wide range of beverages, foods and some pharmaceutical formulations. Preservative efficacy increases with decreasing pH; it is most effective at pH 4.5 or below. However, at

low pH undissociated benzoic acid may produce a slight though discernible taste in food products.

Increasingly, potassium benzoate is used as an alternative to sodium benzoate in applications where a low sodium content is desirable. *See also* Table I.

Table I: Uses of potassium benzoate.

Use	Concentration (%)
Carbonated beverages	0.03–0.08
Food products	≤0.1

8 Description

Potassium benzoate occurs as a slightly hygroscopic, white, odorless or nearly odorless crystalline powder or granules. Aqueous solutions are slightly alkaline and have a sweetish astringent taste.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for potassium benzoate.

Test	USP 40–NF 35 S1
Identification	+
Alkalinity	+
Water	≤1.5%
Heavy metals	≤10 µg/g
Assay (anhydrous basis)	99.0–101.0%

10 Typical Properties

Acidity/alkalinity Aqueous solutions are slightly alkaline.
Melting point >300°C
Solubility *see* Table III.
Specific gravity 1.5

P

Table III: Solubility of potassium benzoate.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	1 in 75
Ethanol (90%)	1 in 50
Ether	Practically insoluble
Methanol	Very slightly soluble
Water	1 in 2.46 at 13°C 1 in 2.43 at 17.5°C 1 in 2.36 1 in 2.27 at 33.3°C 1 in 2.23 at 41°C 1 in 2.15 at 50°C

11 Stability and Storage Conditions

Potassium benzoate is stable at room temperature under normal storage conditions. Since it is slightly hygroscopic, potassium benzoate should be stored in sealed containers. Exposure to conditions of high humidity and elevated temperatures should be avoided.

12 Incompatibilities

Potassium benzoate is incompatible with strong acids and strong oxidizing agents.

13 Method of Manufacture

Potassium benzoate is prepared from the acid–base reaction between benzoic acid and potassium hydroxide.

14 Safety

Potassium benzoate is widely used in food products and is generally regarded as a nontoxic and nonirritant material. However, people with a history of allergies may show allergic reactions when exposed to potassium benzoate. Ingestion is inadvisable for asthmatics. Higher concentrations of potassium benzoate have been reported to cause irritation to mucous membranes.

The WHO acceptable daily intake of total benzoates including potassium benzoate, calculated as benzoic acid, has been estimated at up to 5 mg/kg of body-weight.[1,2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Potassium benzoate may be irritant to the eyes and skin. Eye protection and gloves are recommended. When exposed to heat, and when heated to decomposition, potassium benzoate emits acrid smoke and irritating fumes.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Benzoic acid; sodium benzoate.

18 Comments

Therapeutically, potassium benzoate has been used in the management of hypokalemia.

The EINECS number for potassium benzoate is 209-481-3. The PubChem Compound ID (CID) for potassium benzoate is 23661960.

Potassium Bicarbonate

1 Nonproprietary Names

BP: Potassium Bicarbonate

PhEur: Potassium Hydrogen Carbonate

USP–NF: Potassium Bicarbonate

2 Synonyms

Carbonic acid monopotassium salt; E501; kalii hydrogenocarbonas; monopotassium carbonate; potassium acid carbonate; potassium hydrogen carbonate.

3 Chemical Name and CAS Registry Number

Potassium bicarbonate [298-14-6]

4 Empirical Formula and Molecular Weight

$KHCO_3$ 100.11

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent.

7 Applications in Pharmaceutical Formulation or Technology

As an excipient, potassium bicarbonate is generally used in formulations as a source of carbon dioxide in effervescent preparations, at concentrations of 25–50% w/w. It is of particular use in formulations where sodium bicarbonate is unsuitable, for example, when the presence of sodium ions in a formulation needs to be limited or is undesirable. Potassium bicarbonate is often formulated with citric acid or tartaric acid in effervescent tablets or granules; on contact with water, carbon dioxide is released through chemical reaction, and the product disintegrates. On occasion, the presence of potassium bicarbonate alone may be sufficient in tablet formulations, as reaction with gastric acid can be sufficient to cause effervescence and product disintegration.

Potassium bicarbonate has also been investigated as a gas-forming agent in alginate raft systems.[1,2] The effects of potassium bicarbonate on the stability and dissolution of paracetamol and ibuprofen have been described.[3]

Potassium bicarbonate is also used in food applications as an alkali and a leavening agent, and is a component of baking powder.

8 Description

Potassium bicarbonate occurs as colorless, transparent crystals or as a white granular or crystalline powder. It is odorless, with a saline or weakly alkaline taste.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 8.2 (for a 0.1 M aqueous solution); a 5% solution in water has a pH of ≤8.6.

Solubility Soluble 1 in 4.5 of water at 0°C, 1 in 2.8 of water at 20°C, 1 in 2 of water at 50°C; practically insoluble in ethanol (95%).

Specific gravity 2.17

Table I: Pharmacopeial specifications for potassium bicarbonate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance	+	—
Carbonates	+	—
Normal carbonates	—	≤2.5%
Chloride	≤150 ppm	—
Sulfate	≤150 ppm	—
Ammonium	≤20 ppm	—
Calcium	≤100 ppm	—
Heavy metals	—	≤10 ppm
Iron	≤20 ppm	—
Sodium	≤0.5%	—
Loss on drying	—	≤0.3%
Assay	99.0–101.0%	99.5–101.5%

11 Stability and Storage Conditions

Potassium bicarbonate should be stored in a well-closed container in a cool, dry location. Potassium bicarbonate is stable in air at normal temperatures, but when heated to 100–200°C in the dry state, or in solution, it is gradually converted to potassium carbonate.

12 Incompatibilities

Potassium bicarbonate reacts with acids and acidic salts with the evolution of carbon dioxide.

13 Method of Manufacture

Potassium bicarbonate can be made by passing carbon dioxide into a concentrated solution of potassium carbonate, or by exposing moist potassium carbonate to carbon dioxide, preferably under moderate pressure.

Potassium bicarbonate also occurs naturally in the mineral calcinite.

14 Safety

Potassium bicarbonate is used in cosmetics, foods, and oral pharmaceutical formulations, where it is generally regarded as a relatively nontoxic and nonirritant material when used as an excipient. However, excessive consumption of potassium bicarbonate or other potassium salts may produce toxic manifestations of hyperkalemia. Ingestion of potassium salts can cause gastrointestinal adverse effects, and tablet formulations may cause contact irritation due to high local concentrations of potassium.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe (the E number E501 refers to potassium carbonates). Included in the FDA Inactive Ingredients Database (oral formulations). Included in nonparenteral medicines licensed in the UK and US (chewable tablets; effervescent

granules; effervescent tablets; lozenges; oral granules; oral suspensions; powder for oral solutions). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sodium bicarbonate.

18 Comments

One gram of potassium bicarbonate represents approximately 10 mmol of potassium and of bicarbonate; 2.56 g of potassium bicarbonate is approximately equivalent to 1 g of potassium.

Therapeutically, potassium bicarbonate is used as an alternative to sodium bicarbonate in the treatment of certain types of metabolic acidosis. It is also used as an antacid to neutralize acid secretions in the gastrointestinal tract and as a potassium supplement.

A specification for potassium bicarbonate is contained in the *Food Chemicals Codex* (FCC).[4]

The EINECS number for potassium bicarbonate is 206-059-0. The PubChem Compound ID (CID) for potassium bicarbonate is 516893.

Potassium chloride [7447-40-7]

4 Empirical Formula and Molecular Weight

KCl 74.55

5 Structural Formula

See Section 4.

6 Functional Category

Tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Potassium chloride is widely used in a variety of parenteral and nonparenteral pharmaceutical formulations. Its primary use, in parenteral and ophthalmic preparations, is to produce isotonic solutions.

Many solid dosage forms of potassium chloride exist including: tablets prepared by direct compression[1–4] or granulation;[5,6] effervescent tablets; coated, sustained-release tablets;[7–10] sustained-release wax matrix tablets;[11] microcapsules;[12] pellets; and osmotic pump formulations.[13,14] *See also* Section 18.

Potassium chloride is also used widely in the food industry as a dietary supplement, salt substitute, pH control agent, stabilizer, thickener, and gelling agent. It can also be used in infant formulations.

8 Description

Potassium chloride occurs as odorless, colorless crystals or a white crystalline powder, with an unpleasant, saline taste. The crystal lattice is a face-centered cubic structure.

10 Typical Properties

Acidity/alkalinity pH ≈ 7 for a saturated aqueous solution at 15°C.
Boiling point Sublimes at 1500°C.
Compressibility *see* Figure 1.[3,4]
Density 1.99 g/cm^3; 1.17 g/cm^3 for a saturated aqueous solution at 15°C.
Dielectric constant 4.68 at 10^6 Hz
Heat of fusion 337.7 kJ/kg
Melting point 770°C; also reported as 773°C

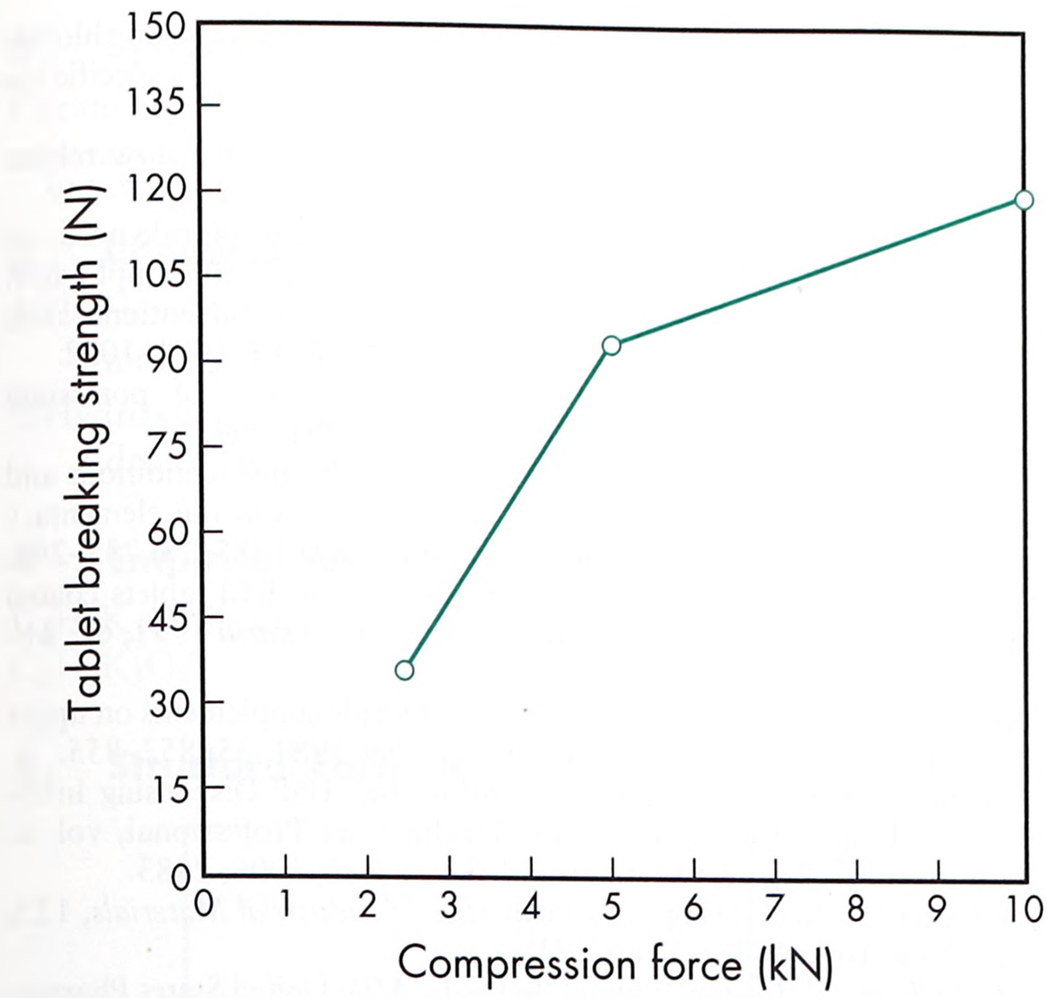

Figure 1: Compression characteristics of potassium chloride.[3] Tablet diameter = 10 mm.

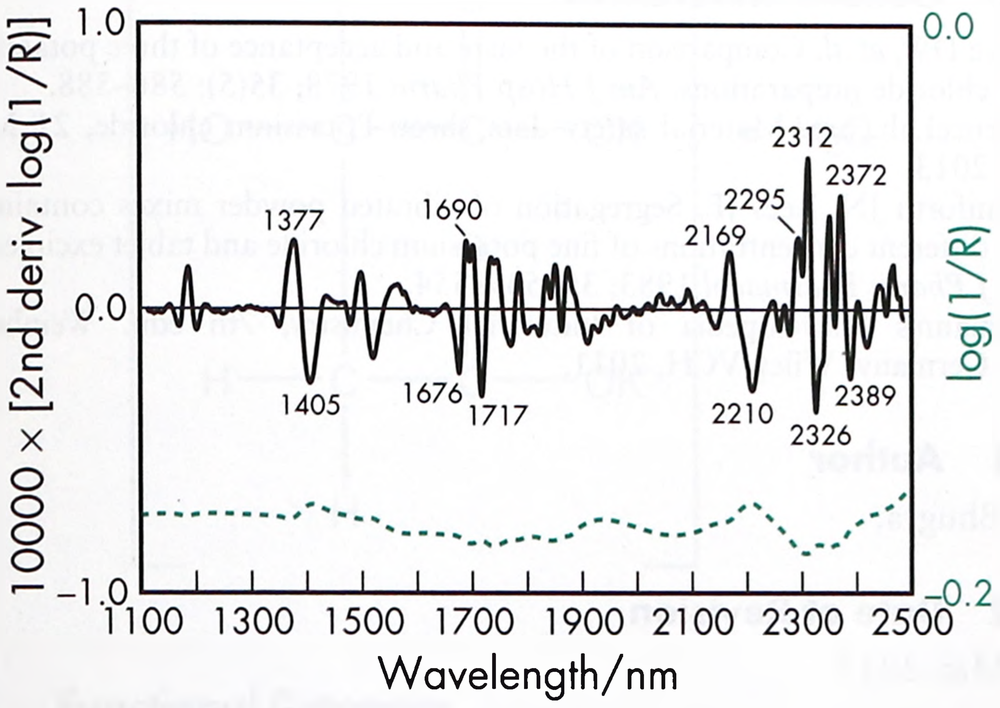

Figure 2: Near-infrared spectrum of potassium chloride measured by reflectance. Potassium chloride does not absorb in the near-infrared region; however, it will generally show some peaks due to traces of moisture (approx. 1450 nm and 1950 nm).

Table II: Solubility of potassium chloride.

Solvent	Solubility at 20°C unless otherwise stated
Acetone	Practically insoluble
Ethanol (95%)	1 in 250
Ether	Practically insoluble
Glycerin	1 in 14
Water	1 in 2.8
	1 in 1.8 at 100°C

Osmolarity A 1.19% w/v solution is isoosmotic with serum.
Refractive index 1.4903
Solubility *see* Table II.
Specific heat 0.694 J/g/K
Spectroscopy

NIR spectrum *see* Figure 2.

11 Stability and Storage Conditions

Potassium chloride tablets become increasingly hard on storage at low humidities due to hygroscopicity. However, tablets stored at 76% relative humidity showed no increase or only a slight increase in hardness.[2] The addition of lubricants, such as 2% w/w magnesium stearate,[1] reduces tablet hardness and hardness on aging.[2] Aqueous potassium chloride solutions may be sterilized by autoclaving or by filtration.

Potassium chloride is stable and should be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Potassium chloride reacts violently with bromine trifluoride and with a mixture of sulfuric acid and potassium permanganate. The presence of hydrochloric acid, sodium chloride, or magnesium chloride decreases the solubility of potassium chloride in water. Aqueous solutions of potassium chloride form precipitates with lead and silver salts. Intravenous aqueous potassium chloride solutions are incompatible with protein hydrolysate.

13 Method of Manufacture

Potassium chloride occurs naturally as the mineral sylvite or sylvine; it also occurs in other minerals such as sylvinite, carnallite, and kainite. Commercially, potassium chloride is obtained by the solar evaporation of brine or by the mining of mineral deposits followed by milling, washing, screening, flotation, crystallization, refining, and drying.

14 Safety

Potassium chloride is used in a large number of pharmaceutical formulations, including oral, parenteral, and topical preparations, both as an excipient and as a therapeutic agent.

Potassium ions play an important role in cellular metabolism, such as enzymatic reactions, nerve conduction, muscle contraction, and carbohydrate metabolism, and imbalances can result in serious clinical effects. Orally ingested potassium chloride is rapidly absorbed from the gastrointestinal tract and excreted by the kidneys, with more side effects observed in patients with renal insufficiency. Potassium chloride is more irritant than sodium chloride when adminstered orally, and ingestion of large quantities of potassium chloride can cause effects such as gastrointestinal irritation, nausea, vomiting, and diarrhea.

High localized concentrations of potassium chloride in the gastrointestinal tract can cause ulceration, hence the development of the many enteric-coated and wax matrix sustained-release preparations that are available.[15] However, many enteric-coated tablets of potassium chloride are no longer recommended because of the high incidence of severe injury to gastrointestinal tissue during tablet dissolution.[16] Although it is claimed that some formulations cause less ulceration than others, it is often preferred to administer potassium chloride as an aqueous solution. However, solutions have also been associated with problems, mainly due to their unpleasant taste.

Parenterally, rapid injection of strong potassium chloride solutions can cause cardiac arrest; in the adult, solutions should be infused at a rate not greater than 750 mg/hour.

Therapeutically, in adults, up to 10 g orally, in divided doses, has been administered daily, while intravenously up to 6 g daily has been used.

LD_{50} (guinea pig, oral): 2.5 g/kg[17]
LD_{50} (mouse, IP): 1.18 g/kg
LD_{50} (mouse, IV): 0.12 g/kg
LD_{50} (mouse, oral): 0.38 g/kg
LD_{50} (rat, IP): 0.66 g/kg
LD_{50} (rat, IV): 0.14 g/kg
LD_{50} (rat, oral): 2.6 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (injections, ophthalmic preparations, oral capsules, and tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sodium chloride.

18 Comments

Each gram of potassium chloride represents approximately 13.4 mmol of potassium; 1.91 g of potassium chloride is approximately equivalent to 1 g of potassium.

Experimentally, potassium chloride is frequently used as a model drug in the development of new solid-dosage forms, particularly for sustained-release or modified-release products.

Potassium chloride is used therapeutically in the treatment of hypokalemia, and as an electrolyte replenisher. For diets where the intake of sodium chloride is restricted, salt substitutes for use in cooking or as table salt are available and contain mainly potassium chloride, e.g. *LoSalt* (Klinge Chemicals Ltd) is a blend of 2/3 potassium chloride and 1/3 sodium chloride with magnesium carbonate added as a flow-promoting agent.

A specification for potassium chloride is contained in the *Food Chemicals Codex* (FCC).[18]

The EINECS number for potassium chloride is 231-211-8. The PubChem Compound ID (CID) for potassium chloride is 4873.

Potassium Citrate

1 Nonproprietary Names

BP: Potassium Citrate

PhEur: Potassium Citrate

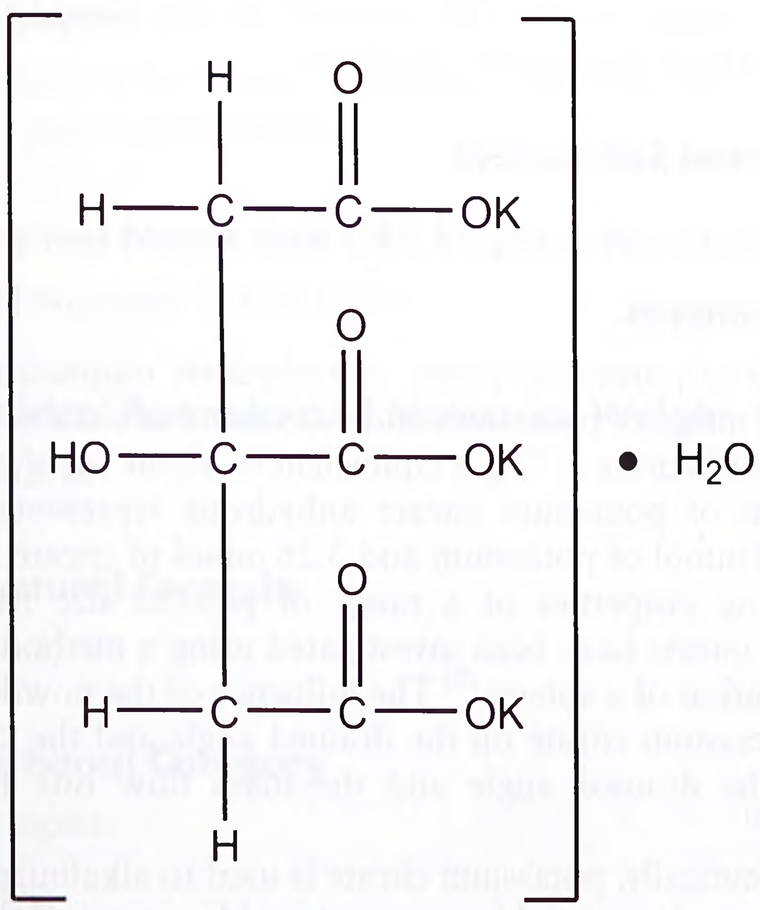
USP–NF: Potassium Citrate

2 Synonyms

Citrate of potash; citric acid potassium salt; E332; kalii citras; tripotassium citrate.

3 Chemical Name and CAS Registry Number

2-Hydroxy-1,2,3-propanetricarboxylic acid tripotassium salt monohydrate [6100-05-6]



2-Hydroxy-1,2,3-propanetricarboxylic acid tripotassium salt anhydrous [866-84-2]

4 Empirical Formula and Molecular Weight

$C_6H_5K_3O_7 \cdot H_2O$ 324.41 (for monohydrate)

$C_6H_5K_3O_7$ 306.40 (for anhydrous)

5 Structural Formula

• H_2O

6 Functional Category

Alkalizing agent; buffering agent; complexing agent.

7 Applications in Pharmaceutical Formulation or Technology

Potassium citrate is used in beverages, foods, and oral pharmaceutical formulations as a buffering and alkalizing agent. It is also used as a sequestering agent. *See* Table I.

Table I: Uses of potassium citrate.

Use	Concentration (%)
Buffer for solutions	0.3–2.0
Complexing agent	0.3–2.0

8 Description

Potassium citrate occurs as transparent prismatic crystals or as a white, granular powder. It is hygroscopic and odorless, and has a cooling, saline taste.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for potassium citrate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Acidity or alkalinity	+	+
Loss on drying	4.0–7.0%	3.0–6.0%

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Potassium citrate is a stable, though hygroscopic material, and should be stored in an airtight container in a cool, dry place. It is deliquescent in moist air.

12 Incompatibilities

Aqueous potassium citrate solutions are slightly alkaline and will react with acidic substances. Potassium citrate may also precipitate alkaloidal salts from their aqueous or alcoholic solutions. Calcium and strontium salts will cause precipitation of the corresponding

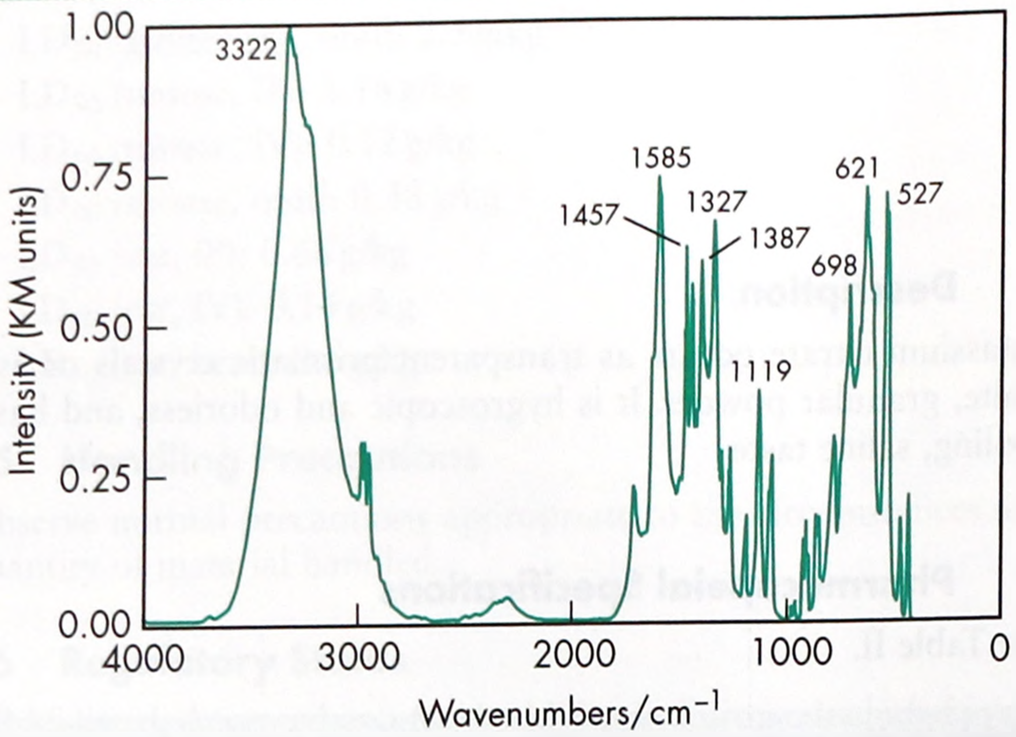

Figure 1: Infrared spectrum of potassium citrate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

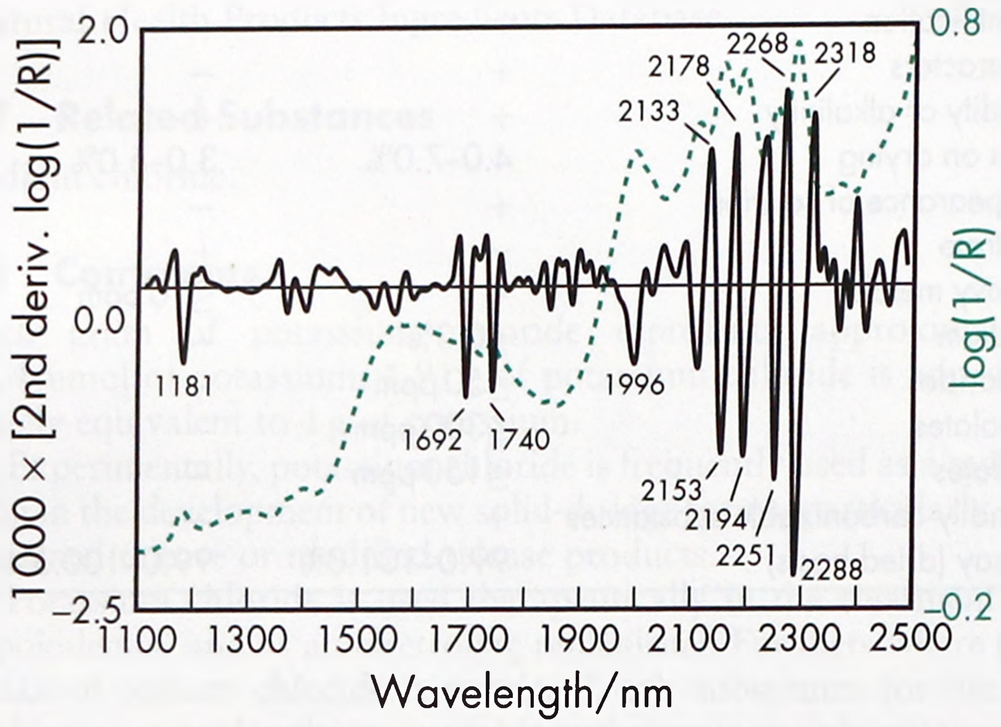

Figure 2: Near-infrared spectrum of potassium citrate, monohydrate measured by reflectance.

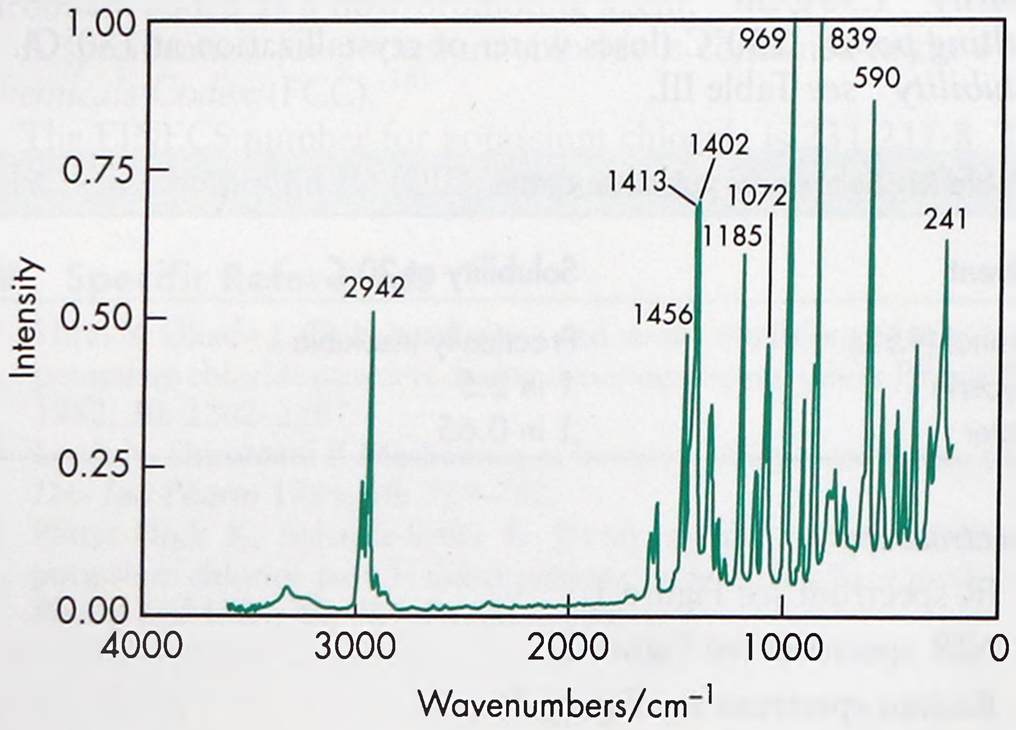

Figure 3: Raman spectrum of potassium citrate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

citrates. Potassium citrate is incompatible with strong oxidizing agents.

13 Method of Manufacture

Potassium citrate is prepared by adding either potassium bicarbonate or potassium carbonate to a solution of citric acid until effervescence ceases. The resulting solution is then filtered and evaporated to dryness to obtain potassium citrate.

14 Safety

Potassium citrate is used in oral pharmaceutical formulations and is generally regarded as a nontoxic and nonirritant material by this route of administration.

Most potassium citrate safety data relate to its use as a therapeutic agent, for which up to 10 g may be administered daily, in divided doses, as a treatment for cystitis. Although there are adverse effects associated with excessive ingestion of potassium salts, the quantities of potassium citrate used as a pharmaceutical excipient are insignificant in comparison to those used therapeutically.

LD_{50} (dog, IV): 0.17 g/kg[1]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Potassium citrate may be irritant to the skin and eyes and should be handled in a well-ventilated environment. Eye protection and gloves are recommended. When heated to decomposition, potassium citrate emits toxic fumes of potassium oxide.[1]

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (oral solutions and suspensions; topical emulsions and aerosol foams). Included in nonparenteral medicines (cutaneous foams and emulsions; oral liquids, granules, mixtures and soluble tablets; topical liquids, emulsions and mousses) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Each gram of potassium citrate monohydrate represents approximately 9.3 mmol of potassium and 3.08 mmol of citrate. Potassium citrate monohydrate 2.77 g is equivalent to about 1 g of potassium. Each gram of potassium citrate anhydrous represents approximately 9.8 mmol of potassium and 3.26 mmol of citrate.

The flow properties of a range of powder size fractions of potassium citrate have been investigated using a method involving the indentation of a sphere.[2] The influence of the powder particle size of potassium citrate on the drained angle and the correlation between the drained angle and the mass flow rate have been reported.[3]

Therapeutically, potassium citrate is used to alkalinize the urine and to relieve the painful irritation caused by cystitis.[4–8]

A specification for potassium citrate is contained in the *Food Chemicals Codex* (FCC).[9]

The EINECS number for potassium citrate is 212-755-5. The PubChem Compound ID (CID) for potassium citrate monohydrate includes 22470 and 2735208.

BP: Potassium Hydroxide
JP: Potassium Hydroxide
PhEur: Potassium Hydroxide
USP–NF: Potassium Hydroxide

2 Synonyms

Caustic potash; E525; kalii hydroxidum; kalium hydroxydatum; potash lye; potassium hydrate.

3 Chemical Name and CAS Registry Number

Potassium hydroxide [1310-58-3]

4 Empirical Formula and Molecular Weight

KOH 56.11

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Potassium hydroxide is widely used in pharmaceutical formulations to adjust the pH of solutions. It can also be used to react with weak acids to form salts.

8 Description

Potassium hydroxide occurs as a white or nearly white fused mass. It is available in small pellets, flakes, sticks and other shapes or forms. It is hard and brittle and shows a crystalline fracture. Potassium hydroxide is hygroscopic and deliquescent; on exposure to air, it rapidly absorbs carbon dioxide and water with the formation of potassium carbonate.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for potassium hydroxide.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

Potassium	—	—	≥59.9%

(a) If intended for use in the manufacture of hemodialysis solutions.

10 Typical Properties

Acidity/alkalinity pH = 13.5 (0.1 M aqueous solution)
Melting point 360°C; 380°C when anhydrous.
Solubility *see* Table II.

Table II: Solubility of potassium hydroxide.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	1 in 3
Ether	Practically insoluble
Glycerin	1 in 2.5
Water	1 in 0.9
	1 in 0.6 at 100°C

11 Stability and Storage Conditions

Potassium hydroxide should be stored in an airtight, nonmetallic container in a cool, dry place.

12 Incompatibilities

Potassium hydroxide is a strong base and is incompatible with any compound that readily undergoes hydrolysis or oxidation. It should

not be stored in glass or aluminum containers, and will react with acids, esters, and ethers, especially in aqueous solution.

13 Method of Manufacture

Potassium hydroxide is made by the electrolysis of potassium chloride. Commercial grades may contain chlorides as well as other impurities.

14 Safety

Potassium hydroxide is widely used in the pharmaceutical and food industries and is generally regarded as a nontoxic material at low concentrations. At high concentrations it is a corrosive irritant to the skin, eyes, and mucous membranes.

LD_{50} (rat, oral): 0.273 g/kg[1]

15 Handling Precautions

Potassium hydroxide is a corrosive irritant to the skin, eyes, and mucous membranes. The solid and solutions cause burns, often with deep ulceration. It is very toxic on ingestion and harmful on inhalation. Observe normal handling precautions appropriate to the quantity and concentration of material handled. Gloves, eye protection, respirator, and other protective clothing should be worn.

Potassium hydroxide is strongly exothermic when dissolved in ethanol (95%) or water, and considerable heat is generated. The reaction between potassium hydroxide solutions and acids is also strongly exothermic.

In the UK, the workplace exposure limit for potassium hydroxide has been set at 2 mg/m^3 short-term.[2]

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (injections; infusions; oral capsules, pastilles and solutions; topical emulsions, gels, solutions and suppositories; vaginal emulsions). Included in nonparenteral and parenteral medicines licensed in the UK. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sodium hydroxide.

18 Comments

Therapeutically, potassium hydroxide is used in various dermatological applications.

A specification for potassium hydroxide is contained in the *Food Chemicals Codex* (FCC).[3]

The EINECS number for potassium hydroxide is 215-181-3.

3 Chemical Name and CAS Registry Number

Dipotassium pyrosulfite [16731-55-8]

4 Empirical Formula and Molecular Weight

$K_2S_2O_5$ 222.32

5 Structural Formula

See Section 4.

6 Functional Category

Antimicrobial preservative; antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Potassium metabisulfite is used in pharmaceutical applications similar to those of sodium metabisulfite. It is used as an antioxidant, antimicrobial preservative, and sterilizing agent.

8 Description

Potassium metabisulfite occurs as white or colorless free-flowing crystals, crystalline powder, or granules, usually with an odor of sulfur dioxide.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for potassium metabisulfite.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Appearance of solution	+	–
pH	3.0–4.5	–
Thiosulfates	+	–
Selenium	≤10 ppm	–

10 Typical Properties

Acidity/alkalinity pH = 3.5–4.5 (5% w/v aqueous solution)
Density (bulk) 1.1–1.3 g/cm^3
Density (tapped) 1.2–1.5 g/cm^3
Melting point 190°C although potassium metabisulfite decomposes at temperatures above 150°C.
Solubility Soluble 1 in 2.2 of water; practically insoluble in ethanol (96%).
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

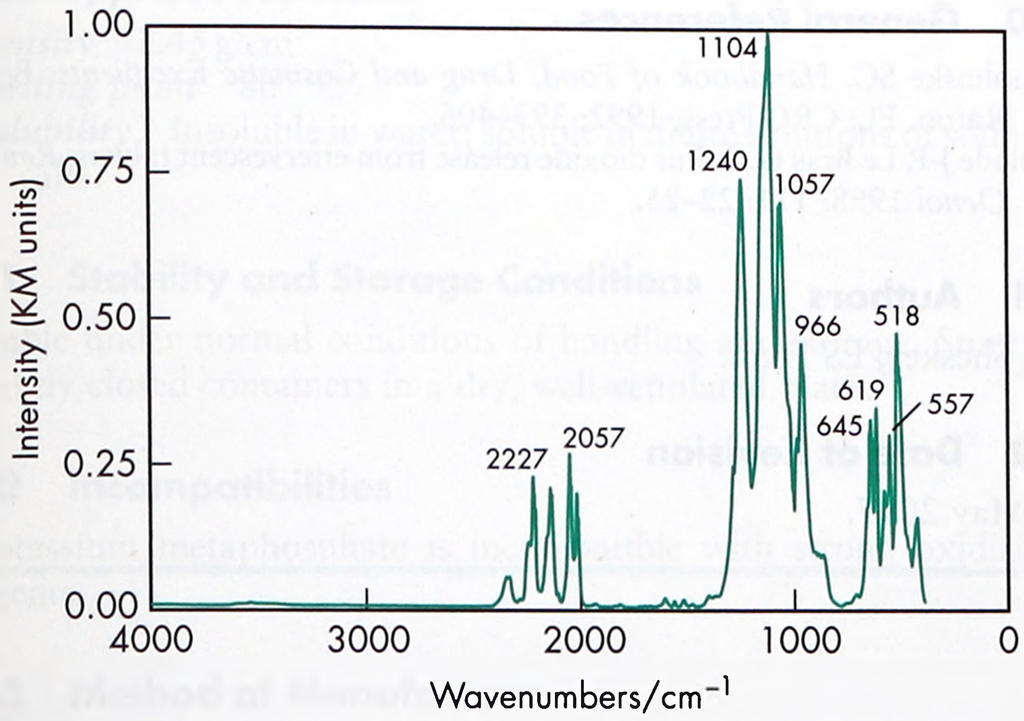

Figure 1: Infrared spectrum of potassium metabisulfite measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

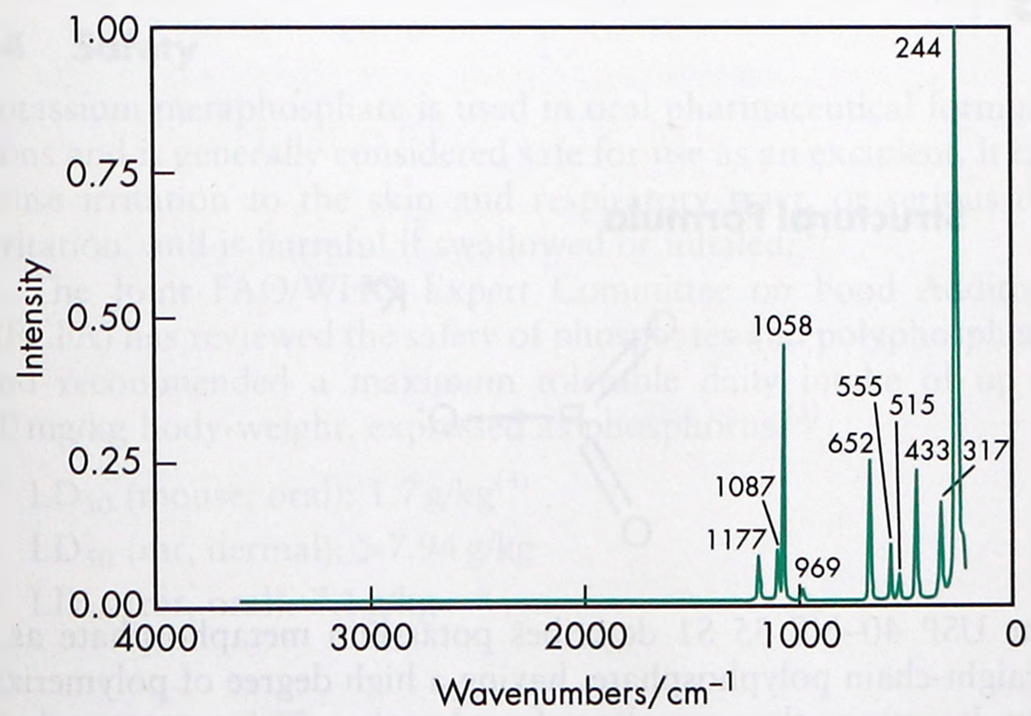

Figure 2: Raman spectrum of potassium metabisulfite measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Potassium metabisulfite should be stored in well-closed containers in a cool, dark place. When stored at a maximum temperature of 25°C and maximum relative humidity of 45%, the shelf-life is 6 months. Potassium metabisulfite decomposes at temperatures above 150°C. In the air, it oxidizes to the sulfate, more readily in the presence of moisture.

In aqueous solution, potassium metabisulfite forms potassium bisulfite ($KHSO_3$) which exerts a strong reducing effect.

12 Incompatibilities

Potassium metabisulfite is incompatible with strong acids, water, and most common metals. It reacts with nitrites and sodium nitrate at room temperature, which occasionally results in the formation of flame. The reaction may be explosive if water is present. Potassium metabisulfite liberates SO_2 with acids.

Sulfites, including potassium metabisulfite, can react with various pharmaceutical compounds including sympathomimetics such as epinephrine (adrenaline),[1] chloramphenicol,[1] cisplatin,[2] and amino acids,[3] which can result in their pharmacological inactivation. Sulfites are also reported to react with phenylmercuric nitrate,[4,5] and may adsorb onto rubber closures.

See also Section 18.

13 Method of Manufacture

Potassium metabisulfite is formed by thermal dehydration of potassium bisulfite.

14 Safety

Potassium metabisulfite is used in a variety of foods and pharmaceutical preparations, including oral, otic, rectal, and parenteral preparations. Potassium metabisulfite is considered a very irritating material, and may cause dermatitis on exposed skin.[6,7] Gastric irritation can occur following ingestion of sulfites.[8]

Hypersensitivity reactions to potassium metabisulfite and other sulfites, mainly used as preservatives in food products, have been reported. Reactions include bronchospasm and anaphylaxis; some deaths have also been reported, especially in those with a history of asthma or atopic allergy.[8–12] These reactions have led to restrictions by the FDA on the use of sulfites in food applications.[13] However, this restriction has not been extended to their use in pharmaceutical applications. Indeed, epinephrine (adrenaline) injections used to treat severe allergic reactions may contain sulfites.[8,13]

In the UK, the acceptable daily intake of potassium metabisulfite and other sulfites used in foodstuffs has been set at up to 3.5 mg/kg body-weight, calculated as sulfur dioxide (SO_2).[14] The WHO has also set an acceptable daily intake of potassium metabisulfite, and other sulfites, at up to 0.7 mg/kg body-weight, calculated as sulphur dioxide (SO_2).[15]

See also Sodium Metabisulfite.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Protective gloves and safety goggles are recommended, and precautions should be taken to minimize exposure to the mucous membranes and respiratory tract. When heated to decomposition, potassium metabisulfite emits toxic fumes of SO_2. It may ignite during milling or grinding to produce powder.[16]

See also Section 12.

16 Regulatory Status

GRAS listed. Accepted in Europe for use as a food additive in certain applications. Included in the FDA Inactive Ingredients Database (IM and IV injection; otic and rectal solutions and

P

suspensions). Included in the Canadian Natural Health Products Ingredients Database. Also included in parenteral and nonparenteral products licensed in the UK.

17 Related Substances

Potassium bisulfite; sodium metabisulfite.

Potassium bisulfite

Empirical formula $KHSO_3$
Molecular weight 120.2
CAS number [7773-03-7]
Synonyms E228; monopotassium sulfite; potassium acid sulfite; potassium bisulphite; potassium hydrogen sulfite.
Comments Accepted in Europe as a food additive in certain applications. Included in food and pharmaceutical applications similarly to potassium metabisulfite.

18 Comments

Potassium metabisulfite is used in applications similar to those of sodium metabisulfite in the food, brewing, and wine making industries. Like all sulfites, potassium metabisulfite is not recommended for use in foods that are a source of thiamin, owing to the instability of the vitamin in their presence. Such foods include meat, raw fruits and vegetables, fresh potatoes, and foods that are a source of vitamin B_{12}.

A specification for potassium metabisulfite is contained in the *Food Chemicals Codex* (FCC).[17]

The EINECS number for potassium metabisulfite is 240-795-3. The PubChem Compound ID (CID) for potassium metabisulfite includes 28019 and 516928.

P

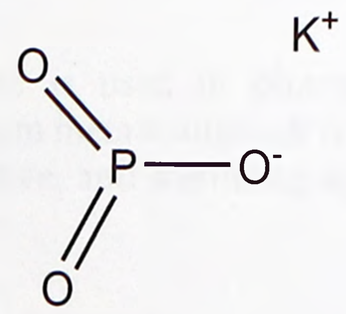
Potassium Metaphosphate

1 Nonproprietary Names

USP–NF: Potassium Metaphosphate

2 Synonyms

E452; *Europhos KMP FG*; potassium Kurrol's salt; potassium polymetaphosphate; potassium polyphosphate.



3 Chemical Name and CAS Registry Number

Potassium metaphosphate [7790-53-6]

4 Empirical Formula and Molecular Weight

KPO_3 118.07

5 Structural Formula

The USP 40–NF 35 S1 describes potassium metaphosphate as a straight-chain polyphosphate, having a high degree of polymerization. It contains the equivalent of not less than 59.0 percent and not more than 61.0 percent of P_2O_5.

6 Functional Category

Buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Potassium metaphosphate is used in pharmaceutical formulations as a buffering agent for oral suspensions.[1]

8 Description

Potassium metaphosphate occurs as a white, odorless powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for potassium metaphosphate.

Test	USP 40–NF 35 S1
Identification	+
Viscosity	6.5–15 cps
Lead	≤5 ppb
Heavy metals	≤20 µg/g
Fluoride	≤10 µg/g
Assay (P_2O_5)	>59.0 to ≤61.0%

10 Typical Properties

Density 2.45 g/cm^3
Melting point 807°C
Solubility Insoluble in water; soluble in dilute solutions of sodium salts.

11 Stability and Storage Conditions

Stable under normal conditions of handling and storage. Store in tightly closed containers in a dry, well-ventilated place.

12 Incompatibilities

Potassium metaphosphate is incompatible with strong oxidizing agents.

13 Method of Manufacture

Potassium metaphosphate is prepared by the thermal dehydration of potassium dihydrogen phosphate.

14 Safety

Potassium metaphosphate is used in oral pharmaceutical formulations and is generally considered safe for use as an excipient. It can cause irritation to the skin and respiratory tract, or serious eye irritation, and is harmful if swallowed or inhaled.[2]

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) has reviewed the safety of phosphates and polyphosphates and recommended a maximum tolerable daily intake of up to 70 mg/kg body-weight, expressed as phosphorus.[3]

LD_{50} (mouse, oral): 1.7 g/kg[4]
LD_{50} (rat, dermal): >7.94 g/kg
LD_{50} (rat, oral): 7.1 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Avoid skin and eye contact. Suitable eye protection, gloves and protective clothing should be worn. Avoid breathing dust, vapor, mist or gas and use only in a chemical fume hood. Avoid prolonged or repeated exposure. Keep away from ignition sources.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral suspensions). Potassium metaphosphate is included in the EAFUS list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Potassium metaphosphate has been investigated for use in a powder for suspension in the treatment of gastric-related disorders, comprising a therapeutically effective amount of an acid-labile, substituted benzimidazol proton pump inhibitor with a buffering agent in approx. 0.1–2.5 mEq per mg of the proton pump inhibitor.[1]

The low water solubility of potassium metaphosphate has led to it being evaluated as a polishing material in dental formulations, such as toothpaste and tooth powder.[5]

Potassium metaphosphate is also used as an emulsifier, desiccant, and as a binding or raising agent in foods.[6] It is used a surfactant in cosmetics.[7]

The EINECS number for potassium metaphosphate is 232-212-6. The PubChem Compound ID (CID) for potassium metaphosphate is 16133895.

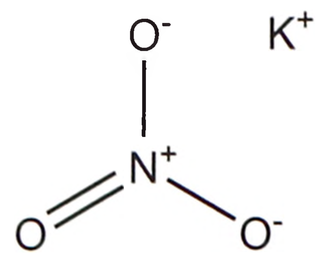
Potassium Nitrate

1 Nonproprietary Names

BP: Potassium Nitrate
PhEur: Potassium Nitrate
USP–NF: Potassium Nitrate

2 Synonyms

E252; kalii nitras; kalium nitricum; niter; nitrate of potash; nitric acid, potassium salt; saltpeter.



3 Chemical Name and CAS Registry Number

Potassium nitrate [7757-79-1]

4 Empirical Formula and Molecular Weight

KNO_3 101.1

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Potassium nitrate is used as a preservative in eye lotions and eye drops. It is widely used in foods and oral care products; *see* Section 18.

8 Description

Potassium nitrate occurs as a white or almost white crystalline powder or colorless crystals, with a cooling, saline, pungent taste.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 6.2 at 14°C for 10% aqueous solution
Boiling point 400°C
Density 2.11 g/cm^3
Melting point 333°C
Solubility Freely soluble in water; very soluble in boiling water; practically insoluble in alcohol; soluble in glycerol.

11 Stability and Storage Conditions

Potassium nitrate is considered to be a stable material; however, it may decompose if heated. Store in airtight containers in a cool, well-ventilated place.

Table I: Pharmacopeial specifications for potassium nitrate.

Test	PhEur 9.2	USP 40–NF 35 S1
Characters	+	–
Identification	+	+
Appearance of solution	+	–
Acidity or alkalinity	+	–
Reducible substances	+	–
Chlorides	≤20 ppm[a]	≤0.03%
Sulfates	≤150 ppm	≤0.1%
Ammonium	≤100 ppm[b]	–
Calcium	≤100 ppm[b]	–
Iron	≤20 ppm[c]	≤10 ppm
Sodium	≤0.1%	≤0.1%
Lead	–	≤10 ppm
Heavy metals	–	≤20 ppm
Loss on drying	≤0.5%	–
Limit of nitrite	–	≤5 µg/g
Assay (dried substance)	99.0–101.0%	99.0–100.5%

(a) If for ophthalmic use.
(b) ≤50 ppm if for ophthalmic use.
(c) ≤10 ppm if for ophthalmic use.

12 Incompatibilities

Potassium nitrate is incompatible with reducing agents, strong acids, metals and organic compounds. An explosive reaction occurs with potassium chlorate or bromine trifluoride.

13 Method of Manufacture

Potassium nitrate is produced by double decomposition of sodium nitrate with potassium chloride.

14 Safety

Potassium nitrate is used as a food additive and in oral and eyecare products, and is therefore regarded as a safe material when applied appropriately for these uses.

However, potassium nitrate in its pure form is irritating to the respiratory tract, and may cause coughing and shortness of breath. It is also irritating to the skin and eyes, causing redness, itching, and pain. Ingestion of large quantities may cause violent gastroenteritis. Prolonged exposure to small amounts may produce anemia, methemoglobinemia, and nephritis.

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) has reviewed the safety of potassium nitrate and recommended an acceptable daily intake of up to 3.7 mg/kg body weight daily, expressed as the nitrate ion.[1]

LD_{50} (rabbit, oral): 1.9 g/kg[2]
LD_{50} (rat, oral): 3.75 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Contact with other materials may cause fire. Thermal decomposition produces highly toxic fumes. Avoid creating and inhaling dust. Protective eye goggles, clothing, and respiratory equipment should be worn.

16 Regulatory Status

Approved by the FDA as a direct food additive. Included in the EAFUS database. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Phenylmercuric nitrate.

18 Comments

Potassium nitrate is included in dentrifices to reduce tooth hypersensitivity.[3] When taken by mouth in dilute solution, potassium nitrate acts as a diuretic, and was formerly used for this purpose.[4]

Potassium nitrate has been used experimentally to induce corneal neovascularization in animal models.[5]

A specification for potassium nitrate is included in the *Food Chemicals Codex* (FCC).[6]

The EINECS number for potassium nitrate is 231-818-8.

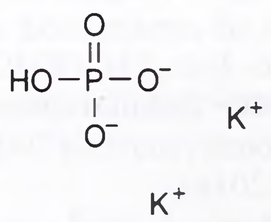
Potassium Phosphate, Dibasic

1 Nonproprietary Names

BP: Dipotassium Hydrogen Phosphate
PhEur: Dipotassium Phosphate
USP–NF: Dibasic Potassium Phosphate

2 Synonyms

Dikalii phosphas; dipotassium hydrogen phosphate; dipotassium phosphate; E340; phosphoric acid, dipotassium salt; potassium phosphate.



3 Chemical Name and CAS Registry Number

Dipotassium hydrogen orthophosphate [7758-11-4]
Dipotassium hydrogen orthophosphate trihydrate [16788-57-1]

4 Empirical Formula and Molecular Weight

K_2HPO_4	174.2
$K_2HPO_4\ 3\,H_2O$	228.22

5 Structural Formula

See Section 4.

6 Functional Category

Buffering agent.

7 Applications in Pharmaceutical Formulation or Technology

Dibasic potassium phosphate is mainly used in pharmaceutical formulations as a buffering agent in nonparenteral and parenteral products; for example, dibasic potassium phosphate is included as a buffing agent in nasal influenza vaccines for children and adolescents.[1]

8 Description

Dibasic potassium phosphate occurs as a very hygroscopic white powder or colorless crystals.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH 8.5–9.6 for a 5% w/v solution in water at 25°C.
Density 2.44 g/cm^3
Melting point 465°C with decomposition.
Solubility Freely soluble in water (167 g/100 mL at 20 °C); very slightly soluble in ethanol (95%).

Table I: Pharmacopeial specifications for dibasic potassium phosphate.

Test	PhEur 9.2[a]	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Insoluble substances	–	≤0.2%
Appearance of solution	+	–
Chloride	≤200 ppm	≤0.03%
Sulfate	≤0.1%	≤0.1%
Arsenic	≤2 ppm	≤3 ppm
Iron	≤10 ppm	≤30 ppm
Heavy metals	–	≤10 ppm
Sodium	≤0.1%	+
Fluoride	–	≤0.001%
pH	–	8.5–9.6
Loss on drying	≤2.0%	≤1.0%
Carbonate	–	+
Limit of monobasic or tribasic salt	–	+
Limit of monobasic salt	≤2.5%	–
Reducing substances	+	–
Assay (dried basis)	98.0–101.0%	98.0–100.5%

(a) The PhEur 9.2 includes a limit for endotoxins for material intended for parenteral use.

11 Stability and Storage Conditions

Dibasic potassium phosphate is very hygroscopic. Store in tightly closed containers.

12 Incompatibilities

Soluble phosphates are incompatible in solution with alkaloids, antipyrene, chloral hydrate, pyrogallol and resorcinol.[2] There is the potential for the formation of insoluble salts with divalent metal ions such as calcium; this should be considered when multiple injections and/or infusion fluids are to be administered to a patient.

P

13 Method of Manufacture

Dibasic potassium phosphate is produced when two moles of potassium hydroxide are added stoichiometrically to one mole of phosphoric acid (this is a very exothermic reaction). The solution is taken to a pH endpoint, filtered, evaporated and cooled. The crystallized product is centrifuged and dried.

14 Safety

Dibasic potassium phosphate powder may cause irritation of the gastrointestinal tract if ingested, and the respiratory tract if inhaled. It may cause irritation to skin, eyes, lungs, mucous membranes and the gastrointestinal tract.

The Joint FAO/WHO Expert Committee on Food Additives (JECFA) has reviewed the safety of phosphates and polyphosphates and recommended a maximum tolerable intake of 70 mg/kg body weight, expressed as phosphorus.[3]

The Cosmetic Ingredient Review Expert Panel has assessed dibasic potassium phosphate and concluded that the material is safe as used in cosmetic formulations in present practices of use and concentration.[4]

LD_{50} (rat, oral): >0.5 g/kg[5]

LD_{50} (rabbit, SC): >0.3 g/kg; >5 g/kg[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Gloves, eye protection, a respirator, and other protective clothing should be worn.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (oral capsules, powders, suspensions, syrups; IM, IV, SC and intra-articular injections). Accepted for use as a food additive in Europe. Included in the EAFUS list compiled by the FDA. Included in the Canadian Natural Health Products Ingredients Database.

Dibasic potassium phosphate may be a component of oral rehydration mixtures. It is the active ingredient of Dipotassium Hydrogen Phosphate Injection BP.

17 Related Substances

Sodium phosphate, dibasic; monobasic potassium phosphate; tripotassium phosphate.

Monobasic potassium phosphate

Empirical formula KH_2PO_4
Molecular weight 136.1
CAS number [7778-77-0]
Synonyms Monopotassium phosphate; potassium acid phosphate; potassium biphosphate; potassium dihydrogen orthophosphate; potassium dihydrogen phosphate.
Appearance A white, crystalline powder or colorless crystals.
Solubility Freely soluble in water; practically insoluble in alcohol.
Comments The USP 40–NF 35 S1 lists Monobasic Potassium Phosphate and the PhEur 9.2 lists Potassium Dihydrogen Phosphate. A specification for monobasic potassium phosphate is included in the *Food Chemicals Codex*.[6]

Tripotassium phosphate

Empirical formula K_3PO_4
Molecular weight 212.27
CAS number [7778-53-2]
Synonyms Tribasic potassium phosphate; tripotassium orthophosphate.
Appearance A white, crystalline powder or colorless crystals.
Solubility Freely soluble in water; practically insoluble in alcohol.
Comments Deliquescent. A food additive used in the preparation of whips and emulsions, and as a foam stabilizer. Aqueous solutions are highly alkaline. A specification for tribasic potassium phosphate is included in the *Food Chemicals Codex*.[6]

18 Comments

One gram of dibasic potassium phosphate contains approximately 11.5 mmol potassium and 5.7 mmol phosphate.

Dibasic potassium phosphate is used in fermentation and cell culture. A 2.08% w/v aqueous solution of dibasic potassium phosphate is isoosmotic with serum.

The EINECS number for dibasic potassium phosphate is 231-834-5. The Pub Chem Compound ID (CID) for dibasic potassium phosphate is 24450. The UNII Code for dibasic potassium phosphate is CI71S98N1Z.

A specification for dibasic potassium phosphate is included in the *Food Chemicals Codex*.[6]

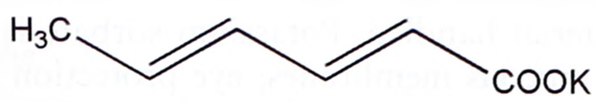
Potassium Sorbate

1 Nonproprietary Names

BP: Potassium Sorbate
PhEur: Potassium Sorbate
USP–NF: Potassium Sorbate

2 Synonyms

E202; 2,4-hexadienoic acid (*E*,*E*)-potassium salt; kalii sorbas; potassium (*E*,*E*)-hexa-2,4-dienoate; potassium (*E*,*E*)-sorbate; sorbic acid potassium salt.



3 Chemical Name and CAS Registry Number

2,4-Hexadienoic acid potassium salt [24634-61-5]

4 Empirical Formula and Molecular Weight

$C_6H_7O_2K$ 150.22

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Potassium sorbate is an antimicrobial preservative, with antibacterial and antifungal properties used in pharmaceuticals, foods, enteral preparations, and cosmetics. Generally, it is used at concentrations of 0.1–0.2% in oral and topical formulations, especially those containing nonionic surfactants. Potassium sorbate has been used to enhance the ocular bioavailability of timolol.[1]

Potassium sorbate is used in approximately twice as many pharmaceutical formulations as is sorbic acid owing to its greater solubility and stability in water. Like sorbic acid, potassium sorbate has minimal antibacterial properties in formulations above pH 6.

8 Description

Potassium sorbate occurs as a white crystalline powder with a faint, characteristic odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for potassium sorbate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance of solution	+	—
Acidity or alkalinity	+	+
Loss on drying	≤1.0%	≤1.0%
Heavy metals	—	≤10 ppm
Aldehydes (as C_2H_4O)	≤0.15%	—
Assay (dried basis)	99.0–101.0%	98.0–101.0%

10 Typical Properties

Antimicrobial activity Potassium sorbate is predominantly used as an antifungal preservative, although it also has antibacterial properties. Similarly to sorbic acid, the antimicrobial activity is dependent on the degree of dissociation; there is practically no antibacterial activity above pH 6. Preservative efficacy is increased with increasing temperature,[2] and increasing concentration of potassium sorbate.[2] The efficacy of potassium sorbate is also increased when used in combination with other antimicrobial preservatives or glycols since synergistic effects occur.[3] Reported minimum inhibitory concentrations (MICs) at the pH values indicated are shown in Table II.[3]

Table II: Minimum inhibitory concentrations (MIC) of potassium sorbate.

Microorganism	MIC (μg/mL) at the stated pH		
	5.5	6.0	7.0
Escherichia coli	1400	1500	3800
Pseudomonas aeruginosa	1600–2300	1900–2500	5600–9000
Staphylococcus aureus	1200	1000	3800

Density 1.363 g/cm^3
Melting point 270°C with decomposition.
Solubility *see* Table III.
Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Potassium sorbate is more stable in aqueous solution than sorbic acid; aqueous solutions may be sterilized by autoclaving.

The bulk material should be stored in a well-closed container, protected from light, at a temperature not exceeding 40°C.

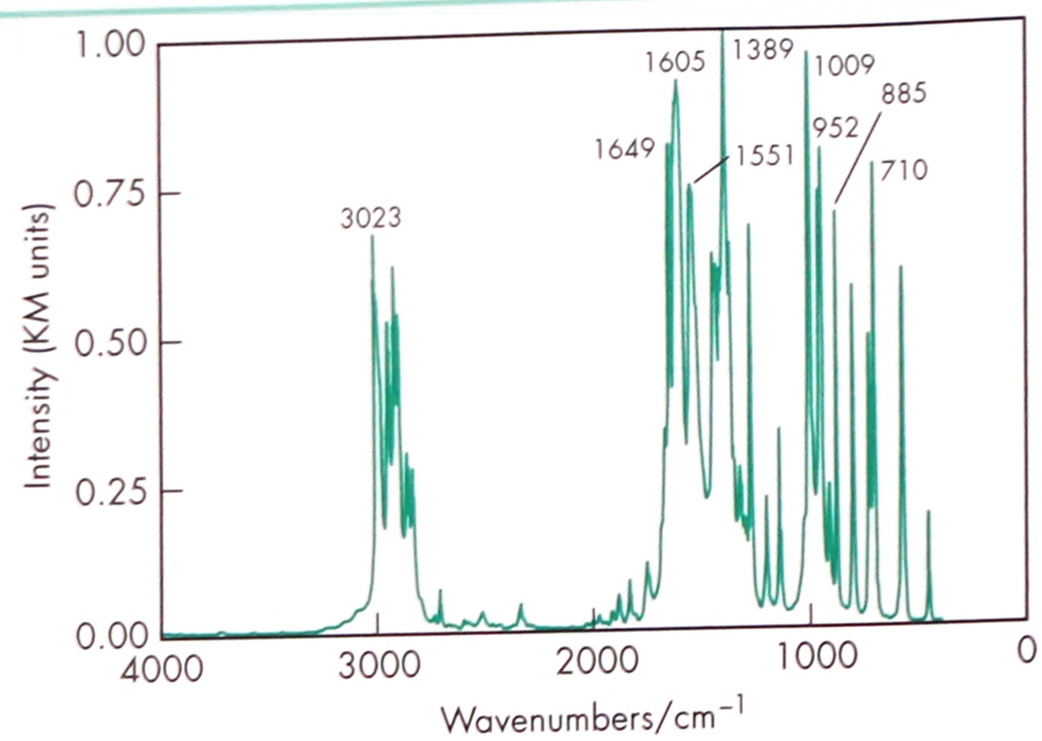


Figure 1: Infrared spectrum of potassium sorbate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

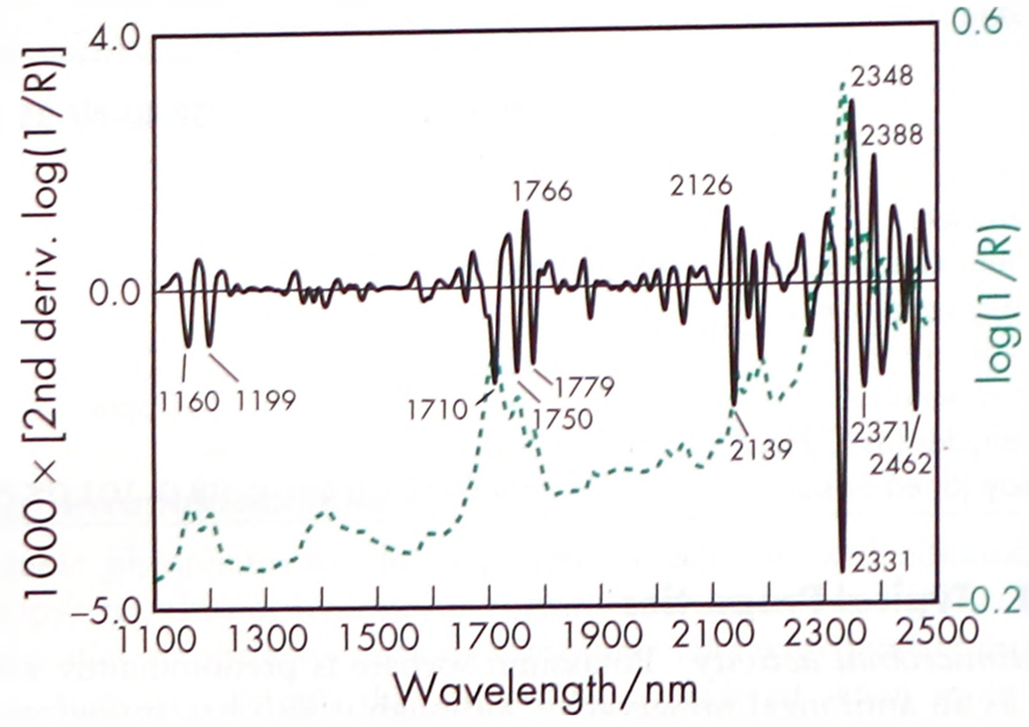

Figure 2: Near-infrared spectrum of potassium sorbate measured by reflectance.

Table III: Solubility of potassium sorbate.

Solvent	Solubility at 20°C unless otherwise stated
Acetone	1 in 1000
Benzene	Practically insoluble
Chloroform	Very slightly soluble
Corn oil	Very slightly soluble
Ethanol	1 in 50
Ethanol (95%)	1 in 35
Ethanol (5%)	1 in 1.7
Ether	Very slightly soluble
Propylene glycol	1 in 1.8
	1 in 2.1 at 50°C
	1 in 5 at 100°C
Water	1 in 1.72
	1 in 1.64 at 50°C
	1 in 1.56 at 100°C

12 Incompatibilities

Some loss of antimicrobial activity occurs in the presence of nonionic surfactants and some plastics. *See also* Sorbic Acid.

13 Method of Manufacture

Potassium sorbate is prepared from sorbic acid and potassium hydroxide.

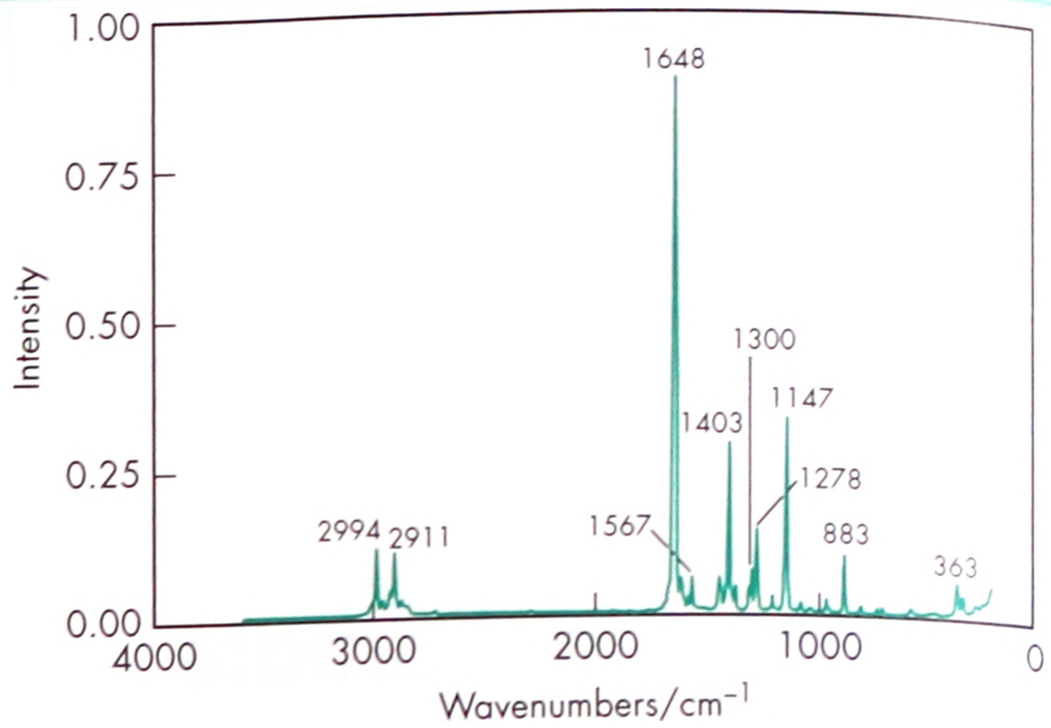

Figure 3: Raman spectrum of potassium sorbate measured in the 180 reflectance mode. Adapted with permission of Informa Healthcare.

14 Safety

Potassium sorbate is used as an antimicrobial preservative in oral and topical pharmaceutical formulations and is generally regarded as a relatively nontoxic material. However, some adverse reactions to potassium sorbate have been reported, including irritant skin reactions which may be of the allergic, hypersensitive type. There have been no reports of adverse systemic reactions following oral consumption of potassium sorbate.

The WHO has set an estimated total acceptable daily intake for sorbic acid, calcium sorbate, potassium sorbate, and sodium sorbate expressed as sorbic acid at up to 25 mg/kg body-weight.[4,5]

LD_{50} (mouse, IP): 1.3 g/kg[6]

LD_{50} (rat, oral): 4.92 g/kg

See also Sorbic Acid.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Potassium sorbate is irritant to the skin, eyes, and mucous membranes; eye protection and gloves are recommended. In areas of limited ventilation, a respirator is also recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (nasal sprays; oral capsules, solutions, suspensions, syrups, tablets; topical creams and lotions). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Sorbic acid.

18 Comments

Much of the information contained in the sorbic acid monograph on safety, incompatibilities, and references also applies to potassium, calcium, and sodium sorbates. *See* Sorbic Acid for further information.

Potassium sorbate has less antimicrobial activity than sorbic acid, but is more water soluble. Most potassium sorbate compounds will contain sorbic acid.

A specification for potassium sorbate is contained in the *Food Chemicals Codex* (FCC)[7] and the *Japanese Pharmaceutical Excipients* (JPE).[8]

The EINECS number for potassium sorbate is 246-376-1. The PubChem Compound ID (CID) for potassium sorbate includes 23676745 and 24184641.

Povidone

1 Nonproprietary Names

BP: Povidone

JP: Povidone

PhEur: Povidone

USP–NF: Povidone

2 Synonyms

E1201; *Kollidon*; *Plasdone*; poly[1-(2-oxo-1-pyrrolidinyl)ethylene]; polyvidone; polyvinylpyrrolidone; povidonum; *Povipharm*; PVP; 1-vinyl-2-pyrrolidinone polymer.

3 Chemical Name and CAS Registry Number

1-Ethenyl-2-pyrrolidinone homopolymer [9003-39-8]

4 Empirical Formula and Molecular Weight

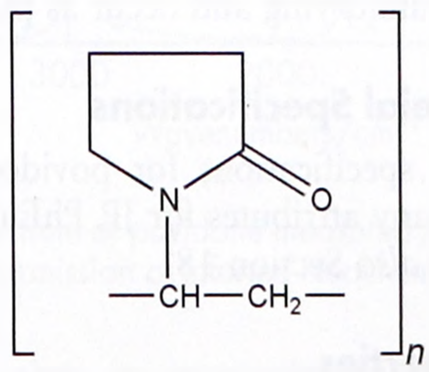
$(C_6H_9NO)_n$ 2 500–3 000 000

The USP 40–NF 35 S1 describes povidone as a synthetic polymer consisting essentially of linear 1-vinyl-2-pyrrolidinone groups, the differing degree of polymerization of which results in polymers of various molecular weights. It is characterized by its viscosity in aqueous solution, relative to that of water, expressed as a *K*-value, in the range 10–120. The *K*-value is calculated using Fikentscher's equation:[1]

$$\log z = c\left[\frac{75k^2}{1 + 1.5kc}\right] + k$$

where z is the relative viscosity of the solution of concentration c (in % w/v), and k is the *K*-value $\times 10^{-3}$.

Alternatively, the *K*-value may be determined from the following equation:



$$K\text{-value} = \sqrt{\frac{300c \log z + (c + 1.5c \log z)^2 + 1.5}{0.15c + 0.003c^2}}$$

where z is the relative viscosity of the solution of concentration c (in % w/v).

Approximate molecular weights for different povidone grades are shown in Table I.

See also Section 8.

5 Structural Formula

6 Functional Category

Coating agent; film-forming agent; solubilizing agent; suspending agent; tablet and capsule binder; tablet and capsule disintegrant.

7 Applications in Pharmaceutical Formulation or Technology

Although povidone is used in a variety of pharmaceutical formulations, it is primarily used in solid-dosage forms. In tableting,

Table I: Approximate molecular weights for different grades of povidone.

K-value	Approximate molecular weight
12	2 500
15	8 000
17	10 000
25	30 000
30	50 000
60	400 000
90	1 000 000
120	3 000 000

Table II: Uses of povidone.

Use	Concentration (%)
Carrier for drugs	10–25
Dispersing agent	Up to 5
Eye drops	2–10
Suspending agent	Up to 5
Tablet binder, tablet diluent, or coating agent	0.5–5

povidone solutions are used as binders in wet-granulation processes.[2,3] Povidone is also added to powder blends in the dry form and granulated *in situ* by the addition of water, alcohol, or hydroalcoholic solutions. Povidone is used as a solubilizer in oral and parenteral formulations, and has been shown to enhance dissolution of poorly soluble drugs from solid-dosage forms.[4–6] Povidone solutions may also be used as coating agents or as binders when coating active pharmaceutical ingredients on a support such as sugar beads.

Povidone is additionally used as a suspending, stabilizing, or viscosity-increasing agent in a number of topical and oral suspensions and solutions. The solubility of a number of poorly soluble active drugs may be increased by mixing with povidone. *See* Table II. Povidone has also been used in thin films as a support for dosage forms.[7]

Special grades of pyrogen-free povidone are available and have been used in parenteral formulations; *see* Section 14.

8 Description

Povidone occurs as a fine, white to creamy-white colored, odorless or almost odorless, hygroscopic powder. Povidones with *K*-values equal to or lower than 30 are manufactured by spray-drying and occur as spheres. Povidone K-90 and higher *K*-value povidones are manufactured by drum drying and occur as plates.

9 Pharmacopeial Specifications

The pharmacopeial specifications for povidone have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table III. *See also* Section 18.

10 Typical Properties

Density (bulk) 0.29–0.39 g/cm^3 for *Plasdone*.
Density (tapped) 0.39–0.54 g/cm^3 for *Plasdone*.
Density (true) 1.180 g/cm^3
Flowability

20 g/s for povidone K-15;

16 g/s for povidone K-29/32.

Melting point Softens at 150°C.
Moisture content Povidone is very hygroscopic, significant amounts of moisture being absorbed at low relative humidities. *See* Figures 1 and 2.

Table III: Pharmacopeial specifications for povidone.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification[a]	+	+	+
Characters[a]	–	+	–
pH	+	+	+
$K \leq 30$	3.0–5.0	3.0–5.0	3.0–5.0
$K > 30$	4.0–7.0	4.0–7.0	4.0–7.0
Appearance of solution[a]	+	+	–
Viscosity	–	+	+
Water	≤5.0%	≤5.0%	≤5.0%
Residue on ignition	≤0.1%	≤0.1%	≤0.1%
Lead	–	–	≤10 ppm
Aldehydes	≤500 ppm[b]	≤500 ppm[b]	≤0.05%
Formic acid	≤0.5%	≤0.5%	≤0.5%
Hydrazine	≤1 ppm	≤1 ppm	≤1 ppm
Vinylpyrrolidinone	≤10 ppm	≤10 ppm	≤0.001%
Pyrrolidone	≤3.0%	≤3.0%	≤3.0%
Peroxides	≤400 ppm[c]	≤400 ppm[c]	≤400 ppm[c]
K-value	25–90	10–120	–
≤15	85.0–115.0%	85.0–115.0%	85.0–115.0%
>15	90.0–108.0%	90.0–108.0%	90.0–108.0%
Heavy metals[a]	≤10 ppm	–	–
Assay (nitrogen content)	11.5–12.8%	11.5–12.8%	11.5–12.8%

(a) These tests have not been fully harmonized at the time of publication.
(b) Expressed as acetaldehyde.
(c) Expressed as hydrogen peroxide.

Particle size distribution

Kollidon 25/30: 90% >50 µm, 50% >100 µm, 5% >200 µm; *Kollidon 90*: 90% >200 µm, 95% >250 µm.[8]

Solubility Freely soluble in acids, chloroform, ethanol (95%), ketones, methanol, and water; practically insoluble in ether, hydrocarbons, and mineral oil. In water, the concentration of a solution is limited only by the viscosity of the resulting solution, which is a function of the *K*-value.

Spectroscopy

IR spectrum *see* Figure 3.

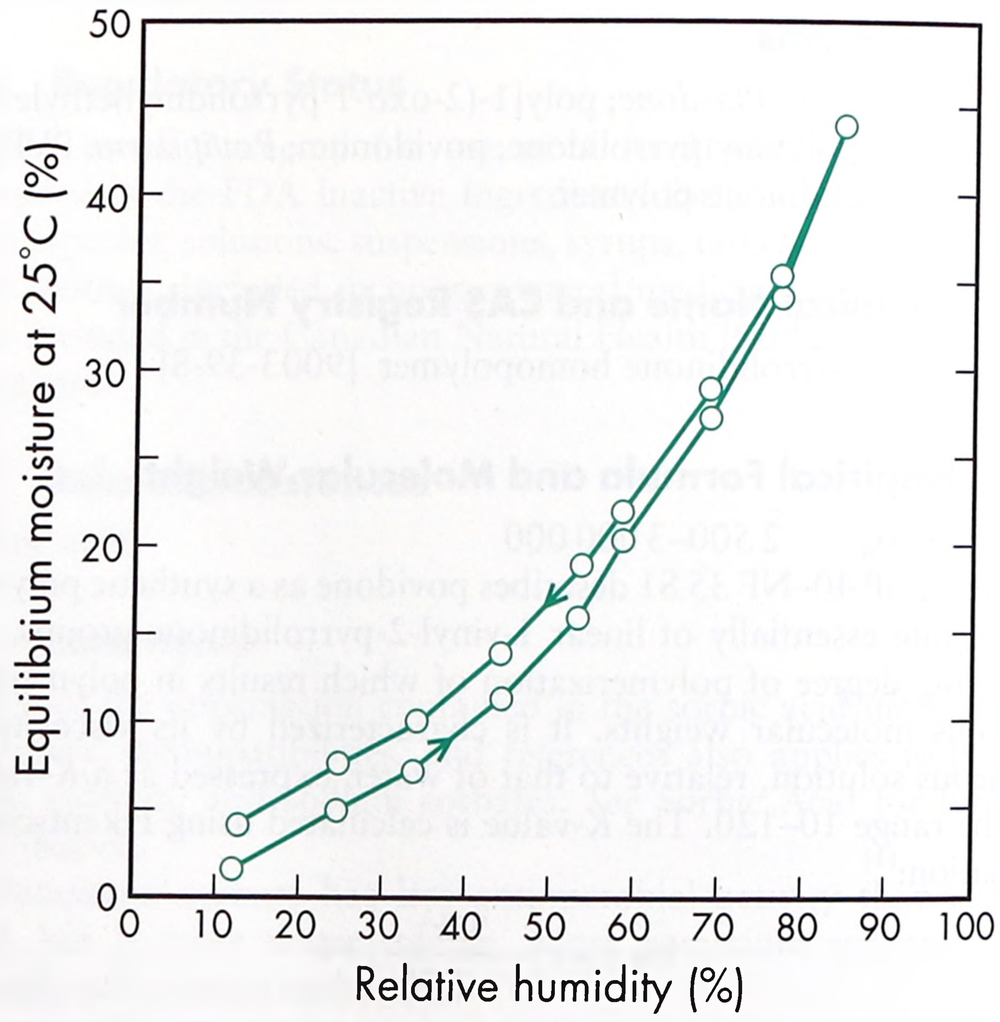


Figure 1: Sorption–desorption isotherm of povidone K-15 (*Plasdone K-15*, Ashland Specialty Ingredients).

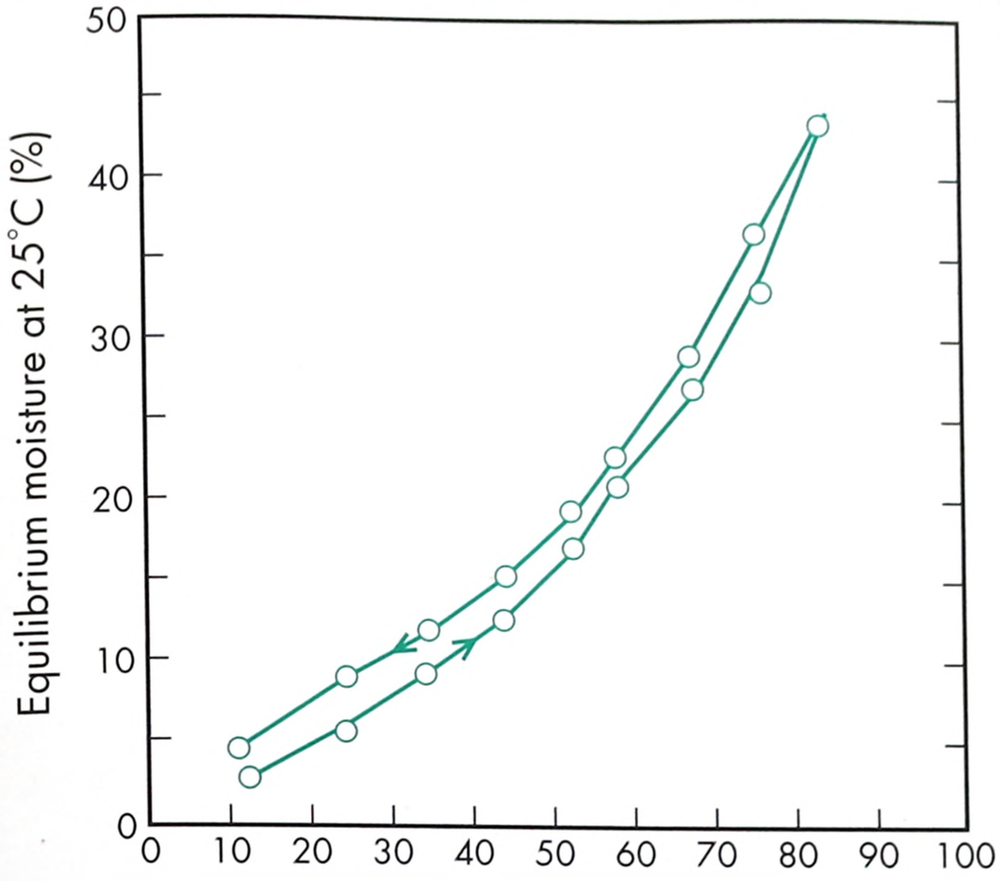

Figure 2: Sorption–desorption isotherm of povidone K-29/32 (*Plasdone K-29/32*, Ashland Specialty Ingredients).

Table IV: Dynamic viscosity of 10% w/v aqueous povidone (*Kollidon*) solutions at 20°C.[8]

Grade	Dynamic viscosity (mPa s)
K-11/14	1.3–2.3
K-16/18	1.5–3.5
K-24/27	3.5–5.5
K-28/32	5.5–8.5
K-85/95	300–700

Table V: Dynamic viscosity of 5% w/v povidone (*Kollidon*) solutions in ethanol (95%) and propan-2-ol at 25°C.[8]

Grade	Dynamic viscosity (mPa s)	
	Ethanol (95%)	Propan-2-ol
K-12PF	1.4	2.7
K-17PF	1.9	3.1
K-25	2.7	4.7
K-30	3.4	5.8
K-90	53.0	90.0

NIR spectrum *see* Figure 4.

Raman spectrum *see* Figure 5.

Surface tension Water-soluble polymers such as povidone will have an impact on the surface tension of water. They do not have the classic impact associated with surfactants where the drop in surface tension occurs at low concentration and plateaus at the critical micelle concentration (CMC), but instead continue to have an impact on the surface tension until the concentration reaches the gel point; *see* Figures 6 and 7.[9]

Viscosity (dynamic) The viscosity of aqueous povidone solutions depends on both the concentration and the molecular weight of the polymer employed. *See* Tables IV and V.[8]

11 Stability and Storage Conditions

Povidone darkens to some extent on heating at 150°C, with a reduction in aqueous solubility. It is stable to a short cycle of heat exposure around 110–130°C; steam sterilization of an aqueous solution does not alter its properties. Aqueous solutions are susceptible to mold growth and consequently require the addition of suitable preservatives.

Povidone may be stored under ordinary conditions without undergoing decomposition or degradation. However, since the powder is hygroscopic, it should be stored in an airtight container in a cool, dry place.

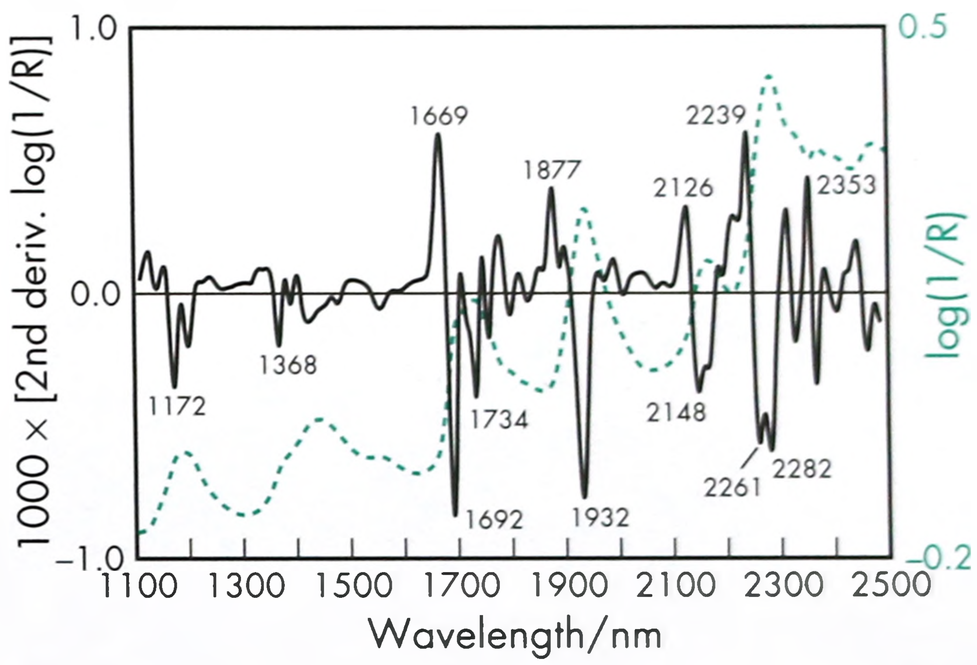

Figure 4: Near-infrared spectrum of povidone measured by reflectance.

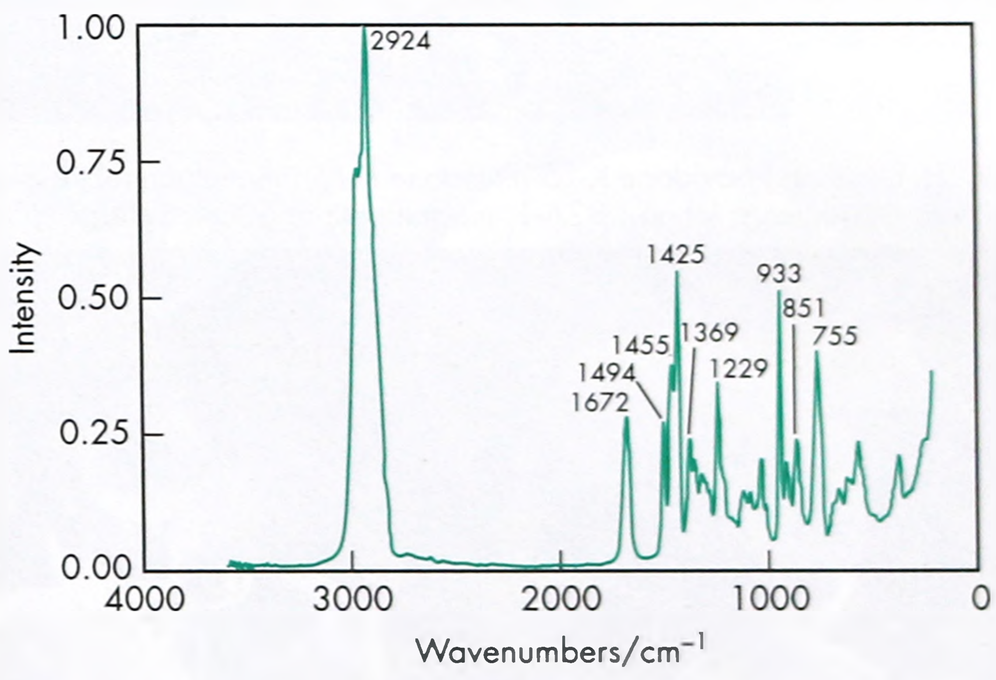

Figure 5: Raman spectrum of povidone measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Povidone is compatible in solution with a wide range of inorganic salts, natural and synthetic resins, and other chemicals. It forms

13 Method of Manufacture

Povidone is manufactured by the Reppe process. Acetylene and formaldehyde are reacted in the presence of a highly active copper acetylide catalyst to form butynediol, which is hydrogenated to butanediol and then cyclodehydrogenated to form butyrolactone. Pyrrolidone is produced by reacting butyrolactone with ammonia. This is followed by a vinylation reaction in which pyrrolidone and acetylene are reacted under pressure. The monomer, vinylpyrrolidone, is then polymerized in the presence of a combination of catalysts to produce povidone.

14 Safety

Povidone has been used in pharmaceutical formulations for many years, being first used in the 1940s as a plasma expander, although it has now been superseded for this purpose by dextran.[10]

Povidone is widely used as an excipient, particularly in oral tablets and solutions. When consumed orally, povidone may be regarded as essentially nontoxic since it is not absorbed from the gastrointestinal tract or mucous membranes.[10] Povidone additionally has no irritant effect on the skin and causes no sensitization.

Reports of adverse reactions to povidone primarily concern the formation of subcutaneous granulomas at the injection site of intramuscular injections formulated with povidone.[11] Evidence also exists that povidone may accumulate in the organs of the body following intramuscular injection.[12]

A temporary acceptable daily intake for povidone has been set by the WHO at up to 25 mg/kg body-weight.[13]

LD_{50} (mouse, IP): 12 g/kg[14]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection, gloves, and a dust mask are recommended.

16 Regulatory Status

Accepted for use in Europe as a food additive. Included in the FDA Inactive Ingredients Database (IM and IV injections; ophthalmic preparations; oral capsules, drops, granules, suspensions, and tablets; sublingual tablets; topical and vaginal preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Crospovidone.

18 Comments

Povidone is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Povidone has been extensively studied for its impact on dissolution and stability in various formulations, such as gelleable drug forms,[15] spray-dried dispersions,[16] nasal delivery systems,[17] and drug nanoparticles.[18]

The molecular adduct formation properties of povidone may be used advantageously in solutions, slow-release solid-dosage forms, and parenteral formulations. Perhaps the best-known example of povidone complex formation is povidone–iodine, which is used as a topical disinfectant.

For accurate standardization of solutions, the water content of the solid povidone must be determined before use and taken into account for any calculations. Many excipients such as povidone may contain peroxides as trace contaminants. These can lead to degradation of an active pharmaceutical ingredient that is sensitive to oxidation.

A specification for povidone is contained in the *Food Chemicals Codex* (FCC).[19]

BP: Proline

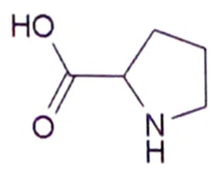
JP: L-Proline

PhEur: Proline

USP–NF: Proline

2 Synonyms

AjiPure; P; Pro; prolinum; 2-pyrrolidinecarboxylic acid.



3 Chemical Name and CAS Registry Number

L-Pyrrolidine-2-carboxylic acid [147-85-3]

4 Empirical Formula and Molecular Weight

$C_5H_9NO_2$ 115.1

5 Structural Formula

6 Functional Category

Dispersing agent.

7 Applications in Pharmaceutical Formulation or Technology

Proline is used as a stabilizer in liquid formulations for injection or infusion. It is more effective than glycine at controlling dimer formation[1,2] and aggregation, maintaining antibody function and reducing discoloration in liquid intravenous immunoglobulin preparations.[1] These stabilizing effects are attributable to proline's amphiphilic properties.[1,3] It has been used in intravenous immunoglobulin preparations at concentrations of 250 mmol/L and at pH 4.8.[3]

8 Description

Proline is an amphiphilic amino acid and occurs as white crystals or crystalline powder and has a sweet taste. It is deliquescent.

9 Pharmacopeial Specifications

See Table I.

Partition coefficient log *P* (octanol : water) = -2.54

Solubility See Table II.

11 Stability and Storage Conditions

Store protected from light in well-closed containers.

12 Incompatibilities

—

13 Method of Manufacture

Proline is synthesized from glutamic acid.

14 Safety

Proline is mostly well-tolerated. Hemolysis-related adverse reactions have been reported in patients given proline-stabilized intravenous immunoglobulins. However, incidences of renal adverse effects were low for proline-stabilized intravenous immunoglobulins, particularly compared with sucrose-stabilized preparations.[4]

Preparations containing proline are contraindicated in patients with hyperprolinaemia.

Increases in amino acid concentrations have been found to induce sister-chromatid exchanges in human lymphocytes. This mutagenic effect was not found to be dose-dependent.[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition,

proline emits toxic nitrogen oxides.[6] Wear suitable protective clothing to avoid inhalation of dust and contact with eyes. Keep away from heat and sources of ignition. Evaporate residue from empty containers under a fume hood as they may otherwise pose a fire risk.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (infusions/injections) and the Canadian Natural Health Products Ingredients Database. Also included in parenteral products licensed in the UK.

17 Related Substances

Glycine; DL-Proline.

DL-Proline

CAS number [609-36-9]
Melting point 190°C when anhydrous, decomposes at 205°C.
Solubility Soluble in water and ethanol; sparingly soluble in acetone, chloroform and benzene; insoluble in ether.
Comments The EINECS number for DL-proline is 210-189-3. The PubChem Compound ID (CID) for DL-proline is 614.

18 Comments

Proline is also used in the cosmetics industry in hair and skin conditioning products.[7]

A specification for proline is included in the *Food Chemicals Codex* (FCC).[8]

The EINECS number for proline is 205-702-2. The PubChem Compound ID (CID) for proline is 145742.

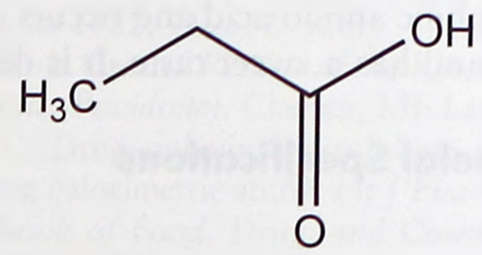
Propionic Acid

1 Nonproprietary Names

USP–NF: Propionic Acid

2 Synonyms

Carboxyethane; ethanecarboxylic acid; E280; ethylformic acid; metacetonic acid; methylacetic acid; propanoic acid; pseudoacetic acid.



3 Chemical Name and CAS Registry Number

Propionic acid [79-09-4]

4 Empirical Formula and Molecular Weight

$C_3H_6O_2$ 74.08

5 Structural Formula

6 Functional Category

Acidulant; antimicrobial preservative; antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Propionic acid is primarily used as an antioxidant and antimicrobial preservative in oral and topical pharmaceutical applications.

8 Description

Propionic acid occurs as a corrosive, oily liquid having a slightly pungent, disagreeable, rancid odor. It is flammable.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for propionic acid.

Test	USP 40–NF 35 S1
Specific gravity	0.988–0.993
Distilling range	138.5–142.5°C
Heavy metals	≤10 ppm
Limit of nonvolatile residue	≤0.01%
Readily oxidizable substances	+
Limit of aldehydes	+
Assay	99.5–100.5%

10 Typical Properties

Antimicrobial activity *see* Table II.

Table II: Typical minimum inhibitory concentrations (MICs) for propionic acid at pH 3.9.[1]

Microorganism	MIC (μg/mL)
Aspergillus niger	2000
Candida albicans	2000
Escherichia coli	2000
Klebsiella pneumoniae	1250
Penicillium notatum	2000
Pseudomonas aeruginosa	3000
Pseudomonas cepacia	3000
Pseudomonas fluorescens	1250
Staphylococcus aureus	2000

Autoignition temperature 513°C
Boiling point 141.1°C
Dissociation constant $pK_a = 4.874$
Flash point 52–58°C (open cup)
Melting point −21.5°C
Partition coefficients Octanol : water = 0.33.
Refractive index $n_D^{25} = 1.3848$
Solubility Miscible with chloroform, ethanol (95%), ether, and water.
Specific gravity 0.9934
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Surface tension 27.21 mN/m (27.21 dynes/cm) at 15°C
Vapor density (relative) 2.56 (air = 1)
Vapor pressure 320 Pa (2.4 mmHg) at 20°C
Viscosity (dynamic) *see* Table III.

Table III: Dynamic viscosity of propionic acid.

Viscosity (dynamic) (mPa s)	Temperature
1.175	15°C
1.02	25°C
0.956	30°C
0.668	60°C
0.495	90°C

11 Stability and Storage Conditions

Although stable, propionic acid is flammable. It should be stored in an airtight container away from heat and flames.

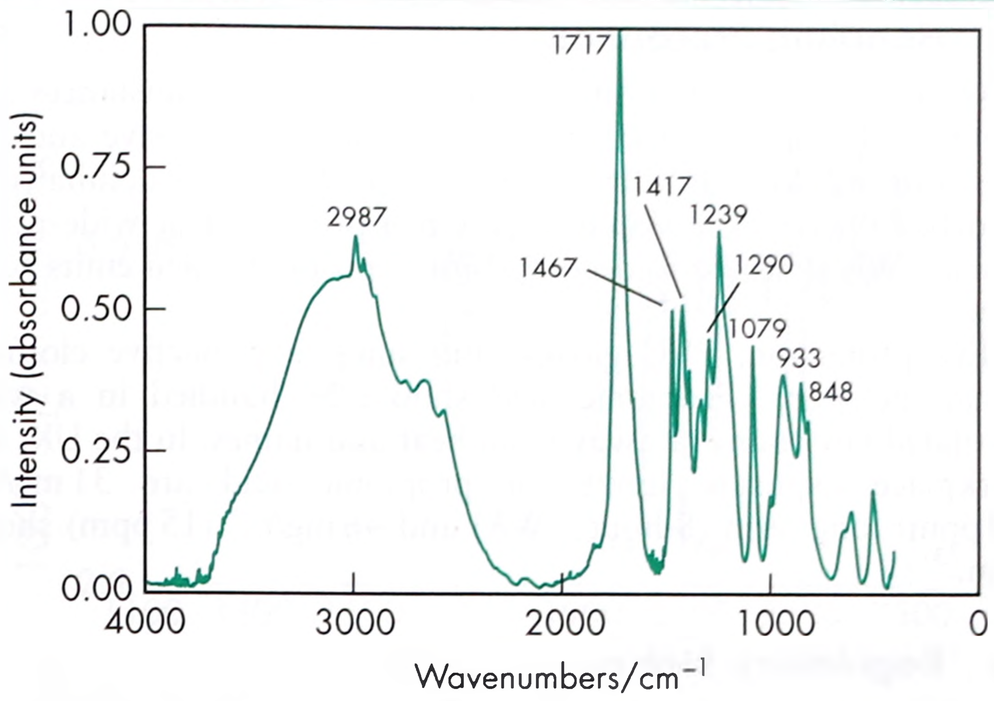


Figure 1: Infrared spectrum of propionic acid measured by transmission. Adapted with permission of Informa Healthcare.

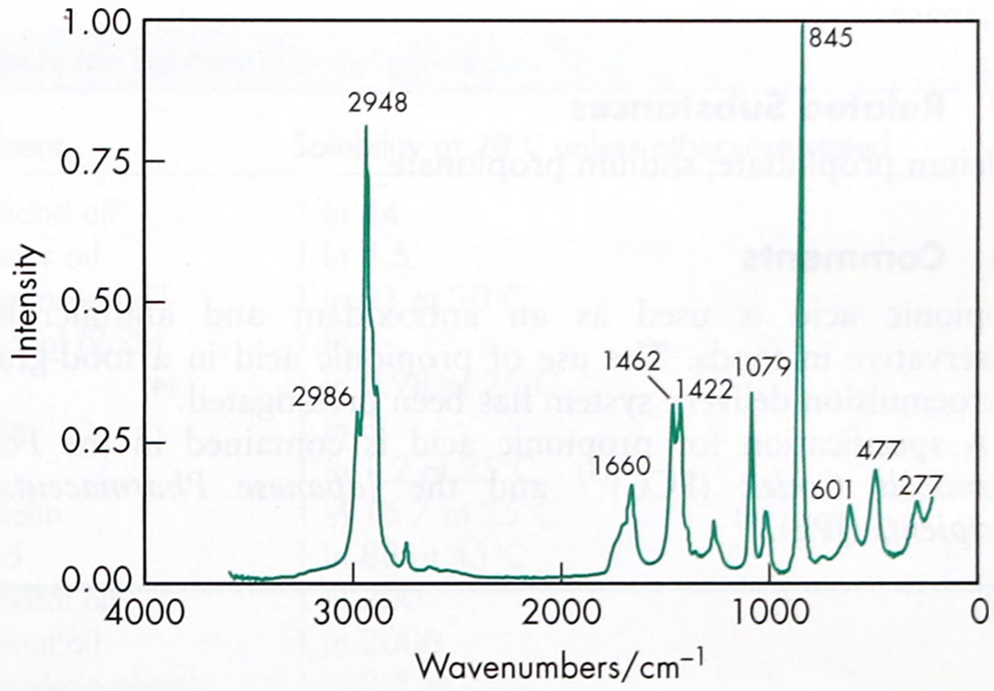

Figure 2: Raman spectrum of propionic acid measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Propionic acid is incompatible with alkalis, ammonia, amines, and halogens. It can be salted out of aqueous solutions by the addition of calcium chloride or other salts.

13 Method of Manufacture

Propionic acid can be obtained from wood pulp waste liquor by fermentation. It can also be prepared from ethylene, carbon monoxide and steam; from ethanol and carbon monoxide using boron trifluoride catalyst; from natural gas; or as a by-product in the pyrolysis of wood. Very pure propionic acid can be obtained from propionitrile. Propionic acid can be found in dairy products in small amounts.

14 Safety

Propionic acid is generally regarded as a nontoxic and nonirritant material when used in low levels as an excipient. Up to 1% may be used in food applications (up to 0.3% in flour and cheese products). Propionic acid is readily metabolized.

The pure form of propionic acid is corrosive and will cause burns to any area of contact. Both liquid and vapor forms are flammable. Concentrated propionic acid is harmful if swallowed, inhaled or absorbed through the skin. Symptoms of overexposure, in addition to irritation of the eyes, skin, nose and throat, include abdominal pain, nausea, and vomiting. *See also* Sodium Propionate.

LD_{50} (mouse, IV): 0.63 g/kg[2]
LD_{50} (rabbit, skin): 0.5 g/kg
LD_{50} (rat, oral): 2.6 g/kg

P

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Propionic acid is corrosive and can cause eye and skin burns. It may be harmful if swallowed, inhaled or absorbed through the skin as a result of prolonged or widespread contact. When heated to decomposition, propionic acid emits acrid fumes.

Eye protection, PVC gloves, and suitable protective clothing should be worn. Propionic acid should be handled in a well-ventilated environment away from heat and flames. In the UK, the workplace exposure limits for propionic acid are 31 mg/m^3 (10 ppm) long-term (8-hour TWA) and 46 mg/m^3 (15 ppm) short-term.[3]

16 Regulatory Status

GRAS listed. Accepted for use in Europe as a food additive. In Japan, propionic acid is restricted to use as a flavoring agent. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Calcium propionate; sodium propionate.

18 Comments

Propionic acid is used as an antioxidant and antimicrobial preservative in foods. The use of propionic acid in a food-grade microemulsion delivery system has been investigated.[4]

A specification for propionic acid is contained in the *Food Chemicals Codex* (FCC)[5] and the *Japanese Pharmaceutical Excipients* (JPE).[6]

The EINECS number for propionic acid is 201-176-3. The PubChem Compound ID (CID) for propionic acid is 1032.

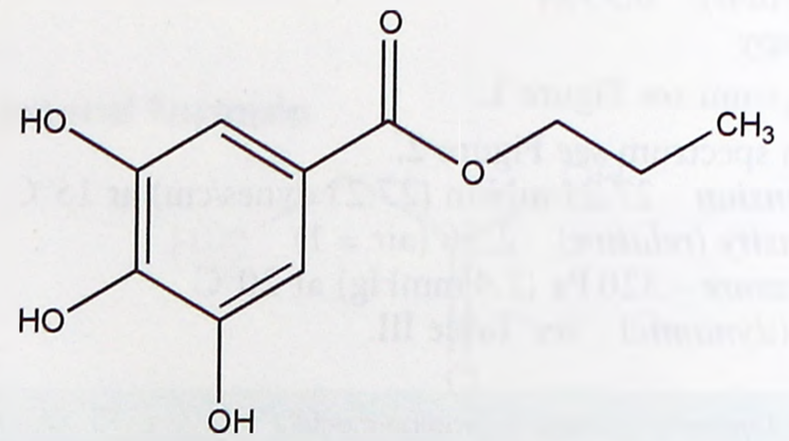
Propyl Gallate

1 Nonproprietary Names

BP: Propyl Gallate
PhEur: Propyl Gallate
USP–NF: Propyl Gallate

2 Synonyms

E310; gallic acid propyl ester; *n*-propyl gallate; *Progallin P*; propyl 3,4,5-trihydroxybenzoate; propylis gallas; *Tenox PG*.



3 Chemical Name and CAS Registry Number

3,4,5-Trihydroxybenzoic acid propyl ester [121-79-9]

4 Empirical Formula and Molecular Weight

$C_{10}H_{12}O_5$ 212.20

5 Structural Formula

6 Functional Category

Antioxidant; antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Propyl gallate has become widely used as an antioxidant in cosmetics, perfumes, foods, and pharmaceuticals since its use in preventing autoxidation of oils was first described in 1943.[1,2] It is primarily used, in concentrations up to 0.1% w/v, to prevent the rancidity of oils and fats;[3] it may also be used at concentrations of

0.002% w/v to prevent peroxide formation in ether, and at 0.01% w/v to prevent the oxidation of paraldehyde. Synergistic effects with other antioxidants such as butylated hydroxyanisole and butylated hydroxytoluene have been reported. Propyl gallate is also said to possess some antimicrobial properties; *see* Section 10.

Studies have shown that, when added to powder blends containing ketorolac, propyl gallate significantly increases the drug stability in the preparation.[4]

Propyl gallate has approximately equivalent antioxidant properties to other alkyl gallates when used in equimolar concentration; however, solubilities vary; *see* Section 17.

8 Description

Propyl gallate is a white, odorless or almost odorless crystalline powder, with a bitter astringent taste that is not normally noticeable at the concentrations employed as an antioxidant.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for propyl gallate.

Test	PhEur 9.2	USP 40–NF 35 S1

Soybean oil	1 in 100 at 25°C
Water	1 in 1000
	1 in 286 at 25°C

11 Stability and Storage Conditions

Propyl gallate is unstable at high temperatures and is rapidly destroyed in oils that are used for frying purposes.

The bulk material should be stored in a well-closed, nonmetallic container, protected from light, in a cool, dry place.

12 Incompatibilities

The alkyl gallates are incompatible with metals, e.g. sodium, potassium, and iron, forming intensely colored complexes. Complex formation may be prevented, under some circumstances, by the addition of a sequestering agent, typically citric acid. Propyl gallate may also react with oxidizing materials.

13 Method of Manufacture

Propyl gallate is prepared by the esterification of 3,4,5-trihydroxybenzoic acid (gallic acid) with *n*-propanol. Other alkyl gallates are prepared similarly using an appropriate alcohol of the desired alkyl chain length.

14 Safety

It has been reported, following animal studies, that propyl gallate has a strong contact sensitization potential.[7] Propyl gallate has also produced cytogenic effects in CHO-K1 cells.[8] However, despite this, there have been few reports of adverse reactions to propyl gallate.[9] Those that have been described include contact

dermatitis, allergic contact dermatitis,[9–13] and methemoglobinemia in neonates.[14]

The WHO has set an estimated acceptable daily intake for propyl gallate at up to 1.4 mg/kg body-weight.[15]

LD_{50} (cat, oral): 0.4 g/kg[16]
LD_{50} (mouse, oral): 1.7 g/kg
LD_{50} (rat, oral): 2.1 g/kg
LD_{50} (rat, IP): 0.38 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. When heated to decomposition, propyl gallate may emit toxic fumes and smoke.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM injections; oral, and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Dodecyl gallate; ethyl gallate; octyl gallate.

Ethyl gallate

Empirical formula $C_9H_{10}O_5$
Molecular weight 198.17
CAS number [831-61-8]
Synonym Ethyl 3,4,5-trihydroxybenzoate
Appearance White, odorless or almost odorless, crystalline powder.
Melting point 151–154°C
Solubility *see* Table IV.

Table IV: Solubility of ethyl gallate.

Solvent	Solubility at 20°C
Ethanol (95%)	1 in 3
Ether	1 in 3
Peanut oil	Practically insoluble
Water	Slightly soluble

18 Comments

Propyl gallate has been reported to impart an 'off' flavor to corn and cottonseed oils when used as an antioxidant.[17]

A specification for propyl gallate is contained in the *Food Chemicals Codex* (FCC) and the *Japanese Pharmaceutical Excipients* (JPE).[18,19]

The EINECS number for propyl gallate is 204-498-2. The PubChem Compound ID (CID) for propyl gallate is 4947.

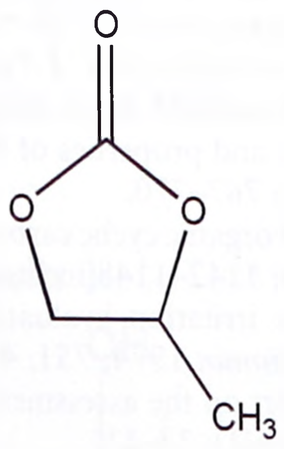
Propylene Carbonate

1 Nonproprietary Names

USP–NF: Propylene Carbonate

2 Synonyms

Carbonic acid; cyclic methylethylene carbonate; cyclic propylene ester; cyclic propylene carbonate; 4-methyl-2-oxo-1,3-dioxolane; 2-oxo-4-methyl-1,3-dioxolane; 1,2-propanediol cyclic carbonate; 1,2-propylene carbonate.



3 Chemical Name and CAS Registry Number

±-4-Methyl-1,3-dioxolan-2-one [108-32-7]

4 Empirical Formula and Molecular Weight

$C_4H_6O_3$ 102.09

5 Structural Formula

6 Functional Category

Solvent.

7 Applications in Pharmaceutical Formulation or Technology

Propylene carbonate is used mainly as a solvent in oral and topical pharmaceutical formulations.

In topical applications, propylene carbonate has been used in combination with propylene glycol as a solvent for corticosteroids. The corticosteroid is dissolved in the solvent mixture to yield microdroplets that can then be dispersed in petrolatum.[1] Propylene carbonate has been used as a dispensing solvent in topical preparations.[2]

Propylene carbonate has also been used in hard gelatin capsules as a nonvolatile, stabilizing, liquid carrier. For formulations with a low dosage of active drug, a uniform drug content may be obtained by dissolving the drug in propylene carbonate and then spraying this solution on to a solid carrier such as compressible sugar; the sugar may then be filled into hard gelatin capsules.[3]

Propylene carbonate has also been used to investigate drug release from rapamycin-loaded micellar copolymers.[4,5]

8 Description

Propylene carbonate is a clear, colorless, odorless, mobile liquid.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Boiling point 242°C
Dielectric constant 66.14 (15–30°C)
Flash point 135°C
Freezing point −48.8°C

Table I: Pharmacopeial specifications for propylene carbonate.

Test	USP 40–NF 35 S1
Identification	+
Specific gravity at 20°C	1.203–1.210
pH[a]	6.0–7.5
Residue on ignition	≤0.01%
Assay	99.0–100.5%

(a) 10% v/v aqueous solution with 0.3% saturated KCl.

Heat of combustion 14.21 kJ/mol (3.40 kcal/mol)
Heat of vaporization 55.2 kJ/mol (13.2 kcal/mol) at 150°C.
Refractive index n_D^{20} = 1.4189
Solubility Practically insoluble in hexane; freely soluble in water. Miscible with acetone, benzene, chloroform, ethanol, ethanol (95%), and ether.
Specific heat 2.57 J/g/°C (0.62 cal/g/°C) at 20°C.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Vapor pressure 4 Pa (0.03 mmHg) at 20°C.
Viscosity (dynamic) 2.5 mPa s (2.5 cP) at 25°C.

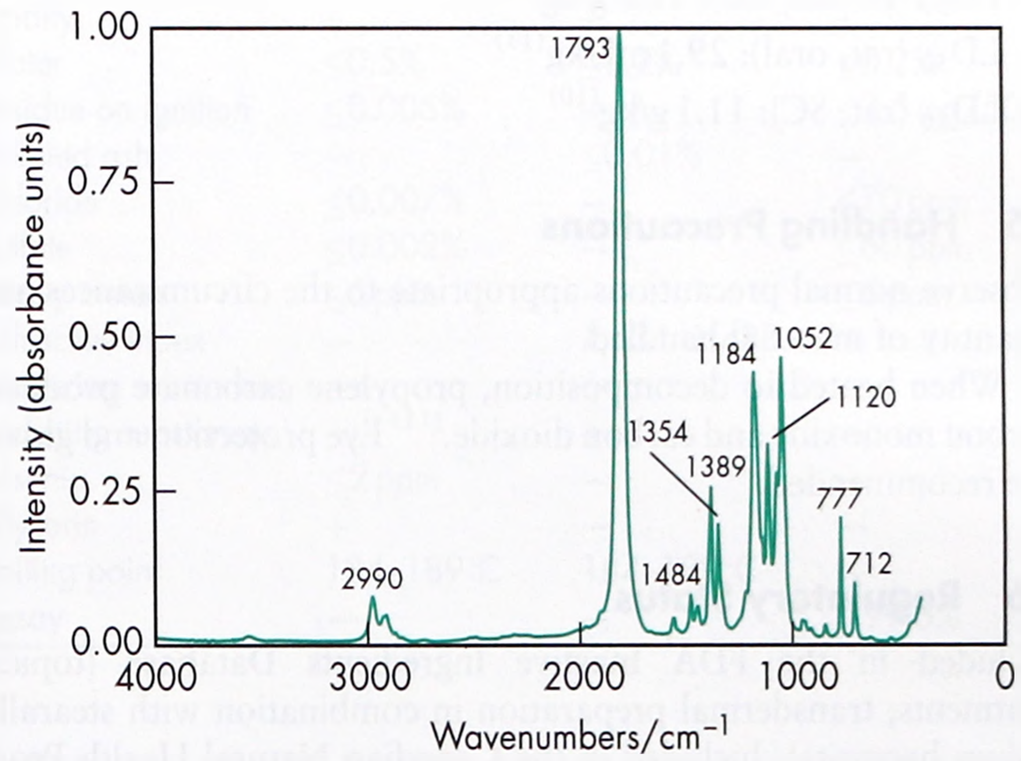


Figure 1: Infrared spectrum of propylene carbonate measured by transmission. Adapted with permission of Informa Healthcare.

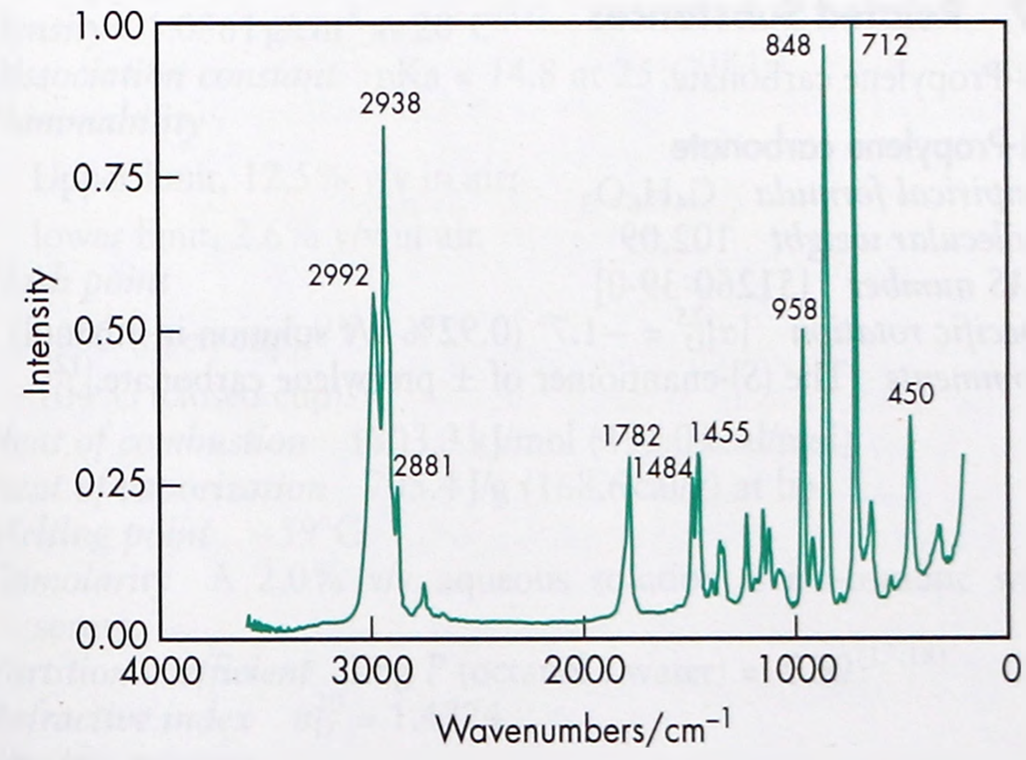

Figure 2: Raman spectrum of propylene carbonate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Propylene carbonate and its aqueous solutions are stable but may degrade in the presence of acids or bases, or upon heating; *see also* Section 12.

Store in a well-closed container in a cool, dry place.

12 Incompatibilities

Propylene carbonate hydrolyzes rapidly in the presence of strong acids and bases, forming mainly propylene oxide and carbon dioxide. Propylene carbonate can also react with primary and secondary amines to yield carbamates.

13 Method of Manufacture

Propylene oxide reacts with carbon dioxide to yield propylene carbonate.[4] Propylene carbonate may also be prepared by the reaction of sodium bicarbonate with propylene chlorohydrin.[5]

14 Safety

Propylene carbonate is used as a solvent in oral and topical pharmaceutical formulations, and is generally regarded as an essentially nontoxic and nonirritant material. However, it may be irritant to the eyes and mucous membranes.

In animal studies, propylene carbonate was found to cause tissue necrosis after parenteral administration.[8]

LD_{50} (mouse, oral): 20.7 g/kg[9]
LD_{50} (mouse, SC): 15.8 g/kg[10]
LD_{50} (rat, oral): 29.1 mL/kg[11]
LD_{50} (rat, SC): 11.1 g/kg[10]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

When heated to decomposition, propylene carbonate produces carbon monoxide and carbon dioxide.[11] Eye protection and gloves are recommended.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical ointments; transdermal preparation in combination with stearalkonium hectorite). Included in the Canadian Natural Health Products Ingredient Database.

17 Related Substances

(*S*)-Propylene carbonate.

(*S*)-Propylene carbonate
Empirical formula $C_4H_6O_3$
Molecular weight 102.09
CAS number [51260-39-0]
Specific rotation $[\alpha]_D^{25} = -1.7°$ (0.92% v/v solution in ethanol)
Comments The (*S*)-enantiomer of ±-propylene carbonate.[12]

18 Comments

Propylene carbonate may be used as a solvent, at room and elevated temperatures, for many cellulose-based polymers and plasticizers. Propylene carbonate is also used in cosmetics.

It has been suggested that the substitution of acetonitrile as an organic modifier in mobile phases for liquid chromatography by mixtures of propylene carbonate and ethanol may be considered a more environmental approach for pharmaceutical applications.[13]

The EINECS number for propylene carbonate is 203-572-1. The PubChem Compound ID (CID) for propylene carbonate is 7924.

$C_3H_8O_2$ 76.09

5 Structural Formula

6 Functional Category

Antimicrobial preservative; humectant; plasticizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Propylene glycol has become widely used as a solvent, extractant, humectant, and preservative in a variety of parenteral and nonparenteral pharmaceutical formulations. *See* Table I.

It is a better general solvent than glycerin and dissolves a wide variety of materials, such as corticosteroids, phenols, sulfa drugs, barbiturates, vitamins (A and D), most alkaloids, and many local anesthetics.

Propylene glycol is commonly used as a plasticizer in aqueous film-coating formulations.

The effect of propylene glycol on the freeze-thaw of injectable formulations has been investigated.[1,2] An investigation into skin penetration enhancers found propylene glycol altered the skin barrier properties, therefore may have potential use in treatment of impaired skin barrier conditions.[3]

Propylene glycol has also been investigated in various delivery systems, including self-emulsifying and mucoadhesive systems,[4–12] as a plasticizer in hot-melt extruded sustained-release formulations,[13] and in a formulation to improve the stability of photosensitive drugs.[14]

8 Description

Propylene glycol is a clear, colorless, viscous, practically odorless liquid, with a sweet, slightly acrid taste resembling that of glycerin.

Table I: Uses of propylene glycol.

Use	Dosage form	Concentration (%)
Humectant	Topicals	≈15
Preservative	Solutions, semisolids	15–30
Solvent or cosolvent	Aerosol solutions	10–30
	Oral solutions	10–25
	Parenterals	10–60
	Topicals	5–80

9 Pharmacopeial Specifications

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for propylene glycol.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Appearance	—	+	—
Specific gravity	1.035–1.040	1.035–1.040	1.035–1.037
Acidity	+	+	+
Water	≤0.5%	≤0.2%	≤0.2%
Residue on ignition	≤0.005%	—	≤3.5 mg/50 g
Sulfated ash	—	≤0.01%	—
Chloride	≤0.007%	—	≤70 ppm
Sulfate	≤0.002%	—	≤60 ppm
Heavy metals	≤5 ppm	—	≤5 ppm
Refractive index	—	1.431–1.433	—
Oxidizing substances	—	+	—
Reducing substances	—	+	—
Arsenic	≤2 ppm	—	—
Glycerin	+	—	—
Boiling point	184–189°C	184–189°C	—
Assay	—	—	≥99.5%

10 Typical Properties

Autoignition temperature 371°C
Boiling point 187–188°C
Density 1.0361 g/cm^3 at 20°C[15]
Dissociation constant pKa = 14.8 at 25°C[16,17]
Flammability
Upper limit, 12.5% v/v in air;
lower limit, 2.6% v/v in air.
Flash point
99°C (open cup);[18]
104°C (closed cup).[18]
Heat of combustion 1803.3 kJ/mol (431.0 kcal/mol)
Heat of vaporization 705.4 J/g (168.6 cal/g) at bp
Melting point −59°C
Osmolarity A 2.0% v/v aqueous solution is iso-osmotic with serum.
Partition coefficient Log *P* (octanol : water) = -0.92[17,18]
Refractive index n_D^{20} = 1.4324
Specific rotation
$[\alpha]_D^{20}$ = −15.0° (neat) for (*R*)-form;
$[\alpha]_D^{20}$ = +15.8° (neat) for (*S*)-form.

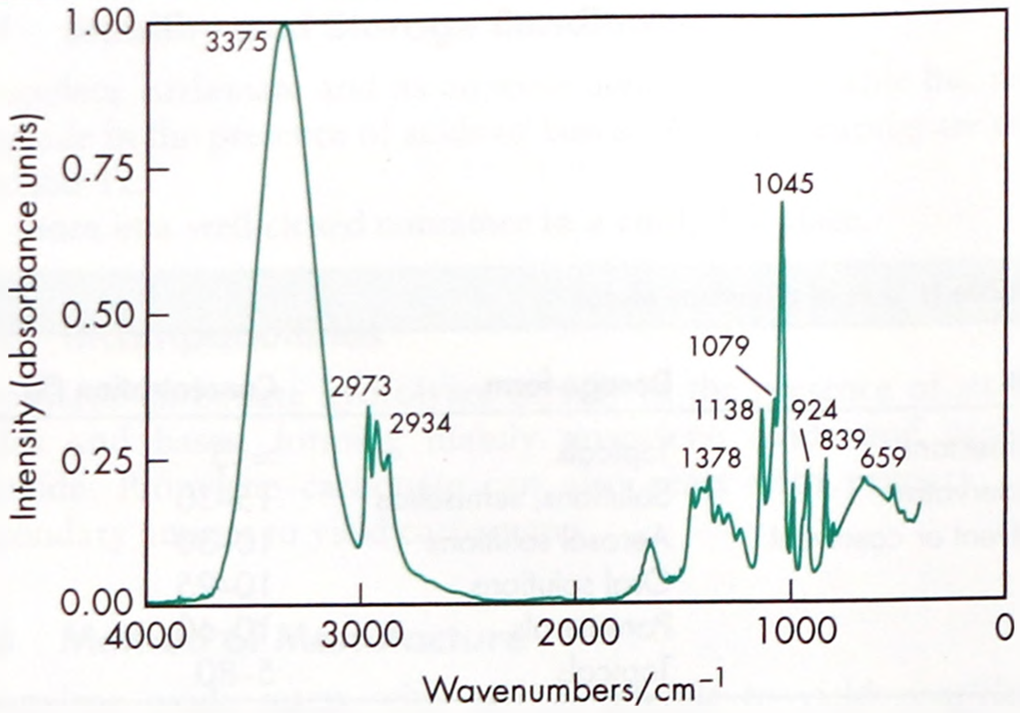

Figure 1: Infrared spectrum of propylene glycol measured by transmission. Adapted with permission of Informa Healthcare.

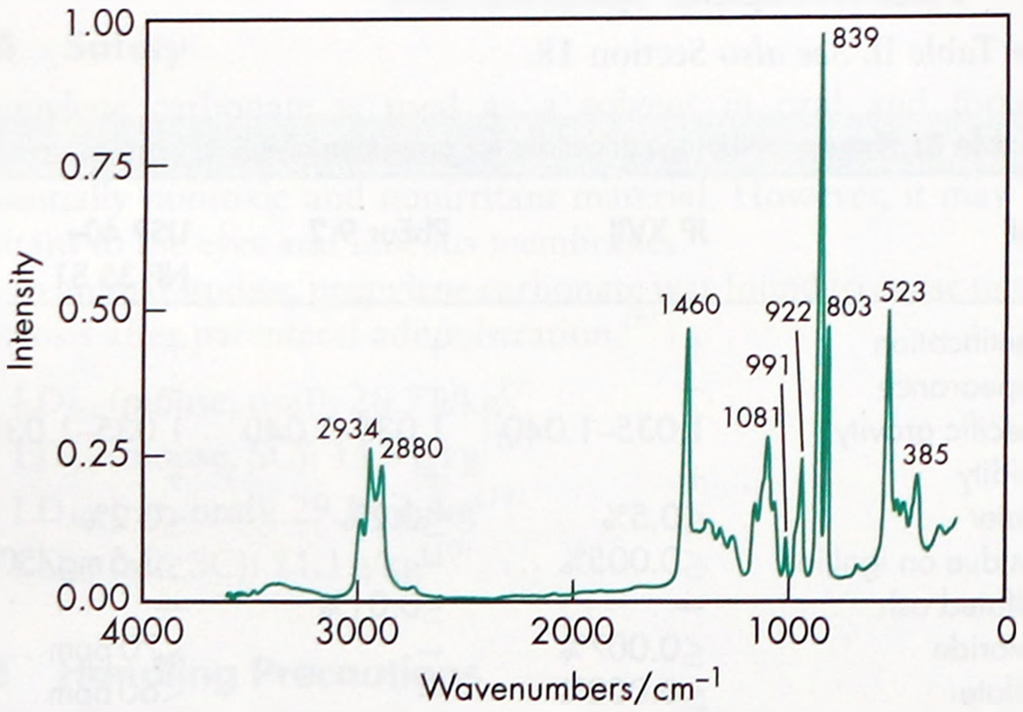

Figure 2: Raman spectrum of propylene glycol measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Solubility Miscible with acetone, chloroform, ethanol (95%), methanol; glycerin, and water; soluble at 1 in 6 parts of ether; not miscible with light mineral oil or fixed oils, but will dissolve some essential oils.

Specific heat 2.47 J/g (0.590 cal/g) at 20°C.

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Surface tension 40.1 mN/m (40.1 dynes/cm) at 25°C.

Vapor density (relative) 2.62 (air = 1)

Vapor pressure 9.33 Pa (0.07 mmHg) at 20°C.

Viscosity (dynamic) 58.1 mPa s (58.1 cP) at 20°C.

11 Stability and Storage Conditions

At cool temperatures, propylene glycol is stable in a well-closed container, but at high temperatures, in the open, it tends to oxidize, giving rise to products such as propionaldehyde, lactic acid, pyruvic acid, and acetic acid. When heated to decomposition, propylene glycol emits acrid smoke and toxic fumes of CO and CO_2.

Propylene glycol is chemically stable when mixed with ethanol (95%), glycerin, or water; aqueous solutions may be sterilized by autoclaving.

Propylene glycol is hygroscopic and should be stored in a well-closed container, protected from light, in a cool, dry place.

12 Incompatibilities

Propylene glycol is incompatible with oxidizing reagents such as potassium permanganate.

13 Method of Manufacture

Propylene is converted to chlorohydrin by chlorine water and hydrolyzed to 1,2-propylene oxide. With further hydrolysis, 1,2-propylene oxide is converted to propylene glycol.[19]

14 Safety

Propylene glycol is used in a wide variety of pharmaceutical formulations and is generally regarded as a relatively nontoxic material. It is also used extensively in foods and cosmetics. As a likely consequence of its metabolism and excretion, propylene glycol is less toxic than other glycols. Propylene glycol is rapidly absorbed from the gastrointestinal tract; there is also evidence that it is absorbed topically when applied to damaged skin. It is extensively metabolized in the liver, mainly to lactic and pyruvic acids, and is also excreted unchanged in the urine.[20,21]

In topical preparations, propylene glycol is regarded as minimally irritant,[22] although it is more irritant than glycerin. There have been some reports of contact dermatitis associated with propylene glycol,[23–25] and some local irritation is produced upon application to mucous membranes or when it is used under occlusive conditions.[26] Systemic dermatitis has been documented after ingestion of propylene glycol through food or medicine,[27] while parenteral administration may cause pain or irritation when propylene glycol is used in high concentration.

Propylene glycol is estimated to be one-third as intoxicating as ethanol, with administration of large volumes being associated with adverse effects most commonly on the central nervous system, especially in neonates and children.[28–31] Other adverse reactions reported, though generally isolated, include: ototoxicity;[32] cardiovascular effects; seizures; and hyperosmolarity[33] and lactic acidosis, both of which occur most frequently in patients with renal impairment. Adverse effects are more likely to occur following consumption of large quantities of propylene glycol or on administration to neonates, children under 4 years of age, pregnant women, and patients with hepatic or renal failure. Adverse events may also occur in patients treated with disulfiram or metronidazole.[34]

An intravenous acetaminophen preparation containing propylene glycol was administered to 60 neonates in a prospective cohort study; it was found that a median exposure of 34.1 mg/kg a day was tolerated well.[35] However, the same authors caution that neonates have a lower tolerance limit to propylene glycol than adults, and more research is needed in neonates.[36] On the basis of metabolic and toxicological data, the WHO has set an acceptable daily intake of propylene glycol at up to 25 mg/kg body-weight.[37] Formulations containing 35% propylene glycol can cause hemolysis in humans.

In animal studies, there has been no evidence that propylene glycol is teratogenic or mutagenic. Rats can tolerate a repeated oral daily dose of up to 30 mL/kg body-weight in the diet over 6 months, while the dog is unaffected by a repeated oral daily dose of 2 g/kg in the diet for 2 years.[38]

LD_{50} (mouse, IP): 9.72 g/kg[39]
LD_{50} (mouse, IV): 6.63 g/kg
LD_{50} (mouse, oral): 22.0 g/kg
LD_{50} (mouse, SC): 17.37 g/kg
LD_{50} (rat, IM): 14.0 g/kg
LD_{50} (rat, IP): 6.66 g/kg
LD_{50} (rat, IV): 6.42 g/kg
LD_{50} (rat, oral): 20.0 g/kg
LD_{50} (rat, SC): 22.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Propylene glycol should be handled in

a well-ventilated environment; eye protection and gloves are recommended. In the UK, the long-term (8-hour TWA) workplace exposure limit for propylene glycol vapor and particulates is 474 mg/m^3 (150 ppm) and 10 mg/m^3 for particulates.[40]

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (buccal films, dental preparations; IM and IV injections; inhalations; ophthalmic, oral, otic, percutaneous, rectal, topical, photopheresis, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Propylene glycol alginate.

18 Comments

Propylene glycol is one of the materials that have been selected for harmonization by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

As an antiseptic it is similar to ethanol, and against molds it is similar to glycerin and only slightly less effective than ethanol. In addition to its uses as an excipient, propylene glycol is used in veterinary medicine as an oral glucogenic in ruminants.[41]

A possible hepatoprotective effect of propylene glycol due to the inhibition of CYP2E1 has been found in a single-blinded crossover study in 15 healthy subjects taking liquid and solid preparations of acetaminophen.[42]

Propylene glycol is also used in cosmetics and in the food industry as a carrier for emulsifiers and as a vehicle for flavors in preference to ethanol, since its lack of volatility provides a more uniform flavor.

A specification for potassium glycol is contained in the *Food Chemicals Codex* (FCC).[43]

The EINECS number for propylene glycol is 200-338-0. The PubChem Compound ID (CID) for propylene glycol is 1030.

Propylene Glycol Alginate

1 Nonproprietary Names

USP–NF: Propylene Glycol Alginate

2 Synonyms

Alginic acid, propylene glycol ester; E405; hydroxypropyl alginate; *Kelcoloid*; *Kimiloid*; *Manucol Ester*; *PGA*; *Profoam*; propane-1,2-diol alginate; *TIC Pretested*.

P

3 Chemical Name and CAS Registry Number

Propylene glycol alginate [9005-37-2]

4 Empirical Formula and Molecular Weight

Propylene glycol alginate is a propylene glycol ester of alginic acid, a linear glycuronan polymer consisting of a mixture of β-(1→4)-D-mannosyluronic acid and α-(1→4)-L-gulosyluronic acid residues.

5 Structural Formula

See Section 4.

6 Functional Category

Emulsifying agent; foam stabilizing agent; suspending agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Propylene glycol alginate is used as a stabilizing, suspending, gelling, and emulsifying agent in oral and topical pharmaceutical formulations. Typically, a concentration of 0.3–5.0% w/v is used, although this may vary depending upon the specific application and the grade of propylene glycol alginate used.

8 Description

Propylene glycol alginate occurs as a white to yellowish colored, practically odorless and tasteless, fibrous or granular powder.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

Table I: Pharmacopeial specifications for propylene glycol alginate.

Test	USP 40–NF 35 S1
Identification	+
Microbial limits	≤200 cfu/g
Loss on drying	≤20.0%
Ash	≤10.0%
Arsenic	≤3 ppm
Lead	≤10 ppm
Heavy metals	≤40 ppm
Free carboxyl groups	+
Esterified carboxyl groups	+
Assay (of alginates)	+

10 Typical Properties

Solubility Soluble in dilute organic acids and water, forming stable, viscous, colloidal solutions at pH 3. Depending upon the degree of esterification, propylene glycol alginate is also soluble in aqueous ethanol/water mixtures containing up to 60% w/w of ethanol (95%). The interfacial and foaming properties of propylene glycol alginate aqueous solutions have been studied, and were found to be affected by the degree of esterification and molecular weight.[1]

Spectroscopy

NIR spectrum *see* Figure 1.

Viscosity (dynamic) The viscosity of aqueous solutions depends upon the grade of material used. Typically, a 1% w/v aqueous solution has a viscosity of 20–400 mPa s (20–400 cP). Viscosity may vary depending upon concentration, pH, temperature, or the presence of metal ions. *See also* Sodium Alginate.

11 Stability and Storage Conditions

Propylene glycol alginate is a stable material, although it will gradually become less soluble if stored at elevated temperatures for extended periods.

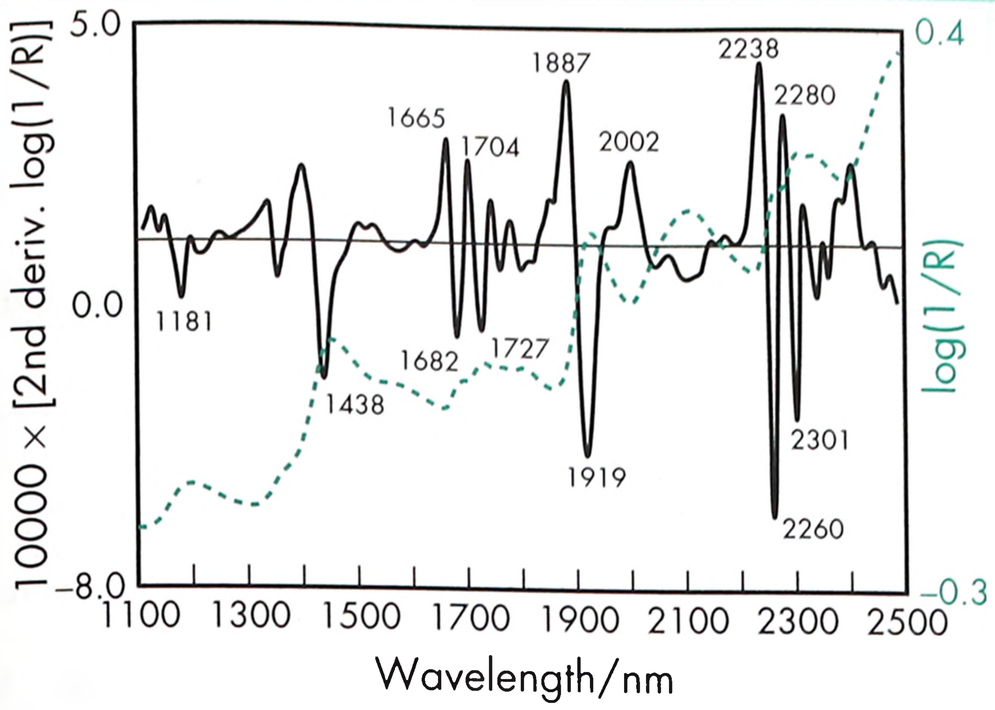

Figure 1: Near-infrared spectrum of propylene glycol alginate measured by reflectance.

Propylene glycol alginate solutions are most stable at pH 3–6. In alkaline solutions, propylene glycol alginate is rapidly saponified. Alginate solutions are susceptible to microbial spoilage and should be sterilized or preserved with an antimicrobial preservative. However, sterilization processes may adversely affect the viscosity of propylene glycol alginate solutions; *see* Sodium Alginate.

The bulk material should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Propylene glycol alginate is incompatible with strong oxidizing agents.

13 Method of Manufacture

Alginic acid, extracted from brown seaweed, is reacted with propylene oxide to form propylene glycol alginate. Various grades may be obtained that differ in composition according to the degree of esterification and the percentage of free and neutralized carboxyl groups present in the molecule; complete esterification of alginic acid is impractical.

14 Safety

Propylene glycol alginate is used in oral and topical pharmaceutical formulations. It is generally regarded as a nontoxic and nonirritant material, although excessive oral consumption may be harmful. A study in five healthy male volunteers fed a daily intake of 175 mg/kg body-weight of propylene glycol alginate for 7 days, followed by a daily intake of 200 mg/kg body-weight of propylene glycol alginate for a further 16 days, showed no significant adverse effects.[2]

Inhalation of alginate dust may be irritant and has been associated with industrially related asthma in workers involved in alginate production. However, it appears that the cases of asthma were linked to exposure to seaweed dust rather than pure alginate dust.[3]

LD_{50} (hamster, oral): 7.0 g/kg[4]
LD_{50} (mouse, oral): 7.8 g/kg
LD_{50} (rabbit, oral): 7.6 g/kg
LD_{50} (rat, oral): 7.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled.

Propylene glycol alginate may be irritant to the eyes or respiratory system if inhaled as dust; *see* Section 14. Eye protection, gloves, and a dust respirator are recommended. Propylene glycol alginate should be handled in a well-ventilated environment and kept away from heat.

16 Regulatory Status

GRAS listed. Accepted in Europe for use as a food additive. Included in the FDA Inactive Ingredients Database (oral preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Alginic acid; propylene glycol; sodium alginate.

18 Comments

Propylene glycol alginate is also used in cosmetics and food products.

A specification for propylene glycol alginate is contained in the *Food Chemicals Codex* (FCC).[5] A specification for propylene glycol alginate is also contained in the *Japanese Pharmaceutical Excipients* (JPE).[6] *See* Alginic Acid and Sodium Alginate for further information.

Propylene Glycol Dilaurate

1 Nonproprietary Names

BP: Propylene Glycol Dilaurate

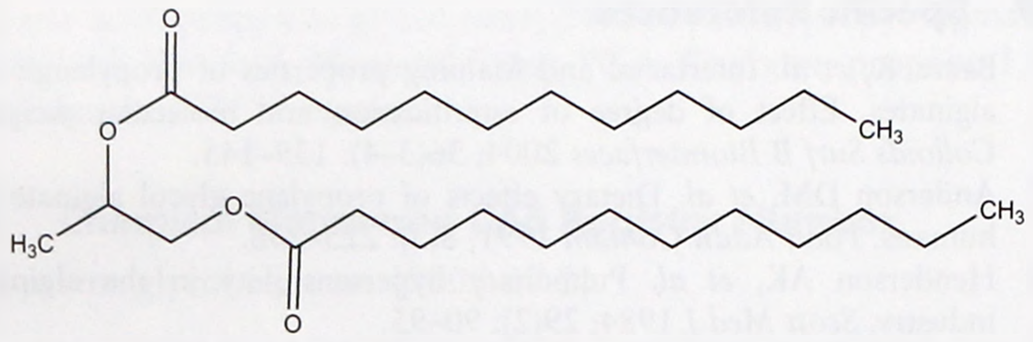
PhEur: Propylene Glycol Dilaurate

USP–NF: Propylene Glycol Dilaurate

2 Synonyms

Capmul PG-2L; 2-dodecanoyloxypropyl dodecanoate; dodecanoic acid, diester with 1,2-propanediol; dodecanoic acid, 1-methyl-1,2-ethanediyl ester; E477; *Emalex PG di-L*; propane-1,2-diyl didodecanoate; lauric acid, diester with propane-1,2-diol; 1-methyl-1,2-ethanediyl ester dodecanoic acid; propylene dilaurate; propylene ester lauric acid; propylenglycoli dilauras.

3 Chemical Name and CAS Registry Number



2-Dodecanoyloxypropyl dodecanoate [22788-19-8]

4 Empirical Formula and Molecular Weight

$C_{27}H_{52}O_4$ 440.7

The USP 40–NF 35 S1 and PhEur 9.2 describe propylene glycol dilaurate as a mixture of the propylene glycol mono- and di-esters of lauric acid, containing not less than 70% of diesters and not more than 30% of monoesters.

5 Structural Formula

6 Functional Category

Emollient; emulsifying agent; emulsion stabilizing agent; nonionic surfactant; oleaginous vehicle; penetration enhancer; solubilizing agent; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Propylene glycol dilaurate is used as a lipid excipient in the formulation of emulsions, microemulsions, soft gelatin capsules, suppositories, lotions, creams and preparations intended for topical drug delivery. It has been shown to act as a skin penetration enhancer.[1,2]

8 Description

Propylene glycol dilaurate occurs as a colorless or slightly yellow, clear oily liquid.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for propylene glycol dilaurate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Acid value	≤ 4	≤ 4
Iodine value	≤ 1	≤ 1
Saponification value	230–250	230–250
Free propylene glycol	≤ 2%	≤ 2%
Water	≤ 1.0%	≤ 1.0%

Assay		
Diesters	≥ 70%	≥ 70%
Monoesters	≤ 30%	≤ 30%

10 Typical Properties

Boiling point 504.7°C at 760 mmHg[3]

Density 0.915 g/cm^3;[3] 0.897 g/cm^3 at 30°C

Flash point 236°C[3]

HLB value Approx. 2.2 for *Emalex PG-di-L*; 2 for *Capmul PG-2L*.

Refractive index n_D^{20} 1.454[3]

Solubility Practically insoluble in water; very soluble in alcohol, methanol, and methylene chloride.

11 Stability and Storage Conditions

Store in tightly closed containers protected from light and moisture.

12 Incompatibilities

Propylene glycol dilaurate is incompatible with strong oxidizing agents.[3]

13 Method of Manufacture

Propylene glycol dilaurate is produced from a reaction between propylene glycol and lauric acid.

14 Safety

Propylene glycol dilaurate is generally not classified as hazardous and is regarded as safe for use in pharmaceutical and cosmetic[4] formulations in the present practice of use. Being a mono- and diester of lauric acid, it may be safely used in food when prescribed conditions are followed.[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Avoid contact with skin and eyes. When heated to decomposition, propylene glycol dilaurate emits carbon oxides. Avoid breathing dust, vapor, mist or gas. Suitable protective clothing is recommended. Avoid sources of ignition.[3]

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets). Accepted for use as a food additive in Europe.

17 Related Substances

Propylene glycol monolaurate.

18 Comments

Propylene glycol dilaurate finds wide application in the food industry.

In the cosmetic industry it is an important nonionic surfactant ingredient in the formulation of creams, lotions and hair conditioners due to its ability to stabilize emulsions. It is also used as a thickener in the formulation of cosmetics.

The EINECS number for propylene glycol dilaurate is 245-217-3. The PubChem Compound (CID) number for propylene glycol dilaurate is 90838.

Propylene Glycol Monolaurate

1 Nonproprietary Names

BP: Propylene Glycol Monolaurate

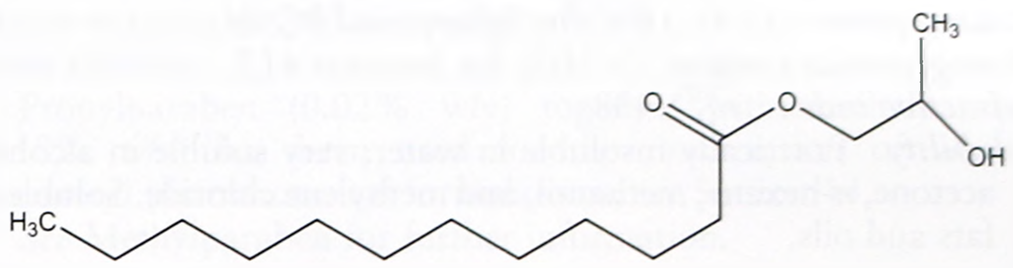
PhEur: Propylene Glycol Monolaurate

USP–NF: Propylene Glycol Monolaurate

2 Synonyms

Capmul PG-12; *Cithrol PGML*; dodecanoic acid, monoester with 1,2 propanediol; E477; *Emalex PGML*; *Imwitor 412*; lauric acid, 2-hydroxypropyl ester; lauric acid, monoester with 1,2 propanediol; *Lauroglycol 90*; *Lauroglycol FCC*; 1,2–Propanediol, 1-laurate; propylene glycol monododecanoate; propylenglycoli monolauras; *Schercemol PGML*; *STELLIESTERS LPG*.

3 Chemical Name and CAS Registry Number



1,2 Propanediol monolaurate [27194-74-7] and [142-55-2]

4 Empirical Formula and Molecular Weight

$C_{15}H_{30}O_3$ 258.4

The PhEur 9.2 and USP 40–NF 35 S1 describe propylene glycol monolaurate as a mixture of propylene glycol mono- and diesters of lauric acid. Based on content, type I (45–70% monoesters and 30–55% diesters) and type II (≥90% monoesters and ≤10% diesters) have been identified.

5 Structural Formula

6 Functional Category

Emollient; emulsifying agent; nonionic surfactant; oleaginous vehicle; penetration enhancer; solubilizing agent.

7 Applications in Pharmaceutical Formulation or Technology

Propylene glycol monolaurate is used as a diluent in soft and hard gelatin capsules. It is also used as a penetration enhancer in transdermal drug delivery systems,[1–6] a co-emulsifier or secondary emulsifier in microemulsions,[7] a nontoxic emulsifier in dentifices, and in self-nanoemulsifying drug delivery systems.[8,9] Propylene glycol monolaurate is used as a solvent for lipophilic actives.

8 Description

Propylene glycol monolaurate occurs as a colorless or slightly yellow oily liquid at 20°C.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for propylene glycol monolaurate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Acid value	≤4	≤4
Iodine value	≤1	≤1
Saponification value		
Type I	210–245	210–245
Type II	200–230	200–230
Free propylene glycol		
Type I	≤5%	≤5%
Type II	≤1%	≤1%
Water	≤1.0%	≤1.0%
Ash	≤0.1%	≤0.1%
Fatty acid composition		
Caprylic acid C8	≤0.5%	≤0.5%
Capric acid C10	≤2.0%	≤2.0%
Lauric acid C12	≥95.0%	≥95.0%
Myristic acid C14	≤3.0%	≤3.0%
Palmitic acid C16	≤1.0%	≤1.0%
Assay		
Type I		
Monoesters	45–70%	45–70%
Diesters	30–55%	30–55%
Type II		
Monoesters	≥90%	≥90%
Diesters	≤10%	≤10%

10 Typical Properties

Boiling point 362.5°C at 760 mmHg;[10] >210°C for *Lauroglycol FCC* and *Lauroglycol 90.*
Density 0.91–0.95 g/cm^3
Flash point 188°C (open cup); also reported as 139.3°C.[10]
HLB value 4.5; 3 for *Lauroglycol FCC*; 5 for *Lauroglycol 90.*
Hydroxyl value 110–140 for Imwitor 412.
Melting point 15°C; 10°C for *Schercemol PGML.*
Monoglyceride content > 50% for *Imwitor 412.*
Refractive index n_D^{60} 1.438
Solubility Practically insoluble in water; very soluble in alcohol, acetone, *n*-hexane, methanol, and methylene chloride. Soluble in fats and oils.

11 Stability and Storage Conditions

Propylene glycol monolaurate shows visible decomposition when heated in the presence of oxygen. When heated to decomposition, or subjected to incomplete combustion, propylene glycol dilaurate emits carbon oxides. In situations where crystallization occurs, the product should be heated to 40–50°C and homogenized prior to use.

Store in tightly closed containers protected from light and moisture.

12 Incompatibilities

Propylene glycol monolaurate is incompatible with strong oxidizing agents.

13 Method of Manufacture

Propylene glycol monolaurate is manufactured by the esterification of propylene glycol and lauric acid.

14 Safety

Propylene glycol monolaurate is generally regarded as safe for use in pharmaceutical and cosmetic[11] formulations in the present practice of use. Prolonged or frequently repeated skin contact may cause allergic reactions in hypersensitive individuals exposed to this product, and it may also cause eye irritation.

LD_{50} (rat, oral): 2.0 g/kg for *Lauroglycol 90* and *Lauroglycol FCC*[12]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Use in a well-ventilated environment, and avoid contact with skin and eyes. Suitable protective clothing is recommended. Avoid sources of ignition.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral tablets, and transdermal controlled-release films). Included in nonparenteral medicines licensed in the UK. Accepted for use as a food additive in Europe. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Propylene glycol dilaurate.

18 Comments

Propylene glycol monolaurate has been investigated as a cosolvent in a self-emulsifying oral formulation of coenzyme Q10.[13]

Propylene glycol monolaurate is used as a lipid excipient for veterinary products, including for food-producing animals. It is also used in the agricultural industry for the formulation of some herbicides and pesticides.[14] Propylene glycol monolaurate is also used as an emollient or lubricant in skin lotions and lipsticks. In skin lotions it is used to increase the resistance to freezing and decrease the tendency to produce surface crusts.[15]

The EINECS number for propylene glycol monolaurate is 248-315-4 and 205-542-3. The PubChem Compound (CID) number for propylene glycol monolaurate is 14870.

3 Chemical Name and CAS Registry Number

Propyl 4-hydroxybenzoate [94-13-3]

4 Empirical Formula and Molecular Weight

$C_{10}H_{12}O_3$ 180.20

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Propylparaben is widely used as an antimicrobial preservative in cosmetics, food products, and pharmaceutical formulations; *see* Table I.

It may be used alone, in combination with other paraben esters, or with other antimicrobial agents. It is one of the most frequently used preservatives in cosmetics.[1]

The parabens are effective over a wide pH range and have a broad spectrum of antimicrobial activity, although they are most effective against yeasts and molds; *see* Section 10.

Owing to the poor solubility of the parabens, the paraben salts, particularly the sodium salt, are frequently used in formulations. This may cause the pH of poorly buffered formulations to become more alkaline.

Propylparaben (0.02% w/v) together with methylparaben (0.18% w/v) has been used for the preservation of various parenteral pharmaceutical formulations; *see* Section 14.

See Methylparaben for further information.

Table I: Uses of propylparaben in pharmaceutical preparations.

Use	Concentration (%)
IM, IV, SC injections	0.005–0.2
Inhalation solutions	0.015
Intradermal injections	0.02–0.26
Nasal solutions	0.017
Ophthalmic preparations	0.005–0.01
Oral solutions and suspensions	0.01–0.02
Rectal preparations	0.02–0.1
Topical preparations	0.01–0.6
Vaginal preparations	0.02–0.1

8 Description

Propylparaben occurs as a white, crystalline, odorless, and tasteless powder.

9 Pharmacopeial Specifications

The pharmacopeial specifications for propylparaben have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for propylparaben.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—

Related substances	+	+	+
Assay	98.0–102.0%	98.0–102.0%	98.0–102.0%

(a) This test has not been fully harmonized at the time of publication.

10 Typical Properties

Antimicrobial activity Propylparaben exhibits antimicrobial activity between pH 4–8. Preservative efficacy decreases with increasing pH owing to the formation of the phenolate anion. Parabens are more active against yeasts and molds than against bacteria. They are also more active against Gram-positive than against Gram-negative bacteria. The activity of the parabens increases with increasing chain length of the alkyl moiety; however, solubility decreases.

Activity may be improved by using combinations of parabens, as additive effects occur. Propylparaben has been used with methylparaben in parenteral preparations, and is used in combination with other parabens in topical and oral formulations. Activity has also been reported to be improved by the addition of other excipients; *see* Methylparaben.

Reported minimum inhibitory concentrations (MICs) for propylparaben are provided in Table III.[2]

Boiling point 295°C
Density (bulk) 0.426 g/cm^3
Density (tapped) 0.706 g/cm^3
Density(true) 1.288 g/cm^3
Dissociation constant pK_a = 8.4 at 22°C
Flash point 140°C
Partition coefficients Values for different vegetable oils vary considerably and are affected by the purity of the oil; *see* Table IV.

Table III: Minimum inhibitory concentrations (MICs) for propylparaben in aqueous solution.[2]

Microorganism	MIC (μg/mL)
Aerobacter aerogenes ATCC 8308	1000
Aspergillus niger ATCC 9642	500
Aspergillus niger ATCC 10254	200

NIR spectrum *see* Figure 2.
Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Aqueous propylparaben solutions at pH 3–6 can be sterilized by autoclaving, without decomposition.[4] At pH 3–6, aqueous solutions are stable (less than 10% decomposition) for up to about 4 years at room temperature, while solutions at pH 8 or above are subject to rapid hydrolysis (10% or more after about 60 days at room temperature).[5]

See Table VI, for the predicted rate constants and half-lives at 25°C for propylparaben.[5]

Propylparaben should be stored in a well-closed container in a cool, dry place.

Table VI: Predicted rate constants and half-lives at 25°C for propylparaben dissolved in hydrochloric acid solution.

Initial pH of solution	Rate constant $k \pm \sigma$[a] (h^{-1})	Half-life $t_{1/2} \pm \sigma$[a] (day)
1	$(1.255 \pm 0.042) \times 10^{-4}$	230 ± 7.6
2	$(1.083 \pm 0.081) \times 10^{-5}$	2670 ± 200
3	$(8.41 \pm 0.96) \times 10^{-7}$	34 300 ± 3900
4	$(2.23 \pm 0.37) \times 10^{-7}$	130 000 ± 22 000

(a) σ indicates the standard error.

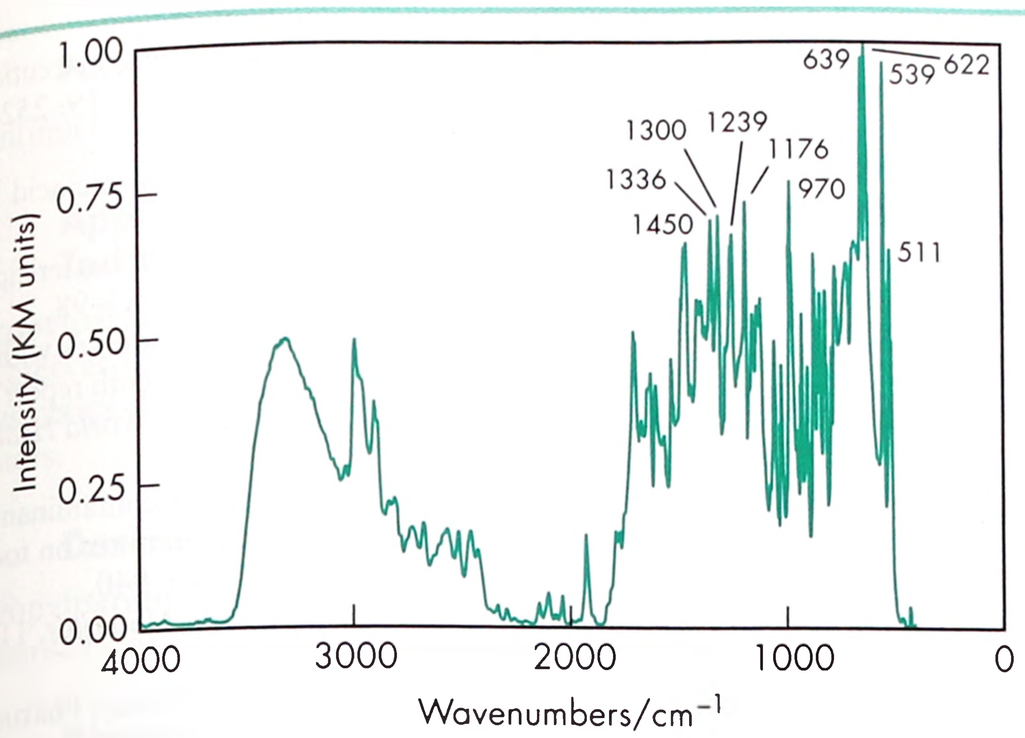

Figure 1: Infrared spectrum of propylparaben measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

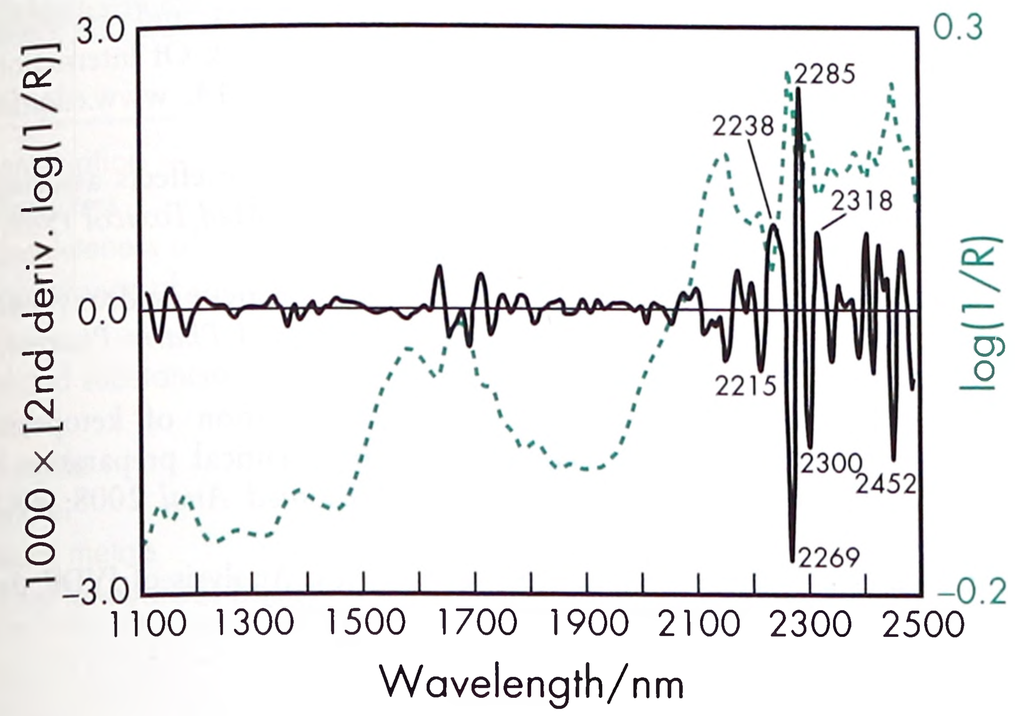

Figure 2: Near-infrared spectrum of propylparaben measured by reflectance.

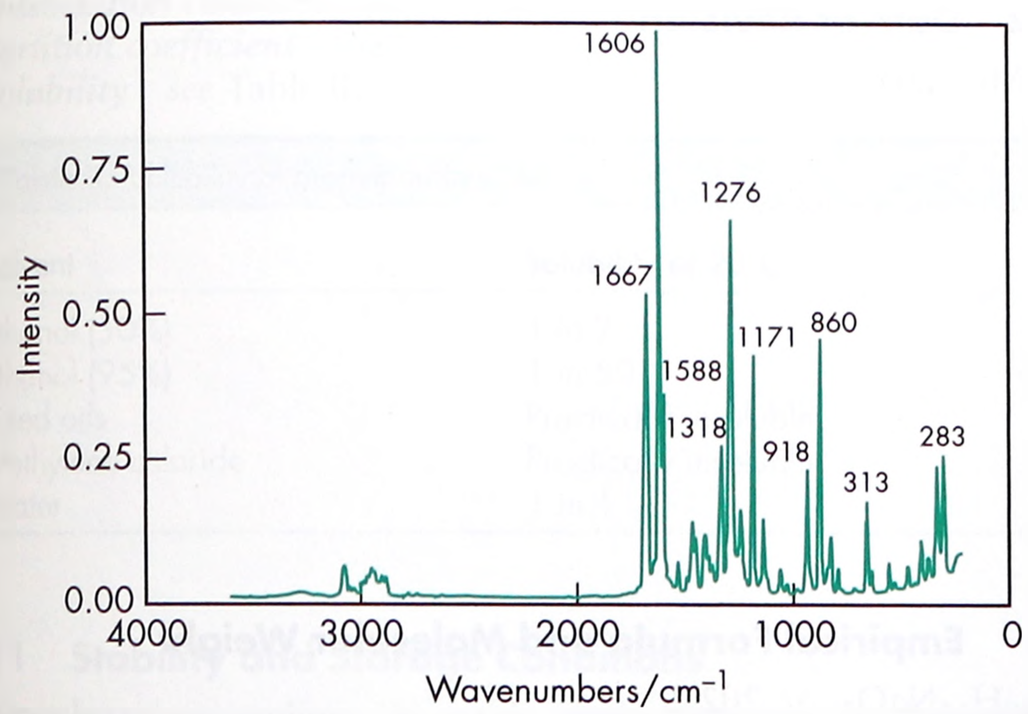

Figure 3: Raman spectrum of propylparaben measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

The predicted amount of propylparaben remaining after autoclaving is given in Table VII.[5]

12 Incompatibilities

The antimicrobial activity of propylparaben is reduced considerably in the presence of nonionic surfactants as a result of micellization.[6] Absorption of propylparaben by plastics has been reported, with the amount absorbed dependent upon the type of plastic and the vehicle.[7] Magnesium aluminum silicate, magnesium trisilicate, yellow iron oxide, and ultramarine blue have also been reported to absorb propylparaben, thereby reducing preservative efficacy.[8,9]

Propylparaben is discolored in the presence of iron and is subject to hydrolysis by weak alkalis and strong acids.

See also Methylparaben.

Table VII: Predicted amount of propylparaben dissolved in hydrochloric acid, after autoclaving.

Initial pH of solution	Rate constant $k \pm \sigma^{(a)}$ (h^{-1})	Predicted residual amount after sterilization (%)
1	$(4.42 \pm 0.10) \times 10^{-1}$	86.30 ± 0.30
2	$(4.67 \pm 0.19) \times 10^{-2}$	98.46 ± 0.06
3	$(2.96 \pm 0.24) \times 10^{-3}$	99.90 ± 0.01
4	$(7.8 \pm 1.1) \times 10^{-4}$	99.97 ± 0.004

13 Method of Manufacture

Propylparaben is prepared by the esterification of *p*-hydroxybenzoic acid with *n*-propanol.

14 Safety

Propylparaben and other parabens are widely used as antimicrobial preservatives in cosmetics, food products, and oral and topical pharmaceutical formulations.

Propylparaben and methylparaben have been used as preservatives in injections and ophthalmic preparations; however, they are now generally regarded as being unsuitable for these types of formulations owing to the irritant potential of the parabens.

Systemically, no adverse reactions to parabens have been reported, although they have been associated with hypersensitivity reactions. The WHO has set an estimated acceptable total daily intake for methyl- and ethylparabens at up to 10 mg/kg bodyweight.[10] However, propylparaben has been excluded from this group in light of *in vitro* and *in vivo* evidence of effects on male reproductive parameters in rats. The occurrence and potency of these effects increase with increasing alkyl chain length. The likelihood of these effects in humans is unclear.[11]

See Methylparaben for more information.

LD_{50} (mouse, IP): 0.2 g/kg[12]
LD_{50} (mouse, oral): 6.33 g/kg
LD_{50} (mouse, SC): 1.65 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Propylparaben may be irritant to the skin, eyes, and mucous membranes, and should be handled in a well-ventilated environment. Eye protection, gloves, and a dust mask or respirator are recommended.

16 Regulatory Status

Propylparaben and methylparaben are affirmed GRAS direct food substances in the US at levels up to 0.1%. All esters except the benzyl ester are allowed for injection in Japan.

In cosmetics, the EU and Brazil allow use of each paraben at 0.4%, but the total of all parabens may not exceed 0.8%. The upper limit in Japan is 1.0%.

Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IM, IV, and SC injections; inhalations; ophthalmic preparations; oral capsules, solutions, suspensions, and tablets; otic, rectal, topical, and vaginal preparations). Included in parenteral and nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

Butylparaben; ethylparaben; methylparaben; propylparaben potassium; propylparaben sodium.

Propylparaben potassium
Empirical formula $C_{10}H_{11}KO_3$
Molecular weight 218.30
CAS number [84930-16-5]
Synonyms Potassium propyl hydroxybenzoate; propyl 4-hydroxybenzoate potassium salt.

18 Comments

Propylparaben has undergone harmonization for many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

A specification for propylparaben is contained in the *Food Chemicals Codex* (FCC).[13]

The EINECS number for propylparaben is 202-307-7. The PubChem Compound ID (CID) for propylparaben is 7175.

See Methylparaben for further information and references.

P

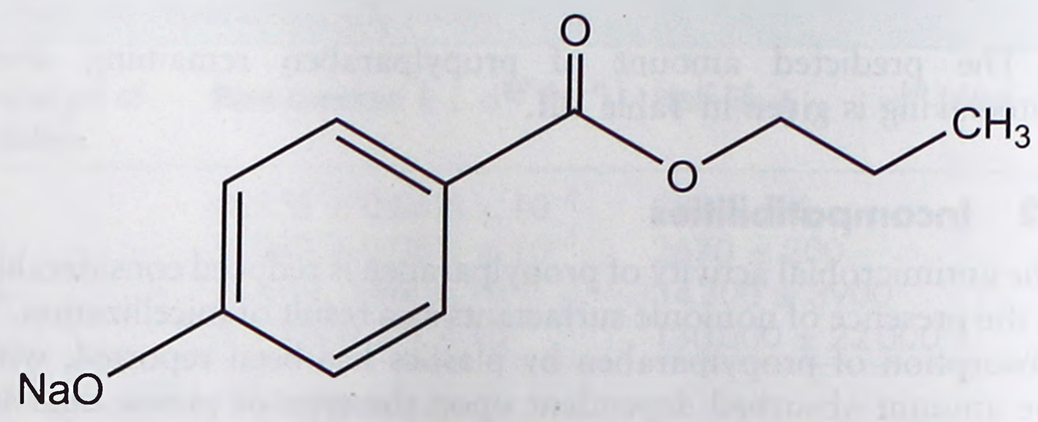
Propylparaben Sodium

1 Nonproprietary Names

BP: Sodium Propyl Hydroxybenzoate
PhEur: Sodium Propyl Parahydroxybenzoate
USP–NF: Propylparaben Sodium

2 Synonyms

E217; 4-hydroxybenzoic acid propyl ester, sodium salt; *Nipasol M Sodium*; parasept; propyl 4-hydroxybenzoate, sodium salt; propyl *p*-hydroxybenzoate, sodium salt; propylis parahydroxybenzoas natricus; sodium 4-propoxycarbonylphenolate; sodium propyl *p*-hydroxybenzoate; soluble propyl hydroxybenzoate.



3 Chemical Name and CAS Registry Number

Sodium 4-propoxycarbonylphenolate [35285-69-9]

4 Empirical Formula and Molecular Weight

$C_{10}H_{11}NaO_3$ 202.2

5 Structural Formula

6 Functional Category

Antimicrobial preservative.

7 Applications in Pharmaceutical Formulation or Technology

Propylparaben sodium is used as an antibacterial or antifungal preservative in oral pharmaceuticals and in many water-based cosmetics. It is generally used in combination with other parabens esters.

8 Description

Propylparaben sodium occurs as a white, crystalline, odorless or almost odorless powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for propylparaben sodium.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Completeness of solution	–	+
Appearance of solution	+	–
pH	9.5–10.5	9.5–10.5
Related substances	+	–
Water	≤5.0%	≤5.0%
Chloride	350 ppm	≤0.035%
Sulfate	300 ppm	≤0.12%
Heavy metals	–	–
Assay (anhydrous basis)	99.0–104.0	98.5–101.5%

10 Typical Properties

Acidity/alkalinity pH = 9.5–10.5 (0.1% w/v aqueous solution)
Dissociation constant pK_a = 8.4 at 22°C
Partition coefficient log *P* (octanol : water) = 3.0
Solubility *see* Table II.

Table II: Solubility of propylparaben sodium.

Solvent	Solubility at 20°C
Ethanol (50%)	1 in 2
Ethanol (95%)	1 in 50
Fixed oils	Practically insoluble
Methylene chloride	Practically insoluble
Water	1 in 1

11 Stability and Storage Conditions

Propylparaben sodium is stable under normal conditions. It decomposes on heating. Store in a tightly closed container.

12 Incompatibilities

The activity of propylparaben sodium can be adversely affected by the presence of other excipients or active ingredients, such as atropine, essential oils, iron, magnesium trisilicate, talc, polysorbate 80 and other nonionic surfactants, sorbitol, weak alkalis, and strong acids.[1]

13 Method of Manufacture

Propylparaben sodium is produced from benzoic acid.

14 Safety

Propylparaben sodium is used in oral pharmaceuticals and cosmetics. The pure form is toxic by the IV route and moderately toxic by ingestion and the IP route. Propylparaben sodium may cause asthma, rashes, and hyperactivity.

See also Propylparaben.

LD_{50} (mouse, IP): 0.49 g/kg
LD_{50} (mouse, IV): 0.18 g/kg
LD_{50} (mouse, oral): 3.7 g/kg[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. Avoid inhalation or contact with eyes, skin, and clothing. Avoid prolonged or repeated exposure. Wear suitable protective clothing, gloves, eye/face protection, and a respirator.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, tablets, suspensions). Accepted for use as a food additive in Europe. Included in nonparenteral medicines (oral capsules, mixtures, orodispersible tablets, solutions and suspensions; cutaneous emulsions) licensed in the UK.

17 Related Substances

Butylparaben; ethylparaben; methylparaben; propylparaben.

18 Comments

Propylparaben sodium may be used instead of propylparaben because of its greater aqueous solubility. However, it may cause the pH of a formulation to become more alkaline.

The EINECS number for propylparaben sodium is 252-488-1. The PubChem Compound ID (CID) for propylparaben sodium is 23679044.

Pullulan

1 Nonproprietary Names

BP: Pullulan

JP: Pullulan

PhEur: Pullulan

USP–NF: Pullulan

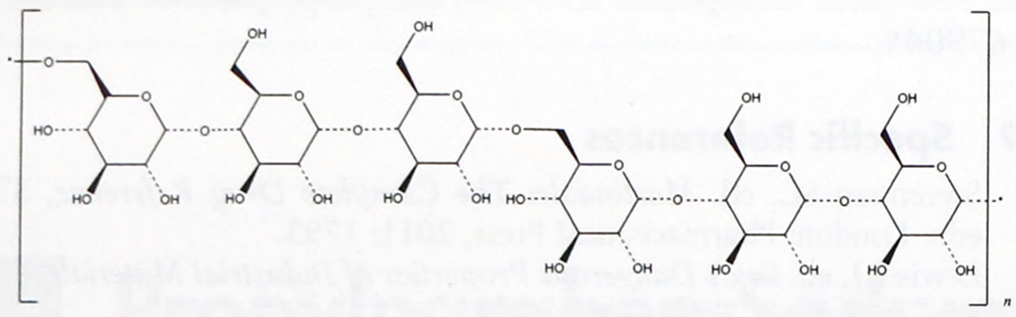
2 Synonyms

E1204; 1,4-1,6-α-D-glucan; 1,6-α-D-glucan; 1,6-α-linked maltotriose; *Pullulan PI-10*; *Pullulan PI-20*.

3 Chemical Name and CAS Registry Number

Poly[6-α-D-glucopyranosyl-(1→4)-α-D-glucopyranosyl-(1→4)-α-D-glucopyranosyl-(1→] [9057-02-07]

4 Empirical Formula and Molecular Weight



$(C_{36}H_{60}O_{30})_n$ n = 1250 approx. (for *Pullulan PI-20*)

The molecular weight may range from 8000 to more than 2 000 000 Da, depending upon conditions under which the producing organism is grown.

The USP 40–NF 35 S1 describes pullulan as a neutral, simple polysaccharide produced by the growth of the polymorphic fungus *Aureobasidium pullulans* with a chain structure of repeated α-1,6 bonds of maltotriose composed of three glucoses in α-1,4 bonds. It may contain some maltotetraosyl units.

The PhEur similarly describes pullulan as a neutral polysaccharide produced by the growth of *Aureobasidium pullulans*; it is a chain structure consisting of repeated α-1,6 linked maltotriose units, each of which is composed of three α-1,4 linked D-glucopyranose units, and it may contain some maltotetraosyl units.

5 Structural Formula

6 Functional Category

Capsule shell material; coating agent; film-forming agent; tablet and capsule diluent; tablet and capsule binder; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Pullulan has been used in pharmaceutical formulation as a polymer carrier for producing quick-dissolving edible films by a solvent casting method.[1–3] It can also be formed into capsule shells that are water-soluble with relatively low oxygen permeability, which may be useful for ingredients sensitive to oxidation.[4]

Granular pullulan can be used in tablets to improve the tableting performance of both drugs and other excipients.[4] Pullulan can also be used in the formulation of tablet coatings. When used as a base coat it is claimed to provide improved adhesion; and when used as a topcoat it increases the strength and resilience of the coating.[4]

The films formed by drying pullulan solutions are highly oxygen impermeable and have excellent mechanical properties.[5]

Pullulan is widely used in cosmetics for the preparation of shampoos, skin care, and facial cleansing products. It has also been used in Japan for many years as a food additive and ingredient for coatings on food.[4]

8 Description

Pullulan occurs as a white to off-white odorless powder.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for pullulan.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Viscosity (kinematic)	100–180 $mm^2 s^{-1}$	100–180 $mm^2 s^{-1}$	100–180 $mm^2 s^{-1}$
Microbial limits			
Bacteria	–	<100 cfu/g	<100 cfu/g
Yeasts and molds	–	–	<100 cfu/g
pH	4.5–6.5	4.5–6.5	4.5–6.5
Loss on drying	≤6.0%	≤6.0%	≤6.0%
Residue on ignition	≤0.3%	≤0.3%	≤0.3%
Heavy metals	≤5 ppm	–	≤5 μg/g
Content of monosaccharide, disaccharide, and oligosaccharides	≤10.0%	≤10.0%	≤10.0%
Nitrogen content	≤0.05%	≤0.05%	≤0.05%

10 Typical Properties

Ash 0–0.16 for *Pullulan PI-20*[6]

Combined mono-, di-, and oligosaccharides 5.0–8.7% for *Pullulan PI-20*[6]

Hygroscopicity Pullulan is not hygroscopic. Moisture content is 10–15% at relative humidity of less than 70%.

Lead <1 mg/kg for *Pullulan PI-20*[6]

Nitrogen 0.002–0.004 for *Pullulan PI-20*[6]

pH 5-7 for *Pullulan PI-20* (10% w/w aqueous solution)[6]

Purity 91.2–95.0% dry weight for *Pullulan PI-20*[6]

Refractive index Significant positive linear correlation of concentration and refractive index at 20 and 45°C.

Solubility Freely soluble in cold and hot water. Soluble in dimethylformamide or dimethyl sulfoxide. Practically insoluble in ethanol. Insoluble in organic solvents such as methylene chloride.

Viscosity 132–179 $mm^2 s^{-1}$ for *Pullulan PI-20* 10% w/w aqueous solution at 30°C.[6]

11 Stability and Storage Conditions

Pullulan is nonreducing and relatively stable. It decomposes and carbonizes at 250–280°C. It is stable in aqueous solution over a wide pH range and in the presence of salts and most metal ions; only prolonged heating at pH <3 leads to a decrease in viscosity, which is indicative of hydrolytic depolymerization.[6]

Store in well-closed containers at room temperature.

12 Incompatibilities

—

13 Method of Manufacture

Pullulan is produced by mesophilic (22–30°C) fermentation of starch syrup with the black yeast *Aureobasidium pullulans*. The culture is filtered, sterilized, decolorized, and further filtered before removal of salts and protein contaminants with an ion-exchange resin. The liquid is concentrated, decolorized, and filtered before being evaporated to dryness. The solid is then pulverized.

14 Safety

Studies have indicated that pullulan is hydrolyzed only very slowly by gastrointestinal enzymes but is fermented to short-chain fatty acids by intestinal microorganisms.[7] A dietary level of 10% pullulan equal to 7.9 g/kg per day was tolerated by male and female rats without toxicological effects.[7] The acceptable daily intake for humans is <10 g.

There was no indication of genotoxic potential in a mutagenicity study in *Salmonella typhimurium*.[8]

LD_{50} (mice, oral): >14 g/kg[7]
LD_{50} (rat, oral): >24 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Approved as a food ingredient in Japan. Included in the Canadian Natural Health Products Ingredients Database. Included in nonparenteral medicines licensed in the UK.

17 Related Substances

Dextran; dextrin.

18 Comments

In the brand name *Pullulan PI-20*, P stands for pullulan, I stands for deionized, and 20 designates the average molecular weight of approx. 200 000 Da.

Pullulan has been found to stabilize a moisture-sensitive drug in a lyophilized formulation owing to the restricted water mobility in the polysaccharide.[9] Studies have indicated that nanoparticles of pullulan have merit as possible carriers for intracellular delivery of genes and nucleotide drugs.[10]

Chemically substituted pullulans capable of forming hydrogels have been described.[11] Pullulan-stearic acid conjugates have been used to prepare nanoparticles for drug delivery.[12] Pullulan acetate phthalate has been shown to improve the dissolution rate of diazepam from co-ground mixtures.[13]

Pullulan and dextran are both polysaccharides derived from microbial fermentation of starch or other sugar sources.

A specification for pullulan is included in the *Food Chemicals Codex* (FCC)[14] and the *Japanese Pharmaceutical Excipients* (JPE).[15]

The EINECS number for pullulan is 232-945-1.

Pyroxylin

1 Nonproprietary Names

BP: Pyroxylin
JP: Pyroxylin
USP–NF: Pyroxylin

2 Synonyms

Celloidin; cellulose nitrate; cellulose tetranitrate; collodion (see Section 7); collodion wool; colloxylin; pyroxylin solution; nitrocellulose; *Parlodion*; soluble guncotton; xyloidin.

3 Chemical Name and CAS Registry Number

Pyroxylin [9004-70-0]

4 Empirical Formula and Molecular Weight

$(C_{12}H_{16}N_4O_{18})_n$ $(504.3)_n$

5 Structural Formula

Pyroxylin is a mixture of nitrates of cellulose, corresponding to the introduction of 2 to 2.5 nitrate groups per sugar unit.

Collodion USP 40–NF 35 S1 contains pyroxylin 40 g, ether 750 mL, and alcohol 250 mL and is prepared by adding the alcohol and the ether to the pyroxylin and shaking occasionally until the pyroxylin is dissolved.

BP 2017 states that collodion for the preparation of flexible collodion (*see* Section 17) is prepared by adding 100 g of pyroxylin to 900 mL of a mixture of 3 volumes of solvent ether and 1 volume of ethanol (90 %) and agitating until dissolved.

6 Functional Category

Film-forming agent.

7 Applications in Pharmaceutical Formulation or Technology

Pyroxylin is used in the preparation of collodions, which are applied to the skin for the protection of small cuts and abrasions. In addition, pyroxylin has been investigated in the preparation of microcapsules,[1] and in the preparation of thermo-responsive controlled-release systems.[2–4]

Collodion is a liquid preparation intended for local external application to the skin; it includes pyroxylin as the film-forming agent. Application of collodion to the skin results in the evaporation of the solvent, and a transparent, occlusive, flexible film forms on the skin. Flexibility of the film is conferred by the inclusion of a plasticizing agent such as castor oil, while the presence of camphor in the formulation makes the films waterproof. Collodion can be used to seal off minor cuts or wounds that have partially healed, or as a means of holding a dissolved medicament, such as salicylic acid, in contact with the skin for long periods.

Collodion has been used as a vehicle for fluorouracil in an attempt to reduce or eliminate the side effects of fluorouracil treatment of solar keratoses;[5] fluorouracil in collodion has also been used to treat common warts on the hands.[6]

8 Description

Pyroxylin occurs as white or almost white cuboid granules, white flakes, or fibrous material. The fibrous material resembles absorbent cotton but is harsher to the touch and more powdery. Both the granules and the fibrous material appear moist and are highly flammable.

Collodion is a colorless or pale yellow syrupy liquid with an odor of ether.

9 Pharmacopeial Specifications

See Tables I and II. *See also* Section 17 and 18.

Table I: Pharmacopeial specifications for pyroxylin.

Test	BP 2017	JP XVII	USP 40–NF 35 S1
Identification	+	+	–
Characteristics	+	+	–
Clarity and color of solution	+	+	–
Viscosity (kinematic)	1160–2900 mm^2/s	–	–
Nitrogen	11.7–12.2%	–	–
Acidity	–	+	+
Water-soluble substances	–	≤ 1.5 mg	≤ 1.5 mg
Residue on ignition	–	≤ 0.3%	≤ 0.3%
Viscosity (dynamic)	–	–	110–147 mPa s

Table II: Pharmacopeial specifications for collodion.

Test	BP 2017	USP 40–NF 35 S1
Identification	–	+
Characteristics	+	–
Specific gravity	0.785–0.795	0.765–0.775
Acidity	–	+
Alcohol content	–	22.0–26.0%
Viscosity (kinematic)	405–700 mm^2/s	–
Assay	–	≥5.0% w/w

10 Typical Properties

The properties of nitrated celluloses largely depend upon the number of nitrate groups introduced into the cellulose molecule.

Autoignition temperature 180–190°C (collodion)
Boiling point 38°C (collodion)
Explosion limits 2–36% (collodion)
Flash point –45°C (closed cup) (collodion)
Melting point –123°C (collodion)
Solubility Pyroxylin is freely soluble in acetone, and very slightly soluble in diethyl ether. It is soluble in methanol, amyl acetate, and glacial acetic acid but is insoluble in water and ether–alcohol mixtures. Collodion is insoluble in water; on the addition of water to collodion, pyroxylin may precipitate.

11 Stability and Storage Conditions

Pyroxylin should be stored loosely packed, protected from light, and stored at a temperature not exceeding 15°C, remote from fire. The containers should be suitably designed to disrupt should the internal pressure reach or exceed 1400 kPa. The amount of damping or moistening fluid must not be allowed to fall below

25% w/w; should this happen, the material should either be rewetted or used immediately for the preparation of collodion.

Upon heating or exposure to light, pyroxylin is decomposed with the evolution of nitrous acid vapors, leaving a carbonaceous residue.

Collodion USP should be stored in airtight containers at a temperature not exceeding 30°C and remote from fire. The label of collodion USP should include a caution statement to the effect that collodion is highly flammable.

When heated to decomposition, collodion emits toxic fumes including oxides of carbon and oxides of nitrogen.

12 Incompatibilities

Pyroxylin is incompatible with oxidizing agents.

Collodion is incompatible with acetyl peroxide, bromoazide, chlorine, strong oxidizing agents, strong acids, strong bases and amines. It readily forms explosive mixtures with air.

13 Method of Manufacture

Pyroxylin is a nitrated cellulose obtained by the action of a mixture of nitric and sulfuric acids on wood pulp or cotton linters that have been freed from fatty matter. It must be damped or moistened with not less than 25% by weight of isopropyl alcohol or of an alcohol such as industrial methylated spirit.

14 Safety

Pyroxylin may cause allergic skin reactions.

Collodion causes irritation to the skin, eyes, and respiratory tract. Collodion should not be considered as a tablet or sugar coating as it is toxic and remains insoluble in the gastrointestinal tract.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled.

Pyroxylin is highly flammable. Particular care should be exercised when drying pyroxylin as the material obtained is explosive and sensitive to ignition by impact or friction; it should be handled as carefully as possible.

Collodion as liquids and vapors is highly flammable and it is explosive. Keep away from heat, sparks, and flames and use only with adequate ventilation.

16 Regulatory Status

Pyroxylin is included in gels, solutions, and paints for topical administration in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Flexible collodion.

Flexible collodion

Nonproprietary names

BP: Flexible Collodion

USP–NF: Flexible Collodion

Description Flexible collodion USP contains camphor 20 g, castor oil 30 g, and collodion to 1000 g; the ingredients are weighed into a bottle and the mixture shaken until the camphor is dissolved.

Flexible collodion BP is a solution of colophony in a mixture of virgin castor oil and collodion. If prepared extemporaneously, it contains colophony 25 g, virgin castor oil 25 g, and collodion to 1000 mL. The ingredients are mixed and stirred until the colophony has dissolved, allowing any deposit to settle and decanting the clear liquid.

Pharmacopeial specifications *See* Table III.

Table III: Pharmacopeial specifications for flexible collodion.

Test	BP 2017	USP 40–NF 35 S1
Identification	+	+
Specific gravity	–	0.770–0.790
Alcohol content	20–23% v/v	21–25%

pH Neutral (for a 1% solution of flexible collodion in water).

Solubility Flexible collodion is very slightly soluble in cold water but insoluble in hot water; it is soluble in methanol, diethyl ether and acetone.

Stability and storage conditions USP 40–NF 35 S1 states that flexible collodion should be stored in airtight containers at a temperature not exceeding 30°C and remote from fire. The label should include a caution statement to the effect that flexible collodion is highly flammable. Flexible collodion is stable under normal conditions of use, but is liable to form explosive peroxides on exposure to light and air.

Safety Flexible collodion vapors may cause drowsiness and dizziness. Allergic contact dermatitis to colophony included in the formulation of flexible collodion BP has been reported.[7]

Comments Flexible collodion is included in salicylic acid collodion BP, which is used in the treatment of warts and corns. The uptake of salicylic acid into the stratum corneum of the forearm of human volunteers was found to be greater from flexible collodion than an ointment formulation; the partitioning of the salicylic acid from the collodion formulation was concentration independent.[8]

Cantharidin in flexible collodion has been used in the treatment of molluscum contagiosum in children,[9] while triamcinolone acetonide in flexible collodion has been investigated as a treatment for a range of dermatological conditions.[10]

The BP 2017 states that when collodion is prescribed or demanded, flexible collodion shall be dispensed or supplied. Flexible collodion is included in solutions for topical administration in the UK. It is also included in the Canadian Natural Health Products Ingredients Database as a film-former for topical use only.

18 Comments

Collodion has also been used in the preparation of model membranes,[11,12] and as dressings for central venous catheters.[13]

A monograph for salicylic acid collodion is included in the BP 2017 and USP 40–NF 35 S1.

3 Chemical Name and CAS Registry Number

2-Pyrrolidinone [616-45-5]

4 Empirical Formula and Molecular Weight

C_4H_7NO 85.11

5 Structural Formula

6 Functional Category

Penetration enhancer; plasticizing agent; solubilizing agent; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Pyrrolidone and *N*-methylpyrrolidone (*see* Section 17) are mainly used as solvents in veterinary injections. Pyrrolidone has been shown to be a better solubilizer than glycerin, propylene glycol, or ethanol.[1] They have also been suggested for use in human pharmaceutical formulations as solvents in parenteral, oral, and topical applications. In topical applications, pyrrolidones appear to be effective penetration enhancers.[2–6] Pyrrolidones have also been investigated for their application in controlled-release depot formulations.[4,7]

8 Description

Pyrrolidone occurs as a clear, colorless or slightly grayish liquid, as white or almost white crystals, or colorless crystal needles. It has a characteristic odor.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for pyrrolidone.

Test	PhEur 9.2
Identification	+
Characters	+
Appearance	+
Alkalinity	+
Related substances	+
Water	≤0.1%
Sulfated ash	≤0.1%
Melting point	≈25°C
Boiling point	≈245°C
Relative density	1.112–1.115
Refractive index	1.487–1.490

10 Typical Properties

Acidity/alkalinity pH = 8.2–10.8 for a 10% v/v aqueous solution.
Antimicrobial activity Pyrrolidone has also been shown to possess strong antimicrobial activity against Gram-positive and Gram-negative bacteria, and mold.
Boiling point 245°C
Dipole moment 2.3 Debye at 25°C
Enthalpy of vaporization 48.21 ± 3.0 kJ/mol
Flash point 129°C (open cup)
Refractive index n_D^{25} = 1.480–1.490
Solubility Miscible with ethanol (95%), propan-2-ol, and water. Also miscible with other organic solvents such as aromatic hydrocarbons including benzene, carbon disulfide, chloroform, ether, and ethyl acetate.
Specific gravity 1.11 at 25°C
Viscosity (dynamic) 13.3 mPa s (13.3 cP) at 25°C

11 Stability and Storage Conditions

Pyrrolidone is chemically stable and, if it is kept in unopened original containers, the shelf-life is approximately one year. Pyrrolidone should be stored in a well-closed container protected from light and oxidation, at temperatures below 20°C.

12 Incompatibilities

Pyrrolidone is incompatible with oxidizing agents and strong acids.

13 Method of Manufacture

Pyrrolidone is prepared from butyrolactone by a Reppe process, in which acetylene is reacted with formaldehyde.

14 Safety

Pyrrolidones are mainly used in veterinary injections and have also been suggested for use in human oral, topical, and parenteral pharmaceutical formulations. In mammalian species, pyrrolidones are biotransformed to polar metabolites that are excreted via the urine.[8,9] Pyrrolidone is mildly toxic by ingestion and subcutaneous routes; mutagenicity data have been reported.[10]

LD_{50} (guinea pig, oral): 6.5 g/kg[10]
LD_{50} (rat, oral): 6.5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Some pyrrolidones in their pure state are considered toxic, corrosive, and flammable; contact with skin and eyes should be avoided. Vapors or sprays should not be inhaled. Suitable eye and skin protection and a respirator are recommended. When heated to decomposition, pyrrolidone emits toxic fumes of NO_x.

16 Regulatory Status

—

17 Related Substances

Methylpyrrolidone.

18 Comments

The EINECS number for pyrrolidone is 204-648-7. The PubChem Compound ID (CID) for pyrrolidone is 12025.

Raffinose

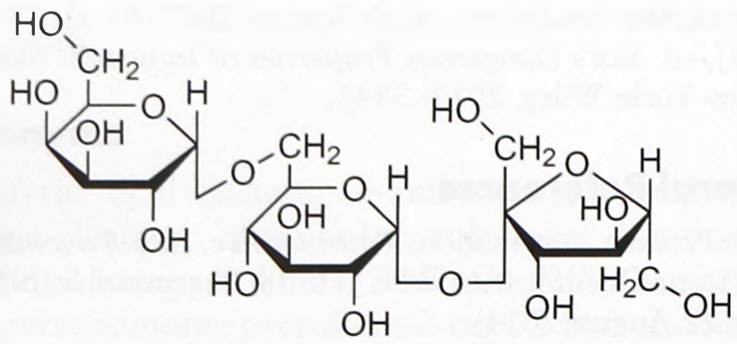
1 Nonproprietary Names

None adopted.

2 Synonyms

Gossypose; melitose; melitriose; D-raffinose; D-(+)-raffinose.

3 Chemical Name and CAS Registry Number



β-D-Fructofuranosyl-O-α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside, anhydrous [512-69-6]

β-D-Fructofuranosyl-O-α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside pentahydrate [17629-30-0]

4 Empirical Formula and Molecular Weight

$C_{18}H_{32}O_{16}$ 504.44 (for anhydrous)
$C_{18}H_{32}O_{16}·5H_2O$ 594.52 (for pentahydrate)

5 Structural Formula

D-Raffinose anhydrous

6 Functional Category

Lyophilization aid.

7 Applications in Pharmaceutical Formulation or Technology

Raffinose is a trisaccharide carbohydrate that is used as a bulking agent, stabilizing agent, and water scavenger in freeze-drying where it acts as a stabilizer for freeze-dried formulations.[1–4] It is also used as a crystallization inhibitor in sucrose solutions.[5,6]

Raffinose has also been investigated for use in spray-dried powders for oral inhalation formulations.[7–9]

8 Description

Raffinose is a white crystalline powder. It is odorless and has a sweet taste approximately 10% that of sucrose.[10]

9 Pharmacopeial Specifications

—

10 Typical Properties

Collapse temperature –26°C[2]
Decomposition temperature 118–119°C (anhydrous); 130°C (pentahydrate).[11]
Density (bulk) 0.67 g/cm^3 (pentahydrate)
Density (tapped) 0.98 g/cm^3 (pentahydrate)
Density (true) 1.465 g/cm^3 (anhydrous)
Diffusion coefficient (infinite dilution) 0.33×10^{-5} cm^2/s (water at 15°C)[12]
Glass transition temperature 114°C (amorphous)[13]
Heat of solution at infinite dilution (25°C) 52 kJ/mol (crystalline pentahydrate); –38 kJ/mol (amorphous)[1]
Melting point 80°C (pentahydrate);[11] 118°C (anhydrous)[14]
Optical rotation 105° (pentahydrate); 123° (anhydrous)[15]
Specific gravity 1.465 (pentahydrate)[11]
Solubility in methanol 0.10 g/mL[15]
Solubility in water 0.14 g/mL[11]
Solubility Soluble 1 in 10 of methanol, in pyridine and 1 in 7.1 of water; slightly soluble in ethanol (95%); insoluble in diethyl ether.

The data for the crystal structure,[16,17] NMR structure,[18] powder x-ray diffraction pattern,[19] water vapor sorption isotherms,[19,20] glass transition temperature as a function of water,[19] heat capacity,[1] heat of solution properties,[1] vapor pressure,[21] and osmotic pressure[22] are described in the literature.

SEM 1: Excipient: D-(+)-raffinose pentahydrate; manufacturer: Sigma-Aldrich (Lot No. 092K01211); magnification: 100×.

SEM 2: Excipient: D-(+)-raffinose pentahydrate; manufacturer: Sigma-Aldrich (Lot No. 092K01211); magnification: 500×.

11 Stability and Storage Conditions

Raffinose is stable under ordinary conditions of use and storage. Excessive heat should be avoided to prevent degradation. Thermal

decomposition products are carbon monoxide and carbon dioxide.[23,24]

12 Incompatibilities

Raffinose is incompatible with strong oxidizing agents.[24]

13 Method of Manufacture

Raffinose occurs naturally in Australian manna, cottonseed meal, and seeds of various food legumes. It can be isolated from beet sugar molasses through sucrose separation, seed-crystallization, and filtration.[17,25]

14 Safety

Raffinose is a naturally occurring trisaccharide investigated for use in freeze-dried pharmaceutical formulations. It occurs in a number of plants that are consumed widely (*see* Section 13).

Short-term exposure may cause irritation to skin, eyes and respiratory tract.[24] Long-term exposure has shown adverse reproductive effects in animals.[26]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Dust generation should be kept to reasonable levels to avoid ignition or explosion.[23,24] When heated to decomposition it emits acrid smoke and irritating vapors.[26] Suitable respiratory protection, gloves and safety glasses are recommended.

16 Regulatory Status

Raffinose is a naturally occurring trisaccharide and is consumed as part of a normal diet.

17 Related Substances

Raffinose is composed of three monosaccharides: galactose, glucose, and fructose. It shares related structures with sucrose and melibiose. It is also related to stachyose, which possesses an additional (1→6)-linked α-D-galactopyranosyl unit.

Two solvated forms[25] and an amorphous form[18,27,28] of raffinose can be synthesized.

18 Comments

Raffinose has been shown to accumulate in organisms that can survive extreme desiccation, and has therefore been examined as an excipient in stabilizing co-lyophilized protein and labile preparations during storage at elevated temperatures.[29,30]

When exposed to elevated relative humidity of 75% at 25°C, raffinose has been shown to form different hydrate levels.[31]

Raffinose is indigestible by humans because of a lack of an α-galactosidase and undergoes fermentation in the colon, causing production of carbon dioxide, hydrogen, and methane gases.[14]

Raffinose is used as a blood substitute.

The EINECS number for raffinose is 208-146-9. The PubChem Compound ID (CID) for raffinose includes 10542, 219993, and 439242.

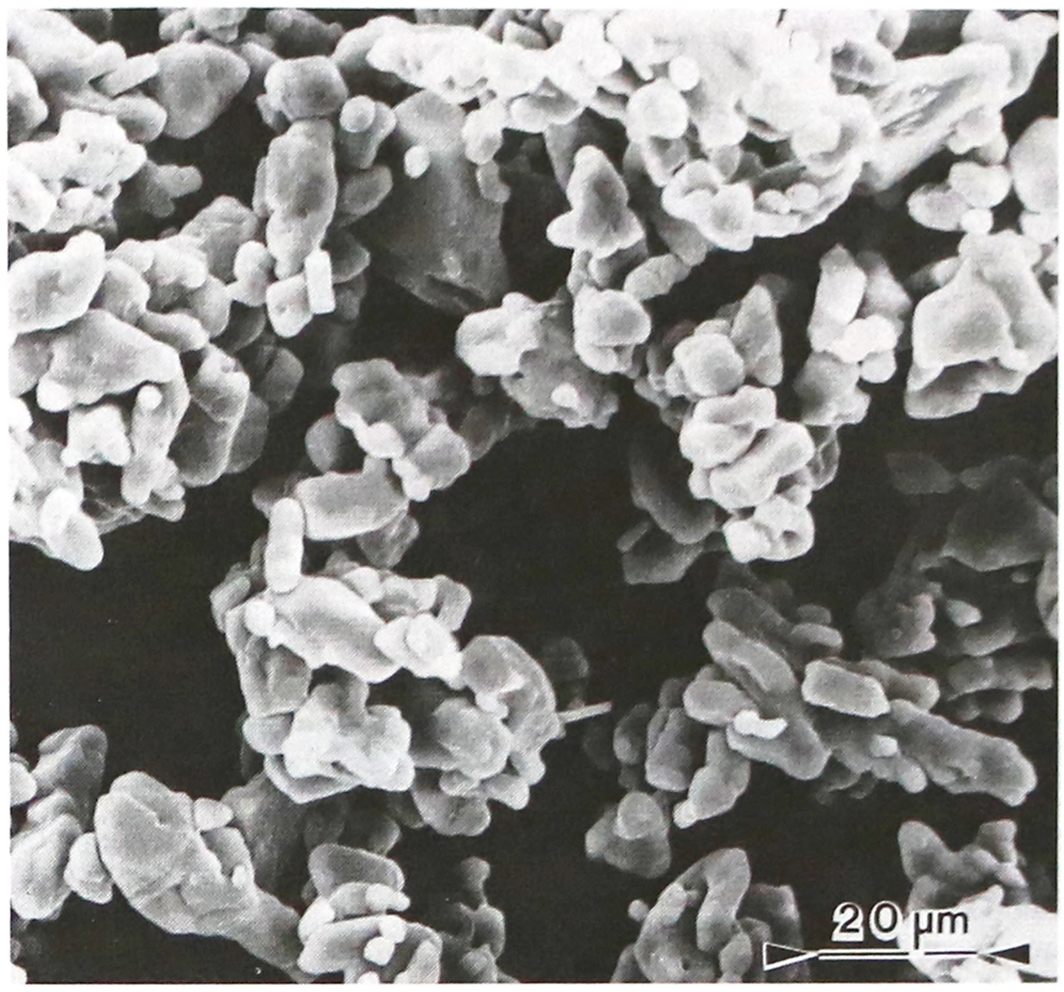
5 Structural Formula

6 Functional Category

Sweetening agent.

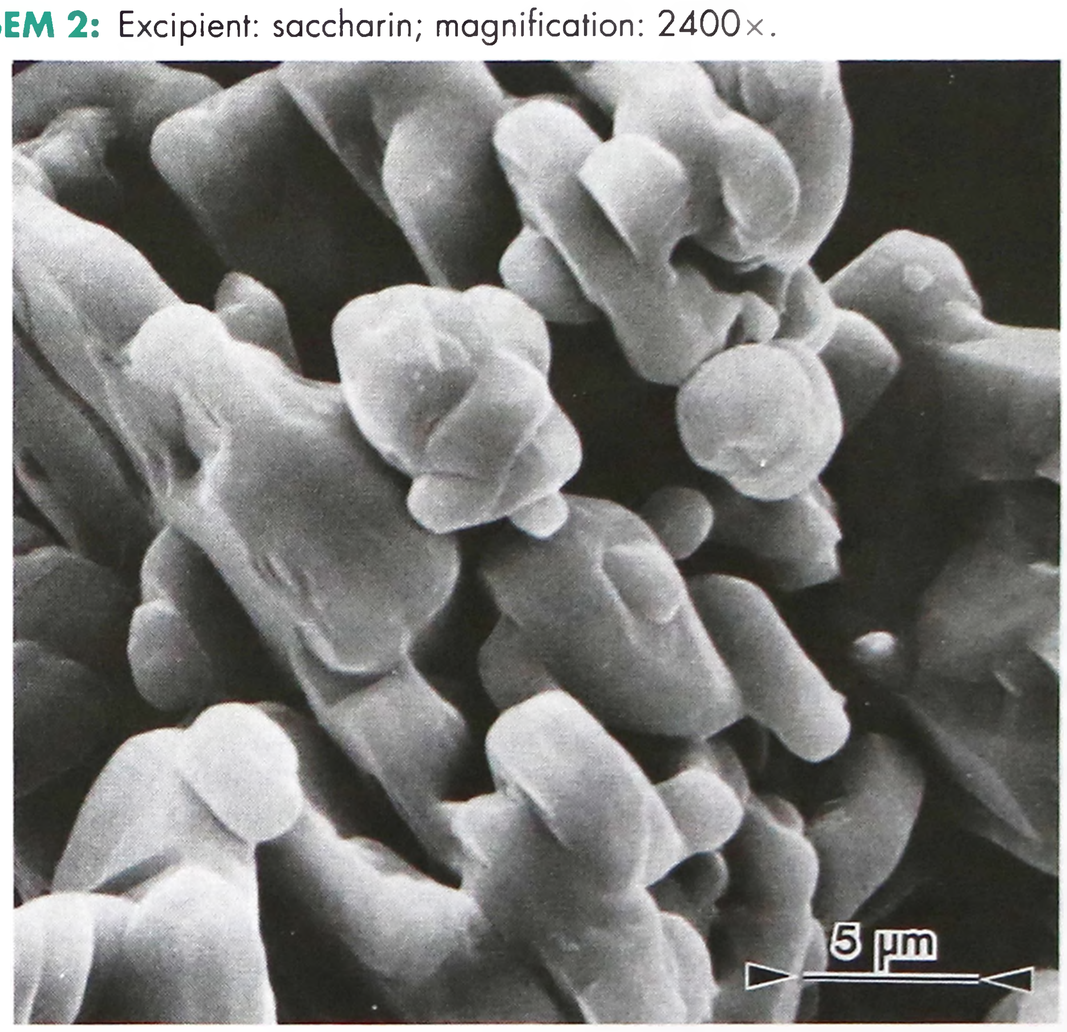
7 Applications in Pharmaceutical Formulation or Technology

Saccharin is an intense, artificial and non-nutritive sweetening agent used in beverages, food products, table-top sweeteners, and oral hygiene products such as toothpastes and mouthwashes. In oral pharmaceutical formulations, it is used at a concentration of 0.02–0.5% w/w. It has been used in chewable tablet formulations as a sweetening agent.[1,2]



Saccharin has been used as a dissolution enhancer for solid dispersions to form salts, various pharmaceutical cocrystals and coamorphous systems, which have improved stability of their amorphous states.[3–7]

Saccharin can be used to mask some unpleasant taste characteristics or to enhance flavor systems. Its sweetening power is approximately 300–600 times that of sucrose.



8 Description

Saccharin occurs as odorless white crystals or a white crystalline powder and can have a faintly aromatic odor. It has an intensely sweet taste, which is detectable in aqueous dilutions of 1:100 000. It has a metallic or bitter aftertaste that at normal levels of use can be detected by approximately 25% of the population. The aftertaste can be masked by blending saccharin with other sweeteners.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Saccharin is stable under the normal range of conditions employed in formulations. It effloresces when exposed to dry air.

In the bulk form it shows no detectable decomposition and only when it is exposed to a high temperature (125°C) at a low pH (pH 2) for over 1 hour does significant decomposition occur. It is generally stable between pH 2 and 7 and at temperatures below 150°C. The decomposition product formed is (ammonium-*o*-sulfo)benzoic acid, which is not sweet.[8] The aqueous stability of saccharin is excellent.

Saccharin should be stored in a well-closed container in a dry place.

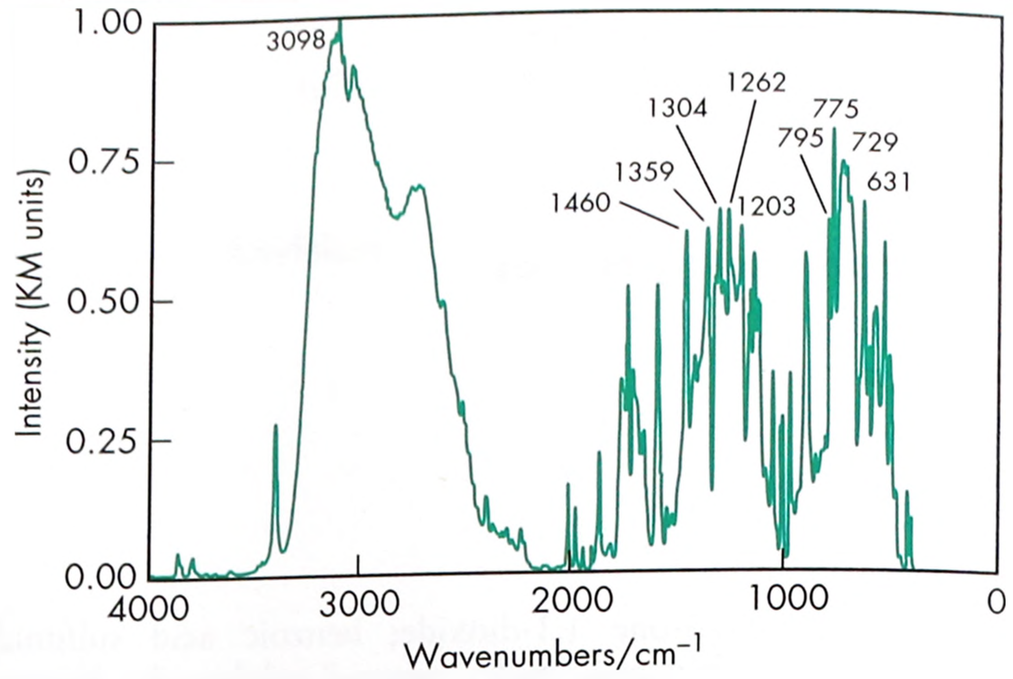

Figure 1: Infrared spectrum of saccharin measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

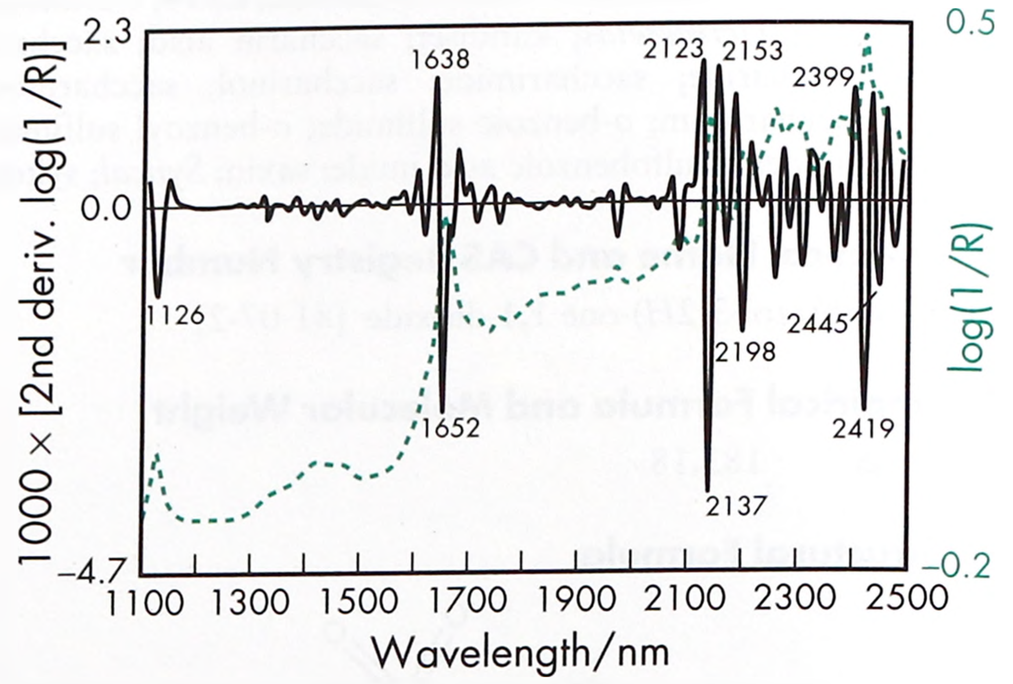

Figure 2: Near-infrared spectrum of saccharin measured by reflectance.

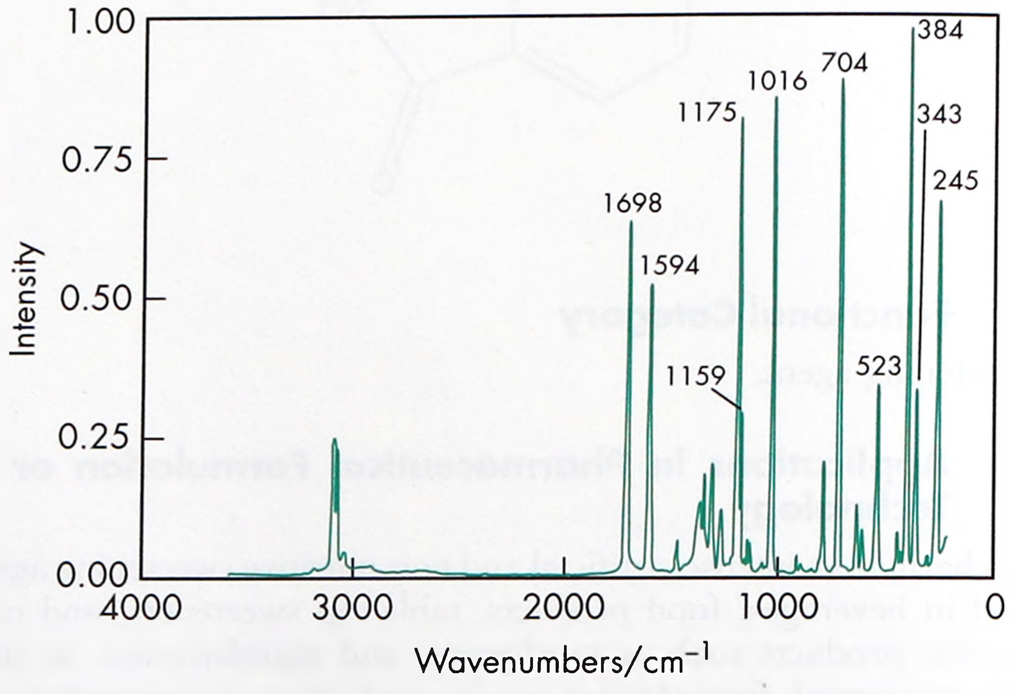

Figure 3: Raman spectrum of saccharin measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Saccharin can react with large molecules, resulting in a precipitate being formed. It is incompatible with strong oxidizing agents and does not undergo Maillard browning.

13 Method of Manufacture

Saccharin is prepared from toluene by a series of reactions known as the Remsen–Fahlberg method. Toluene is first reacted with chlorosulfonic acid to form *o*-toluenesulfonyl chloride, which is

reacted with ammonia to form the sulfonamide. The methyl group is then oxidized with dichromate, yielding *o*-sulfamoylbenzoic acid, which forms the cyclic imide saccharin when heated.

An alternative method involves a refined version of the Maumee process. Methyl anthranilate is initially diazotized to form 2-carbomethoxybenzenediazonium chloride; sulfonation followed by oxidation then yields 2-carbomethoxybenzenesulfonyl chloride. Amidation of this material, followed by acidification, forms insoluble acid saccharin.

14 Safety

There has been considerable controversy concerning the safety of saccharin, which has led to extensive studies since the mid-1970s.

Two-generation studies in rats exposed to diets containing 5.0–7.5% total saccharin (equivalent to 175 g daily in humans) suggested that the incidence of bladder tumors was significantly greater in saccharin-treated males of the second generation than in controls.[9,10] Further experiments in rats suggested that a contaminant of commercial saccharin, *o*-toluene sulfonamide, might also account for carcinogenic effects. In view of these studies, a ban on the use of saccharin was proposed in several countries. However, in 1977 a ban by the FDA led to a Congressional moratorium that permitted the continued use of saccharin in the US. The warning labels describing the ban on saccharin-sweetened products were removed in 2000 and 2001, and the position of the FDA was reversed, with saccharin being declared safe for consumption. It is currently one of the six artificial sweeteners approved by the FDA.

From the available data it now appears that the development of tumors is a sex-, species-, and organ-specific phenomenon, and extensive epidemiological studies have shown that saccharin intake is not related to bladder cancer in humans. Human bladder cancer is not observed when saccharin is used at normal levels.[11,12]

The WHO has set a temporary acceptable daily intake for saccharin, including its calcium, potassium, and sodium salts, at up to 2.5 mg/kg body-weight.[13] In the UK, the Committee on Toxicity of Chemicals in Food, Consumer Products, and the Environment (COT) has set an acceptable daily intake for saccharin and its calcium, potassium, and sodium salts (expressed as saccharin sodium) at up to 5 mg/kg body-weight.[14]

Adverse reactions to saccharin, although relatively few in relation to its widespread use, include urticaria with pruritus following ingestion of saccharin-sweetened beverages,[15] breathing difficulties, increased risk of obesity,[16] and photosensitization reactions.[17] Most of the hypersensitivity reactions observed are as a result of the sulfonamide functional group, and therefore patients with known allergies to sulfonamides are advised to avoid saccharin.[18]

LD_{50} (mouse, oral): 17.5 g/kg[19]
LD_{50} (rat, IP): 7.10 g/kg
LD_{50} (rat, oral): 14.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, saccharin releases toxic gases, which may contain sodium oxide as well as oxides of sulfur and nitrogen.[19] Eye protection and a dust mask are recommended.

16 Regulatory Status

Accepted for use as a food additive in Europe. Note that the EU number 'E954' is applied to both saccharin and saccharin salts. Included in the FDA Inactive Ingredients Database (oral solutions, syrups, tablets; topical preparations; inhalation, aerosols). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

[6485-34-3] for the anhydrous form

Synonyms *Syncal CAS.*
Appearance White, odorless crystals or crystalline powder with an intensely sweet taste.
Solubility 1 in 4.7 ethanol (95%); 1 in 2.6 of water.

18 Comments

Saccharin has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The perceived intensity of sweeteners relative to sucrose depends upon their concentration, temperature of tasting, and pH, and on the flavor and texture of the product concerned.

Intense sweetening agents will not replace bulk, textural, or preservative characteristics of sucrose if sucrose is removed from a formulation.

Synergistic effects for combinations of sweeteners have been reported. Saccharin is often used in combination with cyclamates and aspartame since the saccharin content may be reduced to minimize any aftertaste.

Saccharin is a common material in the production of probenazole (a rice fungicide).

A specification for saccharin is contained in the *Food Chemicals Codex* (FCC).[20]

The EINECS number for saccharin is 201-321-0. The PubChem Compound ID (CID) for saccharin is 5143.

Saccharin Sodium

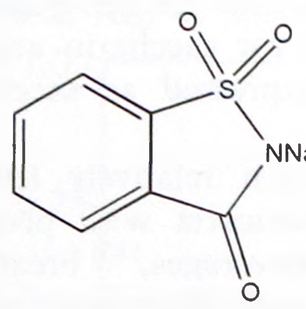
1 Nonproprietary Names

BP: Saccharin Sodium
JP: Saccharin Sodium Hydrate
PhEur: Saccharin Sodium
USP–NF: Saccharin Sodium

S

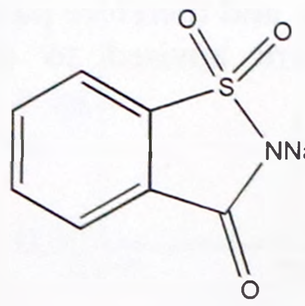
2 Synonyms

1,2-Benzisothiazolin-3-one 1,1-dioxide, sodium salt; 2-sulfobenzoic acid imidesodium salt; 2,3-dihydro-3-oxobenzisosulfonazolesodium salt; *Crystallose*; E954; gendorf 450; *o*-benzoylsulfimide sodium salt; *o*-sulfobenzimidesodium; saccharin sodium salt; saccharinsodium salthydrate; saccharinum natricum; sodium saccharide; sodium saccharinate; sodium saccharine; sodium *o*-benzosulfimide; soluble gluside; soluble saccharin; sucra; sucaryl sodium; *Syncal*.



3 Chemical Name and CAS Registry Number

1,2-Benzisothiazol-3(2*H*)-one 1,1-dioxide, sodium salt
[128-44-9] for the anhydrous material
[6155-57-3] for the dihydrate
See also Section 8.



4 Empirical Formula and Molecular Weight

$C_7H_4NNaO_3S$	205.16
$C_7H_4NNaO_3S \cdot {}^2/_3H_2O$ (84%)	217.24
$C_7H_4NNaO_3S \cdot 2H_2O$ (76%)	241.19

5 Structural Formula

$\bullet 2H_2O$ 76% saccharin sodium (dihydrate)

$\bullet {}^2/_3 H_2O$ 84% saccharin sodium

6 Functional Category

Flavoring agent; sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Saccharin sodium is an intense sweetening agent used in beverages, food products, table-top sweeteners,[1] and pharmaceutical formulations such as tablets, powders, medicated confectionery, gels, suspensions, liquids, and mouthwashes;[2] *see* Table I. It has been used to mask the bitter taste of dental lidocaine injection for dental procedures.[3] It is also used in vitamin preparations.

Saccharin sodium is considerably more soluble in water than saccharin, and is more frequently used in pharmaceutical formulations. Its sweetening power is approximately 300–600 times that of sucrose. Saccharin sodium enhances flavor systems and may be used to mask some unpleasant taste characteristics.

Injection of saccharin sodium has been used to measure the arm-to-tongue circulation time.

Table I: Uses of saccharin sodium.

Use	Concentration (%)
Dental paste/gel	0.12–0.3
IM/IV injections	0.9
Oral solution	0.075–0.6
Oral syrup	0.04–0.25

8 Description

Saccharin sodium occurs as a white, odorless or faintly aromatic, efflorescent, crystalline powder. It has an intensely sweet taste, with a metallic or bitter aftertaste that at normal levels of use can be detected by approximately 25% of the population. The aftertaste can be masked by blending saccharin sodium with other sweeteners. Saccharin sodium can contain variable amounts of water.

9 Pharmacopeial Specifications

The pharmacopeial specifications for saccharin sodium have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for saccharin sodium.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification[a]	+	+	+
Characters[a]	+	+	–
Clarity and color of solution	+	+	+
Acidity or alkalinity	+	+	+
Water	≤15.0%	≤15.0%	≤15.0%
Benzoate and salicylate	+	–	+
Toluenesulfonamides[a]	+	+	+
Heavy metals[a]	≤10 ppm	–	≤10 ppm
Readily carbonizable substances	+	+	+
Assay (anhydrous basis)	99.0–101.0%	99.0–101.0%	99.0–101.0%

(a) These tests have not been fully harmonized at the time of publication.

10 Typical Properties

Unless stated, data refer to either 76% or 84% saccharin sodium.

Acidity/alkalinity pH = 6.6 (10% w/v aqueous solution)

Density (bulk)

0.8–1.1 g/cm^3 (76% saccharin sodium);

0.86 g/cm^3 (84% saccharin sodium).

Density (particle) 1.70 g/cm^3 (84% saccharin sodium)

Density (tapped)

0.9–1.2 g/cm^3 (76% saccharin sodium);

0.96 g/cm^3 (84% saccharin sodium).

Melting point >300°C[4] decomposes upon heating.

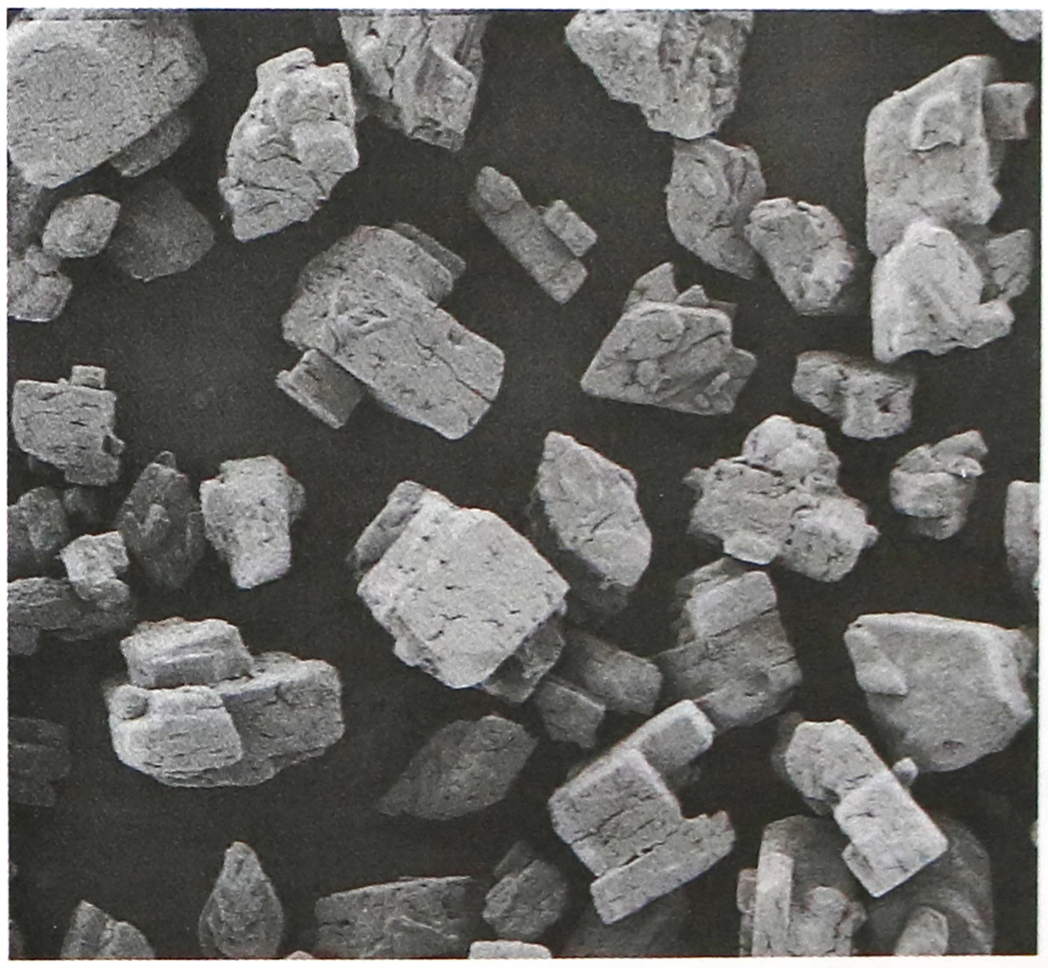
Moisture content Saccharin sodium 76% contains 14.5% w/w water; saccharin sodium 84% contains 5.5% w/w water. During drying, water evolution occurs in two distinct phases. The 76% material dries under ambient conditions to approximately 5.5% moisture (84% saccharin sodium); the remaining moisture is then removed only by heating.

Solubility *see* Table III.

Table III: Solubility of saccharin sodium.

Solvent	Solubility at 20°C unless otherwise stated
Buffer solutions:	
pH 2.2 (phthalate)	1 in 1.15
	1 in 0.66 at 60°C
pH 4.0 (citrate–phosphate)	1 in 1.21
	1 in 0.69 at 60°C
pH 7.0 (citrate–phosphate)	1 in 1.21
	1 in 0.66 at 60°C
pH 9.0 (borate)	1 in 1.21
	1 in 0.69 at 60°C
Ethanol	1 in 102
Ethanol (95%)	1 in 50
Ether	Practically insoluble
Propylene glycol	1 in 3.5
Propan-2-ol	Practically insoluble
Water	1 in 1.2

Specific surface area 0.25 m^2/g



Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

SEM 1: Excipient: saccharin sodium; magnification: 35×; voltage: 5 kV.

11 Stability and Storage Conditions

Saccharin sodium is stable under the normal range of conditions employed in formulations. Only when it is exposed to a high temperature (125°C) at a low pH (pH 2) for over 1 hour does significant decomposition occur. The 84% grade is the most stable form of saccharin sodium since the 76% form will dry further under ambient conditions. Solutions for injection can be sterilized by autoclave.

Saccharin sodium should be stored in a well-closed container in a dry and adequately ventilated place.

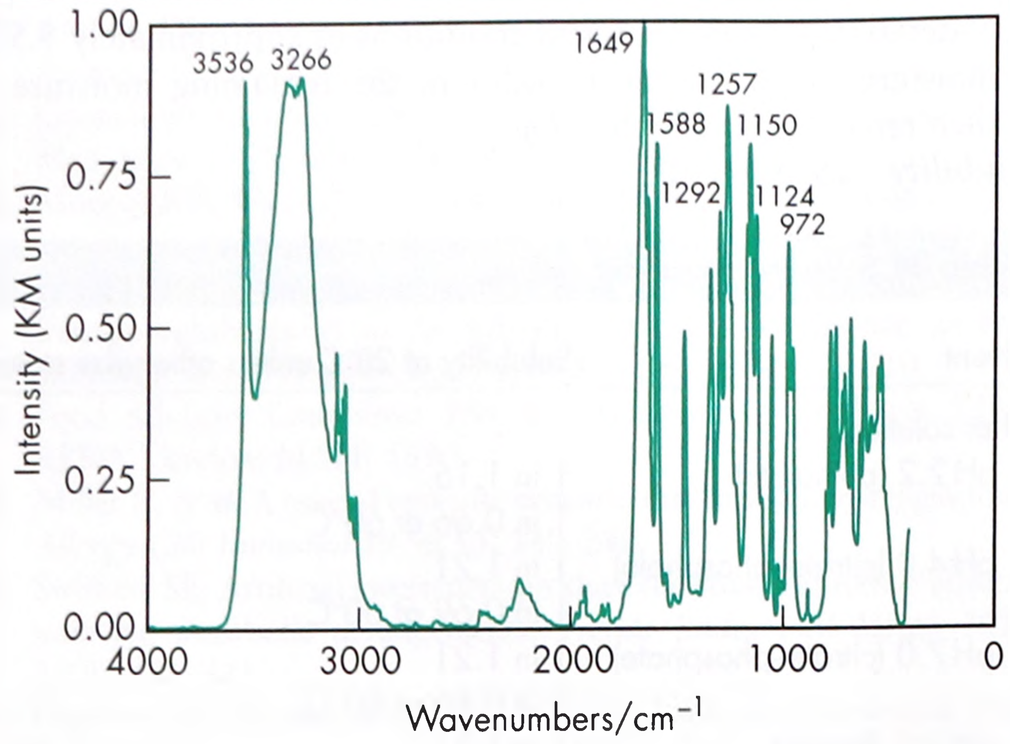


Figure 1: Infrared spectrum of saccharin sodium dihydrate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

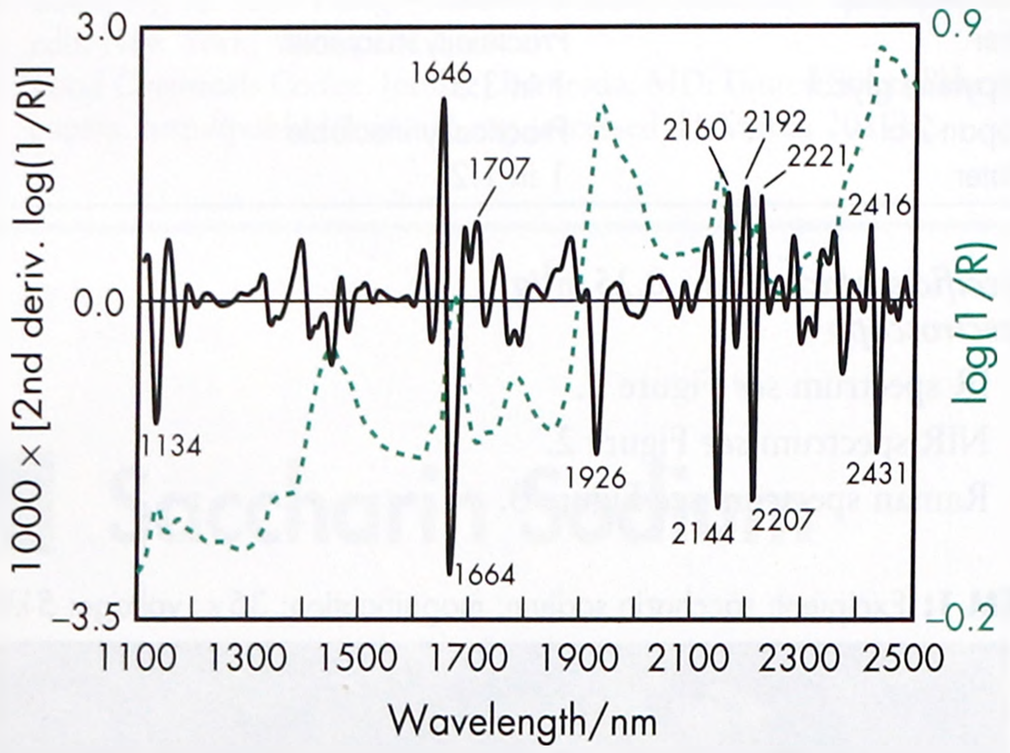

Figure 2: Near-infrared spectrum of saccharin sodium measured by reflectance.

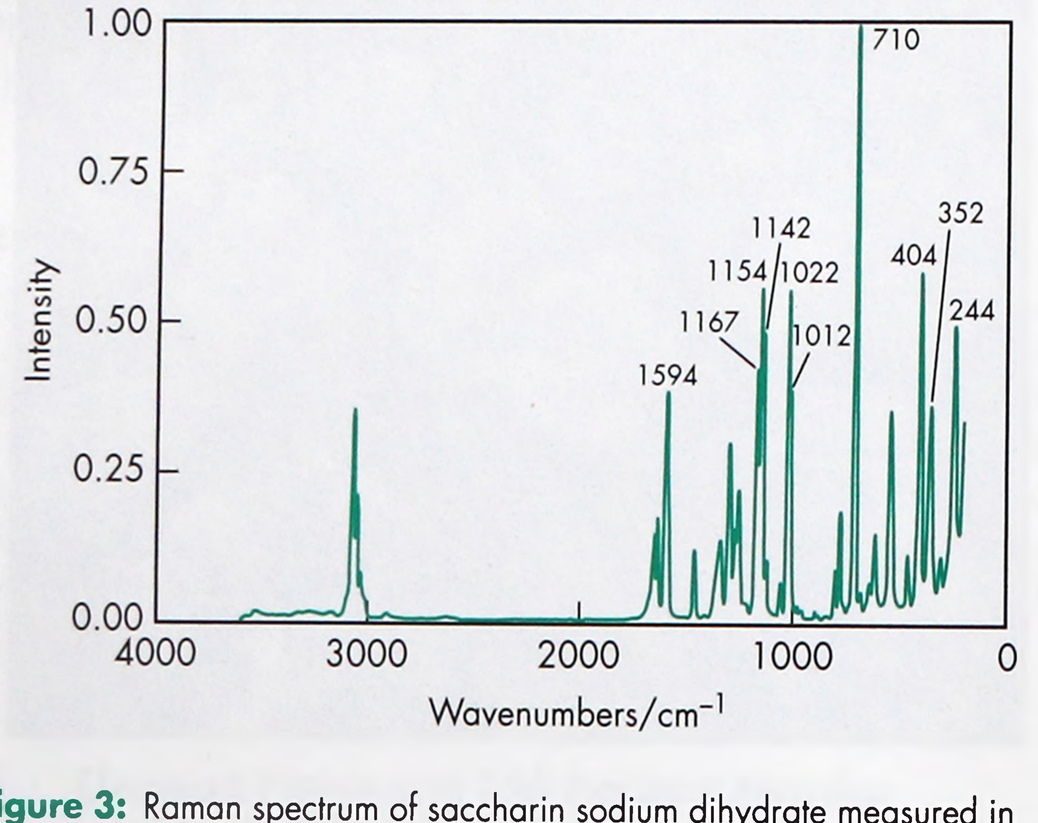

Figure 3: Raman spectrum of saccharin sodium dihydrate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Saccharin sodium is incompatible with strong oxidizing agents. It does not undergo Maillard browning.

13 Method of Manufacture

Saccharin is produced by the oxidation of *o*-toluene sulfonamide by potassium permanganate in a solution of sodium hydroxide. Acidification of the solution precipitates saccharin, which is then dissolved in water at 50°C and neutralized by addition of sodium hydroxide. Rapid cooling of the solution initiates crystallization of saccharin sodium from the liquors.

14 Safety

There has been considerable controversy concerning the safety of saccharin and saccharin sodium in recent years; however, it is now generally regarded as a safe, intense sweetener, and is not categorized as a hazardous substance for humans. However, there is evidence for its carcinogenicity in rodents.[5,6] *See* Saccharin for further information.

The WHO has set a temporary acceptable daily intake of up to 2.5 mg/kg body-weight for saccharin, including its salts.[7] In the UK, the Committee on Toxicity of Chemicals in Food, Consumer Products, and the Environment (COT) has set an acceptable daily intake for saccharin and its salts (expressed as saccharin sodium) at up to 5 mg/kg body-weight.[8]

LD_{50} (mouse, oral): 17.5 g/kg[9]
LD_{50} (rat, IP): 7.1 g/kg
LD_{50} (rat, oral): 14.2 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. When heated to decomposition, saccharin sodium releases toxic gases, including NO_x, Na_2O, and SO_x. In addition, toxic fumes of carbon and CO_x may be emitted. Eye protection and a dust mask are recommended.

16 Regulatory Status

Accepted for use as a food additive in Europe; 'E954' is applied to both saccharin and saccharin salts. Included in the FDA Inactive Ingredients Database (buccal and dental preparations; IM and IV injections; oral preparations; topical preparations; inhalation preparations; rectal tablets, solutions, and suspensions). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Acesulfame potassium; alitame; aspartame; isomalt; lactitol; maltitol; mannitol; neotame; saccharin; sorbitol; sucralose; tagatose; thaumatin; xylitol.

18 Comments

Saccharin sodium has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

The perceived intensity of sweeteners relative to sucrose depends upon their concentration, temperature of tasting, and pH, and on the flavor and texture of the product concerned.

Intense sweetening agents will not replace bulk, textural, or preservative characteristics of sugar if sugar is removed from a formulation.

Synergistic effects for combinations of sweeteners have been reported. Saccharin sodium is often used in combination with cyclamates and aspartame since the saccharin sodium content may be reduced to minimize any aftertaste.

The PubChem Compound ID (CID) for saccharin sodium includes 656582 and 23691045.

Safflower Oil

1 Nonproprietary Names

BP: Refined Safflower Oil
PhEur: Safflower Oil, Refined
USP–NF: Safflower Oil

2 Synonyms

Aceite de alazor; aceite de cartamo; carthami oleum raffinatum; dygminu aliejus, rafinuotas; huile de carthame; saffllorolja, raffinerad; safflower oil (unhydrogenated); saflonoljy puhdistettu.

3 Chemical Name and CAS Registry Number

Safflower oil [8001-23-8]

4 Empirical Formula and Molecular Weight

The PhEur 9.2 defines the composition of the fatty acid fraction of two types of refined safflower oil (type I and type II); *see* Section 9.

5 Structural Formula

See Section 4.

6 Functional Category

Emollient; oleaginous vehicle; solvent.

7 Applications in Pharmaceutical Formulation or Technology

Safflower oil is mainly used as an oleaginous vehicle in oral and topical formulations.

Safflower oil has been used as a vehicle in the development of an oral dosage form containing a novel viral-specific inhibitor of the replication of human rhinoviruses.[1] It has also been used as a solvent for a capsule formulation containing a new antilipemic agent; formulations containing safflower oil were found to have the greatest bioavailability in dogs compared with formulations containing PEG 300 or water.[2]

Safflower oil is used in cosmetics products such as soaps, lotions, creams, and hair-care preparations.

8 Description

Refined safflower oil is a clear, viscous, yellow to pale-yellow liquid, with a slight vegetable odor.

9 Pharmacopeial Specifications

See Table I. *See also* Section 18.

The PhEur 9.2 defines the composition of the fatty acid fraction, refractive index, and relative density values of two types of refined safflower oil (type I and type II); *see* Tables II and III.

Table I: Pharmacopeial specifications for safflower oil.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	—
Characters	+	—
Acid value	≤0.5	—
Peroxide value	≤10.0[a]	≤10
Unsaponifiable matter	≤1.5%	≤1.5%
Alkaline impurities	+	—
Composition of fatty acids	+[b]	+
Brassicasterol	≤0.3% in sterol fraction of oil	—
Water	≤0.1%	—
Free fatty acids	—	+
Iodine value	—	135–150
Heavy metals	—	≤10 ppm

(a) ≤5.0 if for parenteral use.
(b) Compositions of the fatty acid fraction of type I and type II refined safflower oil are defined.

Table II: Composition of the fatty acids for safflower oil.

Fatty acid	PhEur 9.2		USP 40–NF 35 S1
	Type I	Type II	
Saturated fatty acids of chain length less than C_{14}	≤0.2%	≤0.2%	—
Myristic acid	≤0.2%	≤0.2%	—
Palmitic acid	4.0–10.0%	3.6–6.0%	2–10%
Stearic acid	1.0–5.0%	1.0–5.0%	1–10%
Oleic acid	8.0–21.0%	70.0–84.0%	7–42%
Linoleic acid	68.0–83.0%	7.0–23.0%	72–84%
Linolenic acid	≤0.5%	≤0.5%	—
Arachidic acid	≤0.5%	≤1.0%	—
Eicosenoic acid	≤0.5%	≤1.0%	—
Behenic acid	≤1.0%	≤1.2%	—

Table III: Refractive index and relative density values for type I and type II refined safflower oils.

	Refined safflower oil	
	Type I	Type II
Refractive index	≈1.476	≈1.472
Relative density	≈0.922	≈0.914

10 Typical Properties

Acid value 1.0–9.7
Flash point >287.8°C (closed cup)
Hydroxyl value 2.9–6.0
Iodine value 140–150
Refractive index

n_D^{25} = 1.472–1.475;

n_D^{40} = 1.4690–1.4692.

See also Table III.
Relative density *see* Table III.
Saponification value 188–194
Solubility Soluble in organic solvents. Refined safflower oil is miscible with ether, chloroform, light petroleum (bp 40–60°C); practically insoluble in alcohol. Solubility in water is <0.1%.
Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

11 Stability and Storage Conditions

Safflower oil thickens and becomes rancid on prolonged exposure to air. It is also sensitive to light. Safflower oil should be preserved in tight, light-resistant containers. Refined safflower oil should be stored in a well-filled, airtight container, protected from light.

Parenteral fat emulsions containing safflower oil are destabilized by electrolytes; severe droplet coalescence in the emulsion occurs 3–5 days after the addition of 10% v/v dimethyl sulfoxide, and after 10 days if 5% v/v is added.[1] Parenteral fat emulsions are prone to bacterial and fungal growth. Generally, fat emulsions containing safflower oil or soybean oil show similar growth patterns,[2,3] although growth of *Candida albicans* has been reported to be higher in safflower oil containing fat emulsions than in other types of emulsion.[4]

12 Incompatibilities

Safflower oil is incompatible with strong oxidizing agents.

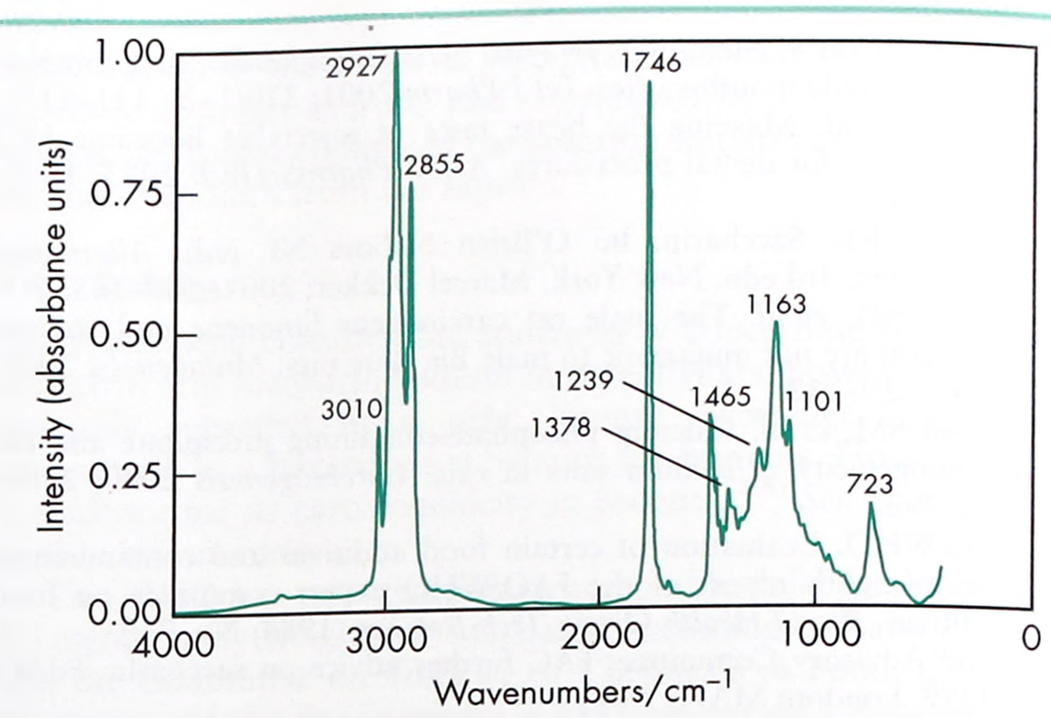

Figure 1: Infrared spectrum of safflower oil measured by transmission. Adapted with permission of Informa Healthcare.

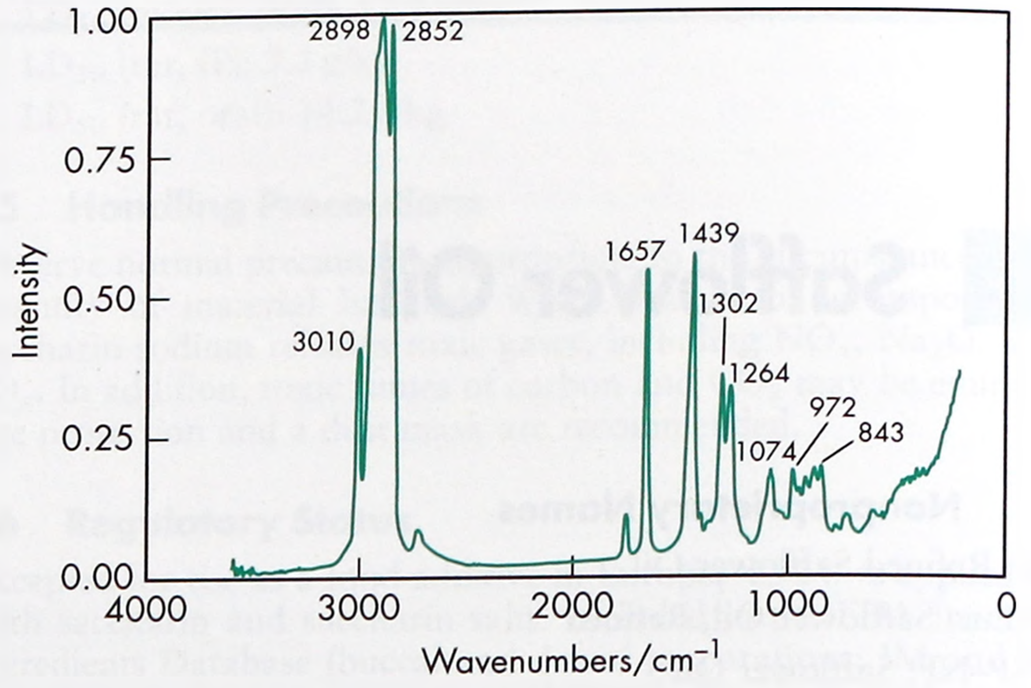

Figure 2: Raman spectrum of safflower oil measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Refined safflower oil is the fatty oil obtained from the seeds of *Carthamus tinctorius* L. (type I) or from seeds of hybrids of *Carthamus tinctorius* L. (type II) by expression and/or extraction followed by refining. Type II refined safflower oil is rich in oleic (*cis*-9-octadecenoic) acid. It may contain a suitable antioxidant.

Safflower oil USP 40–NF 35 S1 is the refined fixed oil yielded by the seed of *Carthamus tinctorius* Linné (Fam. Compositae).

14 Safety

Safflower oil is an edible oil and generally presents no significant health hazards following eye contact, skin contact, oral ingestion, or inhalation. Skin irritation or allergic reactions, or eye irritation may occur. Ingestion of large doses can cause vomiting. Safflower oil may cause diarrhea.

LD_{50} (mouse, IP): >50 g/kg[5]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition, safflower oil emits acrid smoke and irritating fumes.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (topical lotion). Included in the Canadian Natural Health Products Ingredients Database. Included in an intravenous fat emulsion (*Liposyn II*)

available in the US. Included in a capsule formulation available in Canada and in a non-medicinal capsule formulation previously available in the UK. It is also a component of a Canadian enteral nutrition preparation.

17 Related Substances

Almond oil; canola oil; corn oil; cottonseed oil; peanut oil; safflower glycerides; sesame oil; soybean oil; sunflower oil.

Safflower glycerides

CAS number [79982-97-1]

Comments Safflower glycerides (safflower oil monoglycerides) are used in cosmetics as emollients and emulsifying agents. The EINECS number for safflower glycerides is 279-360-8.

18 Comments

The PhEur 9.2 requires the label for refined safflower oil to state, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms, and the type of oil (type I or type II). The PhEur 9.2 also lists a monograph for safflower flower, while JP XVII includes an unofficial monograph for safflower.

Safflower oil is used as a component of parenteral fat emulsions for the preparation of parenteral nutrition solutions. A topical lotion containing 3% safflower oil is commercially available, and parenteral fat emulsions containing a mixture of safflower oil 5% and soya oil 5%, or 10% and 10%, respectively, have been administered as part of total parenteral nutrition regimes.

Safflower oil is used as a food, being consumed in the form of soft margarine, salad oils, and cooking oils.

Safflower oil has been investigated as a vehicle in the development of an oral dosage form containing a novel viral-specific inhibitor of the replication of human rhinoviruses.[6] It has also been investigated as a solvent for a capsule formulation containing a new antilipemic agent; formulations containing safflower oil were found to have the greatest bioavailability in dogs compared with formulations containing PEG 300 or water.[7] Safflower oil has been studied as a vehicle in an *in situ*-forming oleogel implant[8] as well as a vehicle for a subcutaneous injection of high-dose lysozyme microparticles.[9]

A specification for safflower oil is listed in *Japanese Pharmaceutical Excipients* (JPE).[10] A monograph for safflower oil (unhydrogenated) is contained in the *Food Chemicals Codex* (FCC).[11]

The EINECS number for safflower oil is 232-276-5.

Saponite

1 Nonproprietary Names

None adopted.

2 Synonyms

Afrodit; aluminum-saponite; auxite; cathkinite; ferroan saponite; griffithite; *Imvite 1016*; *Ionite P*; *Laponite*; licianite; lucianite; piotine; *SapCa-1*; *Smectiton SA*; *SMI 200H*; *Stevensonite*; *Sumecton 5A*; *SY 5*; *Veegum S6198*; zebedassite.

3 Chemical Name and CAS Registry Number

Saponite [1319-41-1]

4 Empirical Formula and Molecular Weight

$(Ca_{0.5}Na)_{0.3}(Mg,Fe^{2+})_3(Si,Al)_4O_{10}(OH)_2 \cdot 4H_2O$ ≈480

Saponite is a mineral with an approximate empirical formula owing to the variability in cation substitution; *see* Table I.

5 Structural Formula

Saponite is composed of two tetrahedral layers formed by phylosilicate sheets and one octahedral layer. Common impurities include manganese, nickel, phosphorus, potassium, and titanium.

See Section 4.

6 Functional Category

Adsorbent; emulsifying agent; viscosity-increasing agent.

Table I: Approximate composition of saponite based on chemical analysis.[1]

Component	Wt % range
SiO_2	39.6–54.7
Al_2O_3	3.9–10.2
MgO	15.8–33.3
Fe_2O_3	0.2–12.0
FeO	0–7.8
CaO	0–2.9
Na_2O	0–0.7
K_2O	0–0.3
TiO_2	0–0.4
MnO	0–0.3
H_2O+ (structural water OH)	4.2–12.0
H_2O- (hydration water)	7.2–17.4

7 Applications in Pharmaceutical Formulation or Technology

Saponite is a colloidal material present in various naturally occurring clays such as magnesium aluminum silicates[2] and is therefore suitable for use in pharmaceutical formulation applications as an adsorbent, viscosity-increasing agent, suspending agent, or as an oil-in-water emulsifying agent.[3] Saponite swells to many times its dry volume when added to water.

Saponite, as a component of magnesium aluminium silicates, is useful as a formulation component in semisolid cosmetic and health care products.[4]

8 Description

Saponite is a naturally occurring 2:1 phyllosilicate clay of the smectite (montmorillonite) group. It is a magnesium-rich hydrated aluminum silicate and is present as a component of some commercial magnesium aluminum silicate clays. It occurs in soft, amorphous masses in the cavities of certain rocks.

Saponite occurs as a white to off-white, dull powder composed of fine-grained crystals of colloidal size. The material is greasy or soapy to the touch and swells on the addition of water.

S

9 Pharmacopeial Specifications

See Section 18.

10 Typical Properties

Density (true) ~2.24-2.3 g/cm^3 (measured; may vary with clay source)
Crystal data Monoclinic: a = 5.3, b = 9.14, c = 16.9, $\beta \approx 97°$.
Hardness (Mohs) 1–2
Moisture content

~13.7% water loss up to 150°C;

~6.9% water loss above 150°C.

11 Stability and Storage Conditions

Saponite is a stable material and should be stored in a cool, dry place.

12 Incompatibilities

Saponite may generate heat in contact with hydrofluoric acid.

13 Method of Manufacture

Naturally occurring saponite is mined from deposits in various localities around the world.

14 Safety

Saponite is a natural clay mineral that is not acutely toxic; therefore, no toxicity values have been established. However, it may contain small amounts of crystalline silica in the form of quartz. Chronic exposure to crystalline silica can have adverse effects on the respiratory system. EU labeling states the material is not classified as dangerous.

Saponite dust can be irritating to the respiratory tract and eyes. Contact with this material may cause drying of the skin.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material being handled. Avoid generating and breathing dust, and use eye protection. For dusty conditions, eye protection, gloves, and a dust mask are recommended. The occupational exposure limits for saponite are 5 mg/m^3 (respirable) PEL-TWA, 3 mg/m^3 (respirable) TLV-TWA, and 10 mg/m^3 (inhalable) dust TLV-TWA.

16 Regulatory Status

The components of saponite are individually reported in the EPA TSCA Inventory.

17 Related Substances

Attapulgite; bentonite; kaolin; hectorite; magnesium aluminum silicate; talc.

18 Comments

Saponite is listed as a component of aluminum magnesium silicate in the PhEur 9.2, BP 2017, and USP 40–NF 35 S1.

Saponite is a swelling clay with a low cation exchange capacity, and when mixed with water it displays thixotropic properties. Saponite is similar to bentonite, and has the capacity to adsorb drugs through cationic exchange.[5] Drug–saponite adsorbates show a slight reduction in dissolution rate[6] and the mechanistics of adsorption of drug molecules to saponite have been examined.[7,8] Saponite is useful in the formulation of gastrointestinal X-ray contrast agents[9] and formulations designed for sustained drug delivery to the gastrointestinal tract.[10] The adsorption mechanism of drugs to saponite and other smectites, as well as the subsequent drug release kinetics from these complexes, has been studied using a variety of physical characterization techniques.[11,12] The intercalation tendency of nutraceutical species,[13] L-DOPA[14] and proteins[15,16] have also been reported.

Saponite is listed on the Canada nondomestic substances list (NDSL) and Chinese inventory of existing chemical substances (IECSC). The EINECS number for saponite is 215-289-0.

Sesame Oil

1 Nonproprietary Names

BP: Refined Sesame Oil
JP: Sesame Oil
PhEur: Sesame Oil, Refined
USP–NF: Sesame Oil

2 Synonyms

Benne oil; gingelly oil; gingili oil; jinjili oil; *Lipovol SES*; sesami oleum raffinatum; teel oil.

3 Chemical Name and CAS Registry Number

Sesame oil [8008-74-0]

4 Empirical Formula and Molecular Weight

A typical analysis of refined sesame oil indicates the composition of the acids, present as glycerides, to be: arachidic acid 0.8%; linoleic acid 40.4%; oleic acid 45.4%; palmitic acid 9.1%; and stearic acid 4.3%. Sesamin, a complex cyclic ether, and sesamolin, a glycoside, are also present in small amounts.

Note that other reported analyses may vary slightly from that above.[1]

The monographs for Sesame Oil in the USP 40–NF 35 S1 and Refined Sesame Oil in the PhEur 9.2 specify the acceptable range of eight triglycerides found in sesame oil.

5 Structural Formula

See Section 4.

6 Functional Category

Oleaginous vehicle; solvent.

7 Applications in Pharmaceutical Formulation or Technology

The major use of sesame oil in pharmaceutical formulations is as a solvent in the preparation of sustained-release intramuscular injections of steroids, such as estradiol valerate, hydroxyprogesterone caproate, testosterone enanthate, and nandrolone decanoate,[2] or other oil-soluble drug substances, such as the decanoate or enanthate esters of fluphenazine, haloperidol, and ergocalciferol. The disappearance of sesame oil from the injection site, following subcutaneous or intramuscular administration to pigs, has been reported to have a half-life of about 23 days.[3] The *in vitro* drug release rates from oily depot formulations containing sesame oil intended for intra-articular administration have been reported,[4] as has the *in vitro* release of local anesthetics from sesame oil suspensions.[5]

Sesame oil may be used as a solvent in the preparation of subcutaneous injections,[6] oral capsules,[7,8] rectal suppositories,[9] and ophthalmic preparations;[10] it may also be used in the formulation of suspensions[11] and emulsions.[11–13]

S

8 Description

Refined sesame oil is a clear, pale-yellow colored liquid with a slight, pleasant odor and a bland taste. It solidifies to a soft mass at about −4°C.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sesame oil.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	—	+	—
Specific gravity	0.914–0.921	≈0.919	0.912–0.921
Refractive index at 20°C	—	≈1.473	—
Heavy metals	—	—	≤10 µg/g
Cottonseed oil	—	+	+

Composition of triglycerides	—	+	+
Alkaline impurities	—	+	+
Water	—	≤0.1%	≤0.1%

(a) In sesame oil intended for parenteral use.

10 Typical Properties

Density 0.916–0.920 g/cm^3
Flash point 338°C (open cup)
Freezing point −5°C
Refractive index n_D^{40} = 1.4650–1.4665
Solubility Insoluble in water; practically insoluble in ethanol (95%); miscible with diethyl ether, carbon disulfide, chloroform, ether, hexane, and light petroleum.
Specific rotation $[\alpha]_D^{25}$ = +1° to +9°
Viscosity (dynamic) 43 mPa s (43 cP)

11 Stability and Storage Conditions

Sesame oil is more stable than most other fixed oils and does not readily become rancid; this has been attributed to the antioxidant effect of some of its characteristic constituents. The PhEur 9.2 permits the addition of a suitable antioxidant to sesame oil.

Sesame oil may be sterilized by aseptic filtration or dry heat. It has been reported that suitable conditions for the sterilization of injections containing sesame oil are a temperature of 170°C for 2 hours; it has been suggested that 150°C for 1 hour is inadequate.[14] However, it has been demonstrated that dry heat sterilization of sesame oil at 150°C for 1 hour was sufficient to kill all added *Bacillus subtilis* spores.[15]

Sesame oil should be stored in a well-filled, airtight, light-resistant container, at a temperature not exceeding 40°C. Sesame oil intended for use in the manufacture of parenteral dosage forms should be stored under an inert gas in an airtight glass container.

The PhEur 9.2 states that when the container is opened, its contents are to be used as soon as possible; any part of the contents not used at once is protected by an atmosphere of an inert gas.

12 Incompatibilities

Sesame oil may be saponified by alkali hydroxides.

13 Method of Manufacture

Sesame oil is obtained from the ripe seeds of one or more cultivated varieties of *Sesamum indicum* Linné (Fam. Pedaliaceae) by expression in a hydraulic press or by solvent extraction. The crude oil thus obtained is refined to obtain an oil suitable for food or pharmaceutical use. Improved color and odor may be obtained by further refining.

14 Safety

Sesame oil is mainly used in intramuscular and subcutaneous injections; it should not be administered intravenously. It is also used in topical pharmaceutical formulations and consumed as an edible oil.

Although it is generally regarded as an essentially nontoxic and nonirritant material,[16] there have been rare reports of hypersensitivity to sesame oil, with sesamin suspected as being the primary allergen.[17–20] Anaphylactic reactions to sesame seeds have also been reported. However, it is thought that the allergens in the seeds may be inactivated or destroyed by heating as heat-extracted sesame seed oil or baked sesame seeds do not cause anaphylactic reactions in sesame seed-allergic individuals.[21]

Subcutaneous nodules have been reported after the subcutaneous administration of sesame oil.[22]

LD_{50} (rabbit, IV): 678 µg/kg[23]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Spillages of sesame oil are slippery and should be covered with an inert absorbent material prior to disposal.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (IM and SC injections; oral capsules, concentrates, emulsions, and tablets; also topical preparations). Included in parenteral (IM injections) and nonparenteral (oral capsules) medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Almond oil; canola oil; corn oil; cottonseed oil; peanut oil; soybean oil; sunflower oil.

18 Comments

Multiple-emulsion formulations, in which sesame oil was one of the oil phases incorporated, have been investigated as a prolonged-release system for rifampicin;[24] microemulsions containing sesame oil have been prepared for the transdermal delivery of ketoprofen.[25] Sesame oil has also been included in self-microemulsifying drug delivery systems,[26] and fast-disintegrating lyophilized dry emulsion tablets[27] for oral administration. It has also been used in the preparation of liniments, pastes, ointments, and soaps. A sesame paste (tahini), composed of crushed sesame seeds in sesame oil, has been investigated as a novel suspending agent.[28]

Sesame oil is additionally used as an edible oil and in the preparation of oleomargarine.

Shellac

1 Nonproprietary Names

BP: Shellac

JP: Purified Shellac
White Shellac

PhEur: Shellac

USP–NF: Shellac

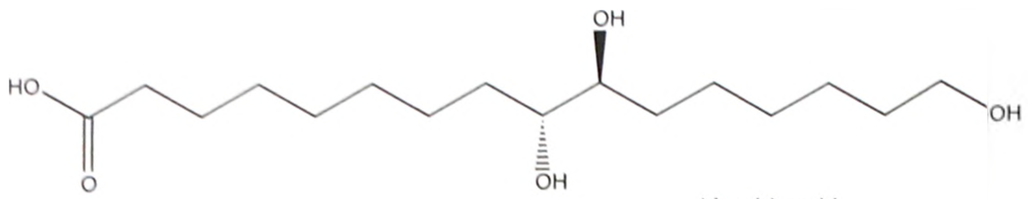
2 Synonyms

AT 10-1010; *Blonde*; *Bulls Eye Shellac*; *CertiSeal FC 300A*; *Crystalac*; E904; *Excelacs 3-Circles*; *Excelacs 3-Stars*; *Gifu Shellac GBN-PH*; *Gifu Shellac Pearl-811*; lac; lacca; *Mantrolac R-49*; *Mantrolac R-52*; *Marcoat 125*; *Opaglos R*; *Sepifilm SN*; *SSB Aquagold*; *SSB 55 Pharma*; *SSB 56 Pharma*; *SSB 57 Pharma*; *Swanlac*.

3 Chemical Name and CAS Registry Number

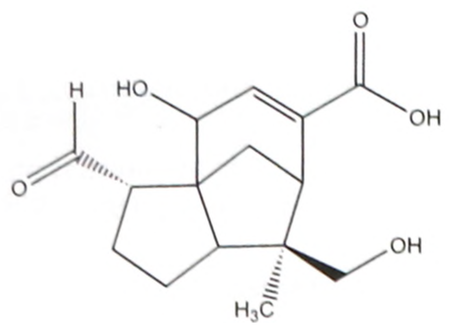
Shellac [9000-59-3]

4 Empirical Formula and Molecular Weight



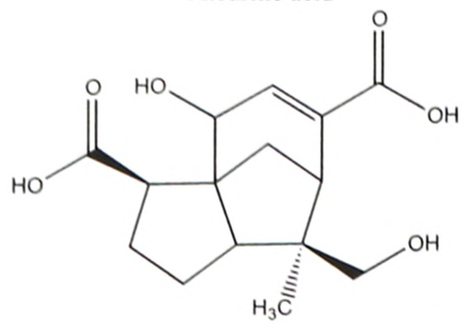
Shellac is the general term for the refined form of lac, a natural polyester resin secreted by insects.

PhEur 9.2 and USP 40–NF 35 S1 define four types of shellac depending on the refining method, and JP XVII mentions only two types; *see* Section 13.



Elementary analysis reveals that shellac contains carbon, hydrogen, oxygen, and a negligible amount of ash. Orange shellac contains approx. 68% carbon, 9% hydrogen and 23% oxygen, and with a molecular weight of 1006 (bleached shellac is 949) the empirical formula for the average shellac molecule is $C_{60}H_{90}O_{15}$. Even with this relatively low molecular weight, shellac has excellent film-forming properties.

Lac is a complex mixture of aliphatic and alicyclic acids. The major components are aleuritic, jalaric and shellolic acids, as well as butolic and kerrolic acids. Seed lac and orange shellac contain approximately 5–6% wax and two coloring components, the water soluble laccaic acid and the water insoluble erythrolaccin.



5 Structural Formula

Aleuritic acid

Jalaric acid

Shellolic acid

6 Functional Category

Coating agent; film-forming agent; microencapsulating agent; modified-release agent.

7 Applications in Pharmaceutical Formulation or Technology

Shellac is widely used as a moisture barrier coating for tablets and pellets due to its low water vapor and oxygen permeability. It has usually been applied in the form of alcoholic or aqueous solutions (pharmaceutical glazes); *see also* Section 18.

Shellac, particularly novel aqueous shellac solutions, is mainly used in food products and nutritional supplements.[1,2] Aqueous ammonium shellac solutions, based on dewaxed orange shellac, do not show the problems exhibited by alcoholic shellac solutions and are used as enteric coatings for granules, pellets, tablets, soft and hard gelatine capsules, primarily in nutritional supplements.[3]

Shellac is a primary ingredient of pharmaceutical printing inks for capsules and tablets, and can be applied as a 40% w/v alcoholic solution. It has also been used to apply one or two sealing coats to tablet cores to protect them from moisture before being film- or sugar-coated.

Other applications of shellac are the coating or encapsulation of powders or granules, e.g. in probiotics.[4] Prior to the introduction of film coating, a combination of shellac, cetostearyl alcohol and stearic acid was used as an enteric coating. In cosmetics, shellac is used in hairsprays, mascara and lipstick formulations.[5] Aqueous shellac solutions are also used for colonic drug delivery.[6]

8 Description

Shellac is tasteless and may have a faint odor. The typical odor of shellac is the result of a complex fragrance system.[7]

Shellac is a natural resin that may be obtained in a variety of colors ranging from light yellow to dark red in the form of hard, brittle flakes with or without wax, depending on the refining process; *see* Sections 4 and 13. The different types of shellac include bleached shellac, bleached dewaxed shellac, dewaxed and decolorized shellac, dewaxed flake shellac, dewaxed orange shellac, dewaxed shellac, orange shellac, purified shellac, refined bleached shellac, regular bleached shellac, regular waxy shellac, wax-containing shellac, and white shellac. The flakes may be crushed or milled to a coarse or fine powder. Bleached shellac is supplied as a coarse off-white powder.

Refined bleached shellac	≤20 mg	–	≤0.2%
Regular bleached shellac	–	–	≤5.5%

(a) For white shellac.

10 Typical Properties

The properties of shellac depend on the insect strain and host tree as well as the method used for refining the crude lac (seed lac).

Density 1.035–1.140 g/cm^3

Dissociation constant pK_a value = 5.60–6.59[8]

Glass transition temperature 33–52°C;[8] the wide range in temperature is a result of the process used in refining and the type of seed lac used as a starting material.

Hydroxyl value 230–280

Iodine number 10–18

Melting point 77–90°C

Refractive index n_D^{20} = 1.514–1.524

Saponification value 185–260

Solubility *see* Table II.

Table II: Solubility of shellac.

Solvent	Solubility at 20°C
Alkalis	Soluble
Benzene	1 in 10
Ethanol	1 in 2
Ethanol (95%)	1 in 1.2 (very slowly soluble)
Ether	1 in 8
Hexane	Practically insoluble
Propylene glycol	1 in 10
Water	Practically insoluble

11 Stability and Storage Conditions

After long periods of storage, shellac becomes less readily soluble in alcohol, less fluid on heating, and darker in color; *see also* Section 18.

Shellac should be stored in a well-closed container at temperatures below 15°C. Wax-containing grades should be mixed before

use to ensure uniform distribution of the wax. Orange and dewaxed orange shellac have a shelf-life of 1 to 2 years. The shelf-life of bleached shellac is approximately 6 months.

12 Incompatibilities

Shellac is chemically reactive with aqueous alkalis, organic bases, alcohols, and agents that esterify carboxyl groups. Therefore, shellac should be used with caution in the presence of such compounds.

13 Method of Manufacture

Shellac or lac is cultivated and refined from lacca, a resinous secretion produced by the tiny insect *Kerria lacca* (Kerr) Lindinger (Coccideae), formerly *Laccifer lacca* (Kerr). The insects are parasitic on certain trees, mainly in India. In Thailand and South China, the resin is secreted by another species, *Laccifer chinensis* (Madihassan) on different trees.[8,9] The insects pierce through the bark of the tree and transform the sap into a natural polyester resin, called stick lac, which is secreted through the surface of their body. The resin forms thick encrustations on the smaller branches and twigs, which are then scraped off the twigs and further processed to produce seed lac, as it is known at this stage. Seed lac is then refined to become shellac.

The chemical composition, properties and the color of shellac depend on the insect or insect strain, and thus the host tree, as well as the process used for refining.[8] Three very different processes are used for refining the seed lac to shellac (bleaching, melting, and solvent extraction),[8–10] resulting in products with different characteristics and properties.

Bleaching process Refined bleached or white shellac is obtained by dissolving seed lac in an aqueous alkaline solution, which is then filtered, dewaxed, and bleached with sodium hypochlorite to completely remove the color. However, changes in the molecular structure and the addition of chlorine substituents may lead to self-crosslinking and polymerization.

Melting process After melting the seed lac, the highly viscous molten lac is pressed through a filter and drawn to a thin film. Once cooled, the film breaks into thin flakes. The shellac wax is not removed by this process and the color depends on the type of seed lac used.

Solvent extraction process Solvent extraction is a very gentle process for refining shellac. The seed lac is dissolved in ethanol, and wax and impurities are removed by filtration. Activated carbon is used to produce light-colored grades. After a further filtration step and the removal of ethanol, the resin is drawn to a thin film, which breaks into flakes after cooling. The properties of the final product depend on the type of seed lac used and are influenced by the processing parameters and the grade of activated carbon.

PhEur 9.2 and USP 40–NF 35 S1 define four types of shellac depending on the refining method, and the JP XVII mentions two types; *see* Table III.

Table III: Types of shellac according to the refining process.

Refining process	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Bleaching	—	Bleached shellac	Regular bleached shellac
Bleaching and dewaxing	White shellac	Bleached dewaxed shellac	Refined bleached shellac
Melting	—	Wax-containing shellac	Orange shellac
Solvent extraction	Purified shellac	Dewaxed shellac	Dewaxed orange shellac

The use of the term 'pharmaceutical grade' as well as the quality of the shellac depends on the manufacturer.

Seed lac is mainly produced in India, Thailand and China. Orange shellac, refined by the melting process, is manufactured by several companies in India, Thailand and South-East Asia. Bleached shellac is produced in the US, Canada, Japan, India, Thailand and South China. Dewaxed orange shellac is refined by the solvent extraction process in Germany, Japan and India.

14 Safety

Shellac is used in oral pharmaceutical formulations, food products, and cosmetics. It is generally regarded as an essentially nonirritant and nontoxic material at the levels employed as an excipient.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Shellac can be irritating to the eyes, and to the respiratory system if inhaled as dust. Eye protection, gloves, and a dust respirator are recommended. Shellac should be handled in a well-ventilated environment.

16 Regulatory Status

Accepted as a food additive in the US, Europe, and Japan. Included in the FDA Inactive Ingredients Database (oral capsules and tablets). Included in nonparenteral medicines (oral tablets and capsules, often in printing ink formulations) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Aleuritic acid; aqueous shellac solution; laccaic acid B; pharmaceutical glaze.

Aleuritic acid

Empirical formula $C_{16}H_{32}O_5$
Molecular weight 304.42
CAS number [533-87-9]
Synonyms DL-*erythro*-9,10,16,-Trihydroxyhexadecanoic acid; 9,10,16-trihydroxypalmitic acid; 8,9,15-trihydroxypentadecane-1-carboxylic acid.
Melting point 100–101°C
Solubility Soluble in hot water and lower alcohols.
Comments Main component of shellac. Isolated by saponification, and the starting material for the synthesis of macrocyclic musk compounds for fragrances and pheromones.[11]

The EINECS number for aleuritic acid is 208-578-8.

Aqueous shellac solution

CAS number [68308-35-0]
Synonyms Shellac ammonium salt
Comments Aqueous solution of shellac with 20-25 % solids at a pH of 7–7.5. The EINECS number is 269-647-6. Used as a coating material for granules, pellets, tablets, hard and soft gelatine capsules. Suitable for sustained-release and enteric coatings, as moisture barrier and as encapsulation agent.[3,9,10]

Laccaic acid B

Empirical formula $C_{24}H_{16}O_{12}$
Molecular weight 496
Synonyms Lac dye; natural red 25; 9,10-dihydro-3,5,6,8-tetrahydroxy-7-[2-hydroxy-5-(2-hydroxyethyl)phenyl]-9,10-dioxo-1,2-anthracenedicarboxylic acid.
CAS number [17249-00-2]
Solubility Water soluble
Comments Laccaic acid consists of 5 compounds, laccaic acid A, B, C, D and E. Laccaic acid B is used as a food color in Japan. The color is pH dependent: orange at pH 3 to reddish purple at above pH 7.

S

Pharmaceutical glaze

Synonyms Confectionary glaze, alcoholic shellac solution

Comments Pharmaceutical glaze is a specially denatured alcoholic solution of shellac containing between 20% and 57% of shellac. It may be prepared using either ethanol or ethanol (95%), and may contain waxes and titanium dioxide as an opacifying agent.

18 Comments

Under the general term shellac, many grades are available. The pharmacopeial specifications are very narrow with regard to purity; however, they allow a wide range for the acid value. The variability of the physicochemical properties of different shellac types has to be considered, especially for the manufacture of controlled-release formulations.[8,12]

Shellac in the form of its alcoholic solution (pharmaceutical glaze) has been used for many years as an enteric coating for pharmaceutical applications. However, due to significant problems with delayed disintegration and changes in release profiles of the coated dosage forms after storage, alcoholic shellac solutions have limited use as enteric coatings in the pharmaceutical industry today.[3,13,14] Problems are due to an esterification of the carboxyl groups of shellac with alcohol and a polymerization due to trapped alcohol residues in the dry film. The use of bleached shellac, where the molecular structure is partly changed by the treatment with sodium hypochlorite, increases the polymerization problems.

Shellac films from ammoniated aqueous shellac solutions using dewaxed orange shellac do not have these problems and have very stable release characteristics even after extended storage times. Furthermore, they can be formulated in combination with other polymers such as HPMC, CMC, sodium alginates, or modified starch together with plasticizers to meet the disintegration requirements of the USP, PhEur and JP.[2,3,9,10] To avoid cracking of the coating film, a higher glass transition temperature of the ammonium salt form[15] has to be considered for the manufacture of formulations coated with aqueous ammoniacal solutions.[16]

A specification for bleached shellac is contained in the *Food Chemicals Codex* (FCC).[17]

The EINECS number for shellac is 232-549-9.

Simethicone

1 Nonproprietary Names

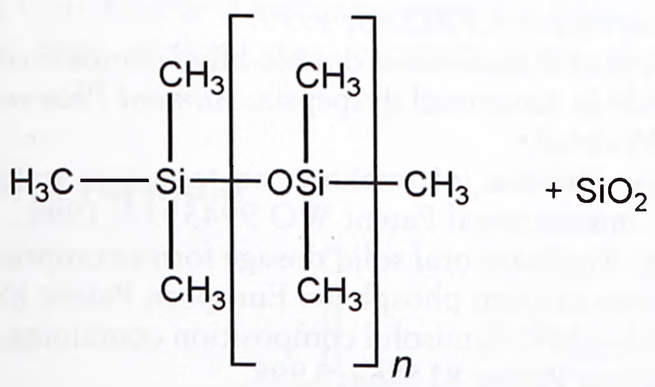
BP: Simeticone

PhEur: Simeticone

USP–NF: Simethicone

2 Synonyms

Dow Corning Q7-2243 LVA; *Dow Corning Q7-2587*; polydimethylsiloxane–silicon dioxide mixture; *Sentry Simethicone*; *Silfar*; simeticonum.



3 Chemical Name and CAS Registry Number

α-(Trimethysilyl-ω-methylpoly[oxy(dimethylsilylene)], mixture with silicon dioxide [8050-81-5]

4 Empirical Formula and Molecular Weight

See Section 8.

5 Structural Formula

where n = 200–350

6 Functional Category

Antifoaming agent; tablet and capsule diluent; water-repelling agent.

7 Applications in Pharmaceutical Formulation or Technology

The main use of simethicone as an excipient is as an antifoaming agent in pharmaceutical manufacturing processes, for which 1–50 ppm is used. It is also included in antacid products such as tablets or capsules.[1–6]

When simethicone is used in aqueous formulations, it should be emulsified to ensure compatibility with the aqueous system and components.

In the US, up to 10 ppm of simethicone may be used in food products.

8 Description

The PhEur 9.2 and USP 40–NF 35 S1 describe simethicone as a mixture of fully methylated linear siloxane polymers containing repeating units of the formula $[-(CH_3)_2SiO-]_n$, stabilized with trimethylsiloxy end-blocking units of the formula $[(CH_3)_3\ SiO-]$, and silicon dioxide. It contains not less than 90.5% and not more than 99.0% of the polydimethylsiloxane $[-(CH_3)_2SiO-]_n$, and not less than 4.0% and not more than 7.0% of silicon dioxide. The PhEur 9.2 additionally states that the degree of polymerization is between 20–400.

Simethicone occurs as a translucent, gray-colored, viscous fluid. It has a molecular weight of 14 000–21 000.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for simethicone.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	–
Production	+	–
Acidity	+	–
Defoaming activity	≤15 seconds	≤15 seconds
Loss on heating	–	≤18.0%
Volatile matter	≤1.0%	–
Heavy metals	–	≤5 µg/g
Mineral oils	+	–
Phenylated compounds	+	–
Assay (silicon dioxide)	–	4.0–7.0%
Assay (silica)	4.0–7.0%	–
Assay (polydimethylsiloxane)	90.5–99.0%	90.5–99.0%

10 Typical Properties

Boiling point 35°C

Refractive index n_D^{20} = 0.965–0.970

Solubility Practically insoluble in ethanol (95%) and water. The liquid phase is soluble in benzene, chloroform, and ether, but silicon dioxide remains as a residue in these solvents.

Specific gravity 0.95–0.98 at 25°C

Spectroscopy

IR spectrum *see* Figure 1.

Raman spectrum *see* Figure 2.

Viscosity (kinematic) 370 mm^2/s (370 cSt) at 25°C for *Dow Corning Q7-2243 LVA*.

11 Stability and Storage Conditions

Simethicone is generally regarded as a stable material when stored in the original unopened container. A shelf-life of 18 months from the date of manufacture is typical. However, some simethicone products have a tendency for the silicon dioxide to settle slightly and containers of simethicone should therefore be shaken thoroughly to ensure uniformity of contents before sampling or use. Simethicone should be stored in a cool, dry location away from oxidizing materials.

Simethicone can be sterilized by dry heating or autoclaving. With dry heating, a minimum of 4 hours at 160°C is required.

12 Incompatibilities

Simethicone as supplied is not generally compatible with aqueous systems and will float like an oil on a formulation unless it is first emulsified. It should not be used in formulations or processing conditions that are very acidic (below pH 3) or highly alkaline (above pH 10), since these conditions may have some tendency to break the polydimethylsiloxane polymer. Simethicone cannot normally be mixed with polar solvents of any kind because it is very minimally soluble. Simethicone is incompatible with oxidizing agents.

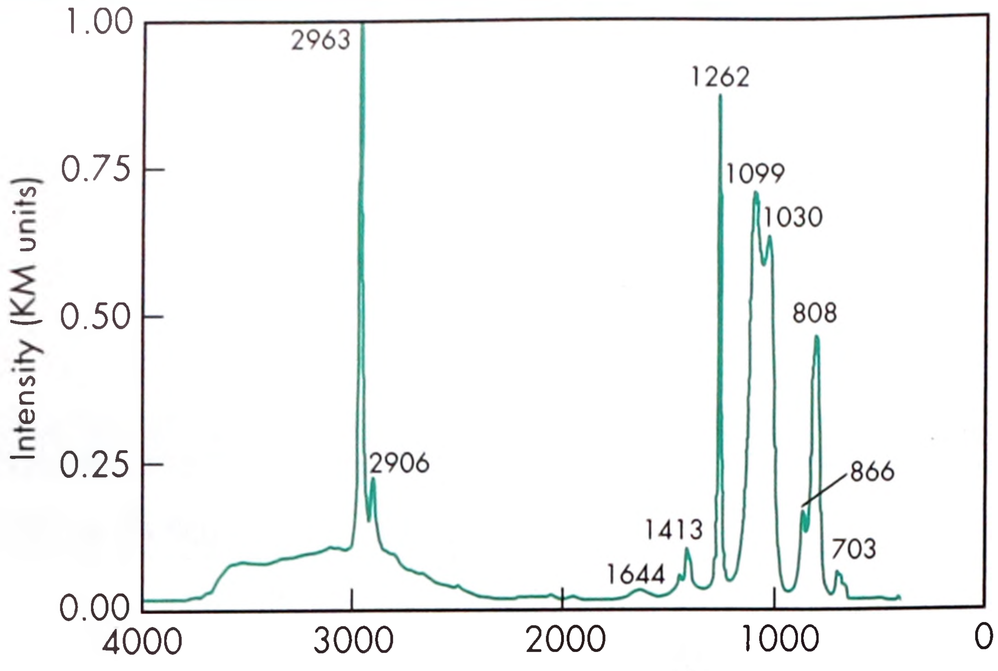


Figure 1: Infrared spectrum of simethicone measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

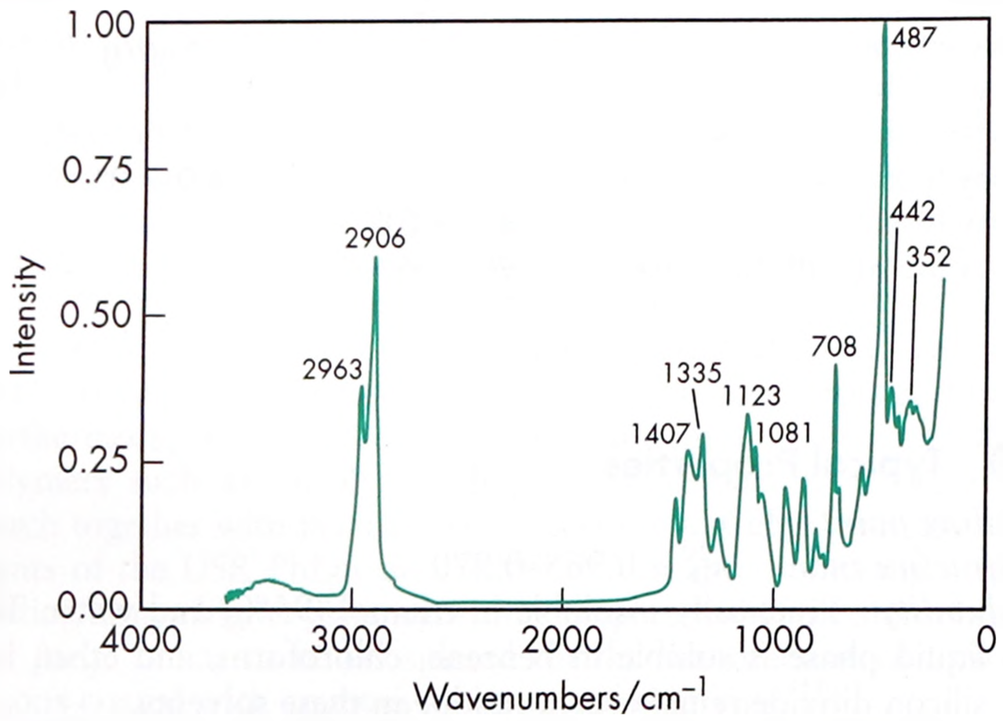

Figure 2: Raman spectrum of simethicone measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

13 Method of Manufacture

Silicon dioxide is initially rendered hydrophobic in one of a variety of proprietary processes specific to a particular manufacturer. It is then slowly mixed with the silicone fluids in a formulation. After mixing, the simethicone is milled to ensure uniformity.

14 Safety

Simethicone is used in cosmetics, foods, and oral and topical pharmaceutical formulations, and is generally regarded as a relatively nontoxic and nonirritant material when used as an excipient. Direct contact with the eye may cause irritation.

Therapeutically, oral doses of 125–250 mg of simethicone, three or four times daily, have been given as an antiflatulent. Doses of 20–40 mg of simethicone have been given with feeds to relieve colic in infants.[7]

LD_{50} (dog, IV): 0.9 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended. Simethicone should be handled in areas with adequate ventilation.

16 Regulatory Status

Included in the FDA Inactive Ingredients Database (oral capsules, granules, pastilles, powders, solutions, suspensions, tablets; IM-IV powder for injection solutions; rectal and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Cyclomethicone; dimethicone.

18 Comments

Therapeutically, simethicone is included in a number of oral pharmaceutical formulations as an antiflatulent, although its therapeutic benefit is questionable.[8,9] In some types of surgical or gastroscopic procedures where gas is used to inflate the body cavity, a defoaming preparation containing simethicone may be used in the area to control foaming of the fluids.[10]

The PubChem Compound ID (CID) for simethicone includes 6433516 and 9794495.

Sodium Acetate

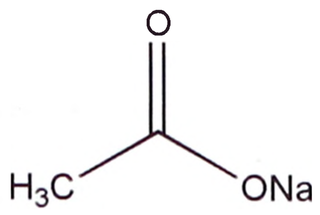
1 Nonproprietary Names

BP: Sodium Acetate Trihydrate
JP: Sodium Acetate Hydrate
PhEur: Sodium Acetate Trihydrate
USP–NF: Sodium Acetate

2 Synonyms

Acetic acid, sodium salt; E262; natrii acetas trihydricus; sodium ethanoate; sodium ethanoate trihydrate.

3 Chemical Name and CAS Registry Number



Sodium acetate anhydrous [127-09-3]
Sodium acetate trihydrate [6131-90-4]

4 Empirical Formula and Molecular Weight

$C_2H_3NaO_2$ 82.0 (for anhydrous)
$C_2H_3NaO_2 \cdot 3H_2O$ 136.1 (for trihydrate)

Note that the trihydrate is the material described in the JP XVII, PhEur 9.2 and USP 40–NF 35 S1, although the PhEur 9.2 is the only pharmacopeia that makes this explicit with the title of the monograph.

5 Structural Formula

6 Functional Category

Antimicrobial preservative; buffering agent; flavoring agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium acetate is used as part of a buffer system when combined with acetic acid in various intramuscular, intravenous, topical, ophthalmic, nasal, oral, otic, and subcutaneous formulations. It may be used to reduce the bitterness of oral pharmaceuticals.[1] It can be used to enhance the antimicrobial properties of formulations; it has been shown to inhibit the growth of *S. aureus* and *E. coli*, but not *C. albicans* in protein hydrolysate solutions.[2] It is widely used in the food industry as a preservative.[3]

8 Description

Sodium acetate occurs as colorless, transparent crystals or a white granular crystalline powder with a slight acetic acid odor.

9 Pharmacopeial Specifications

See Table I.

10 Typical Properties

Acidity/alkalinity pH = 7.5–9.0 (5% w/v aqueous solution)
Hygroscopicity The anhydrous and trihydrate sodium acetate are hygroscopic.
Melting point 58°C for trihydrate; 324°C for anhydrous.[4]
Solubility Soluble 1 in 0.8 in water, 1 in 20 in ethanol (95%).
Specific gravity 1.53
Spectroscopy
IR spectrum *see* Figure 1.
Raman spectrum *see* Figure 2.

Table I: Pharmacopeial specifications for sodium acetate.

Assay (dried basis)	≥99.5%	99.0–101.0%	99.0–101.0%

11 Stability and Storage Conditions

Sodium acetate should be stored in airtight containers.

12 Incompatibilities

Sodium acetate reacts with acidic and basic components. It will react violently with fluorine, potassium nitrate, and diketene.

13 Method of Manufacture

Sodium acetate is prepared by neutralization of acetic acid with sodium carbonate.

14 Safety

Sodium acetate is widely used in cosmetics, foods, and pharmaceutical formulations (*see* Section 18), and is generally regarded as a nontoxic and nonirritant material.

A short-term feeding study in chickens with a diet supplemented with 5.44% sodium acetate showed reduced growth rates that were attributed to the sodium content.[5] Sodium acetate is poisonous if injected intravenously, is moderately toxic by ingestion, and is an irritant to the skin and eyes.[6]

LD_{50} (rat, oral): 3.53 g/kg[6]
LD_{50} (mouse, IV): 0.34 g/kg[6]
LD_{50} (mouse, SC): 8.0 g/kg[6]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium acetate is a mild skin and eye

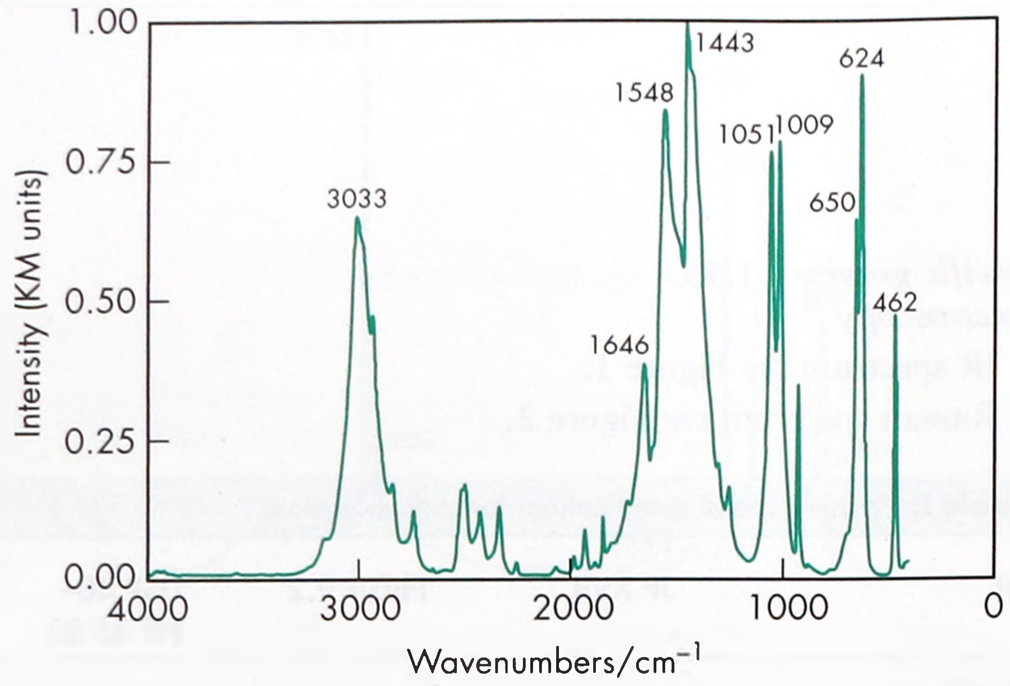

Figure 1: Infrared spectrum of sodium acetate (anhydrous) measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

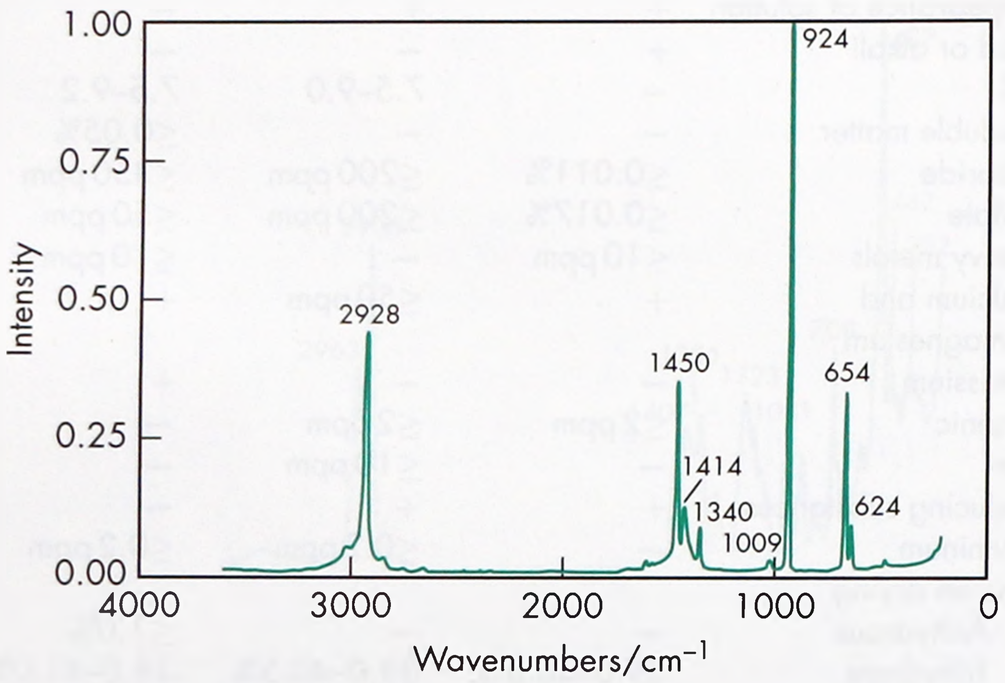

Figure 2: Raman spectrum of sodium acetate (anhydrous) measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

S

irritant; gloves and eye protection are recommended. On exposure, wash eyes and skin with large amounts of water. Inhalation of dust may cause pulmonary tract problems. When heated to decomposition, sodium acetate emits toxic fumes of NaO_2.[6]

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (injections, nasal, otic, ophthalmic, and oral preparations). Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

—

18 Comments

Sodium acetate was shown to enhance aqueous humor to plasma concentration ratio of timolol by about 20-fold in an ophthalmic monoisopropyl PVM-MA matrix system, presumably by decreasing systemic absorption.[7]

Sodium acetate has also been used experimentally in matrix tablet formulations, where it increased the effect of carbomer as a sustained release matrix.[8]

Sodium acetate has also been used therapeutically for the treatment of metabolic acidosis in premature infants,[9,10] and in hemodialysis solutions.[11,12]

A specification for sodium acetate is contained within the *Food Chemicals Codex* (FCC).[13] The PhEur 9.2 also contains a monograph on sodium acetate [1-^{11}C] injection under Radiopharmaceutical Preparations.

The EINECS number for sodium acetate is 204-823-8. The PubChem Compound ID (CID) for sodium acetate trihydrate is 23665404.

Sodium Alginate

1 Nonproprietary Names

BP: Sodium Alginate

PhEur: Sodium Alginate

USP–NF: Sodium Alginate

2 Synonyms

Alginato sodico; algin; alginic acid, sodium salt; E401; *Kelcosol*; *Keltone*; natrii alginas; *Pronova*; *Protanal*; sodium polymannuronate.

3 Chemical Name and CAS Registry Number

Sodium alginate [9005-38-3]

4 Empirical Formula and Molecular Weight

Sodium alginate consists chiefly of the sodium salt of alginic acid, which is a mixture of polyuronic acids composed of residues of D-mannuronic acid and L-guluronic acid.

The block structure and molecular weight of sodium alginate samples have been investigated.[1]

5 Structural Formula

See Section 4.

6 Functional Category

Modified-release agentsuspending agent; tablet and capsule binder; tablet and capsule disintegrant; viscosity-increasing agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium alginate is used in a variety of oral and topical pharmaceutical formulations.[2] In tablet formulations, sodium alginate may be used as both a binder and disintegrant;[3] it has been used as a diluent in capsule formulations.[4] Sodium alginate has also been used in the preparation of sustained-release oral formulations since it can delay the dissolution of a drug from tablets,[5–7] capsules,[8] and aqueous suspensions.[9] It has also been used in oral formulations of enteric capsules,[10] multiparticulate floating systems,[11] sustained-release liquids,[12] and soft tablets.[13] The effects of particle size, viscosity and chemical composition of sodium alginate on drug release from matrix tablets have been described.[14]

In topical formulations, sodium alginate is widely used as a thickening and suspending agent in a variety of pastes, creams, and gels, and as a stabilizing agent for oil-in-water emulsions.

Recently, sodium alginate has been used for the aqueous microencapsulation of drugs,[15] in contrast with the more conventional microencapsulation techniques which use organic-solvent systems. It has also been used in the formation of nanoparticles,[16,17] microcapsules,[18] and beads.[19]

The adhesiveness of hydrogels prepared from sodium alginate has been investigated,[20] and drug release from oral mucosal adhesive tablets,[21,22] buccal gels,[23–27] fast-disintegrating tablets,[28,29] films,[30,31] and vaginal tablets[32] based on sodium alginate have been reported. The esophageal bioadhesion of sodium alginate suspensions may provide a barrier against gastric reflux or site-specific delivery of therapeutic agents.[33,34] Other novel delivery systems containing sodium alginate include ophthalmic solutions that form a gel *in situ* when administered to the eye;[35–37] ophthalmic mucoadhesive systems[38] and intraocular implants;[39] *in situ* forming gels containing paracetamol,[40] and baclofen[41] for oral administration; nasal delivery systems based on mucoadhesive microspheres;[42] and a freeze-dried device intended for the delivery of bone-growth factors.[43]

Hydrogel systems containing alginates have also been investigated for delivery of proteins and peptides.[44] In addition, sodium alginate microspheres have been used in the preparation of a foot-mouth disease DNA vaccine,[45] and in an oral vaccine for *Helicobacter pylori*;[46] chitosan nanoparticles coated with sodium alginate may have applications in mucosal vaccine delivery systems.[47]

Sodium alginate is also used in cosmetics and food products; *see* Table I.

Table I: Uses of sodium alginate.

Use	Concentration (%)
Pastes and creams	5–10
Stabilizer in emulsions	1–3
Suspending agent	1–5
Tablet binder	1–3
Tablet disintegrant	2.5–10

8 Description

Sodium alginate occurs as an odorless and tasteless, white to pale yellowish-brown colored powder.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for sodium alginate.

Test	PhEur 9.2	USP 40–NF 35 S1
Characters	+	–
Identification	+	+
Appearance of solution	+	–
Microbial limits	≤1000 cfu/g	≤200 cfu/g
Loss on drying	≤15.0%	≤15.0%
Ash	–	18.0–27.0%
Sulfated ash	30.0–36.0%	–
Arsenic	–	≤1.5 ppm
Calcium	≤1.5%	–
Chlorides	≤1.0%	–
Lead	–	≤10 ppm
Heavy metals	–	≤40 ppm
Assay (dried basis)	–	90.8–106.0%

10 Typical Properties

Acidity/alkalinity pH ≈ 7.2 (1% w/v aqueous solution)

Solubility Practically insoluble in ethanol (95%), ether, chloroform, and ethanol/water mixtures in which the ethanol content is greater than 30% w/w. Also, practically insoluble in other organic solvents and aqueous acidic solutions in which the pH is less than 3. Slowly soluble in water, forming a viscous colloidal solution.

Spectroscopy

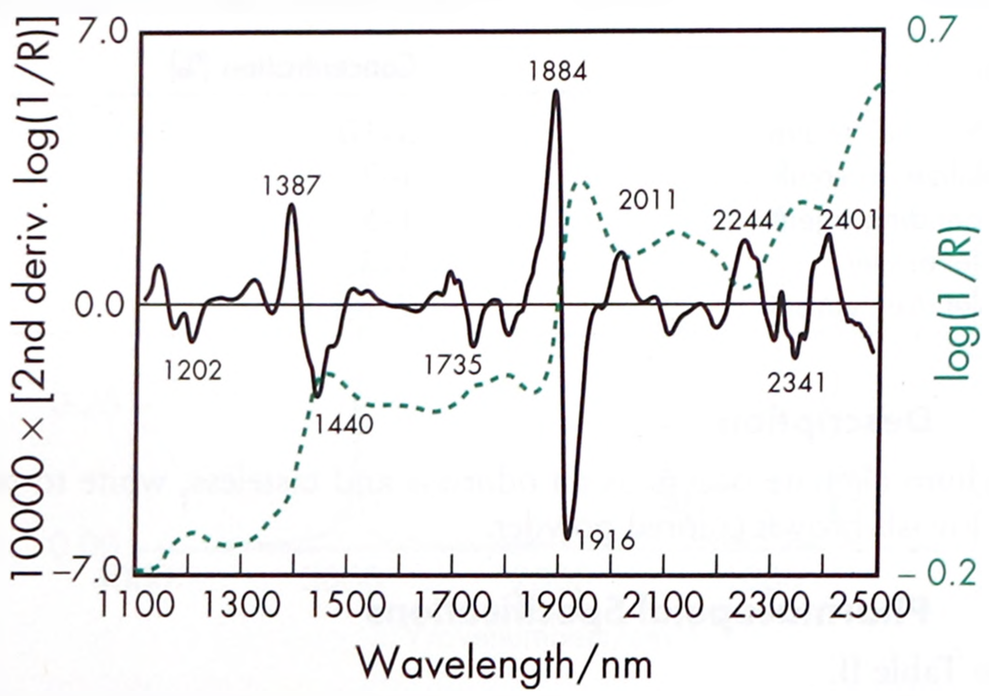

Figure 2: Near-infrared spectrum of sodium alginate measured by reflectance.

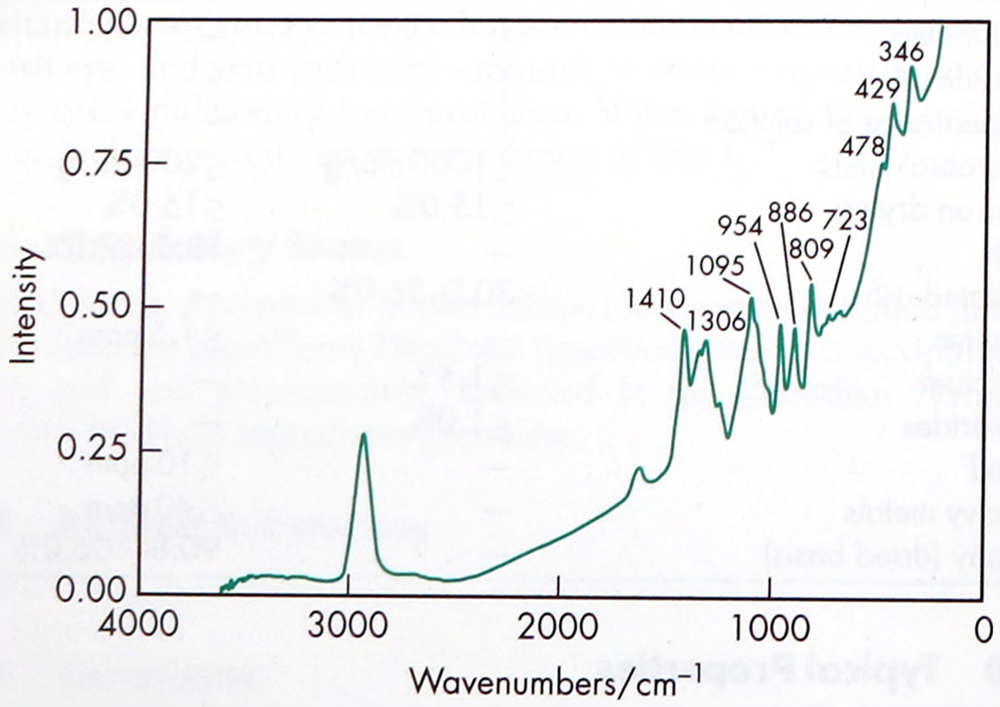

Figure 3: Raman spectrum of sodium alginate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Viscosity (dynamic) Various grades of sodium alginate are commercially available that yield aqueous solutions of varying viscosity. Typically, a 1% w/v aqueous solution, at 20°C, will have a viscosity of 20–400 mPa s (20–400 cP). Viscosity may vary depending upon concentration, pH, temperature, or the presence of metal ions.[55–57] Above pH 10, viscosity decreases; *see also* Alginic Acid and Section 11.

11 Stability and Storage Conditions

Sodium alginate is a hygroscopic material, although it is stable if stored at low relative humidities and a cool temperature.

Aqueous solutions of sodium alginate are most stable at pH 4–10. Below pH 3, alginic acid is precipitated. A 1% w/v aqueous solution of sodium alginate exposed to differing temperatures had a viscosity 60–80% of its original value after storage for 2 years.[58] Solutions should not be stored in metal containers.

Sodium alginate solutions are susceptible on storage to microbial spoilage, which may affect solution viscosity. Solutions are ideally sterilized using ethylene oxide, although filtration using a 0.45 µm filter also has only a slight adverse effect on solution viscosity.[59] Heating sodium alginate solutions to temperatures above 70°C causes depolymerization with a subsequent loss of viscosity. Autoclaving of solutions can cause a decrease in viscosity, which may vary depending upon the nature of any other substances present.[59,60] Gamma irradiation should not be used to sterilize sodium alginate solutions since this process severely reduces solution viscosity.[59,61]

Preparations for external use may be preserved by the addition of 0.1% chlorocresol, 0.1% chloroxylenol, or parabens. If the medium is acidic, benzoic acid may also be used.

The bulk material should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Sodium alginate is incompatible with acridine derivatives, crystal violet, phenylmercuric acetate and nitrate, calcium salts, heavy metals, and ethanol in concentrations greater than 5%. Low concentrations of electrolytes cause an increase in viscosity but high electrolyte concentrations cause salting-out of sodium alginate; salting-out occurs if more than 4% of sodium chloride is present.

13 Method of Manufacture

Alginic acid is extracted from brown seaweed and is neutralized with sodium bicarbonate to form sodium alginate.

14 Safety

Sodium alginate is widely used in cosmetics, food products, and pharmaceutical formulations, such as tablets and topical products, including wound dressings. It is generally regarded as a nontoxic and nonirritant material, although excessive oral consumption may be harmful. A study in five healthy male volunteers fed a daily intake of 175 mg/kg body-weight of sodium alginate for 7 days, followed by a daily intake of 200 mg/kg body-weight of sodium alginate for a further 16 days, showed no significant adverse effects.[62]

The WHO has not specified an acceptable daily intake for alginic acid and alginate salts as the levels used in food do not represent a hazard to health.[63]

Inhalation of alginate dust may be irritant and has been associated with industrial-related asthma in workers involved in alginate production. However, it appears that the cases of asthma were linked to exposure to seaweed dust rather than pure alginate dust.[64]

LD_{50} (cat, IP): 0.25 g/kg[65]
LD_{50} (mouse, IV): 0.2 g/kg
LD_{50} (rabbit, IV): 0.1 g/kg
LD_{50} (rat, IV): 1 g/kg
LD_{50} (rat, oral): >5 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium alginate may be irritant to the eyes or respiratory system if inhaled as dust; *see* Section 14. Eye

protection, gloves, and a dust respirator are recommended. Sodium alginate should be handled in a well-ventilated environment.

16 Regulatory Status

GRAS listed. Accepted in Europe for use as a food additive. Included in the FDA Inactive Ingredients Database (oral capsules, suspensions, syrups, tablets, and troches; oral sustained-action tablets). Included as an excipient in nonparenteral medicines (oral capsules, chewable tablets, modified-release tablets, enteric-coated tablets, suspensions, powders, and lozenges) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Alginic acid; calcium alginate; potassium alginate; propylene glycol alginate.

18 Comments

A number of different grades of sodium alginate, which have different solution viscosities, are commercially available. Many different alginate salts and derivatives are also commercially available including ammonium alginate; calcium alginate; magnesium alginate, and potassium alginate.

To assist in the preparation of dispersions of sodium alginate, the material may be mixed with a dispersing agent such as sucrose, ethanol, glycerol, or propylene glycol.

Therapeutically, sodium alginate has been used in combination with an H_2-receptor antagonist in the management of gastroesophageal reflux,[48] and as a hemostatic agent in surgical dressings.[49,50] Alginate dressings, used to treat exuding wounds, often contain significant amounts of sodium alginate as this improves the gelling properties,[51] and wound dressing systems containing nitrofurazone have been reported.[52] Sponges composed of sodium alginate and chitosan produce a sustained drug release and may be useful as wound dressings or as tissue engineering matrices.[53] Lyophilized wound healing wafers composed of sodium alginate have been found to exhibit large reductions in viscosity following gamma irradiation.[54]

A specification for sodium alginate is contained in the *Food Chemicals Codex* (FCC)[66] and the *Japanese Pharmaceutical Excipients* (JPE).[67]

The PubChem Compound ID (CID) for sodium alginate is 6850754.

Sodium Ascorbate

1 Nonproprietary Names

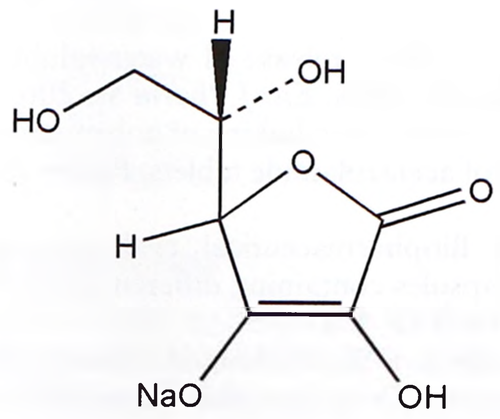
BP: Sodium Ascorbate

PhEur: Sodium Ascorbate

USP–NF: Sodium Ascorbate

2 Synonyms

L-Ascorbic acid monosodium salt; E301; 3-oxo-L-gulofuranolactone sodium enolate; natrii ascorbas; *SA-99*; vitamin C sodium.



3 Chemical Name and CAS Registry Number

Monosodium L-(+)-ascorbate [134-03-2]

4 Empirical Formula and Molecular Weight

$C_6H_7NaO_6$ 198.11

5 Structural Formula

6 Functional Category

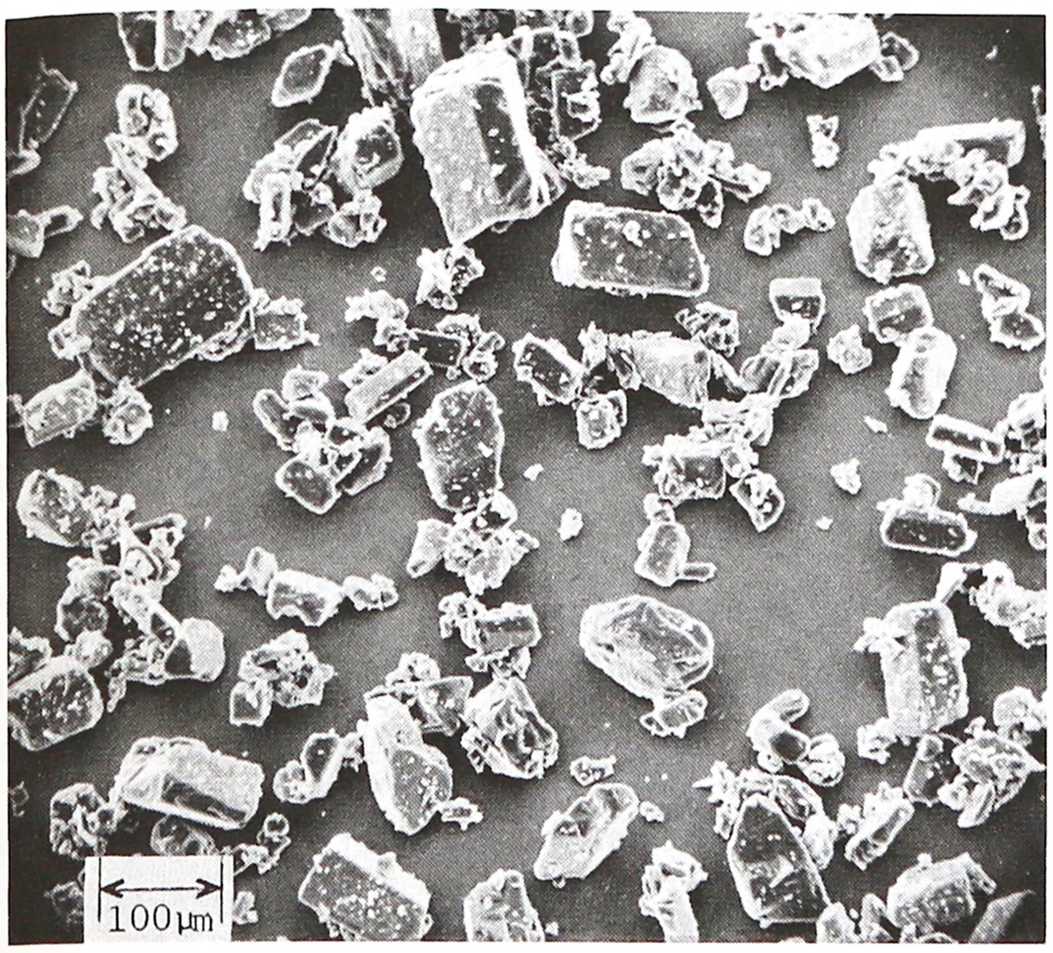
Antioxidant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium ascorbate is used as an antioxidant in pharmaceutical formulations, and also in food products where it increases the effectiveness of sodium nitrite against growth of *Listeria monocytogenes* in cooked meats. It improves gel cohesiveness and sensory firmness of fiberized products regardless of vacuum treatment.

8 Description

Sodium ascorbate occurs as a white or slightly yellow-colored, practically odorless, crystalline powder with a pleasant saline taste.



9 Pharmacopeial Specifications

See Table I.

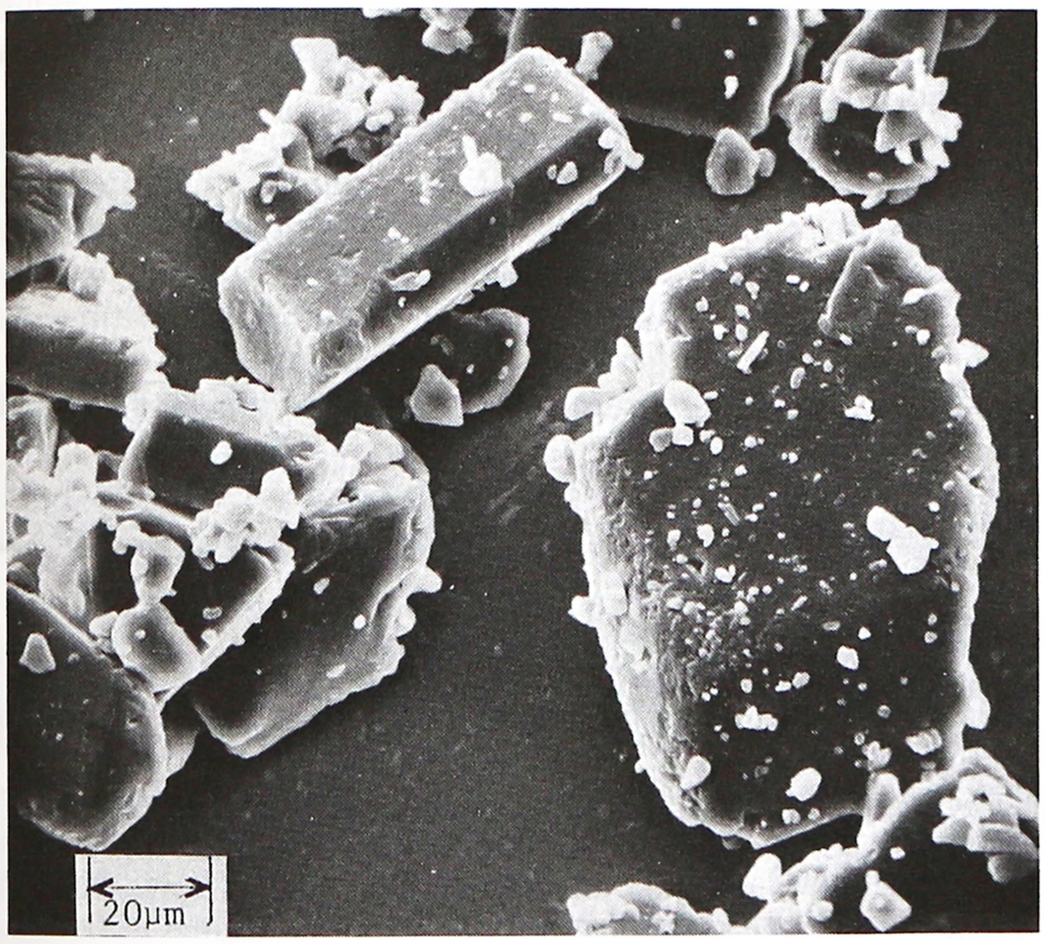


Table I: Pharmacopeial specifications for sodium ascorbate.

Test	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+
Characters	+	—
Appearance of solution	+	—
pH	7.0–8.0	7.0–8.0
Specific optical rotation (10% w/v aqueous solution)	+103° to +108°	+103° to +108°
Oxalic acid	≤0.30%	—
Related substances	+	—
Sulfates	≤150 ppm	—
Copper	≤5 ppm	—
Iron	≤2 ppm	—
Nickel	≤1 ppm	—
Heavy metals	—	≤20 ppm
Loss on drying	≤0.25%	≤0.25%
Assay (dried basis)	99.0–101.0%	99.0–101.0%

SEM 1: Excipient: sodium ascorbate USP-NF; manufacturer: Pfizer Ltd.; lot no: 9B-1 (C92220-C4025); magnification: 120×; voltage: 20 kV.

SEM 2: Excipient: sodium ascorbate USP; manufacturer: Pfizer Ltd.; lot no: 9B-1 (C92220-C4025); magnification: 600×; voltage: 20 kV.

10 Typical Properties

Acidity/alkalinity pH = 7–8 (10% w/v aqueous solution)

Density (tapped)

0.6–1.1 g/cm^3 for fine powder;

0.8–1.1 g/cm^3 for fine granular grade.

Density (true) 1.826 g/cm^3

Hygroscopicity Not hygroscopic. Sodium ascorbate adsorbs practically no water up to 80% relative humidity at 20°C and less than 1% w/w of water at 90% relative humidity.

Melting point 218°C (with decomposition)

Particle size distribution Various grades of sodium ascorbate with different particle-size distributions are commercially available, e.g. approximately 98% passes through a 149 µm mesh for a fine powder grade (Takeda), and approximately 95% passes through a 840 µm mesh for a standard grade (Takeda).

Solubility *see* Table II.

Table II: Solubility of sodium ascorbate.

Solvent	Solubility at 20°C unless otherwise stated
Chloroform	Practically insoluble
Ethanol (95%)	Very slightly soluble
Ether	Practically insoluble
Water	1 in 1.6
	1 in 1.3 at 75°C

Specific gravity

1.782 for powder at 20°C;

1.005 for 1% w/v aqueous solution at 25°C;

1.026 for 5% w/v aqueous solution at 25°C.

Specific rotation $[\alpha]_D^{20} = +104.4°$ (10% w/v aqueous solution)

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Sodium ascorbate is relatively stable in air, although it gradually darkens on exposure to light. Aqueous solutions are unstable and subject to rapid oxidation in air at pH > 6.0.

The bulk material should be stored in a well-closed nonmetallic container, protected from light, in a cool, dry place.

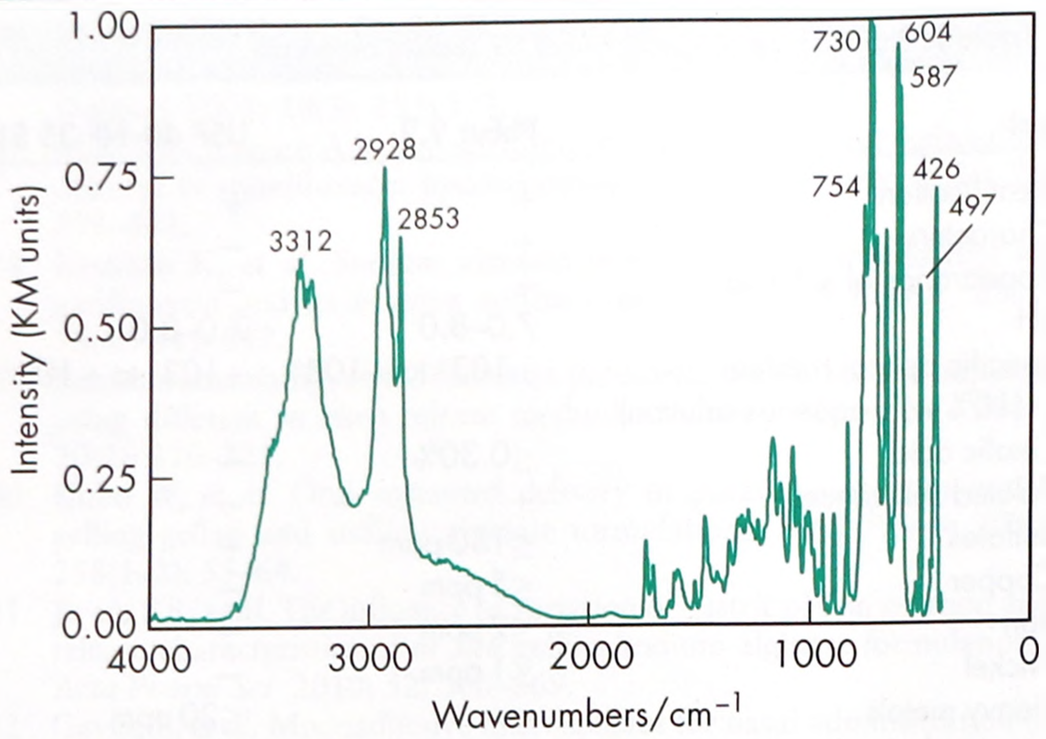

Figure 1: Infrared spectrum of sodium ascorbate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

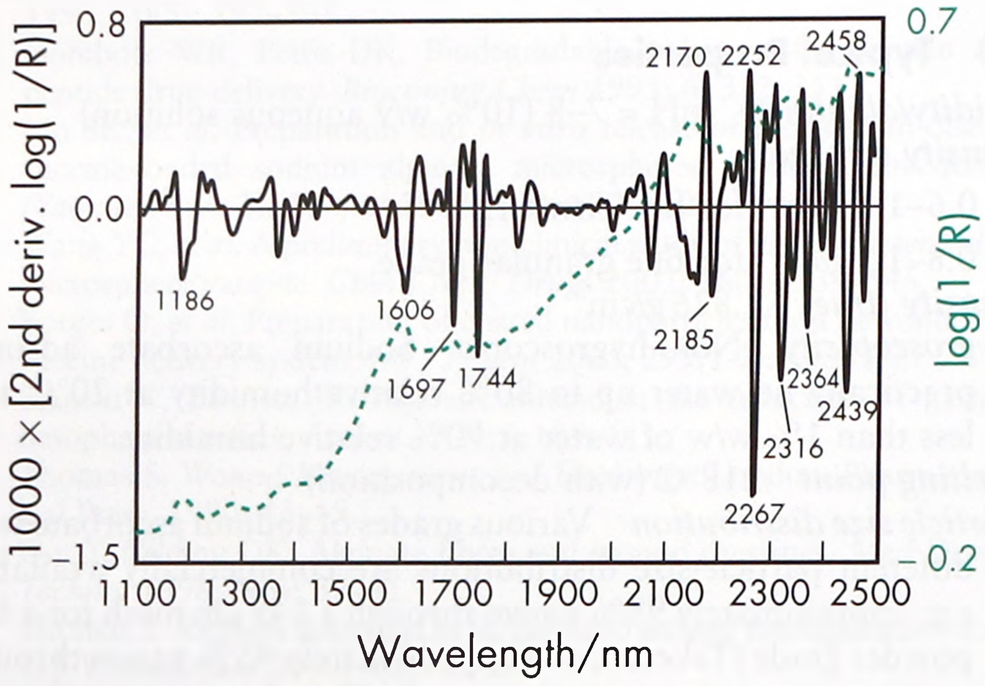

Figure 2: Near-infrared spectrum of sodium ascorbate measured by reflectance.

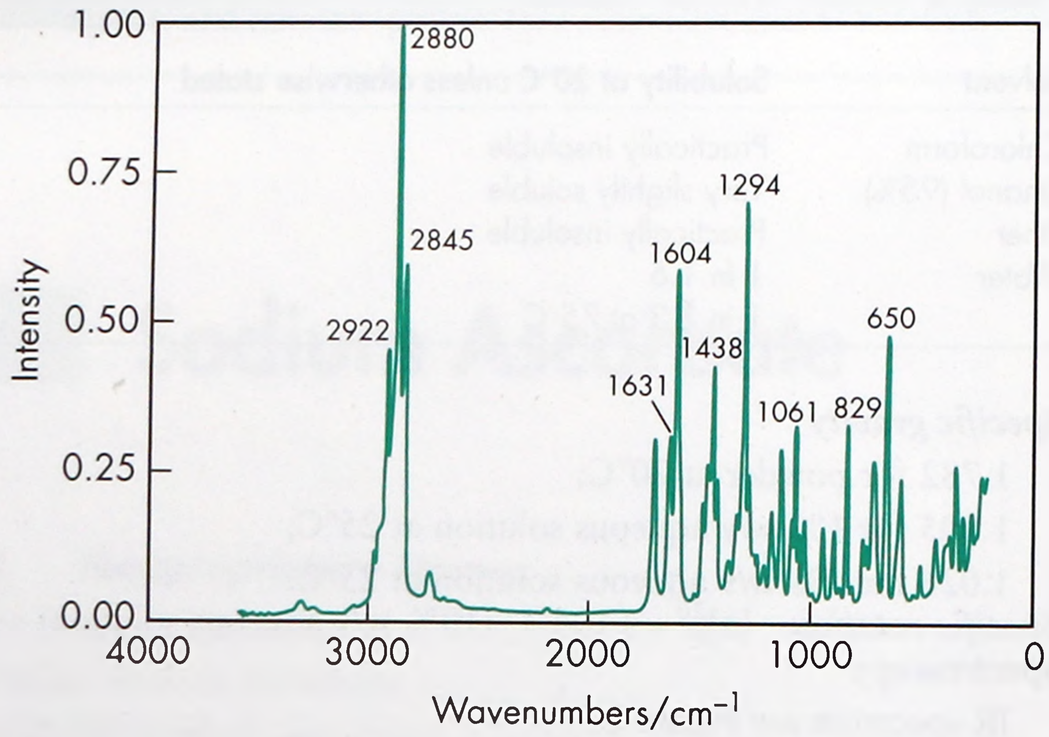

Figure 3: Raman spectrum of sodium ascorbate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

12 Incompatibilities

Incompatible with oxidizing agents, heavy metal ions, especially copper and iron, methenamine, sodium nitrite, sodium salicylate, and theobromine salicylate. The aqueous solution is reported to be incompatible with stainless steel filters.[1]

13 Method of Manufacture

An equivalent amount of sodium bicarbonate is added to a solution of ascorbic acid in water. Following the cessation of effervescence, the addition of propan-2-ol precipitates sodium ascorbate.

14 Safety

The parenteral administration of 0.25–1.00 g of sodium ascorbate, given daily in divided doses, is recommended in the treatment of vitamin C deficiencies. Various adverse reactions have been reported following the administration of 1 g or more of sodium ascorbate, although ascorbic acid and sodium ascorbate are usually well tolerated; *see* Ascorbic acid. There have been no reports of adverse effects associated with the much lower concentrations of sodium ascorbate and ascorbic acid, which are employed as antioxidants.

The WHO has set an acceptable daily intake of ascorbic acid, potassium ascorbate, and sodium ascorbate, as antioxidants in food, at up to 15 mg/kg body-weight in addition to that naturally present in food.[2]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium ascorbate may be irritant to the eyes. Eye protection and rubber or plastic gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (IV preparations; oral tablets). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Ascorbic acid; ascorbyl palmitate; calcium ascorbate.

Calcium ascorbate

Empirical formula $C_{12}H_{14}O_{12}Ca$
Molecular weight 390.31
CAS number [5743-27-1]
Synonyms calcium L-(+)-ascorbate; *CCal-97*; E302.

18 Comments

1 mg of sodium ascorbate is equivalent to 0.8890 mg of ascorbic acid (1 mg of ascorbic acid is equivalent to 1.1248 mg of sodium ascorbate); 1 g of sodium ascorbate contains approximately 5 mmol of sodium.

Sodium ascorbate is used therapeutically as a source of vitamin C in tablets and parenteral preparations. Sodium ascorbate is used as an antioxidant in food products where it increases the effectiveness of sodium nitrite against growth of *Listeria monocytogenes* in cooked meats. It improves gel cohesiveness and sensory firmness of fiberized products regardless of vacuum treatment.

A specification for sodium ascorbate is contained in the *Food Chemicals Codex* (FCC).[3]

The EINECS number for sodium ascorbate is 205-126-1. The PubChem Compound ID (CID) for sodium ascorbate is 23666832.

Sodium Benzoate

1 Nonproprietary Names

BP: Sodium Benzoate

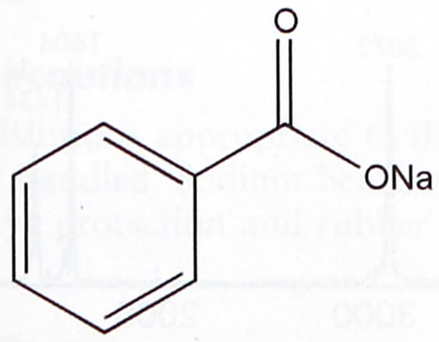
JP: Sodium Benzoate

PhEur: Sodium Benzoate

USP–NF: Sodium Benzoate

2 Synonyms

Benzoate of soda;benzoic acid sodium salt; E211; natrii benzoas; natrium benzoicum; sobenate; sodii benzoas; sodium benzoic acid.



3 Chemical Name and CAS Registry Number

Sodium benzoate [532-32-1]

4 Empirical Formula and Molecular Weight

$C_7H_5NaO_2$ 144.11

5 Structural Formula

6 Functional Category

Antimicrobial preservative; tablet and capsule lubricant.

7 Applications in Pharmaceutical Formulation or Technology

Sodium benzoate is used primarily as an antimicrobial preservative in cosmetics, foods, and pharmaceuticals. It is used in concentrations of 0.02–0.5% in oral medicines, 0.5% in parenteral products, and 0.1–0.5% in cosmetics. The usefulness of sodium benzoate as a preservative is limited by its effectiveness over a narrow pH range; *see* Section 10. The inhibitory concentration of sodium benzoate required in emulsions increases with oil content.

Sodium benzoate is used in preference to benzoic acid in some circumstances, owing to its greater solubility. However, in some applications it may impart an unpleasant flavor to a product. Sodium benzoate has also been used as a tablet lubricant[1] at 2–5% w/w concentrations, providing rapid disintegration times.[2]

8 Description

Sodium benzoate occurs as a white granular or crystalline, slightly hygroscopic powder. It is odorless, or with faint odor of benzoin and has an unpleasant sweet and saline taste.

9 Pharmacopeial Specifications

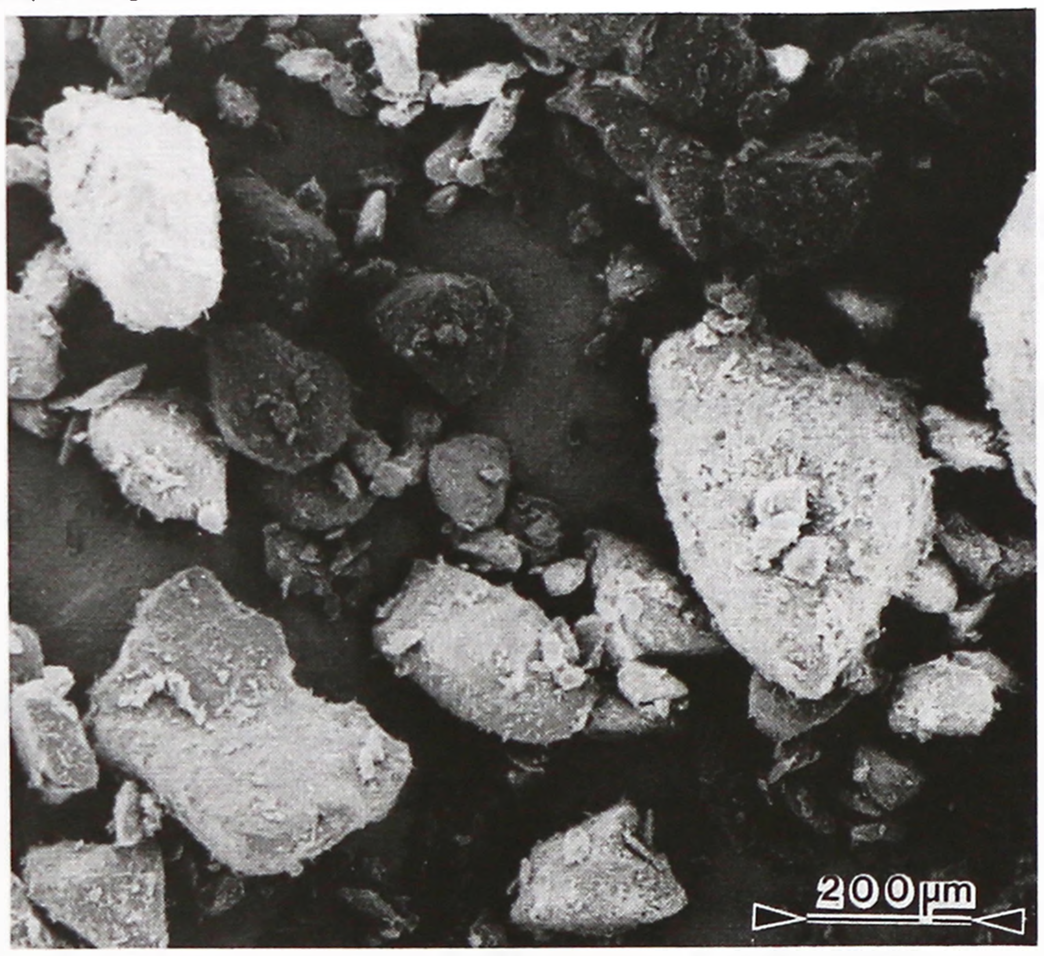
See Table I.

Table I: Pharmacopeial specifications for sodium benzoate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	+	+	–
Acidity or alkalinity	+	+	+
Appearance of solution	+	+	–
Arsenic	≤2 ppm	–	–
Chloride	+	≤200 ppm	–
Heavy metals	≤20 ppm	–	≤10 µg/g
Loss on drying	≤1.5%	≤2.0%	≤1.5%
Phthalic acid	+	–	–
Sulfate	≤0.120%	–	–
Total chlorine	–	≤300 ppm	–
Assay (dried basis)	≥99.0%	99.0–100.5%	99.0–101.0%

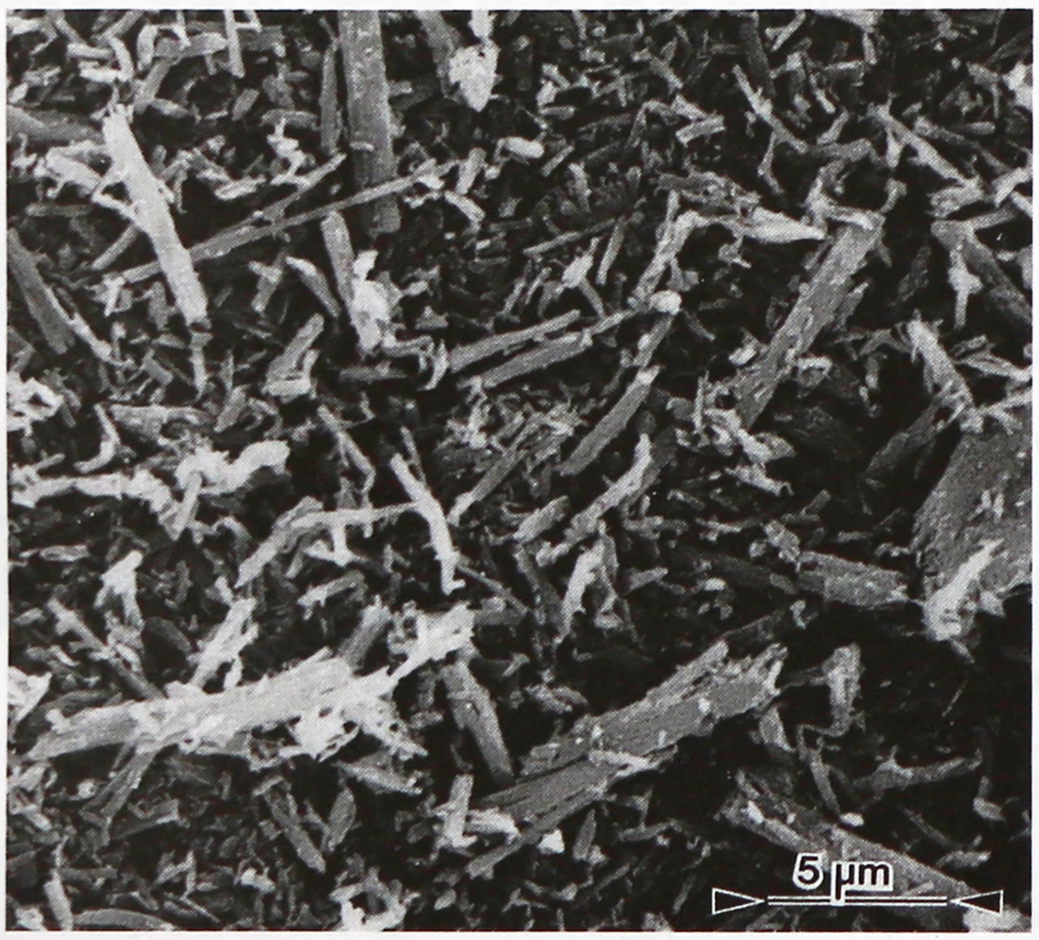
10 Typical Properties

Acidity/alkalinity pH = 8.0 (saturated aqueous solution at 25°C). It is relatively inactive above approximately pH 5.



Antimicrobial activity Sodium benzoate has both bacteriostatic and antifungal properties attributed to undissociated benzoic acid; hence preservative efficacy is best seen in acidic solutions (pH 2–5). In alkaline conditions it is almost without effect.

Density 1.497–1.527 g/cm^3 at 24°C



Freezing point depression 0.24°C (1.0% w/v)

S

SEM 1: Excipient: sodium benzoate; manufacturer: Bush Boake Allen Corp.; magnification: 60×.

11 Stability and Storage Conditions

Aqueous solutions may be sterilized by autoclaving or filtration.

The bulk material should be stored in a well-closed container, in a cool, dry place.

12 Incompatibilities

Sodium benzoate is incompatible with quaternary compounds, gelatin, ferric salts, calcium salts, and salts of heavy metals, including silver, lead, and mercury. Preservative activity may be reduced by

interactions with kaolin[3] or nonionic surfactants. Sodium benzoate may also react with ascorbic acid to form benzene.[4]

13 Method of Manufacture

Sodium benzoate is prepared by the treatment of benzoic acid with either sodium carbonate or sodium bicarbonate.

14 Safety

Ingested sodium benzoate is conjugated with glycine in the liver to yield hippuric acid, which is excreted in the urine. Symptoms of systemic benzoate toxicity resemble those of salicylates.[5] Whereas oral administration of the free-acid form may cause severe gastric irritation, benzoate salts are well tolerated in large quantities: e.g. 6 g of sodium benzoate in 200 mL of water is administered orally as a liver function test.

Clinical data have indicated that sodium benzoate can produce nonimmunological contact urtcaria and nonimmunological immediate contact reactions.[6] However, it is also recognized that these reactions are strictly cutaneous, and sodium benzoate can therefore be used safely at concentrations up to 5%. Nevertheless, this nonimmunological phenomenon should be considered when designing formulations for infants and children.

Other adverse effects include anaphylaxis[7–9] and urticarial reactions, although a controlled study has shown that the incidence of urticaria in patients given sodium benzoate was very low compared with the placebo-controlled group.[10]

It has been recommended that caffeine and sodium benzoate injection should not be used in neonates;[11] however, sodium benzoate has been used by others in the treatment of some neonatal metabolic disorders.[12] It has been suggested that there is a general adverse effect of benzoate preservatives on the behavior of 3-year-old children, which is detectable by parents, but not by a simple clinical assessment.[13]

The WHO acceptable daily intake of total benzoates, calculated as benzoic acid, has been estimated at up to 5 mg/kg of body-weight.[14,15]

LD_{50} (mouse, IM): 2.3 g/kg[15,16]

LD_{50} (mouse, IV): 1.4 g/kg

LD_{50} (mouse, oral): 1.6 g/kg

LD_{50} (rabbit, oral): 2.0 g/kg

LD_{50} (rat, IV): 1.7 mg/kg

LD_{50} (rat, oral): 4.1 g/kg

See also Benzoic Acid.

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium benzoate may be irritant to the eyes and skin. Eye protection and rubber or plastic gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted as a food additive in Europe. Included in the FDA Inactive Ingredients Database (dental preparations; IM and IV injections; oral capsules, solutions and tablets; rectal; and topical preparations). Included in nonparenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Benzoic acid; potassium benzoate.

18 Comments

Sodium benzoate has been studied for use in caffeine preparations and anesthetic formulations.[17]

Sodium benzoate has been used as an antimicrobial agent used in polymeric films in food packaging.[18] Solutions of sodium benzoate have also been administered, orally or intravenously, in order to determine liver function.

A specification for sodium benzoate is contained in the *Food Chemicals Codex* (FCC).[19]

The EINECS number for sodium benzoate is 208-534-8. The PubChem Compound ID (CID) for sodium benzoate is 517055.

Sodium Bicarbonate

1 Nonproprietary Names

BP: Sodium Bicarbonate

JP: Sodium Bicarbonate

PhEur: Sodium Hydrogen Carbonate

USP–NF: Sodium Bicarbonate

2 Synonyms

Baking soda; E500; *Effer-Soda*; monosodium carbonate; natrii hydrogenocarbonas; Sal de Vichy; sodium acid carbonate; sodium hydrogen carbonate.

3 Chemical Name and CAS Registry Number

Carbonic acid monosodium salt [144-55-8]

4 Empirical Formula and Molecular Weight

$NaHCO_3$ 84.01

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium bicarbonate is generally used in pharmaceutical formulations as a source of carbon dioxide in effervescent tablets and granules. It is also widely used to produce or maintain an alkaline pH in a preparation.

In effervescent tablets and granules, sodium bicarbonate is usually formulated with citric and/or tartaric acid;[1] combinations of citric and tartaric acid are often preferred in formulations as citric acid alone produces a sticky mixture that is difficult to granulate, while if tartaric acid is used alone, granules lose firmness. When the tablets or granules come into contact with water, a chemical reaction occurs, carbon dioxide is evolved, and the product disintegrates.[2,3] Melt granulation in a fluidized bed dryer has been suggested as a one-step method for the manufacture of effervescent granules composed of anhydrous citric acid and sodium bicarbonate, for subsequent compression into tablets.[4]

Tablets may also be prepared with sodium bicarbonate alone since the acid of gastric fluid is sufficient to cause effervescence and disintegration. Sodium bicarbonate is also used in tablet formulations to buffer drug molecules that are weak acids, thereby increasing the rate of tablet dissolution and reducing gastric irritation.[5–8]

The effects of tablet binders, such as polyethylene glycols, microcrystalline cellulose, silicified microcrystalline cellulose, pregelatinized starch, and povidone, on the physical and mechanical properties of sodium bicarbonate tablets have also been investigated.[9,10]

Additionally, sodium bicarbonate is used in solutions as a buffering agent for erythromycin,[11] lidocaine,[12] vancomycin hydrochloride,[13] local anesthetic solutions,[14] and total parenteral nutrition (TPN) solutions.[15] In some parenteral formulations, e.g. niacin, sodium bicarbonate is used to produce a sodium salt of the active ingredient that has enhanced solubility. Sodium bicarbonate has also been used as a freeze-drying stabilizer[16,17] and in toothpastes.

Sodium bicarbonate has been used as a gas-forming agent in alginate raft systems[18–20] and in floating, controlled-release oral dosage forms for a range of drugs.[21–26] Formulations containing sodium bicarbonate have also been used for fast-dissolving tablets[27,28] and orodispersible tablets.[29] Tablet formulations containing sodium bicarbonate have been shown to increase the absorption of paracetamol,[30,31] and improve the stability of levothyroxine.[32] Sodium bicarbonate has also been included in formulations of vaginal bioadhesive tablets,[33] sustained-release matrix tablets,[34] and in carbon dioxide-releasing suppositories.[35]

See Table I.

Table I: Uses of sodium bicarbonate.

Use	Concentration (%)
Buffer in tablets	10–40
Effervescent tablets	25–50
Isotonic injection/infusion	1.39

8 Description

Sodium bicarbonate occurs as an odorless, white, crystalline powder with a saline, slightly alkaline taste. The crystal structure is monoclinic prisms. Grades with different particle sizes, from a fine powder to free-flowing uniform granules, are commercially available.

9 Pharmacopeial Specifications

See Table II.

Table II: Pharmacopeial specifications for sodium bicarbonate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

IR spectrum *see* Figure 1.
NIR spectrum *see* Figure 2.
Raman spectrum *see* Figure 3.

Table III: Solubility of sodium bicarbonate.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol (95%)	Practically insoluble
Ether	Practically insoluble
Water	1 in 11
	1 in 4 at 100°C[a]
	1 in 10 at 25°C
	1 in 12 at 18°C

[a] Note that in hot water, sodium bicarbonate is converted to the carbonate.

11 Stability and Storage Conditions

When heated to about 50°C, sodium bicarbonate begins to dissociate into carbon dioxide, sodium carbonate, and water; on heating to 250–300°C for a short time, sodium bicarbonate is completely converted into anhydrous sodium carbonate. However, the process is both time- and temperature-dependent, with conversion 90% complete within 75 minutes at 93°C. The reaction proceeds via surface-controlled kinetics; when sodium bicarbonate crystals are heated for a short period of time, very fine needle-shaped crystals of anhydrous sodium carbonate are formed on the sodium bicarbonate surface.[36]

The effects of relative humidity and temperature on the moisture sorption and stability of sodium bicarbonate powder have been investigated. Sodium bicarbonate powder is stable below 76% relative humidity at 25°C and below 48% relative humidity at 40°C.[37] At 54% relative humidity, the degree of pyrolytic decarboxylation of sodium bicarbonate should not exceed 4.5% in order to avoid detrimental effects on stability.[38]

At ambient temperatures, aqueous solutions slowly decompose with partial conversion into the carbonate; the decomposition is accelerated by agitation or heat. Aqueous solutions begin to break up into carbon dioxide and sodium carbonate at about 20°C, and completely on boiling.

Aqueous solutions of sodium bicarbonate may be sterilized by filtration or autoclaving. To minimize decomposition of sodium bicarbonate by decarboxylation on autoclaving, carbon dioxide is passed through the solution in its final container, which is then hermetically sealed and autoclaved. The sealed container should not be opened for at least 2 hours after it has returned to ambient temperature, to allow time for the complete reformation of the bicarbonate from the carbonate produced during the heating process.

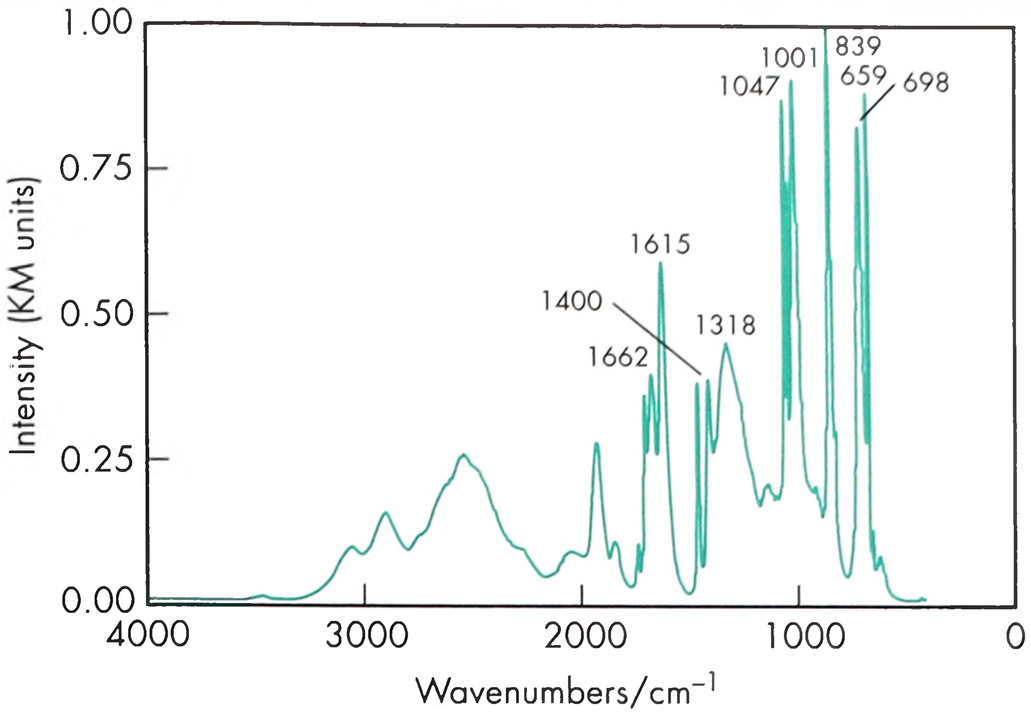

Figure 1: Infrared spectrum of sodium bicarbonate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

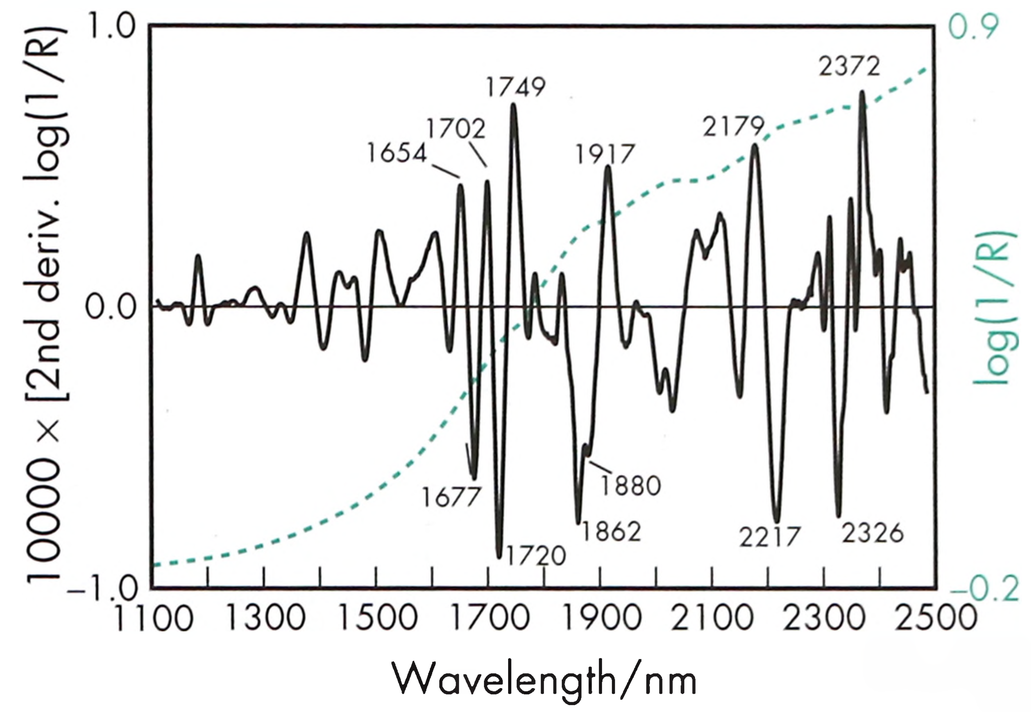

Figure 2: Near-infrared spectrum of sodium bicarbonate measured by reflectance.

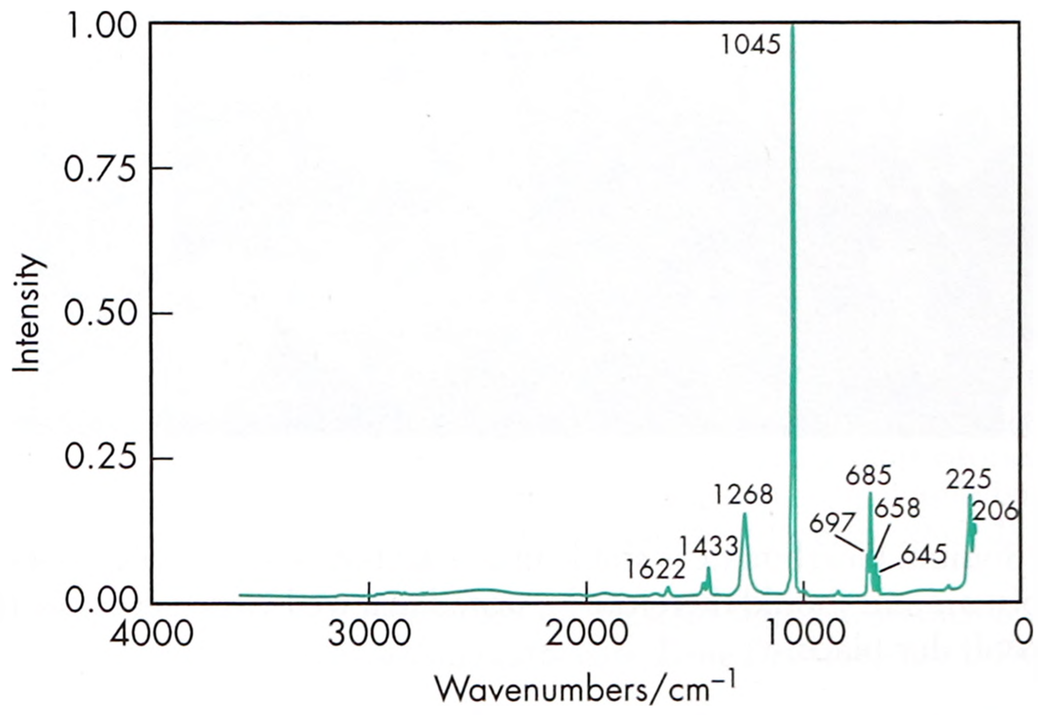

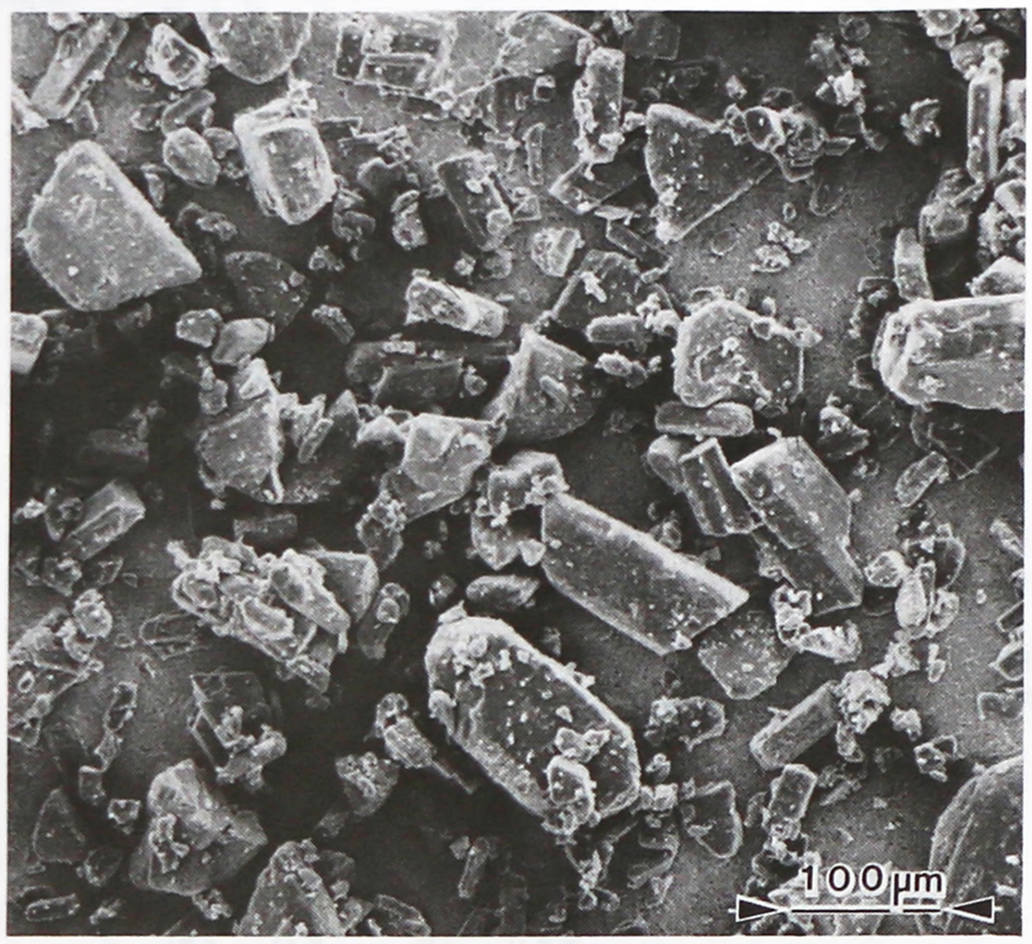

Figure 3: Raman spectrum of sodium bicarbonate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

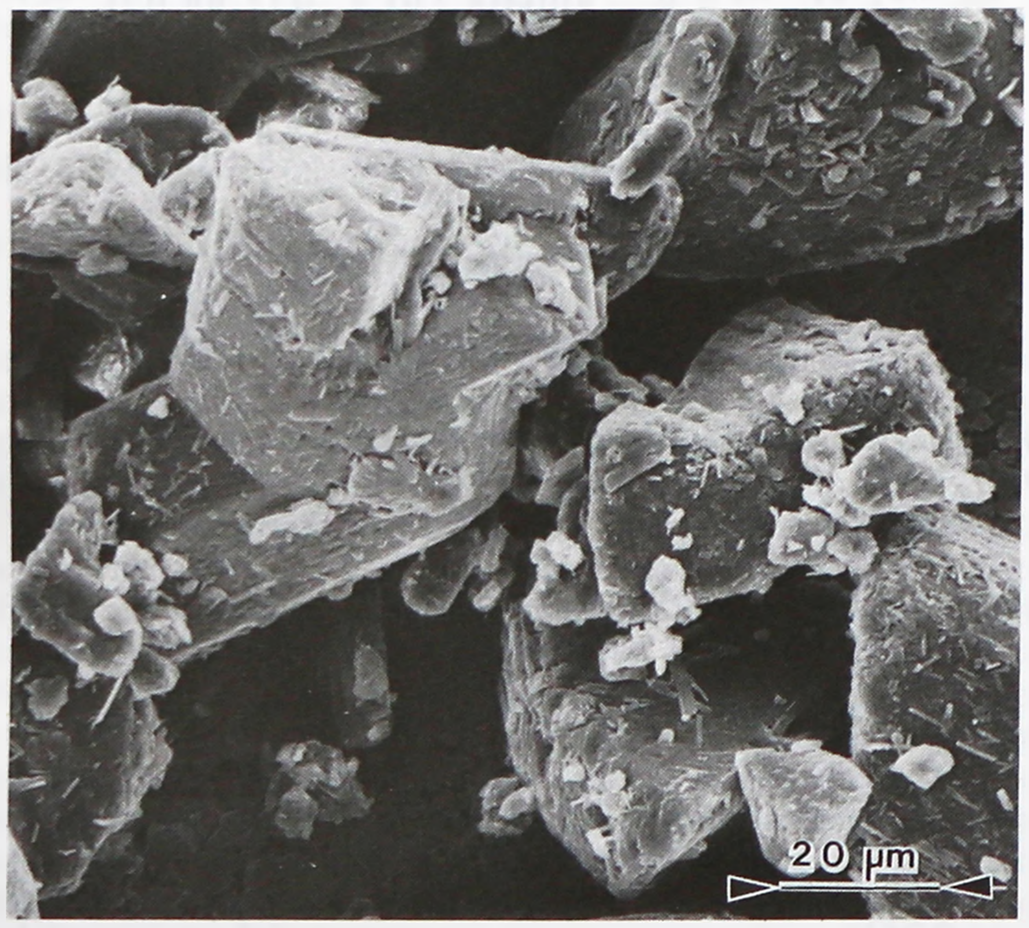

Aqueous solutions of sodium bicarbonate stored in glass containers may develop deposits of small glass particles. Sediments of calcium carbonate with traces of magnesium or other metal carbonates have been found in injections sterilized by autoclaving; these are due to impurities in the bicarbonate or to extraction of calcium and magnesium ions from the glass container. Sedimentation may be retarded by the inclusion of 0.01–0.02% edetate disodium.[39–41]

S

SEM 1: Excipient: sodium bicarbonate; manufacturer: Merck Ltd; magnification: 120×.

SEM 2: Excipient: sodium bicarbonate; manufacturer: Merck Ltd; magnification: 600×.

Sodium bicarbonate is stable in dry air but slowly decomposes in moist air and should therefore be stored in a well-closed container in a cool, dry place.

12 Incompatibilities

Sodium bicarbonate reacts with acids, acidic salts, and many alkaloidal salts, with the evolution of carbon dioxide. Sodium bicarbonate can also intensify the darkening of salicylates.

In powder mixtures, atmospheric moisture or water of crystallization from another ingredient is sufficient for sodium bicarbonate to react with compounds such as boric acid or alum. In liquid mixtures containing bismuth subnitrate, sodium bicarbonate reacts with the acid formed by hydrolysis of the bismuth salt.

In solution, sodium bicarbonate has been reported to be incompatible with many drug substances such as ciprofloxacin,[42,43] amiodarone,[44] nicardipine,[45] and levofloxacin.[46]

13 Method of Manufacture

Sodium bicarbonate is manufactured either by passing carbon dioxide into a cold saturated solution of sodium carbonate, or by the ammonia–soda (Solvay) process, in which first ammonia and then carbon dioxide is passed into a sodium chloride solution to precipitate sodium bicarbonate while the more soluble ammonium chloride remains in solution.

14 Safety

Sodium bicarbonate is used in a number of pharmaceutical formulations including injections and ophthalmic, otic, topical, and oral preparations.

Sodium bicarbonate is metabolized to the sodium cation, which is eliminated from the body by renal excretion, and the bicarbonate anion, which becomes part of the body's bicarbonate store. Any carbon dioxide formed is eliminated via the lungs. Administration of excessive amounts of sodium bicarbonate may thus disturb the body's electrolyte balance, leading to metabolic alkalosis or possibly sodium overload with potentially serious consequences. The amount of sodium present in antacids and effervescent formulations has been sufficient to exacerbate chronic heart failure, especially in elderly patients.[47]

Orally ingested sodium bicarbonate neutralizes gastric acid with the evolution of carbon dioxide and may cause stomach cramps and flatulence.

When used as an excipient, sodium bicarbonate is generally regarded as an essentially nontoxic and nonirritant material.

LD_{50} (mouse, oral): 3.36 g/kg[48]
LD_{50} (rat, oral): 4.22 g/kg[48]

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Eye protection and gloves are recommended.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (buccal chewing gums and tablets; intravenous, intramuscular, intraperitoneal, intrathecal, intravitreal, and subcutaneous injections; ophthalmic preparations; oral capsules, solutions, and tablets). Included in parenteral (intravenous infusions and injections; intramuscular and subcutaneous injections) and nonparenteral medicines (chewing gums; ear drops; eye lotions; mouthwashes; oral capsules, chewable tablets, effervescent powders, effervescent tablets, granules, soluble tablets, orodispersible tablets, suspensions, and tablets; suppositories; throat spray; vaginal insert) licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Potassium bicarbonate.

18 Comments

Each gram of sodium bicarbonate represents approximately 11.9 mmol of sodium and of bicarbonate. Each gram of sodium bicarbonate will neutralize 12 mEq of gastric acid in 60 minutes.

The yield of carbon dioxide from sodium bicarbonate is approximately 52% by weight.

Three molecules of sodium bicarbonate are required to neutralize one molecule of citric acid, and two molecules of sodium bicarbonate to neutralize one molecule of tartaric acid.

Therapeutically, sodium bicarbonate may be used as an antacid,[49] and as a source of the bicarbonate anion in the treatment of metabolic acidosis. Sodium bicarbonate may also be used as a component of oral rehydration salts and as a source of bicarbonate in dialysis fluids; it has also been suggested as a means of preventing radiocontrast-induced nephrotoxicity.[50] Parental sodium bicarbonate is used for urine alkalinisation;[51] the safety and efficacy of enteral sodium bicarbonate has been shown to be a viable alternative to the parenteral route in patients receiving high-dose methotrexate.[51]

Sodium bicarbonate is used in food products as an alkali or as a leavening agent, e.g. baking soda.

A specification for sodium bicarbonate is contained in the *Food Chemicals Codex* (FCC).[52]

The EINECS number for sodium bicarbonate is 205-633-8. The PubChem Compound ID (CID) for sodium bicarbonate includes 516892 and 24192197.

Sodium Borate

1 Nonproprietary Names

BP: Borax
JP: Sodium Borate
PhEur: Borax
USP–NF: Sodium Borate

2 Synonyms

Borax decahydrate; boric acid disodium salt; E285; natrii tetraboras; natrii tetraboras decahydricus; sodium biborate decahydrate; sodium pyroborate decahydrate; sodium tetraborate decahydrate.

S

3 Chemical Name and CAS Registry Number

Disodium tetraborate decahydrate [1303-96-4]

4 Empirical Formula and Molecular Weight

$Na_2B_4O_7 \cdot 10H_2O$ 381.37

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent; antimicrobial preservative; buffering agent; emulsifying agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium borate is used in pharmaceutical formulations as an antimicrobial preservative in ointments and topical creams, and as an emulsifying agent in creams.[1] It has also been used in lozenges, mouthwashes, otic preparations (0.3% w/v), and ophthalmic solutions (0.03–1.0% w/v).

Sodium borate is used in cosmetics such as moisturizers, deodorants, and shampoos. It is also used in foods as an antimicrobial preservative.

8 Description

Sodium borate occurs as white, hard crystals, granules, or crystalline powder. It is odorless and efflorescent.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium borate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Carbonate and bicarbonate	+	–	+
Color of solution	+	+	–
pH	9.1–9.6	9.0–9.6	–
Heavy metals	≤20 ppm	–	≤20 ppm
Arsenic	≤5 ppm	≤5 ppm	–
Calcium	–	≤100 ppm	–
Ammonium	–	≤10 ppm	–
Sulfates	–	≤50 ppm	–
Assay	99.0–103.0%	99.0–103.0%	99.0–105.0%

10 Typical Properties

Acidity/alkalinity pH = 9.0–9.6 (4% w/v aqueous solution)
Density 1.73 g/cm^3
Melting point 75°C when rapidly heated. At 100°C it loses $5H_2O$; at 150°C it loses $9H_2O$; and at 320°C it becomes anhydrous. At about 880°C the substance melts into a glassy state: 'borax beads'.

Solubility 1 in 1 of glycerin; 1 in 1 of boiling water; 1 in 16 of water; practically insoluble in ethanol (95%), ethanol (99.5%), and diethyl ether.

11 Stability and Storage Conditions

Sodium borate should be stored in a well-closed container in a cool, dry place. *See also* Section 18.

12 Incompatibilities

Sodium borate is incompatible with acids, metallic and alkaloidal salts, and strong reducing agents.

13 Method of Manufacture

Sodium borate can be prepared from minerals such as borosodium calcite, pandermite, or tinkal; these are natural sodium or calcium borates. Treatment of the mineral with sodium carbonate and sodium hydrogencarbonate yields the sodium borate decahydrate. In the US, brine from salt lakes is also an important source of sodium borate.[2]

14 Safety

Sodium borate has weak bacteriostatic and astringent properties. Historically, sodium borate has been used as a disinfectant in skin lotions and eye-, nose-, and mouthwashes. However, boric acid is easily absorbed via mucous membranes and damaged skin, and severe toxicity has been observed, especially in babies and children.[3] Consequently, the use of sodium borate as a disinfectant is now considered somewhat obsolete and careful use is recommended. The toxic effects of sodium borate include vomiting, diarrhea, erythema, CNS depression, and kidney damage; fatalities have also been reported.[4–6]

LD_{50} (guinea pig, oral): 5.33 g/kg[4,7]
LD_{50} (mouse, IP): 2.711 g/kg
LD_{50} (mouse, IV): 1.320 g/kg
LD_{50} (mouse, oral): 2.0 g/kg
LD_{50} (rat, oral): 2.66 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and the quantity of material handled; do not combine with acids.

16 Regulatory Status

Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (otic preparations; ophthalmic solutions and suspensions). Included in nonparenteral medicines licensed in the UK, Italy, France, Germany, and Japan. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Boric acid; sodium borate anhydrous.

Sodium borate anhydrous

Synonyms Borax glass; disodium tetraborate anhydrous; fused borax; fused sodium borate; sodium pyroborate; sodium tetraborate anhydrous.

Empirical formula $Na_2B_4O_7$
Molecular weight 201.2
CAS number [1330-43-4]
Boiling point 1575°C (decomposes)
Melting point 741°C
Solubility Slightly soluble in glycerin and water; practically insoluble in ethanol (95%).
Specific gravity 2.367
Comments The EINECS number for sodium borate anhydrous is 215-540-4.

18 Comments

Commercially available sodium borate decahydrate is usually present as monoclinic prismatic crystals that become opaque on the surface in dry air. In addition to the decahydrate, a pentahydrate exists; this is also known as 'jeweller's borax'. The anhydrous substance is also available and is called 'pyroborax'.

Sodium borate has been investigated in the prevention of crystal formation in freeze-dried solutions.[8]

Therapeutically, sodium borate has been used externally as a mild astringent. Preparations of sodium borate in honey have historically been used as paints for the throat, tongue, and mouth, but such use is now inadvisable because of concerns about toxicity in such applications; *see* Section 14.

The EINECS number for sodium borate is 271-536-2. The PubChem Compound ID (CID) for sodium borate is 11954323.

5 Structural Formula

See Section 4.

6 Functional Category

Alkalizing agent; buffering agent; dispersing agent; tablet and capsule diluent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium carbonate is used as an alkalizing agent in injectable, ophthalmic, oral, and rectal formulations.[1]

In effervescent tablets or granules, sodium carbonate is used in combination with an acid, typically citric acid or tartaric acid.[2] When the tablets or granules come into contact with water, an acid–base reaction occurs in which carbon dioxide gas is produced and the product disintegrates.[3] Raw materials with low moisture contents are required to prevent the early triggering of the effervescent reaction.[3]

As an alkalizing agent, concentrations of sodium carbonate between 2% and 5% w/w are used in compressed tablet formulations.[2,4] As an effervescent agent, concentrations of sodium carbonate up to 10% w/w can be used.[3]

8 Description

Sodium carbonate occurs as a white, almost white, or colorless inorganic salt, produced as crystalline powder or granules. It is hygroscopic and odorless.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium carbonate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters	–	+	–
Appearance of solution	+	+	–
Alkali hydroxides and bicarbonates	–	+	–
Chlorides	≤0.071%	≤125 ppm	–
Sulfates	–	≤250 ppm	–
Arsenic	≤3.1 ppm	≤5 ppm	–
Iron	–	≤50 ppm	–
Heavy metals	≤20 ppm	–	≤10 ppm
Loss on drying	≤2.0%	≤1.0%	≤0.5%
Assay (dried basis)	>99.0%	99.5–100.5%	99.5–100.5%

10 Typical Properties

Acidity/alkalinity

Strongly alkaline;
pH = 11.37 (1% w/v aqueous solution at 25°C);
pH = 11.58 (5% w/v aqueous solution at 25°C);
pH = 11.70 (10% w/v aqueous solution at 25°C).[5]

See also Figure 1.[6]

Hygroscopicity One mole of sodium carbonate will gradually absorb 1 mole of water (approximately 15%) on exposure to air.

Melting point 851°C

Refractive index n_D^{20} = 1.3341 at 1.0% w/w solution; 1.3440 at 5.0% w/w solution; 1.3547 at10.0% w/w solution.[7]

Solubility Freely soluble in water, with solubility initially increasing with temperature and then settling at 30.8% w/w above 80°C[6] (*see* Figure 2). Soluble in glycerin; practically insoluble in ethanol (95%).

Specific gravity 2.53

Spectroscopy

IR spectrum *see* Figure 3.

Raman spectrum *see* Figure 4.

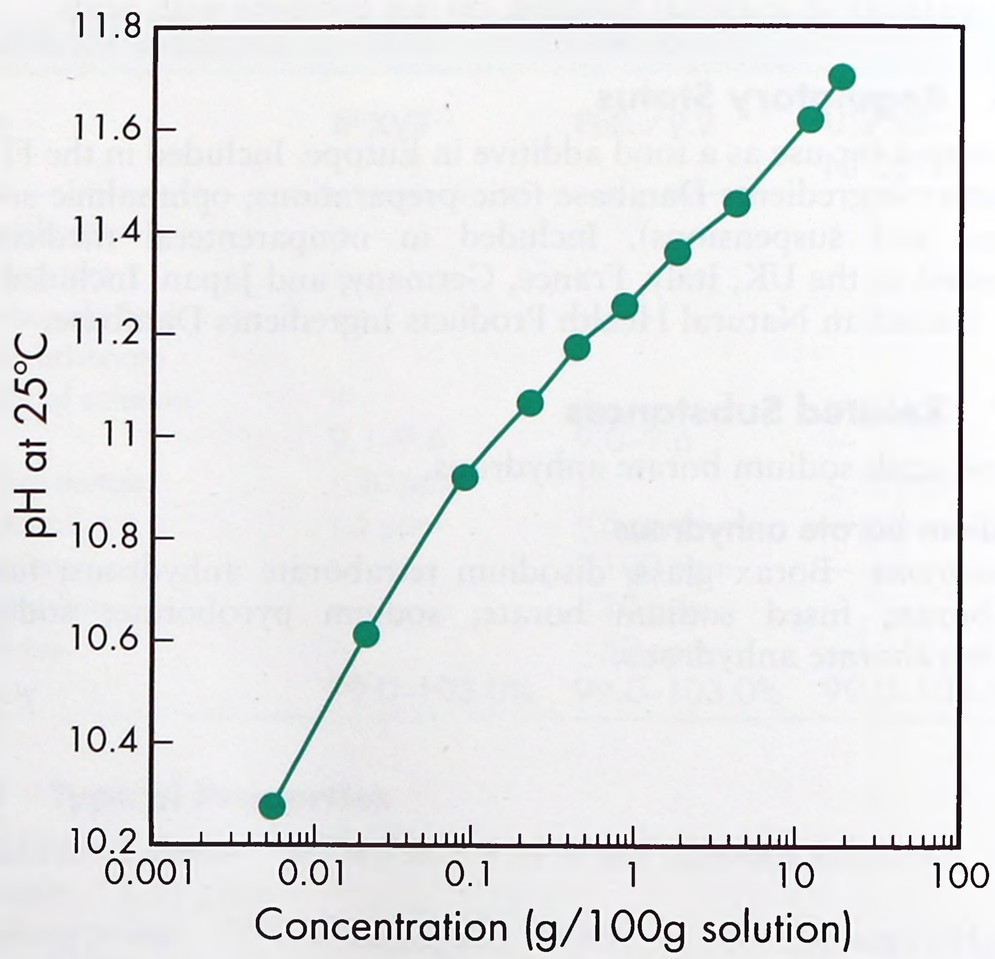

Figure 1: pH of sodium carbonate in water at 25°C.[5] Adapted with permission.

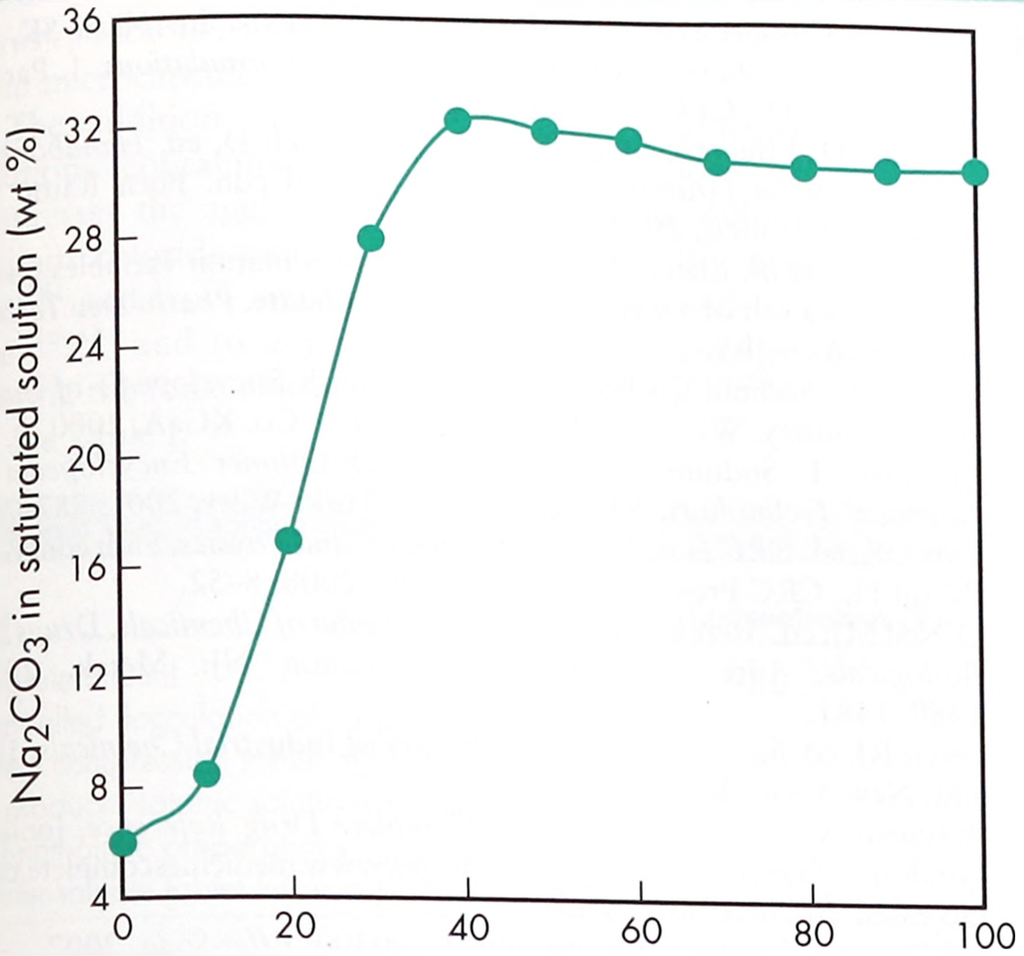

Figure 2: Solubility of sodium carbonate in water.[6] Adapted with permission.

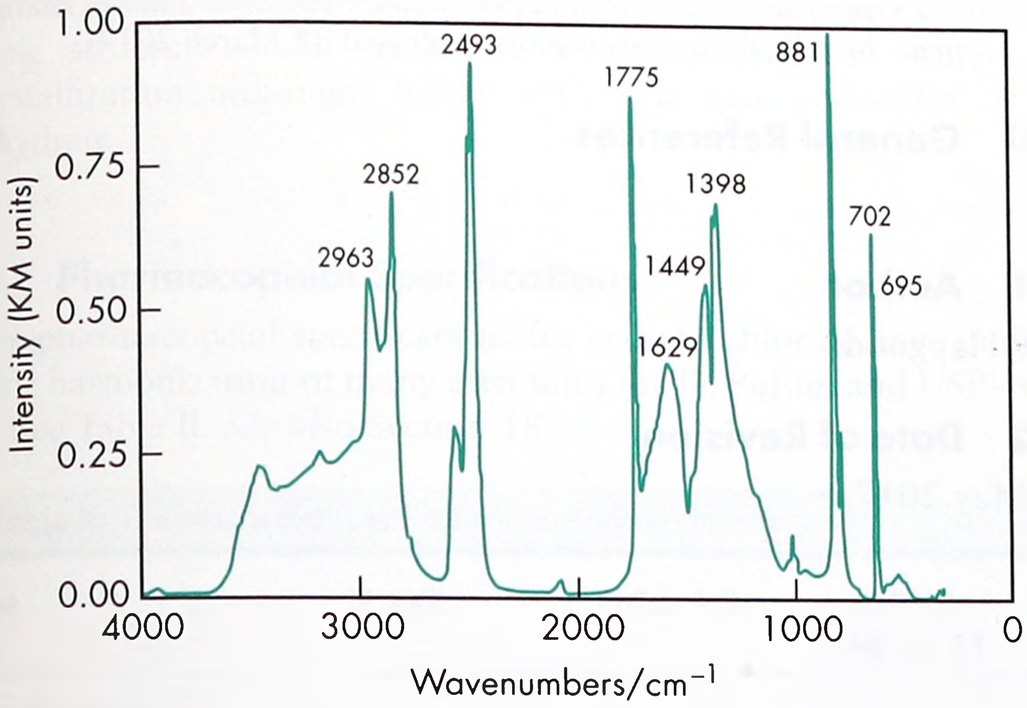

Figure 3: Infrared spectrum of sodium carbonate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

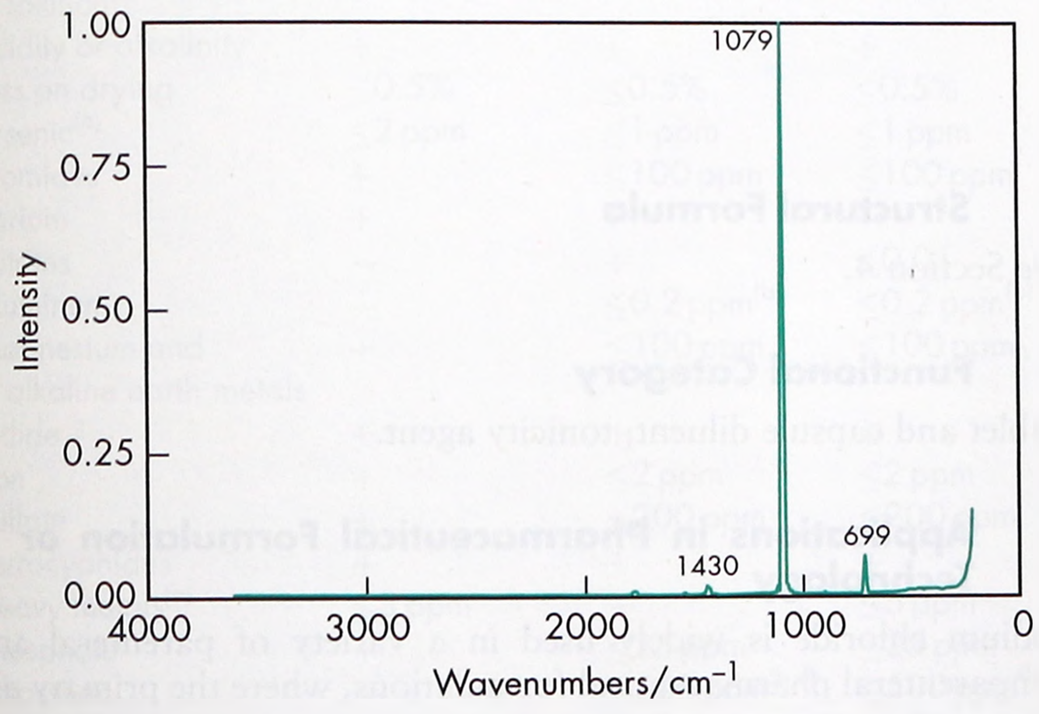

Figure 4: Raman spectrum of sodium carbonate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

11 Stability and Storage Conditions

Sodium carbonate converts to the monohydrate form when in contact with water and produces heat. It begins to lose carbon dioxide at temperatures above 400°C[8] and decomposes before boiling. Store in airtight containers.

12 Incompatibilities

Sodium carbonate decomposes when in contact with acids in the presence of water to produce carbon dioxide and effervescence. It may react violently with aluminum, phosphorous pentoxide, sulfuric acid, fluorine, and lithium.

13 Method of Manufacture

Sodium carbonate is produced by the ammonia-soda process, also known as the Solvay process.[6,8]

14 Safety

Sodium carbonate is used in injectable, oral, and rectal pharmaceutical formulations. The pure form of sodium carbonate is mildly toxic by ingestion, moderately toxic by inhalation and SC routes, and very toxic by the IP route. It is irritating to the skin and eyes. Dust and vapors of sodium carbonate may irritate mucous membranes, causing coughing and shortness of breath. It also has experimental reproductive effects.

Sodium carbonate can migrate to food from packaging materials. When used as an excipient or antacid, sodium carbonate is generally regarded as a nontoxic and nonirritating material.

LD_{50} (mouse, IP): 0.12 g/kg[9]
LD_{50} (mouse, SC): 2.21 g/kg
LD_{50} (rat, oral): 4.09 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of the material handled. When heated to decomposition it emits toxic fumes of sodium oxide. Eye protection and gloves are recommended. Respiratory protection is also recommended if inhalable dust is present.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (intra-arterial, intramuscular, intraperitoneal, intrapleural, intratumor, intravascular, intravenal, and nerve block injections; ophthalmic solutions; oral granules, capsules, buccal chewing gum, and tablets; rectal suspensions). Included in the Canadian Natural Health Products Ingredients Database. Included in parenteral (powder for solution for injection) and nonparenteral medicines (oral effervescent tablets, soluble tablets, granules, lozenges, chewing gums) licensed in the UK.

USP 40–NF 35 S1 allows either the anhydrous or the monohydrate form.

17 Related Substances

Sodium bicarbonate; sodium carbonate decahydrate; sodium carbonate monohydrate.

Sodium carbonate decahydrate

Empirical formula $Na_2CO_3 \cdot 10H_2O$
Molecular weight 286.1
CAS number [6132-02-1]
Description Colorless, transparent, or white crystals or powder.
Solubility Freely soluble in water; practically insoluble in ethanol (95%).
Comments Listed in PhEur 9.2 and JP XVII. Used in alkaline baths.[10]

S

Sodium carbonate monohydrate
Empirical formula $Na_2CO_3 \cdot H_2O$
Molecular weight 124.0
CAS number [5968-11-6]
Description Colorless or white crystals or granules.
Solubility Soluble in 3 parts water, 1.8 parts boiling water, or 7 parts glycerin; practically insoluble in ethanol (95%). Dries out in warm dry air or above 50°C, and converts to anhydrous form above 100°C.
Comments Listed in PhEur 9.2 and USP 40–NF 35 S1. Commonly used in antacid preparations and as a reagent.[10]

18 Comments

Sodium carbonate is more resistant to effervescent reactions than sodium bicarbonate, and therefore sodium bicarbonate is most commonly used in effervescent formulations.[3] Sodium carbonate can be added to these formulations as a stabilizing agent (up to 10% w/w) as it absorbs moisture, preventing early effervescent reactions.[3] This effect is exploited in *Effer-Soda*, in which a sodium bicarbonate core is protected by a surface layer of sodium carbonate, equivalent to 8–12% w/w.[11]

The technical grade of sodium carbonate anhydrous (approximately 99% purity) is known as soda ash.[8] *Sodium Carbonate IPH* (Solvay Pharmaceuticals) is not authorized for parenteral formulations.

Sodium carbonate has been investigated as part of a controlled-release, taste-masking formulation,[12] and in a novel effervescent dry powder inhaler formulation.[13]

Therapeutically, sodium carbonate is used as an oral antacid.[10]

A specification for sodium carbonate is contained in the *Food Chemicals Codex* (FCC).[14]

The EINECS number for sodium carbonate is 207-838-8. The PubChem Compound ID (CID) for sodium carbonate is 10340.

Sodium chloride [7647-14-5]

4 Empirical Formula and Molecular Weight

NaCl 58.44

5 Structural Formula

See Section 4.

6 Functional Category

Tablet and capsule diluent; tonicity agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium chloride is widely used in a variety of parenteral and nonparenteral pharmaceutical formulations, where the primary use is to produce isotonic solutions.

Sodium chloride has been used as a lubricant and diluent in capsules and direct-compression tablet formulations in the past,[1–5] although this practice is no longer common. Sodium chloride has also been used as a channeling agent[6,7] and as an osmotic agent[8,9] in the cores of controlled-release tablets. It has been used as a

porosity modifier in tablet coatings,[10] and to control drug release from microcapsules.[11,12]

The addition of sodium chloride to aqueous spray-coating solutions containing hydroxypropyl cellulose or hypromellose suppresses the agglomeration of crystalline cellulose particles.[13] Sodium chloride can also be used to modify drug release from gels[14] and from emulsions.[15] It can be used to control micelle size,[16–18] and to adjust the viscosity of polymer dispersions by altering the ionic character of a formulation.[19,20]

See Table I.

Table I: Uses of sodium chloride.

Use	Concentration (%)
Capsule diluent	10–80
Controlled flocculation of suspensions	≤1
Direct compression tablet diluent	10–80
To produce isotonic solutions in intravenous or ophthalmic preparations	≤0.9
Water-soluble tablet lubricant	5–20

8 Description

Sodium chloride occurs as a white crystalline powder or colorless crystals; it has a saline taste. The crystal lattice is a face-centered cubic structure. Solid sodium chloride contains no water of crystallization although, below 0°C, salt may crystallize as a dihydrate.

9 Pharmacopeial Specifications

The pharmacopeial specifications for sodium chloride have undergone harmonization of many attributes for JP, PhEur, and USP–NF.

See Table II. *See also* Section 18.

Table II: Pharmacopeial specifications for sodium chloride.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1
Identification	+	+	+
Characters[a]	+	+	—
Appearance of solution[a]	+	+	+
Acidity or alkalinity	+	+	+
Loss on drying	≤0.5%	≤0.5%	≤0.5%
Arsenic[a]	≤2 ppm	≤1 ppm	≤1 ppm
Bromides	+	≤100 ppm	≤100 ppm
Barium	+	+	+
Nitrites	—	+	≤0.01
Aluminum	—	≤0.2 ppm[b]	≤0.2 ppm[b]
Magnesium and alkaline earth metals	+	≤100 ppm	≤100 ppm
Iodide	+	+	+
Iron	+	≤2 ppm	≤2 ppm
Sulfate	+	≤200 ppm	≤200 ppm
Ferrocyanides	+	+	+

Phosphate	+	≤25 ppm	≤25 ppm
Potassium	—	≤500 ppm[b,c]	≤500 ppm[b,c]
Sterility[a]	—	—	+
Bacterial endotoxins[a]	—	≤5 IU/g[c]	+
Assay (dried basis)	99.0–100.5%	99.0–100.5%	99.0–100.5%

(a) These tests have not been fully harmonized at the time of publication.
(b) If for use in peritoneal dialysis, hemodialysis or hemofiltration solutions.
(c) If for parenteral use.

10 Typical Properties

Acidity/alkalinity pH = 6.7–7.3 (saturated aqueous solution)
Angle of repose 38° for cubic crystals
Boiling point 1413°C
Compressibility With sodium chloride powder of less than 30 µm particle size, tablets are formed by plastic deformation; above this size, both plastic deformation and fracture occur.[1,3,4]

See also Figure 1.

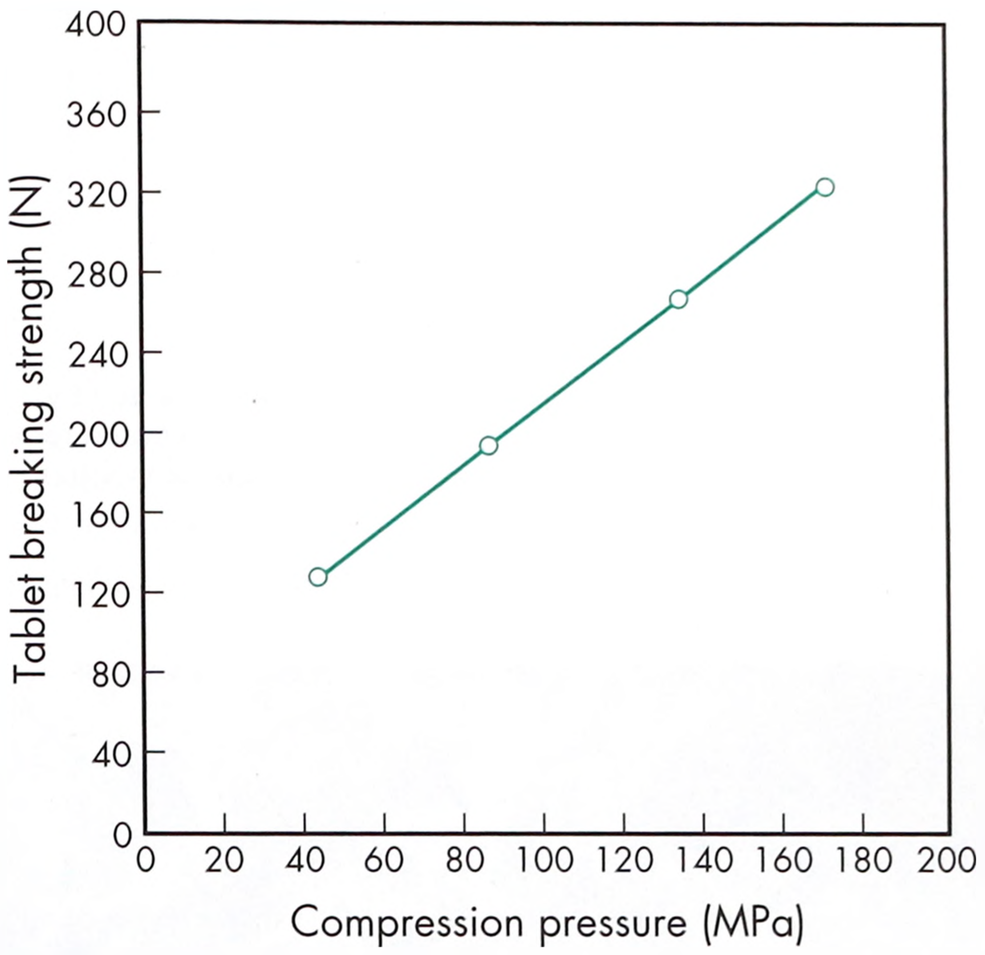

Figure 1: Compression characteristics of sodium chloride (cubic crystals).[3] Tablet diameter = 12 mm.

Density
2.17 g/cm^3;
1.20 g/cm^3 for saturated aqueous solution.
Density (bulk) 0.93 g/cm^3
Density (tapped) 1.09 g/cm^3
Dielectric constant 5.9 at 1 MHz
Freezing point depression *see* Table III.

Table III: Freezing point depression values of aqueous sodium chloride.

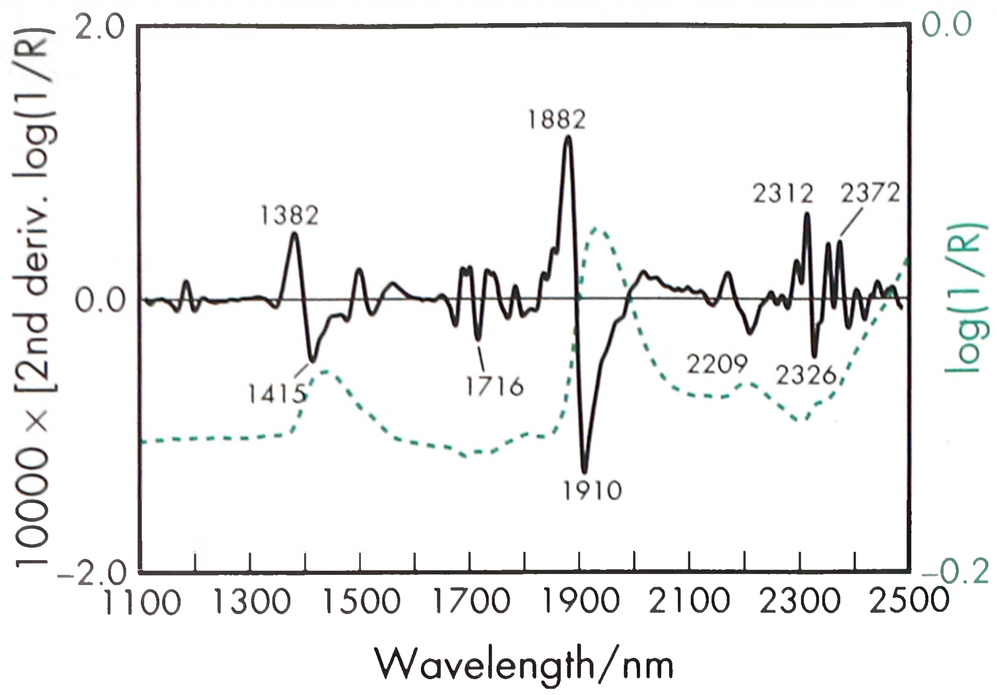
Aqueous sodium chloride solution (% w/v)	Freezing point depression (°C)
11.69	6.90
17.53	10.82
23.38	15.14
30.39	21.12

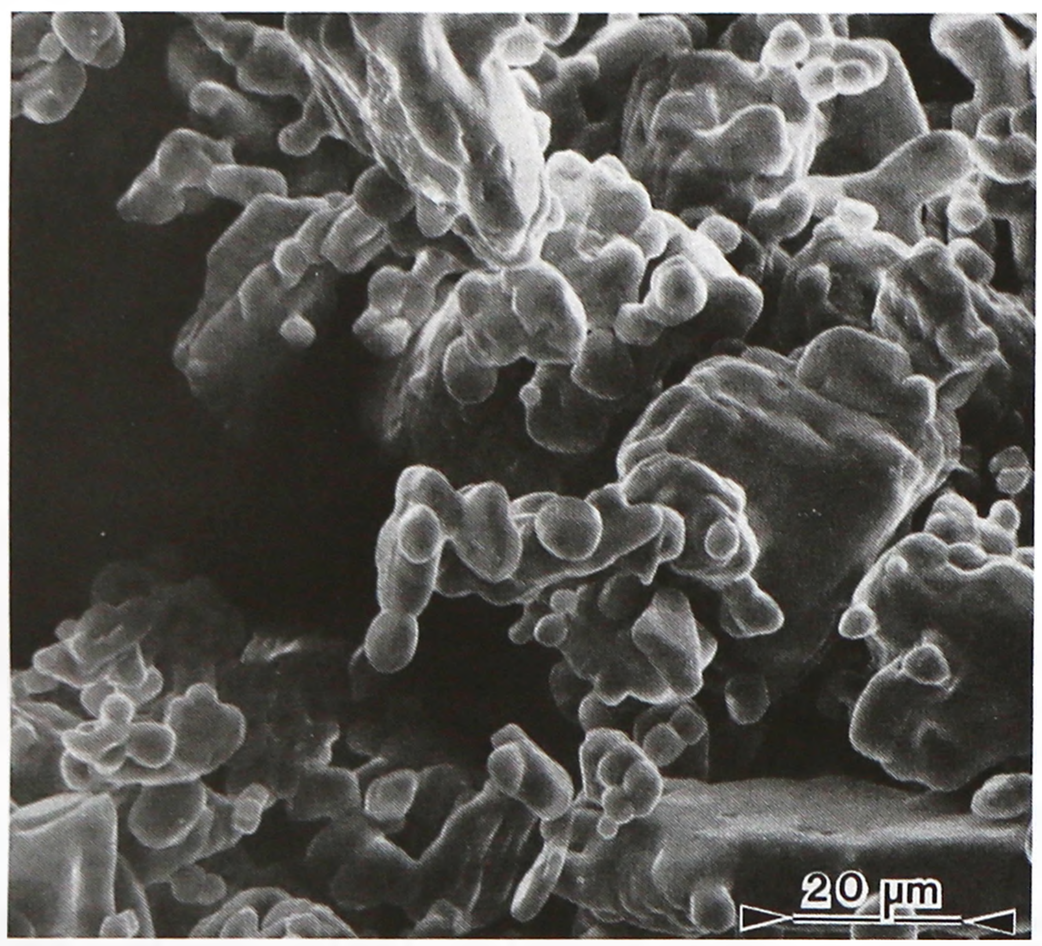
Hardness (Mohs) 2–2.5
Hygroscopicity Hygroscopic above 75% relative humidity.
Melting point 804°C
Osmolarity A 0.9% w/v aqueous solution is iso-osmotic with serum.
Refractive index n_D^{20} = 1.343 for a 1 M aqueous solution.
Solubility *see* Table IV.

Table IV: Solubility of sodium chloride.

Solvent	Solubility at 20°C unless otherwise stated
Ethanol	Slightly soluble
Ethanol (95%)	1 in 250
Glycerin	1 in 10
Water	1 in 2.8
	1 in 2.6 at 100°C

S





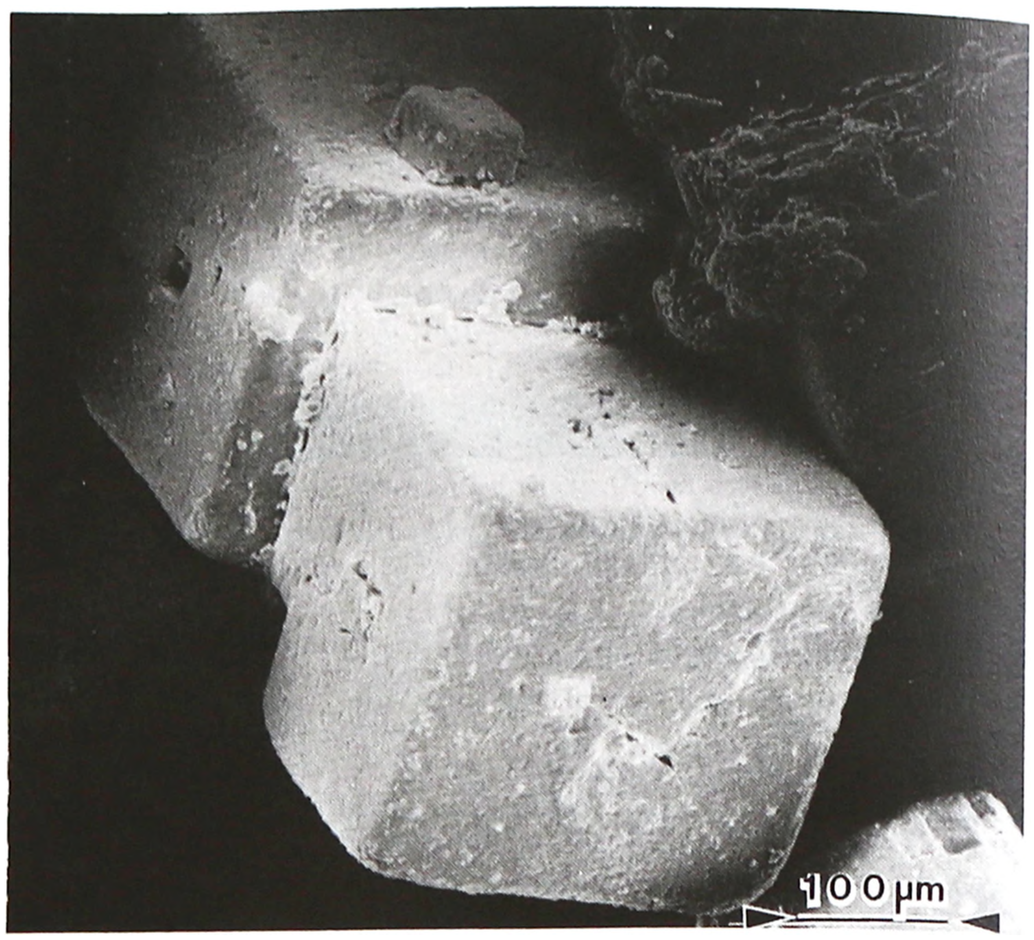


Figure 2: Near-infrared spectrum of sodium chloride measured by reflectance. Sodium chloride does not absorb in the near-infrared region; however, it will generally show some peaks due to traces of moisture (approx. 1450 nm and 1950 nm).

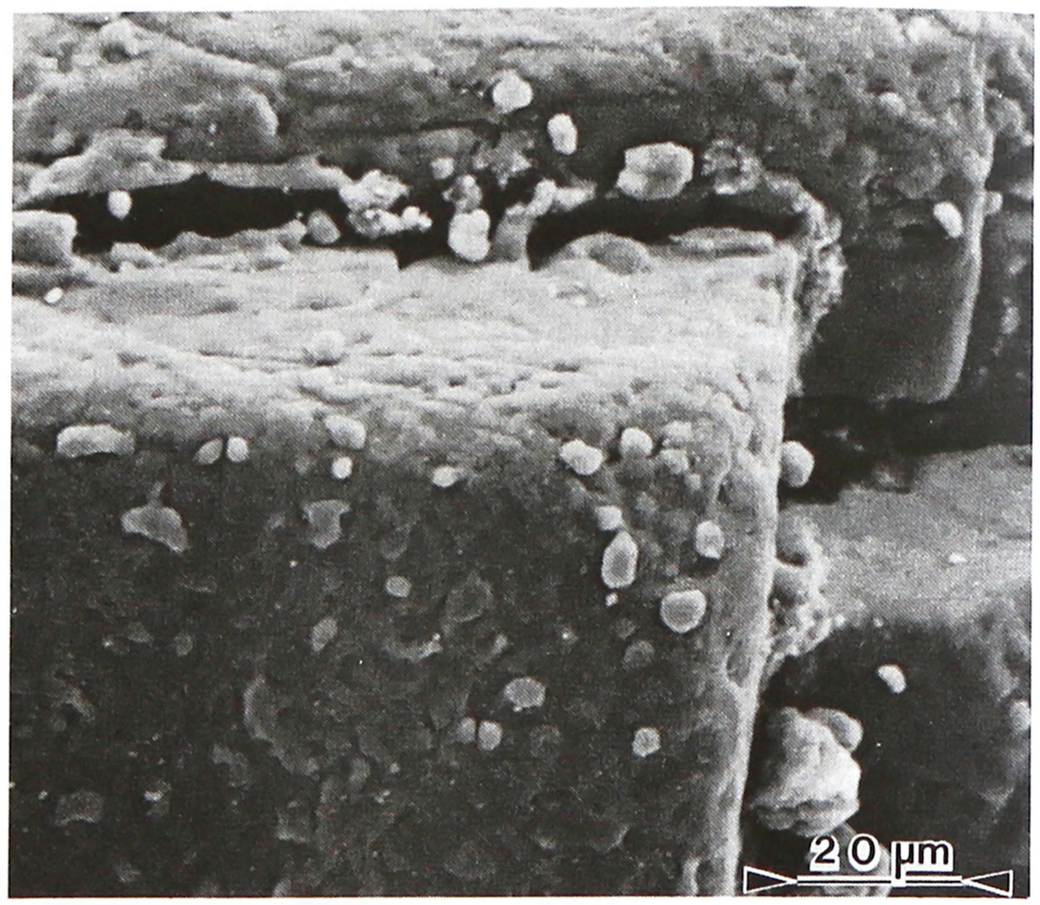

SEM 1: Excipient: sodium chloride, powder; manufacturer: Mallinckrodt Speciality Chemicals Co.; magnification: 600×.

SEM 2: Excipient: sodium chloride, granular; manufacturer: Van Waters & Rogers, Inc.; magnification: 120×.

SEM 3: Excipient: sodium chloride, granular; manufacturer: Van Waters & Rogers, Inc.; magnification: 600×.

S

Thermal conductivity 1.15 Wm/K at 273 K
Specific heat capacity 854 J/kg/K
Spectroscopy

NIR spectrum *see* Figure 2.

Vapor pressure

133.3 Pa at 865°C for solid;

1759.6 Pa at 20°C for a saturated aqueous solution (equivalent to 75.3% relative humidity).

Viscosity A 10% w/v solution has a viscosity of 1.19 mPa s (1.19 cP).

11 Stability and Storage Conditions

Aqueous sodium chloride solutions are stable but may cause the separation of glass particles from certain types of glass containers. Aqueous solutions may be sterilized by autoclaving or filtration. The solid material is stable and should be stored in a well-closed container, in a cool, dry place.

It has been shown that the compaction characteristics and the mechanical properties of tablets are influenced by the relative humidity of the storage conditions under which sodium chloride was kept.[21,22]

12 Incompatibilities

Aqueous sodium chloride solutions are corrosive to iron. They also react to form precipitates with silver, lead, and mercury salts. Strong oxidizing agents liberate chlorine from acidified solutions of sodium chloride. The solubility of the antimicrobial preservative methylparaben is decreased in aqueous sodium chloride solutions[23] and the viscosity of carbomer gels and solutions of hydroxyethyl cellulose or hydroxypropyl cellulose is reduced by the addition of sodium chloride.

13 Method of Manufacture

Sodium chloride occurs naturally as the mineral halite. Commercially, it is obtained by the solar evaporation of sea water, by mining, or by the evaporation of brine from underground salt deposits.

14 Safety

Sodium chloride is the most important salt in the body for maintaining the osmotic tension of blood and tissues. About 5–12 g of sodium chloride is consumed daily, in the normal adult diet, and a corresponding amount is excreted in the urine. As an excipient, sodium chloride may be regarded as an essentially nontoxic and nonirritant material. However, toxic effects following the oral ingestion of 0.5–1.0 g/kg body-weight in adults may occur. The oral ingestion of larger quantities of sodium chloride, e.g. 1000 g in 600 mL of water,[24] is harmful and can induce irritation of the gastrointestinal tract, vomiting, hypernatremia, respiratory distress, convulsions, or death.

In rats, the minimum lethal intravenous dose is 2.5 g/kg body-weight.

LD_{50} (mouse, IP): 6.61 g/kg[25]

LD_{50} (mouse, IV): 0.65 g/kg

LD_{50} (mouse, oral): 4.0 g/kg

LD_{50} (mouse, SC): 3.0 g/kg

LD_{50} (rat, oral): 3.0 g/kg

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. If heated to high temperatures, sodium chloride evolves a vapor irritating to the eyes.

16 Regulatory Status

GRAS listed. Included in the FDA Inactive Ingredients Database (injections; inhalations; nasal, ophthalmic, oral, otic, rectal, and topical preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Potassium chloride.

18 Comments

Sodium chloride has undergone harmonization of many attributes for JP, PhEur, and USP–NF by the Pharmacopeial Discussion Group. For further information see the General Chapter 5.8 in PhEur, along with the 'State of Work' document on the PhEur EDQM website, and also the General Information Chapter G10 in the JP.

Domestic table salt may contain sodium iodide (as a prophylactic substance against goiter) and agents such as magnesium carbonate, calcium phosphate, or starch, which reduce the hygroscopic characteristics of the salt and maintain the powder in a free-flowing state.

Food-grade dendritic salt, which is porous, can be used as an absorbent for liquid medications, and as a tablet diluent in specific formulations.

Each gram of sodium chloride represents approximately 17.1 mmol of sodium and 17.1 mmol of chloride; 2.54 g of sodium chloride is approximately equivalent to 1 g of sodium.

A saturated solution of sodium chloride can be used as a constant-humidity solution; at 25°C, a relative humidity of 75% is produced. A specification for sodium chloride is contained in the *Food Chemicals Codex* (FCC).[26]

The EINECS number for sodium chloride is 231-598-3. The PubChem Compound ID (CID) for sodium chloride is 5234.

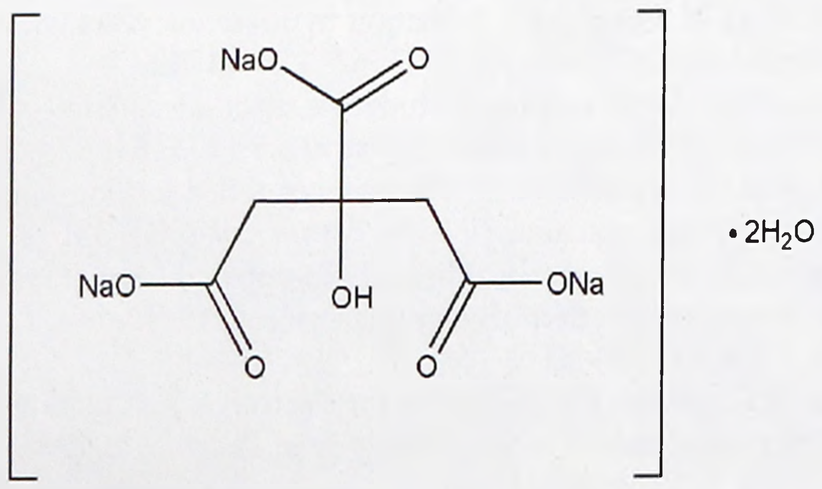
Sodium Citrate Dihydrate

1 Nonproprietary Names

BP: Sodium Citrate
JP: Sodium Citrate Hydrate
PhEur: Sodium Citrate
USP-NF: Sodium Citrate

2 Synonyms

Citric acid trisodium salt; E331; natrii citras; sodium citrate tertiary; trisodium citrate.



3 Chemical Name and CAS Registry Number

Trisodium 2-hydroxypropane-1,2,3-tricarboxylate dihydrate [6132-04-3]

4 Empirical Formula and Molecular Weight

$C_6H_5Na_3O_7 \cdot 2H_2O$ 294.10

5 Structural Formula

6 Functional Category

Alkalizing agent; buffering agent; complexing agent; emulsifying agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium citrate, as either the dihydrate or anhydrous material, is widely used in pharmaceutical formulations; *see* Table I. It is also used as a complexing agent to bind metal ions in solution. The anhydrous material is used in effervescent tablet formulations.[1]

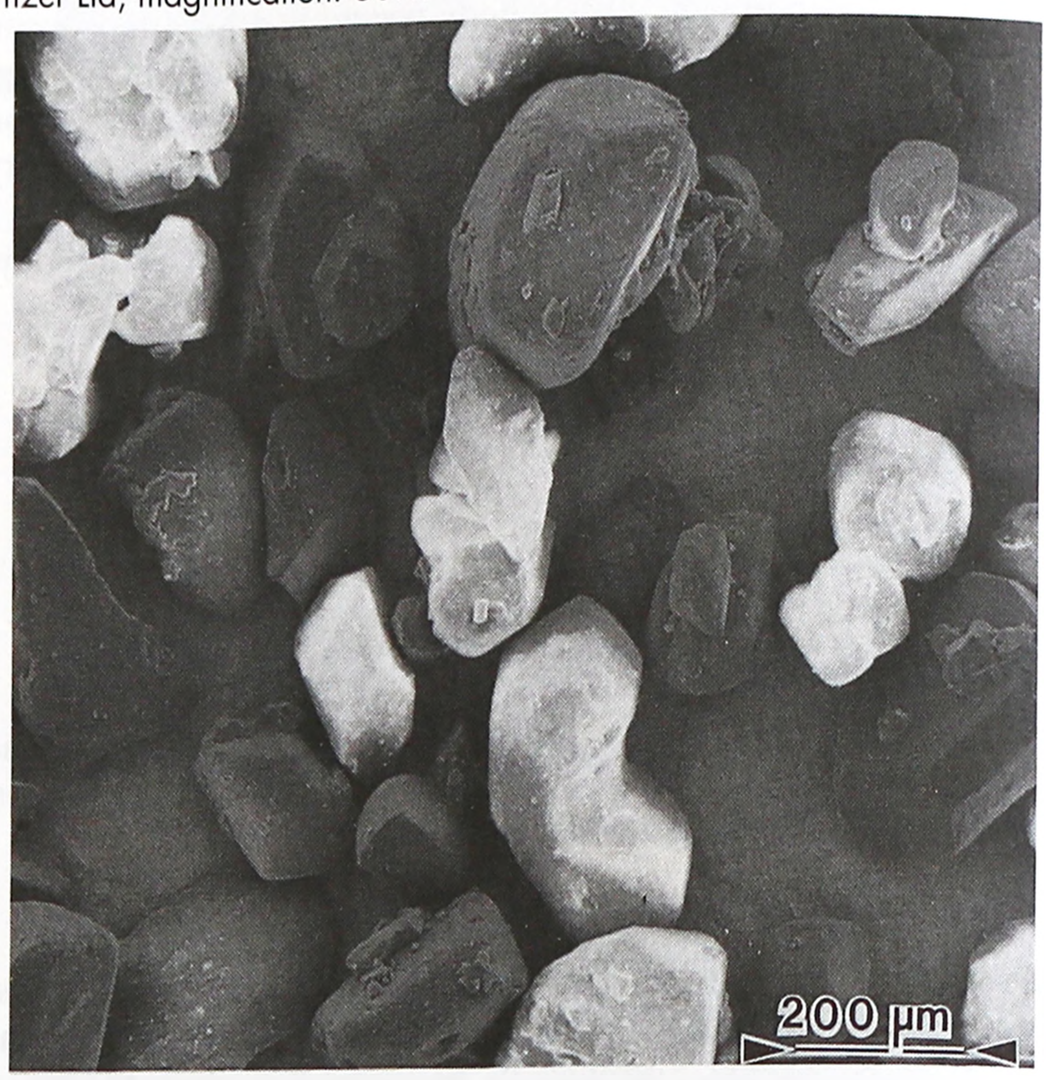


Table I: Uses of sodium citrate dihydrate.

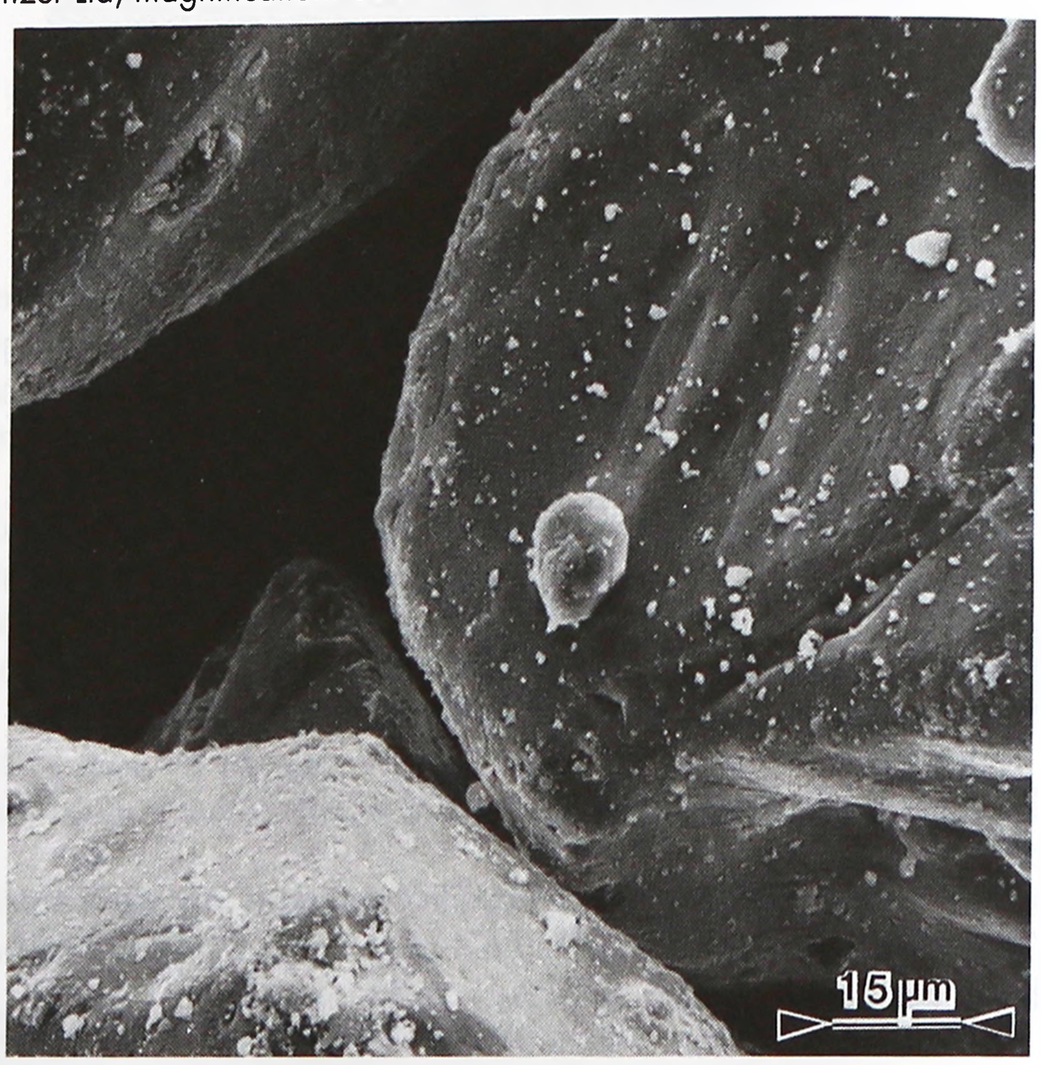
Use	Concentration (%)
Buffering agent	0.3–2.0
Injections	0.02–4.0
Ophthalmic solutions	0.1–2.0
Complexing agent	0.3–2.0



8 Description

Sodium citrate dihydrate consists of odorless, colorless, monoclinic crystals, or a white crystalline powder with a cooling, saline taste. It is slightly deliquescent in moist air, and in warm dry air it is efflorescent. Although most pharmacopeias specify that sodium citrate is the dihydrate, the USP 40–NF 35 S1 states that sodium citrate may be either the dihydrate or anhydrous material.

SEM 1: Excipient: sodium citrate dihydrate (granular); manufacturer: Pfizer Ltd; magnification: 60×.

SEM 2: Excipient: sodium citrate dihydrate (granular); manufacturer: Pfizer Ltd; magnification: 600×.

9 Pharmacopeial Specifications

See Table II.

10 Typical Properties

Acidity/alkalinity pH = 7.0–9.0 (5% w/v aqueous solution)
Density (bulk) 1.12 g/cm^3
Density (tapped) 0.99 g/cm^3
Density (true) 1.19 g/cm^3
Melting point Converts to the anhydrous form at 150°C.
Osmolarity A 3.02% w/v aqueous solution is iso-osmotic with serum.

Table II: Pharmacopeial specifications for sodium citrate dihydrate.

Test	JP XVII	PhEur 9.2	USP 40–NF 35 S1

Assay (anhydrous basis)	99.0–101.0%	99.0–101.0%	99.0–100.5%

[a] If intended for use in large-volume preparations for parenteral use, compliance with a test for pyrogens may be required.

Particle size distribution Various grades of sodium citrate dihydrate with different particle sizes are commercially available.

Solubility Soluble 1 in 1.5 of water, 1 in 0.6 of boiling water; practically insoluble in ethanol (95%).

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Sodium citrate dihydrate is a stable material. Aqueous solutions may be sterilized by autoclaving. On storage, aqueous solutions may cause the separation of small, solid particles from glass containers.

The bulk material should be stored in an airtight container in a cool, dry place.

12 Incompatibilities

Aqueous solutions are slightly alkaline and will react with acidic substances. Alkaloidal salts may be precipitated from their aqueous or hydro-alcohol solutions. Calcium and strontium salts will cause precipitation of the corresponding citrates. Other incompatibilities include bases, reducing agents, and oxidizing agents.

13 Method of Manufacture

Sodium citrate is prepared by adding sodium carbonate to a solution of citric acid until effervescence ceases. The resulting solution is filtered and evaporated to dryness.

14 Safety

After ingestion, sodium citrate is absorbed and metabolized to bicarbonate. Although it is generally regarded as a nontoxic and nonirritant excipient, excessive consumption may cause gastrointestinal discomfort or diarrhea. Therapeutically, in adults, up to 15 g daily of sodium citrate dihydrate may be administered orally, in divided doses, as an aqueous solution to relieve the painful irritation caused by cystitis.

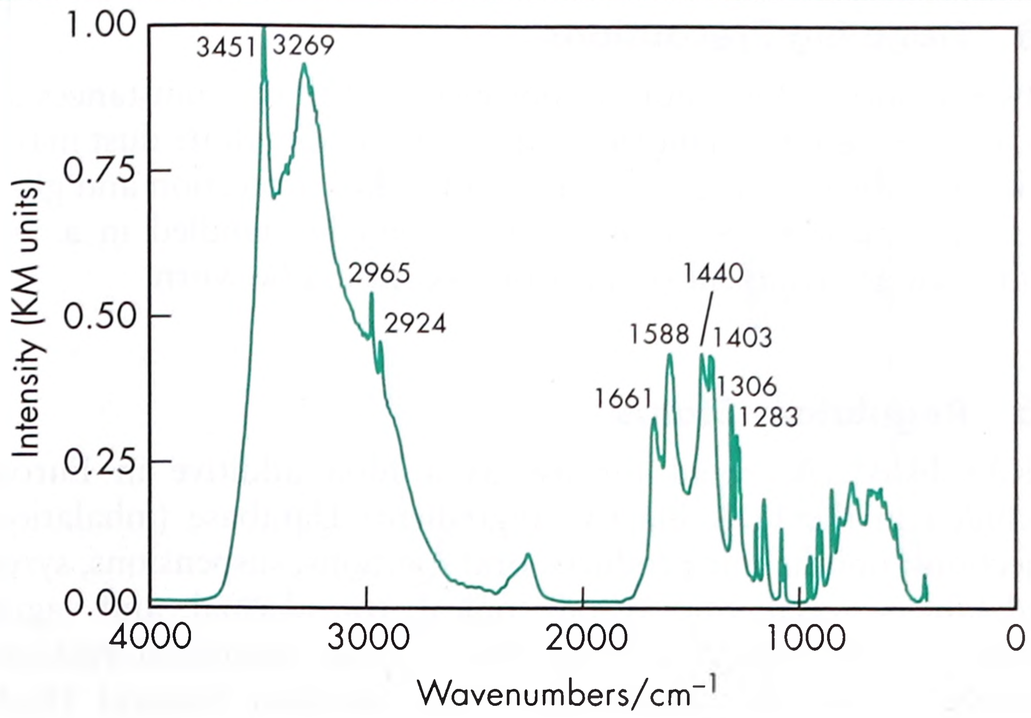

Figure 1: Infrared spectrum of sodium citrate dihydrate measured by diffuse reflectance. Adapted with permission of Informa Healthcare.

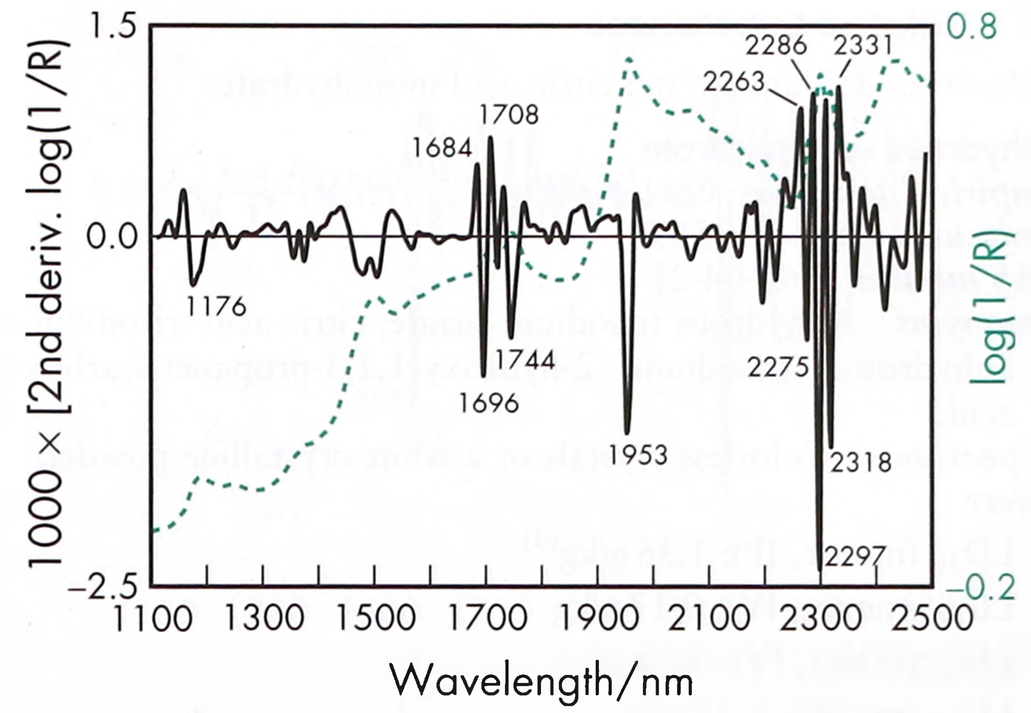

Figure 2: Near-infrared spectrum of sodium citrate dihydrate measured by reflectance.

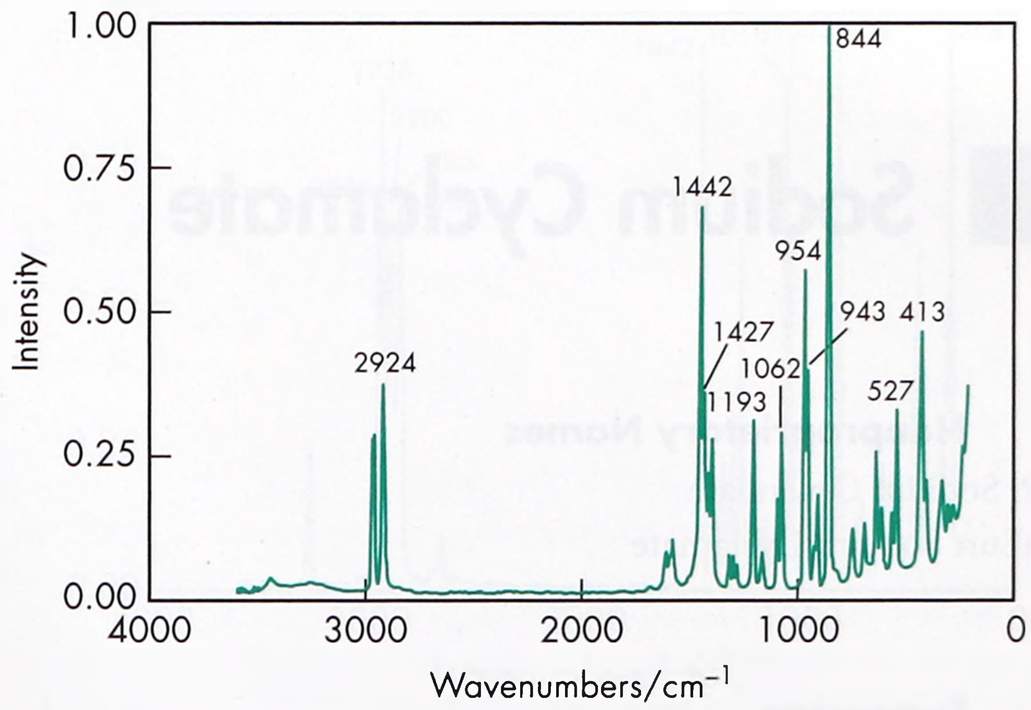

Figure 3: Raman spectrum of sodium citrate dihydrate measured in the 180° reflectance mode. Adapted with permission of Informa Healthcare.

Citrates and citric acid enhance intestinal aluminum absorption in renal patients, which may lead to increased, harmful serum aluminum levels. It has therefore been suggested that patients with renal failure taking aluminum compounds to control phosphate absorption should not be prescribed citrate- or citric acid-containing products.[2]

See Section 17 for anhydrous sodium citrate animal toxicity data.

S

15 Handling Precautions

Observe normal precautions appropriate to the circumstances and quantity of material handled. Sodium citrate dihydrate dust may be irritant to the eyes and respiratory tract. Eye protection and gloves are recommended. Sodium citrate should be handled in a well-ventilated environment or a dust mask should be worn.

16 Regulatory Status

GRAS listed. Accepted for use as a food additive in Europe. Included in the FDA Inactive Ingredients Database (inhalations; injections; ophthalmic products; oral solutions, suspensions, syrups and tablets; nasal, otic, rectal, topical, transdermal, and vaginal preparations). Included in nonparenteral and parenteral medicines licensed in the UK. Included in the Canadian Natural Health Products Ingredients Database.

17 Related Substances

Anhydrous sodium citrate; citric acid monohydrate.

Anhydrous sodium citrate

Empirical formula $C_6H_5Na_3O_7$
Molecular weight 258.07
CAS number [68-04-2]
Synonyms Anhydrous trisodium citrate; citric acid trisodium salt anhydrous; trisodium 2-hydroxy-1,2,3-propanetricarboxylic acid.
Appearance Colorless crystals or a white crystalline powder.
Safety

LD_{50} (mouse, IP): 1.36 g/kg[3]
LD_{50} (mouse, IV): 0.17 g/kg
LD_{50} (rabbit, IV): 0.45 g/kg
LD_{50} (rat, IP): 1.55 g/kg

18 Comments

Each gram of sodium citrate dihydrate represents approximately 10.2 mmol of sodium and 3.4 mmol of citrate. Each gram of anhydrous sodium citrate represents approximately 11.6 mmol of sodium and 3.9 mmol of citrate.

Therapeutically, sodium citrate is used to relieve the painful irritation caused by cystitis, and also to treat dehydration and acidosis due to diarrhea; *see* Section 14.

Sodium citrate, as either the dihydrate or anhydrous material, is used in food products, primarily to adjust the pH of solutions.

Sodium citrate is additionally used as a blood anticoagulant either alone or in combination with other citrates such as disodium hydrogen citrate.

The EINECS number for sodium citrate is 200-675-3. The PubChem Compound ID (CID) for sodium citrate dihydrate is 71474.

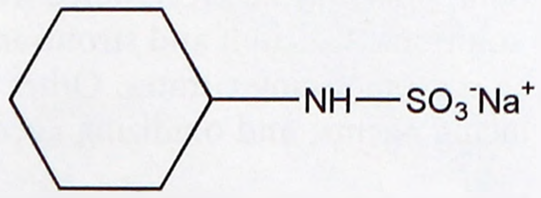
Sodium Cyclamate

1 Nonproprietary Names

BP: Sodium Cyclamate
PhEur: Sodium Cyclamate

2 Synonyms

Cyclamate sodium; cyclohexylsulfamic acid monosodium salt; E952; natrii cyclamas; sodium cyclohexanesulfamate.



3 Chemical Name and CAS Registry Number

Sodium *N*-cyclohexylsulfamate [139-05-9]

4 Empirical Formula and Molecular Weight

$C_6H_{12}NNaO_3S$ 201.22

5 Structural Formula

6 Functional Category

Sweetening agent.

7 Applications in Pharmaceutical Formulation or Technology

Sodium cyclamate is used as an intense sweetening agent in pharmaceutical formulations. In dilute solution, up to about 0.17% w/v, the sweetening power is approximately 30 times that of sucrose. However, at higher concentrations this is reduced and at a concentration of 0.5% w/v a bitter taste becomes noticeable.

Sodium cyclamate enhances flavor systems and can be used to mask some unpleasant taste characteristics. In most applications, sodium cyclamate is used in combination with saccharin, often in a ratio of 10 : 1.[1]

8 Description

Sodium cyclamate occurs as white, odorless or almost odorless crystals, or as a crystalline powder with an intensely sweet taste.

9 Pharmacopeial Specifications

See Table I.

Table I: Pharmacopeial specifications for sodium cyclamate.

Test	PhEur 9.2
Identification	+
Characters	+
Appearance of solution	+
pH (10% w/v aqueous solution)	5.5–7.5
Absorbance at 270 nm	≤0.10
Sulfamic acid	+
Aniline	≤1 ppm
Cyclohexylamine	≤10 ppm
Dicyclohexylamine	≤1 ppm
Sulfates	≤0.1%
Loss on drying	≤1.0%
Assay (dried basis)	98.5–101.0%

10 Typical Properties

Acidity/alkalinity pH = 5.5–7.5 for a 10% w/v aqueous solution.
Melting point >300°C
Solubility *see* Table II.

Table II: Solubility of sodium cyclamate.

Solvent	Solubility at 20°C unless otherwise stated
Benzene	Practically insoluble
Chloroform	Practically insoluble
Ethanol (95%)	1 in 250
Ether	Practically insoluble
Propylene glycol	1 in 25
Water	1 in 5
	1 in 2 at 45°C

Spectroscopy

IR spectrum *see* Figure 1.

NIR spectrum *see* Figure 2.

Raman spectrum *see* Figure 3.

11 Stability and Storage Conditions

Sodium cyclamate is hydrolyzed by sulfuric acid and cyclohexylamine at a very slow rate that is proportional to the hydrogen ion concentration. Therefore, for all practical considerations, it can be regarded as stable. Solutions are also stable to heat, light, and air over a wide pH range.

Samples of tablets containing sodium cyclamate and saccharin have shown no loss in sweetening power following storage for up to 20 years.

The bulk material should be stored in a tightly closed container in a cool, dry and well-ventilated place.

12 Incompatibilities
